824-K. All-Welded Plant Makes 400 Tons of Steelmaking Oxygen a Day. Herman F. Buschow. Welding Design & Fabrication, v. 34, Sept. 1961, p. 35-37.

Tungsten gas-shielded arc and semi-automatic consumable welding processes are used to fabricate Al and stainless steel pressure vessels, heat exchangers, valves and piping of an oxygen plant. (K1d, T29m; SS, Al, 17-57)

825-K. How to Control Distortion and Maintain Dimensional Stability. M. J. Shoelson. Welding Design & Fabrication, v. 34, Sept. 1961, p. 38-39.

Weldment design and process variables including stress relieving for control of shrinkage, warpage and similar distortions during fabrication and for maintaining dimensional stability in service are discussed for mild and structural steels. (K-general, K9, J1a, 9-74; ST)

826-K. Automatic Welder Saves $20,500 a Year. Welding Design & Fabrication, v. 34, Sept. 1961, p. 40.

Spot, projection and upset welding production of dial telephone relays from small parts made of Mg using an automatic feed welder with interchangeable dial tables. (K3, T1n, 1-52; Mg, 17-57)

827-K. Laundry Machines Stay Strong and Clean With Welded Stainless Steel. Welding Design & Fabrication, v. 34, Sept. 1961, p. 46-47.

Submerged arc and spot welding of 0.062 to 0.093-in. 302 stainless steel sheet for fabrication of tubs, cylinders, skirts and trim for automatic washers. (K1e, K3n, T10c; SS, 17-57)

828-K. How We Repair-Weld Machined Parts and Hold Tolerances. Willerd A. Schumbacker. Welding Design & Fabrication, v. 32, Sept. 1961, p. 48-50.

Steel casings and turbine collars machined to size are stress relieved by preheating with a gas torch before arc welding and by peening. (K1, G23n, J1a, 7-51; ST)

829-K. New Welders Make 14% Less Rejects. R. W. Eskelson. Welding Design & Fabrication, v. 34, Sept. 1961, p. 53.

Inside-out argon arc welding of rocket motor cases from 4130 low-alloy steel sheet by the short arc process using automatic equipment. Prevention of distortion in seam, flange and girth welds. Weld quality is examined by X-ray and hydrostatic testing. (K1d, K9, T24e, 1-52; ST, 17-57)

830-K. Wisconsin Welds First Bridge With CO_2. Welding Design & Fabrication, v. 34, Sept. 1961, p. 54-55.

The CO_2 welding process is used to make 3/8 in. fillets and to butt weld 3/8 to 1 3/8 in. thick plates of structural steel. Weld size and shape, quality and welding speed and costs are compared with submerged arc welding. (K1d, T26p; ST, 17-57)

831-K. (Russian.) Investigation of Titanium and Steel Cohesion. I. M. Pavlov and V. N. Brinza. Tsvetnye Metally, Apr. 1961, p. 58-61.

Polishing, etching and insulating by lubrication of the plate surfaces, followed by pressing at 700-1000° C., to determine interlayer diffusion depth and interlayer cohesion and the relationship between cohesion and pressure, temperature and pressing time. 5 ref. (K12, Q10c, 2-61, 3-67, 3-74; Ti, ST)

832-K. Brazing Replaces Machining. Modern Metals, v. 17, Sept. 1961, p. 74, 76.

Dip brazing of "stacks" of Al stampings eliminates machining operations and drill jigs necessary for steel components and increases the savings gained by use of a relatively inexpensive material. (K8n, 1-52; Al, 17-57)

833-K. The Production of House-Wiring Cable. Peter Trippe. Mass Production, v. 37, Sept. 1961, p. 53-63.

Methods of drawing, annealing, tinning and stranding copper wire into conductor cores which are insulated with rubber or polyvinyl chloride sheathing by extrusion and other processes. (K13a, F28, J23, L16; Cu, Sn, NM-d)

834-K. Micro-Wire Welding. L. R. Walker. Welding Fabrication and Design, v. 4, July 1961, p. 9-12.

Low amperage electric arc welding in which smaller-diameter bare-wire electrode is fed into a welding zone shielded by CO_2 or Ar-CO_2 mixture. Welding procedure and equipment design are given for mild steel with CO_2 shielding gas. (K1d; ST)

835-K. The Manufacture of Diesel Locomotive Underframes. J. M. Dudley. Welding Fabrication and Design, v. 4, July 1961, p. 13-16.

Fabrication of mild and high tensile steel underframes using electric arc operating principles for assembling longitudinal sections with attention to maintaining camber. (K1, T23s, 1-52; ST, 17-57)

836-K. (French.) Influence of Composition, Especially of Carbon Content, on Weldability. R. Rousseau. Revue de Metallurgie, v. 58, June 1961, p. 527-535.

Carbon content and its effect on brittle fracture and cracking of carbon or low-alloy steel. Influence of microstructure and composition and preheating before welding. 11 ref. (K9s, Q26s, 2-60, 2-64, 3-71; CN, AY)

837-K. Vacuum Joining by Electron Beam Welding. H. H. Hoffmann. Paper from "Vacuum Metallurgy Conference, Transactions, 1960". Interscience Publishers, Inc., New York 1, 1961, p. 267-287.

Basic principles and technological parameters are reviewed for heating and welding with high and low voltage electron beams. Metallographic analysis of welds produced in Zr, Zircaloy, 304 stainless, Ta, Cb, W, Mo, 2024 Al and Cu with attention to fine grain size obtained, weld penetration depth and narrowness of fusion and heat affected zones. Review of equipment development and design and characteristics of the electron beam. Comparison of the vacuum process to inert gas shielding for avoiding contamination. (K6, 1-73, K9; Zr-b, Ta, Cb, W, Mo, Al-b, Cu, ST)

838-K. Versatile Weld Tooling Saves Costs on Bomarc. T. J. Bosworth and D. S. Hemminger. Western Metalworking, v. 19, Sept. 1961, p. 31-34.

Simultaneous Tig welding in a single production shop of 17-7 PH stainless steel, 4330 modified steel and 2219 and 6061 Al alloys for missile pressure vessels. (K1d, T24e, T26q, 1-52; SS, ST, Al-b)

839-K. (German.) Resistance and Induction Welding of Tubes. E. Hormann. Elektrowarme, v. 19, July 1961, p. 249-266.

Welding processes for Al, Cu, stainless steel and conventional steel tubes including flash butt welding with stationary electrodes, resistance welding with roller electrodes, induction welding with sliding electrodes and induction welding using inductors. Characteristic data are given for the reaction mechanism. (K3, K6n, 1-52; SS, ST, Al, Cu)

840-K. The Technique of Brazing Tools With Sintered Carbide and Its Automation. Karel Pechaty. Czechoslovak Heavy Industry, no. 9, 1961, p. 35-45.

Technological parameters for the brazing of sintered carbide tips to the steel shank include tensile stresses, size and shape of the tip and the composition of both the filler metal and the flux. (K8, 2-60, 3-66, 3-73, T6n; ST, 6-69)

841-K. Stitching Through Metals. Australasian Manufacturer, v. 46, Aug. 19, 1961, p. 44-46.

Fabrication of sheet and strip metals to themselves and to plastics

by stitching with metal wire. Comparison to riveting, bolting and spot welding techniques for joining Cu, brass, Al and cold rolled steel. (K13, 1-52; Cu-b, Al, ST, 4-53)

842-K. New Engineering Laboratory at B.W.R.A. Metal Treatment and Drop Forging, v. 28, Aug. 1961, p. 331-334.

Review of welding research including investigation of fracture in 6 in. mild steel plate; friction welding techniques; continuous seam welding of stainless steels; spot weld temperatures; fabrication of low-alloy steel pressure vessels; and the properties and microstructure of mild weld metal and austenitic stainless steels as observed with the electron microscope. (K-general, K9, A9m, 10-54; ST)

843-K. (German.) Influence of Welder on Wear Resistance of Deposit Welds. H. Uetz and V. Hakenjos. Werkstattstechnik, v. 51, Apr. 1961, p. 173-177.

Autogenous and inert gas welding of St. 37 steel specimens using welding wire containing 33% Cr and 3.5% C and subsequent grinding of the weld to determine wear resistance of weld as a function of the personal skill of the welder. (K1, K3, K9r)

844-K. Three Metals Joined With Inconel Filler Metal 92. Inco Nickel Topics, v. 14, no. 7, 1961, p. 11.

Joining carbon steel, nickel stainless and high Ni alloy to fabricate annealing retort designed to operate at 2100° F. (K-general, 1-52; CN, SS, Ni-b)

845-K. A Design Engineer Looks at Welding. B. W. Spooner. New Zealand Engineering, v. 16, July 15, 1961, p. 255-259.

Use of radiography for flaw detection and testing of experimental techniques. Evaluation of original and repair welds and of thickness of steel as a function of brittle fracture. (K9r, Q26s, S13, S14, 1-53)

846-K. Welding of End Fitting Simplified. Machinery Lloyd (Overseas Edition), v. 33, Sept. 16, 1961, p. 41.

Joining end fittings of stainless steel and Ni-based alloy tubes by an argon arc welding process. Operations can be preset on a control panel. (K1d, 1-52, 18-74; SS, Ni-b, 4-60)

847-K. Costing & Economics of Arc Welding. D. P. Compton. Welding Fabrication and Design, v. 4, Aug. 1961, p. 34-42.

Unit operations and selection of materials are considered in terms of the factors which determine the final process and product cost. Analysis of the cost of weld metal deposition and of methods of improving efficiency. (K1, 17-53, 17-57)

848-K. Significance of Weld Defects and the Bend Test. Light Metals, v. 24, Sept. 1961, p. 253.

The use of bend tests to reveal lack of fusion in pure Al and Al alloy welds. The effects of weld porosity, profile and lack of fusion on the fatigue and tensile properties of the welds. (K9r, Q5; Al-b, 7-51)

849-K. Materials Progress in Organic Adhesives. Metal Progress, v. 80, Oct. 1961, p. 13-I.

Use of a new polyamid epoxy adhesive permits the production of honeycomb panels without the need for vent holes in the core structure. (K12; 7-59)

850-K. What Metal Shall I Use...for Fabrication for Cryogenic Vessels and Equipment? George H. Zennet. Metal Progress, v. 80, Oct. 1961, p. 110.

Techniques for selection and methods for welding metals for industrial cryogenic applications are presented. (K-general, Q23, T26q, 2-63; SGB-r)

851-K. What Metal Shall I Use...for High Strength Welded Structures?... Steels. Metal Progress, v. 80, Oct. 1961, p. 116-121, 158.

Welding of carbon structural steel (ASTM A36-60T); high-strength, low-alloy steel (A441-60T and A242-55); Cb treated steels; heat treated, constructional alloy steel. Typical names, composition, mechanical properties, outstanding characteristics and applications. (K-general, T26; ST, Al, Mg, 7-51, 17-57)

852-K. What Metal Shall I Use...for Resistance-Welded Thermostats? Raymond M. Sears. Metal Progress, v. 80, Oct. 1961, p. 133.

Welding of bimetallic thermostats from high and low expansion metals such as Invar, 430 stainless steel,

B Monel, silicon bronze and Ni. (K3; SGA-a)

853-K. The Technique for Welding Columbium. W. J. Lepkowski, R. E. Monroe and P. J. Rieppel. Welding Design & Fabrication, v. 34, Oct. 1961, p. 54-55.

Tig and Mig welding of Cb alloys containing W, V, Zr, Ti, Hf, Ta, Mo, Cr, Co, Th and Al in gas chambers or in air. Influence of alloying elements which increases hot strength and oxidation resistance on weldability, particularly weld soundness and ductility. (K1d, K9, Q-general, 2-60; Cb-b)

854-K. Brazing the Cobalt Alloys? Here's How. W. J. Lepkowski and R. E. Monroe. Welding Design & Fabrication, v. 34, Oct. 1961, p. 56.

Ag, Ni, Cu and Mn based brazing alloys are specified with brazing temperatures and atmospheres or vacuum conditions for obtaining brazed joints with maximum hot strength and corrosion resistance in Co-bearing superalloys. Application to Multimet (N-155), Udimet 500, M-252 (J-1500), Inconel 700, Rene 41 (J-1610), Haynes 25 and J-1570 (Co-base) alloys. (K8, 10-54; SGA-h, Co, SGA-f, 17-57)

855-K. Techniques for Welding and Fabricating the A-286 High Temperature Alloy. L. J. Hull. Welding Design & Fabrication, v. 34, Oct. 1961, p. 58-60.

Metallurgical design aspects are considered for high strength, heat and oxidation resisting A-286 austenitic alloys, with particular reference to weldability and machinability, as a function of composition and aging and solution treatment. Application of resistance and tungsten arc (with A-286 or Hastelloy W fillers) welding techniques for joining the alloy with cemented carbide tools used for cutting. Effect of hot shortness and work and precipitation hardness on fabricability. Data given for mechanical properties at 68-1300° F. (K-general, K9s, G17, Q-general, 2-60, 2-61, 2-64; SGA-h, ST)

856-K. Welded Design Makes Possible Unique Aluminum Hopper Car. Welding Design & Fabrication, v. 34, Oct. 1961, p. 66-68.

Automatic and semi-automatic fillet and butt welding of extrusions of Alcan 65S-T6 (6061-T6) and sheets of Alcan D54S (6202) by argon shielded arc welding using Alcan 56S (5056) wire to fabricate a covered railroad car with a unique teardrop cross-section. (K1d, T23p, 17-51; Al-b, 4-57, 17-57)

857-K. CO_2-Flux-Shielded Welding Processes Are Fast, Versatile and Economical. Welding Design & Fabrication, v. 34, Oct. 1961, p. 72-74.

Semi-automatic welding of heavy mild steel units by the Dual Shield process using a flux cored electrode and CO_2 shielding, deoxidation of the weld and slag formation being accomplished by the flux. Application of magnetic flux CO_2 shielded welding using Unionarc equipment for fabricating steel bridge girder stiffeners, the flux serving to refine the weld puddle, lower the cooling rate and aid in forming the desired weld contour. (K1d, T26p, 1-52; ST, 17-57)

858-K. Making Minute Parts Faster Is Industry's Big Problem. Henry Lefer. Welding Design & Fabrication, v. 34, Oct. 1961, p. 76-78.

Application of automatic equipment and precision welding processes, including the Tweezer Weld system and capacitor discharge welding, to fabrication of microminiaturized electronic components from tiny wires, whiskers and shapes of Mo, W, steels (including 304 stainless), Au, Ta and other materials. (K-general, T1, 3-73; Mo, W, Au, Ta, ST, 17-57)

859-K. Here's What the Russians Are Doing With Welding. Welding Design & Fabrication, v. 34, Oct. 1961, p. 80-81.

Survey of welding research including ultrasonic spot welding of Al; cold welding of carbon steel, ultrasonic welding of Cu, Ar shielded arc welding of Mo and stainless steel, submerged arc welding of Ni using a ceramic flux, stored energy butt welding of Ti to stainless steel tubing and butt and T-joint welding of plastic sheet and film. (K-general, 10-54)

860-K. Survey of Pipe Couplings. Pt. 2. John Spencer. Engineering Materials and Design, v. 4, Sept. 1961, p. 582-593.

Maximum working pressure and temperature, industrial applications and joint design of steel, stainless steel, gun metal and malleable Fe pipe couplings including screwed, welded, brazed, soldered, capillary, flanged,

self-sealing and quick release. (K-general, T7n; SS, ST, Cu-n, Cu-b, CI-s, 17-57)

861-K. (German.) Palladium in Brazing Technology. J. Sagoschen. Metall, v. 15, Sept. 1961, p. 870-872.

Physical and mechanical properties of high-temperature solders such as Ag-Cu-Pd, Cu-Pd-Ni-Mn, Ni-Mn-Pd, Ag-Pd-Mn and Pd-Ni alloys. Technology of brazing operations including autogenous, dip and induction brazing under protective inert atmosphere. (K8, 1-52, 1-66; SGA-f, Pd)

862-K. (German.) Melting Range and Brazing Temperature for Hard Solders. K. M. Weigert. Metall, v. 15, Sept. 1961, p. 879-880.

Evaluation of melting range and favorable brazing temperatures of solders containing 40-50% Ag, 22-25% Cu and Zn (rest) by investigation of cooling curves and measurement of liquidus temperatures. Relation between working temperature and liquidus temperature. (K7, P12n, M24; Ag-b, Cu-b, Zn-b, SGA-f, 17-57)

863-K. Welding Research--Mines Branch, Dept. of Mines and Technical Surveys. K. Winterton. Canadian Welder, v. 52, Sept. 1961, p. 32-33.

Progress report on research in heat affected zone cracking, on welder joints at temperatures down to -40° F. and on physics of the welding arc. 5 ref. (K9, 10-52)

864-K. (German.) Material Transfer in Electric Arc Welding. William M. Conn. Bergakademie, v. 13, May 1961, p. 307-312.

Theoretic discussion of drop formation and reacting forces in electric arc welding and experimental investigation of the mechanism of drop formation by photographic techniques in the test welding of steel and Al alloys. (K1, K9n, 1-54; ST, Al-b)

865-K. (German.) Development of Aluminum Alloyed Deposit-Welding Electrodes. Friedrich Erdmann-Jesnitzer, Hans Kowalkowski and Walter Schierhorn. Schweisstechnik, v. 15, Sept. 1961, p. 101-106.

Test welding using coated basic electrodes with Al-wire spiral for production of corrosion and wear-resistant deposit welds. Microscopic investigation of welds and production testing of deposit-welded tools for wear resistance and chemical resistance to oxidation and sulphide formation. (K1a, K9, 1-53; Al-b)

866-K. (German.) Processes in the Welding of Alloyed Nonaustenitic Steels. Alfred Schmidt. Schweisstechnik, v. 15, Sept. 1961, p. 106-109.

Review of welding technology including determination of preheating temperature from T-T-T diagram for 25 CrMo 4 steel, assessment of hardening caused by welding using the carbon equivalent, discussion of heat balance in welding of 13 CrMo 44 steel, electrodes and techniques for welding of austenitic-ferritic steels and classification of welding according to difficulty of operation. (K-general, K9, N8, 1-52, 10-54; ST)

867-K. (German.) Principles and Equipment for Electroslag Welding. G. Almquist. Schweisstechnik, v. 15, Sept. 1961, p. 109-112.

Operational parameters include use of 1 to 3 electrodes and of automatic machine for joining sheet steel having wall thicknesses of 20-450 mm. (K6, 1-52; ST, 4-53)

868-K. (Book.) The Science of Adhesive Joints. J. J. Bikerman. 1961. 258 p. Academic Press, Inc., 111 Fifth Ave., New York 3, N. Y.

A broad review of literature covering the joining of glass, rubber, Mg alloys, Mn alloys, Al alloys, brass, bronze, galenite, cast iron and stainless steels with polyethylene, polystyrene, polyvinyl acetate, asphalt, solders, glues and solvent cements. 227 ref. (K12, 10-54, 11-64; SS, CI, Al-b, Cu-b, Mn-b, Pb, NM-d34)

869-K. Seam-Welding Stainless Steel. W. A. Owczarski and R. E. Beach. Machinery (London), v. 99, Sept. 13, 1961, p. 637-639.

Conversion of bench-type spot welder head into a seam welder for processing AISI 304 stainless steel containers, carbon steel, brass and Pt. Surface preparation and microscopic examination of finished welds. (K3p, 1-52; SS, CN, Cu-n, Pt)

870-K. Casting Repair-Welded for Less Than 3% of Replacement Cost. John F. Donnelly. Welding Engineer, v. 46, Oct. 1961, p. 58.

Controlled heat techniques are used for electric welding of a fractured gray iron casting weighing 900 lb. (K-general, 1-52, 18-72; CI-n, 5)

871-K. CO_2-Mig Process Cuts Costs, Man-Hours Per Railroad Car. Welding Engineer, v. 46, Oct. 1961, p. 61.

A fast welding method for fabricating hopper cars from flame-cut steel plate stakes and 88-in. support braces, stack cut and then formed in a press. (K1d, G4d, G22g, T23p, 1-52; ST)

872-K. British Electroslag Welders Speed Caisson Production. S. T. Andrew. Welding Engineer, v. 46, Oct. 1961, p. 66.

Vertical welding of 1 7/8 in. thick steel plate for legs of off-shore oil-drilling rig. Radiographic inspection proves freedom from defects. (K6, S13e, T28, 1-52; ST, 4-53)

873-K. Adhesives May Solve Your Bonding Problems. H. R. Butzlaff and K. F. Charter. Welding Engineer, v. 46, Oct. 1961, p. 70-74.

Dissimilar metals and other materials may be bonded with rubber based adhesives, oil-soluble and oil-resistant elastomers, synthetic and natural resins and resin-elastomer films to form a lightweight, sealed and insulated joint. (K12, 17-57)

874-K. High Strength Yellow Brass Castings Weld Repair. Donald K. Fox. Modern Castings, v. 40, Oct. 1961, p. 89-95.

Tensile and bend testing of test castings oxy-acetylene-gas and inert-gas-shielded-arc welded with several different types of fillers to evaluate the most effective method of repair. 6 ref. (K-general, K9r, 18-72; Cu-n, 5)

875-K. Welding Research Paves Way for Thick Joints in Titanium. Iron Age, v. 188, Oct. 19, 1961, p. 136-137.

Welding of Ti alloy submarine hull plates up to 2-in. thick, preventing cracking by use of an argon-purged welding chamber. Testing of welds to determine the effects of different Ti alloy filler wire compositions on the yield strength and notch toughness of the weld. (K1d, K9r, T22g, 2-60, 10-52; Ti-b)

876-K. Flaw Detector Pinpoints Welds in Aluminum-Covered Wires. W. N. Redstreake. Iron Age, v. 188, Oct. 19, 1961, p. 140-141.

An electronic flaw detector based on a direct current magnetic field detects butt weld and coating flaws in continuously drawn Al-coated steel wire. (K9r, F28h, 1-52; ST, Al)

877-K. (English.) Some Remarks on the Weldability of Aluminum. G. Westendorp. Lastechniek, v. 27, Apr. 1961, p. 70-74.

Consideration of decrease in strength caused by welding heat and porosity in welds of pure and commercially pure Al and 6061 Al alloys. Effect of solubility and diffusion coefficient of hydrogen. (K9n, K9s; Al)

878-K. (English.) Factors Influencing the Properties of Welds in Aluminum. J. C. Bailey and G. W. Eldridge. Lastechniek, v. 27, Apr. 1961, p. 75-83.

Review of procedures for Tig and Mig welding of Al and its alloys. Influence of filler rod composition, impurities, temperature, hydrogen, extent of heat zone and welding speed and current on discontinuities. 16 ref. (K1d, K9, 10-54; Al)

879-K. (English.) Some Design Considerations for Welded Aluminum. S. R. Banks and R. E. Smith. Lastechniek, v. 27, Apr. 1961, p. 91-96.

Relevant factors include composition, corrosion, wear and temperature resistance, deflection, buckling, permissable stress, expansion, static and fatigue strengths and cost. Comparison of Al-Mg, Al-Mg-Si, Al-Cu-Mn-Mg-Si and Al-Zn-Mg alloys with steel. 19 ref. (K9, Q-general, R-general, 10-54, 17-51; Al-b, ST)

880-K. (English.) Aluminum Welding Practice. J. W. A. Wennink, J. Buteyn, L. Capel and A de Sterke. Lastechniek, v. 27, Apr. 1961, p. 97-108.

Edge-preparation, distortion, shrinkage, welding equipment and defects and testing and inspection of welds with reference to Tig and Mig processes. Plate thickness and shrinkage are discussed in comparison with carbon and stainless steels. (K1d, K9, 1-52, 10-54; Al, CN, SS)

881-K. (English.) The Development of Mig Welding Techniques for Al. J. E. Tomlinson and D. Slater. Lastechniek, v. 27, Apr. 1961, p. 109-118.

Procedures and equipment are reviewed in relationship to thermal and other properties of the material. 10 ref. (K1d, P11, 1-52, 10-54; Al)

882-K. Fundamentals of Glass-to-Metal Bonding: Pt. 5. Wettability of Iron by Molten Sodium Disilicate. Robert W. Cline, Richard M. Fulrath and Joseph A. Pask. American Ceramic Society, Journal, v. 44, Sept. 1, 1961, p. 423-428.

Wetting of unoxidized and oxidized Fe and magnetite by sodium disilicate glass at 900-1000° C. under vacuum using a silica tube. Weight loss and contact angles are determined as functions of time, temperature and composition. 9 ref. (K11a, 1-73, 2-60, 2-61; Fe)

883-K. Fundamentals of Glass-to-Metal Bonding: Pt. 6. Reaction Between Metallic Iron and Molten Sodium Disilicate. Lucy G. Hagan and S. Frederick Ravitz. American Ceramic Society, Journal, v. 44, Sept. 1, 1961, p. 428-429.

Finely divided sodium disilicate glass and powdered iron are heated under vacuum at 900-1000° C. in an Armco iron crucible. Weight loss, as affected by temperature, and quantity of Na formed are determined by titrating with a standardized acid. 6 ref. (K11a, S11j, 1-73, 2-61; Fe, Na)

884-K. Fundamentals of Glass-to-Metal Bonding: Pt. 7. Wettability of Iron by Molten Sodium Silicate Containing Iron Oxide. Robert B. Adams and Joseph A. Pask. American Ceramic Society, Journal, v. 44, Sept. 1, 1961, p. 430-433.

Unoxidized Fe and Pt are bonded to Fe-containing sodium disilicate glasses at 1000° C. in a vacuum furnace. Contact angles are determined as functions of composition, time and pressure, with X-ray diffraction and microscopic examination of grain boundaries and interfaces indicating the amount of metal surface irregularity, which influences the degree of adherence. 11 ref. (K11a, M-general, P13h, 2-60, 3-67, 3-74; Fe, Pt)

885-K. Ford Does Its Own Vinyl Coating. Steel, v. 149, Oct. 16, 1961, p. 91-92.

Processing, forming and assembly of vinyl laminates for automotive and other industrial applications. Technological parameters for pretreatment and lamination of cold rolled sheet steel. (K11d, 1-52; ST, 4-53)

886-K. Welding Efficiency Increased. Machinery Lloyd (Overseas Edition), v. 33, Sept. 30, 1961, p. 41-44.

Review of techniques including friction welding of carbon steel, Ti and Al tubes, bars and flat stock; seam welding to produce a pressure-tight bond and bend testing and "pillow" (air pressure) testing of welds. (K3p, K6, K9r, 1-52; CN, Ti, Al)

887-K. How to Join Welded Steel Tubing. Pt. 1. By Welding. R. M. Spencer. Mill & Factory, v. 69, Oct. 1961, p. 114-118.

Arc, gas, spot, projection and stud welding and brazing of carbon steel tubes to tubular products and plates, nuts, rings, fittings and studs. Effect of joint design and tubing wall thickness on choice of method. (K-general, K8n; CN, 4-60)

888-K. Flash-Welding Aluminum to Copper. C. Dana Moore. Machinery (London), v. 99, Oct. 4, 1961, p. 790-792.

Satisfactory joints are produced by forging and fusing on an optimum time cycle. Joints are tested by making 180° bends and by exerting air or liquid pressure. (K3r, K9r, F22j; Al, Cu)

889-K. (German.) Use of Plug-Spot Welding Under Carbon Dioxide in Manufacture of Bodies for Electric Locomotives. H. Rohde. Schweissen und Schneiden, v. 13, Sept. 1961, p. 419-422.

Selection of welding operations such as manual arc welding, electric resistance spot welding and fusion welding with emphasis on plug spot welding under CO_2 for fabrication of various body parts. Apparatus for and mechanism of plug-spot welding. Macrostructure and tensile shear strength of plug-spot welds. (K-general, K3n, T23n)

890-K. (German.) Electroslag Welding of Welding Parts. J. Mennen and F. Thyssen. Schweissen und Schneiden, v. 13, Sept. 1961, p. 430-432.

Application of the electroslag welding process to welding of steel parts including those with wall thicknesses

smaller than 60 mm. Welding technology is discussed in terms of production examples. (K6, 1-52)

891-K. Welding the Stainless Steels. Mechanical World and Engineering Record, v. 141, Oct. 1961, p. 345-346.

Review of oxy-acetylene, atomic hydrogen and electric arc welding of austenitic stainless, low-carbon and martensitic stainless steels. (K-general, 1-52, 10-54; ST)

892-K. (German-French.) Welding of Cast Steel Apparatus. H. P. Siegenthaler. Schweisstechnik--Soudure, v. 51, Sept. 1961, p. 299-305.

Electric welding of heavy (70 mm. wall thickness) cast steel parts containing 0.18-0.25% C. Computation of carbon equivalent; evaluation of preheating temperature; techniques for welding under limited space conditions. (K-general, 1-52; ST, 5)

893-K. Some Special Applications of Welding in Steam, Gas Turbine, and Nuclear Power Plants. J. M. Robertson. British Welding Journal, v. 8, Oct. 1961, p. 463-472.

Butt welding, argon arc welding and submerged arc welding applications involving the joining of austenitic and ferritic steels and Nimonic 90 to produce gas turbine rotors, feedwater heaters, expansion bellows and finned heat exchanger tubes. (K1, T11, W11, 17-57; SS, Ni-b)

894-K. Some Observations on the Notch Toughness of Submerged Arc Weld Deposits. B. Augland and N. Christense. British Welding Journal, v. 8, Oct. 1961, p. 473-476.

Charpy V-notch impact testing from -60 to 20° C. Transition temperatures are given. (K9r, Q23r, Q29, 1-53; 7-51)

895-K. Welding in Shipbuilding. British Welding Journal, v. 8, Oct. 1961, p. 477-481.

A review of papers presented at a London symposium covering cutting, submerged arc, CO_2, automatic, arc and Mig welding of Al-Mg alloys and steel. Radiography and ultrasonics are covered under nondestructive testing. 34 ref. (K-general, S13, T22g, 10-54)

896-K. (Japanese.) The Welding of Tough Pitch Copper by the Inert-Gas Shielded Metal-Arc Process. Keiichi Mizuno. Sumitomo Light Metal Technical Reports, v. 2, July 1961, p. 1-7.

Thick specimens of tough pitch Cu are Mig welded using filler rods of tough pitch Si and P-deoxidized, flux-coated and Ag-bearing (0.23-0.94%) Cu after preheating at 200-500° C. Macrostructure and microstructure, electrical conductivity, mechanical properties and weld. Soundness compared with Tig welded specimens. Joints with X-shapes and 90° root angles and filler rods containing Ag produce best results. 16 ref. (K1d, K9, M27, M28, P15g, Q-general; Cu-a)

897-K. Flux-Cored Electrode Is the Secret in CO_2 Welding Process New to Canada. Canadian Machinery and Metalworking, v. 72, Oct. 1961, p. 136-146.

Automatic and semi-automatic welding of mild, low and medium carbon steels and of alloy steels using the Arcosarc process which combines a wire drive unit, an air or water cooled gun, CO_2 shielding gas and a flux-cored wire. Use of Arcosarc wire in Duomatic and Circomatic machines and in the Electrogas process, based on the electroslag principle. (K1d, K6; CN, AY)

898-K. Electron Welder Beams for Space. Airco News, v. 21, 1961, p. 24-26.

Electron beam welding of W and Mo using heat generated by bombardment with highly accelerated electrons to melt and fuse the metal in a vacuum. Applications in fabrication of vacuum tube components, rocket engine parts and chemical processing equipment. (K6, T-general, 1-73; W, Mo, 17-57)

899-K. How to Fasten Carbide to Steel. Pt. 5. Brazing and Adhesive Bonding. Grant A. Morrison. Machine and Tool Blue Book, v. 56, Nov. 1961, p. 125-129.

Survey of induction heating, furnace and oxy-acetylene torch brazing and adhesive bonding methods used in fastening cemented carbides to steel. Consideration of different brazing alloys, brazing and bonding temperatures, joint and bond strengths, joint design and effect of joint thickness on tensile strength. (K8, K12; ST, 6-69, 7-59)

900-K. Electron Beam Welding Key Tool in Making B-70. Steel, v. 149, Oct. 30, 1961, p. 62-66.

Comparison of transverse weld shrinkage, weld depth to width ratio and weld width plus heat affected zone for electron beam and Tig welding. Consideration of tensile properties, voltage effect, beam current and energy density, tolerance and deformation resistance of Al, Ti and Inconel weldments. (K6, K1d, K9, Q24, Q27a, T24a; Al, Ti, Ni-b, 17-57)

901-K. Flash-Butt Welding Wheel Rims. Welding and Metal Fabrication, v. 29, Oct. 1961, p. 406-408.

Cutting, straightening, bending, flash-butt welding, expanding, recompressing and testing operations for the production of wheel rims for trucks from profiled steel strip. Design and welding cycle of the rim-welding machine. (K3r, T21e, 1-52; ST, 4-53)

902-K. New Arc-Spot Process. Welding and Metal Fabrication, v. 29, Oct. 1961, p. 409.

Design, applications and operation of an arc-spot welding unit based on the arc welding principle and used for spot welding of mild steel and 12 gage stainless steel sheet. Heat and time controls of the unit and sizes of the consumable electrode are discussed for applications in making pallets for the automotive industry. (K1, K3n, T21f, 1-52; CN, SS, 4-53)

903-K. Welding Pittsburgh's Big Dome. Welding and Metal Fabrication, v. 29, Oct. 1961, p. 410-413.

Assembling, bevelling, submerged arc welding and manual welding of steel girder components and flange beams to produce the cantilever framework and movable dome sections for an auditorium roof 400 ft. in diameter. (K-general, K1e, T26n, 1-52, 17-57; ST, 4-57)

904-K. Strong Electron Beam Welds for Pressure Vessels. Kenneth J. Miller. Western Metalworking, v. 19, Oct. 1961, p. 31-32.

Fabrication of high pressure gas storage vessels from 4340 low-alloy steel and special and superalloys such as Inconel X, Inco 713C, 321 and 347 stainless steel, Cb, 6A104V and B-120VCA Ti alloys and Ta by electron beam and Tig automatic welding. (K6, K1d, T26q; AY, SS, Ni-b, Ti-b, Ta, Cb)

905-K. Aspects of CO_2-Shielded Metal-Arc Welding. E. J. Waitman. Welding and Metal Fabrication, v. 29, Oct. 1961, p. 415-420.

A review of the techniques, equipment, welding wires and applications of CO_2-shielded metal arc welding including button welding, spray transfer and dip transfer welding. Joint design and the effects of welding conditions on weld strength, appearance, shape, porosity and penetration pattern. (K1d, K9, 1-52, 10-54)

906-K. Semi-Automatic Welding of Television Components. Instrument Practice, v. 15, Oct. 1961, p. 1277-1278.

Automatic welding techniques are used for welding television chassis and turret tuner spindle assemblies with tolerances down to 0.0015 in. and angular tolerances to 15 min. of arc. (K5, T1, 1-52, 17-55)

907-K. Component Fabrication of Heat Resistant Structures. Stewart M. DePoy. Metal Treating, v. 12, Oct-Nov. 1961, p. 21-23.

Comparison of arc welding and casting techniques for fabrication of Ni and Cr alloy furnace parts on the basis of weight and amount of metal used, repairability and cost. Stress-rupture properties are given for the fabricated components at 1550-1900° F. under pressure of 1000-5000 psi. (K1, G-general, Q3m, W27p, 2-61, 3-74; Ni-b, Cr-b, 17-57)

908-K. (German.) Automatic Multiple-Purpose Welding Machines in Research and Production. A. Smarcan and G. Gerber. Brown Boveri Mitteilungen, v. 48, Aug-Sept. 1961, p. 430-438.

Equipment design and operating principles of welding machines for bonding and deposit welding by thermit powder welding using opposite welding heads or two heads in series (series-arc-process) and Mig and Tig welding using Ar or CO_2 as inert gas with and without additional wire feed. Consideration of macrostructure and shrinkage of weld. (K1d, K9, K11, 1-52)

909-K. (German.) Technology of Mechanical Arc Welding. P. Nobbe. Brown Boveri Mitteilungen, v. 48, Aug-Sept. 1961, p. 448-461.

Fundamentals of semi-automatic and automatic arc welding are given for shape

of weld (bead form coefficients); electrical data including amperage, voltage, current density and kind of current (a-c. or d-c.); welding rate; electrode diameter; electrode and workpiece angle; contact distance; location of mass contact. (K1, K9, W29h, 10-54)

910-K. (German.) Application of Tig Welding to Steels and Copper and Nickel Alloys. A. Schmid. Brown Boveri Mitteilungen, v. 48, Aug-Sept. 1961, p. 462-474.

Review of Tig welding techniques including preparation of seam and testing of welds of machine parts fabricated from unalloyed steel, stainless steels, Ni and Ni alloys and high-melting point metals such as Ti, Zr, Mo, Inconel and Hastelloy. (K1d, K9, T7; ST, SS, Mo, Ni-b, Ti, Zr, 17-57)

911-K. (German.) Problems in Bonding of Steels of Different Composition for Heat Engines by Welding. R. Montandon. Brown Boveri Mitteilungen, v. 48, Aug-Sept. 1961, p. 490-497.

Mechanical testing, investigation of recrystallization by 600-700° C. annealing and stress-rupture testing at 550° C. of specimens consisting of 12% Cr-steel and low-alloyed MoV-steel welded together by electrodes of varying Cr content (0.28-15.5% Cr). Decarburization, age hardening and recrystallization in bond and adjacent material as influenced by weld composition. (K1, K9, N-general, Q-general, 2-60, 2-64; AY, SS, Cr)

912-K. (German.) Nondestructive Testing of Welds, Particularly of Rotor Welds. W. Mohr. Brown Boveri Mitteilungen, v. 48, Aug-Sept. 1961, p. 475-484.

Visual control, X-ray, magnetic and ultrasonic testing of steel weld defects with special attention given to magnetic and ultrasonic testing of circular welds produced by argon-arc and UP (under powder) welding for turbine rotors. (K9r, S13, T7h; ST, 17-57)

913-K. (French.) Flash Welding of Sintered Aluminum as Used for Fuel Element Sheaths. C. Bridoux, H. Foulquier, J. Kaufmann and P. Thome. Revue de Metallurgie, v. 58, Aug. 1961, p. 695-701.

Experimental welding of samples with tensile properties determined as functions of the sparking and upsetting times. Evaluation of relationship between upsetting velocity and length of the upset portion, depth of diffusion zone and creep resistance of weldments at 300 and 500° C. 9 ref. (K3r, K9, Q-general; Al, 6-72)

914-K. Gas-Pressure Bonding. S. J. Paprocki, E. S. Hodge and P. J. Gripshover. Defense Metals Information Center, Battelle Memorial Institute, DMIC Report 159, Sept. 25, 1961, 42 p.

The gas-pressure-bonding process is used for joining, cladding and densifying Al, Be, Mo, Cb, V, Ta, W, Rh, Zr, Cr, Fe, Al, (304, 316, 347, 410) stainless steels and ceramic materials (UO_2, BeO, MgO, UN, UC). The solid state bonding process is conducted in a hot wall high pressure autoclave at 300-2700° F. with gas pressures of 5000-30,000 psi. 36 ref. (K5k, K11, K-general, L22, 2-62, 3-74)

915-K. Arc Welding Heavy Plate for Boring Shields. S. A. Wilson. Machine Production, v. 20, Oct. 1961, p. 27-28.

Heavy plate segments of A-7 mild steel are arc welded with a special low H_2 electrode to form subway boring shields of 16-24 ft. diameter and 40-60 tons weight. The low H_2 electrode contains a high percentage of Fe power and is specified for tacking and for the root pass in groove welds to prevent underbead and root cracks and to eliminate the need for preheating the heavy plate elements. (K1, W29h; ST, 4-53)

916-K. Eight Experts Pinpoint Welding "Mistakes". Steel, v. 149, Oct. 23, 1961, p. 70-75.

Improvement of welding efficiency by eliminating poor fixturing, large metal mass welds and overwelding and by evaluating suitability of equipment design and welding materials. (K9)

917-K. Metallized Plastic Bonded to Aluminum Results in Flashy Product. Products Finishing, v. 26, Nov. 1961, p. 82.

Vacuum metallized polyester plastic film is bonded to Al sheet with a high-strength adhesive for fabrication of an embossed reflector sheet called "Dyrasyl" used for decorative trim and lighting units. (K11d; Al)

918-K. (French.) Welding and Brazing of Copper and Its Alloys. Pt. 8. Cuivre Laitons Alliages, no. 62, Aug. 1961, p. 19-22.

Survey of processes including hydrogen plasma arc, submerged arc, contact arc, stud, pressure gas and cold pressure welding; flame, oxy-arc and powder cutting, metal spraying with Cu and Cu alloys; and thermit welding. (K-general, G22; Cu-b, 10-54)

919-K. Welding 2219 Aluminum for Bomarc Fuel Tanks. Stanley L. Sears and Richard S. Crial. Metal Progress, v. 80, Nov. 1961, p. 88-93.

This important application, the first for 2219, has verified the manufacturing adaptability of the alloy. No other Al has comparable reliability in pressure-vessel applications where postweld heat treatment is required. (K1d, T24, T26q; Al-b, 17-57)

920-K. Flash Welding Copper to Steel. Hermann W. Stieglitz. Metal Progress, v. 80, Nov. 1961, p. 112.

Application of flash welding to the joining of an anode connecter made of a Cu bar which is attached at one end of a steel anode core or billet. Good welded joints are now possible. (K3r, 1-52; ST, Cu)

921-K. Cam-Controlled Welder Joins Irregular Contours. Metalworking Production, v. 105, Oct. 11, 1961, p. 75-76.

Irregular contoured workpieces are automatically submerged arc welded by a universal welding machine having cam co-ordinated workpiece and torch motion. Cams are designed to maintain constant welding conditions throughout the contour. (K1e, 1-52)

922-K. One Way to Make a Brazing Platen. Metalworking Production, v. 105, Oct. 11, 1961, p. 77.

Technique using a specially prepared, contoured plaster reference base on which a flexible epoxy grid, a vinyl sheet, a special cement and a foamed ceramic insulant are laid for brazing stainless steel honeycomb. (K8, 1-52; SS, 7-59)

923-K. The Metal-Arc Welding of Stainless Steels. M. C. T. Bystram. Edgar Allen News, v. 40, Aug. 1961, p. 172-174.

Procedures for welding stainless steel tubing and pipe for service at high temperatures in aggressive atmospheres. Selection of electrodes to provide desired corrosion resistance, creep strength and freedom from cracking. Review of welding physics including embrittlement phenomena and transformations. (K1, K9; SS, 4-60)

924-K. (German.) Steam Shielded Arc Welding. H. W. Rotthaus. Technische Mitteilungen, v. 54, Aug. 1961, p. 286-289.

Test welding of steel using dry and wet steam at various pressures as protective atmosphere and electrodes of various compositions with subsequent investigation of weld quality by mechanical testing and microscopic examination. (K1d, K9; ST)

925-K. (German.) Welding of Thick Sheets Using Automatic Electric Flash-Welding Processes. S. K. Paul and A. Meyer. Technische Mitteilungen, v. 54, Aug. 1961, p. 290-294.

Mechanical thermit powder and CO_2-inert gas shielded welding of 20-60 mm. thick boiler steel sheet. Review of welding technology including electrical aspects, joint preparation, welding efficiency and mechanical strength of welds. 7 ref. (K1d, K3r, K4, 10-54; ST, 4-53)

926-K. (German.) Autogenous Welding-Current Status and Future Development. P. Bernard. Technische Mitteilungen, v. 54, Aug. 1961, p. 306-310.

Review of technology and machinery for autogenous welding, with and without inert-gas shielding, of carbon steels and alloyed austenitic and ferritic steels. Use of autogenous welding in fabrication of thin sheets, boiler manufacture, joining of rails and in aircraft and vehicle production. 6 ref. (K1, 10-54)

927-K. (German.) Technology of Electron Beam Welding. W. Opitz. Technische Mitteilungen, v. 54, Aug. 1961, p. 311-319.

Review of mechanisms and historic development of electron beam welding and classification of fields of application in joining nonferrous and ferrous metals including alloy steels and refractory metals. (K6, 10-54; ST, EG-d37)

928-K. (German.) Current Status and Future Expectations in Resistance Welding. H. Verhoeven. Technische Mitteilungen, v. 54, Aug. 1961, p. 319-323.

Review of technology and machinery design in resistance welding including spot, projection, flash butt, resistance and high-frequency tube and pulse welding. (K3, 10-54)

SECTION L

CLEANING, COATING and FINISHING

1-L. Nickel-Aluminum Coatings Protect Metals up to 1830° F. Materials in Design Engineering, v. 52, Nov. 1960, p. 10.

Coating of steel, Ni and Mo by electroplating with Ni-Al alloys. (L17, Q-general, 1-66; Mo, Ni, ST, Al-b)

2-L. Automobiles/What Materials Are Next? Pt. 3. The Body: A Quest for Quality. Materials in Design Engineering, v. 52, Nov. 1960, p. 151-152.

Rustproofing and painting of steel automobile bodies to improve corrosion resistance. (L26, R-general, T21a; ST)

3-L. Polishing and Cleaning Lighter Bodies. R. E. Green. Machinery, v. 97, Oct. 19, 1960, p. 906-910.

Use of an automatic polishing machine and ultrasonic vibration of trichloroethylene cleaning solution on Cr plated cigarette lighter bodies. (L10b, L12h, 1-74)

4-L The Nickel-Carbonyl Process for Tool Production. Machinery, v. 97, Oct. 19, 1960, p. 911-912.

Production of tool master reproductions composed of pure Ni by electroforming. (L18, T6; Ni)

5-L. Hinac Coatings May See Wider Use. Chemical & Engineering News, v. 38, Oct. 31, 1960, p. 54.

Corrosion, abrasion and fade resistance of chromate-resin coatings for Al, Mg, Zn, carbon steel and stainless steel. (L14c, R-general; Al, Mg, Zn, CN, SS, NM-g33)

6-L. (Swedish.) Electroplating With Metals of the Platinum Group. Uno Tragardh. Teknisk Tidskrift, v. 90, Oct. 14, 1960, p. 995-996.

Use of baths containing $K_2Pt(NO_2)_2SO_4$ in Pt plating. Rh plating with a bath containing its sulphate and excess H_2SO_4. Pd plating by electrodeposition from a solution of palladium tetraminonitrate. Ir plating using Ir electrodes in a fused bath of potassium cyanide and sodium cyanide. Ru plating from a bath containing $Ru(NO)Cl_3$ and HCl. 7 ref. (L17; Ir, Pd, Pt, Rh, Ru)

7-L. Rhodium: Colorer's Care Can Pay Off. J. Newton Perham. American Jewelry Manufacturer, v. 5, Nov. 1960, p. 14-19.

Electroplating of Ni, Au or Ag with Rh for bright, smooth finish. Prevention of foreign metal and organic contamination, Ni build-up and sludge formation in the Rh bath. (L17b; Ag, Au, Ni, Rh)

8-L. (German.) Hard Surfacing of High Alloy Steels. H. Anders. Stahlbau, v. 29, Sept. 1960, p. 295-296.

Use of low-alloyed steel electrodes with a carbon content of no more than 1% and supplying a self-hardening weld metal or of cast iron electrodes containing 1.5-2.5% carbon and up to 40% alloying elements to hard surface stainless steels. (L24, T1f; SS)

9-L. Hard Coat Anodizing Rectifier Adds Control to the Cycle. Iron Age, v. 186, Nov. 17, 1960, p. 146-147.

Hard anodizing of missile components, using a rectifier to control current and voltage in the anodizing bath. (L19, T24e, W11r, 1-52)

10-L. (German.) Economical Pickling of Unalloyed Low Carbon Steel in Sulphuric Acid Using "Wetters". Carl Alex Fischer. Draht-Welt, v. 46, Jan. 1960, p. 17-20.

Pickling with HCl, H_2SO_4 and inhibitors (Rodin 57), with additions of natural (NaCl) and synthetic (HW 54/80030) borax and castor oil containing media called "wetters" which increase pickling rate and improve acid wetting of metals. (L12g; CN-g)

11-L. Plating Costs Tumble Sharply on Lustrous Chrome Line. Iron Age, v. 186, Nov. 10, 1960, p. 184-185.

Use of a new bright Ni plating process. The self-leveling quality of the method eliminates Cu plating and subsequent buffing between the Ni and Cr baths. (L17; Cu, Ni)

12-L. Zinc Plating of Carbonitrided Steel. Leonard R. Kohan and Howard T. Francis. Plating, v. 47, Oct. 1960, p. 1155-1158.

Effect of discontinuity of the barrel-plating process and electrochemical cathodic action of carbonitrided parts on plating efficiency. (L17, J28m; ST, Zn)

13-L. Constant Wattage Hard Anodizing of Aluminum. Martin A. Blumenfeld and W. Fred Schurig. Plating, v. 47, Oct. 1960, p. 1159-1165.

Hard anodic coatings are applied to 6061-T6 Al alloy using constant wattage d-c. power. Effect of temperature, wattage and treatment time on coating rate and abrasion resistance; comparison of coatings with those applied to same alloy using a constant current source. (L19, Q9n; Al)

14-L. "Triclene" Finishing Parts for Corvair Engines. P. C. Bardin. Industrial Finishing, v. 37, Nov. 1960, p. 24-26, 30-32.

Automatic and continuous degreasing, phosphatizing and painting of steel automobile engine parts in an air-free trichlorethylene atmosphere. Use of trichlorethylene in vapor spray degreasing, in phosphatizing solution and as a thinner in paint. (L-general, T21b; ST)

15-L. Fast Finishing of Parts for Warm Air Furnaces. Carl L. Sheets. Industrial Finishing, v. 37, Nov. 1960, p. 64-66.

Electrostatic spraying and baking of enamel coatings on steel panels using a conveyorized system for transferring parts from spray booths to bake ovens. (L26n; ST, 4-53)

16-L. Welding Repairs of Cavitation on Large Hydroelectric Turbines. Martin Friedmann, Jr. Welding Journal, v. 39, Nov. 1960, p. 1124-1126.

Deposition of stainless or mild steel inlays in pits on turbine runners. Chipping as a method of weld preparation. (L24, W11n; CN, SS)

17-L. History and Development of Some Problems Associated With Contract Chemical Cleaning. Charles M. Loucks. Corrosion, v. 16, Oct. 1960, p. 18, 20, 22, 24-26.

Review of chemical cleaning processes using strong mineral acids, alkalis, alkaline salts, CO_2 and weak acids. Behavior of inhibitors in cleaning boilers and feed lines composed of ferrous and nonferrous metals and alloys. 49 ref. (L12, T26q)

18-L. (Italian.) Surface Treatment of Stainless Steels. Giampiero Colombo. Acciaio Inossidabile, v. 27, July-Aug. 1960, p. 461-465.

Washing and degreasing of stainless steels with alkaline solutions. (L12k; SS)

19-L. (Japanese.) Electrodeposition of Nickel Molybdenum Alloy From a $NiSO_4$, Na_2MoO_4 and $Na_3C_6H_5O_7$ Solution Bath. Hiroto Imanaga. Chemical Society of Japan, Journal, Industrial Chemistry Section, v. 63, Aug. 1960, p. 1336-1339.

Effect of time, temperature, current density and concentration of electrolytes on the deposition of a Ni-Mo alloy on a Cu cathode. (L17, 2-60, 2-61, 3-67; Cu, Ni-b, Mo-b)

20-L. Corrosion Prevention in the Aerospace Industries. R. A. Cole. Corrosion Technology, v. 7, Oct. 1960, p. 320-324.

Corrosion prevention by cladding, painting, anodizing and spray coating of aircraft and missile components composed of stainless steel and Al and Mg alloys. (L-general, R10g, T24; Al-b, Mg-b, SS, 17-57)

21-L. Precoated Metals Solve Manufacturers' Problems. Product Finishing, v. 13, Nov. 1960, p. 84-92.

Cutting, welding and forming of steel and Al precoated by galvanizing, painting, laminating or plating with Ni, Cr, or Cu. (L-general, G-general, K-general; Al, ST, Ni, Cr, Cu, 8)

22-L. (German.) Production of Even Uranium Layers of Defined Uranium Content on Aluminum. W. Gebauhr and J. Martin. Atompraxis, v. 6, no. 7, 1960, p. 253-254.

Electrolytic coating of 1 mm. thick cleaned and etched Al sheets in ammoniacal $UO_2(NO_3)_2 \cdot 6H_2O$ solution of pH = 5 at 75° C. Indirect chemical uranium analysis of coatings by cermetric titration of remnant in electrolyte. 16 ref. (L17, S11j; Al, U, 4-53)

23-L. Electrodeposition of Nickel-Zinc Alloys From the Pyrophosphate Bath. T. L. Rama Char and S. K. Panikkar. Electroplating and Metal Finishing, v. 13, Nov. 1960, p. 405-412.

Effect of bath composition, pH, temperature and current density on the composition, Vickers hardness, oxidation resistance and color of the Ni-Zn deposit. 19 ref. (L17, Q29n, R-general; Ni-b, Zn-b)

24-L. Anodizing Copper, Magnesium, Zinc, Cadmium, Steel and Silver. N. P. Fedot'ev and S. Ya. Grilikhes. Electroplating and Metal Finishing, v. 13, Nov. 1960, p. 413-417. (Abstract from English translation of the Russian book "Electropolishing, Anodizing and Electrolytic Pickling of Metals", Robert Draper Ltd., Teddington, England, Feb. 1960.)

Data for bath composition and temperature, current density and cathode composition for anodizing Ag, Cu, Cd, Mg, Zn and steel. Effect of alkali concentration and current density on film thickness. 6 ref. (L19; Ag, Cd, Cu, Mg, Zn, ST)

25-L. A Practical Method of Area Calculation. R. R. Cheffers. Electroplating and Metal Finishing, v. 13, Nov. 1960, p. 418-420.

Areas of complex and hollow workpieces of electroplated metals are determined from calibrations relating cathode area, voltage, current, time and temperature. Plating time for obtaining deposits of exact thickness is then calculated from the effective cathode areas. (L17)

26-L. Chemical Polishing of Aluminium and Its Alloys. Charles C. Cohn. Electroplating and Metal Finishing, v. 13, Nov. 1960, p. 421-423.

Smoothing of Al surfaces by chemical polishing to obtain bright, bright-diffuse and dull-matte finishes. (L12, L19; Al)

27-L. "Trojan" Automatics for Hard Chromium Plating of Cylinder Liners. Electroplating and Metal Finishing, v. 13, Nov. 1960, p. 430-431.

Electroplating of machined, degreased and etched steel cylinder liners produced from deep drawn pressings. (L17; ST, Cr, 4-60)

28-L. Chrome Impregnation Fights Heat and Rust. A. C. Parsons. Canadian Machinery and Metalworking, v. 71, Nov. 1960, p. 90-91.

Chromalloying of steel components by diffusion of Cr into the surface to improve corrosion resistance and mechanical properties. (L15, R-general, Q-general; ST, Cr)

29-L. (German.) Wash-Primer for Metallic Surfaces. H. Kohlhase. Fertigungstechnik und Betrieb, v. 10, Oct. 1960, p. 613-619.

Composition of wash-primers for different metals. Adhesion, corrosion and weathering tests of treated Al alloy, steel sheet and gray cast iron surfaces. (L14, L12; Al-b, CI-n, ST, 4-53)

30-L. (German.) Automation in Electroplating. Fr. Lohrie. Elektro-Anzeiger, v. 13, Oct. 26, 1960, p. 454-455.

Automation of Cu, Ni and Cr electroplating in terms of operation sequence, working and transportation methods and design of baths. Economic considerations. (L17, 18-74; Cu, Cr, Ni)

31-L. Electrodeposition of Copper From Pyrophosphate Bath. S. K. Panikkar and T. L. Rama Char. Research & Industry (India), v. 5, Sept. 1960, p. 277-278.

Plating of Cu on steel from a pyrophosphate bath. Effect of addition agents on deposit brightness. Comparison of throwing power and cathode and anode efficiency of pyrophosphate and cyanide baths. (L17; ST, Cu)

32-L. Factors Producing Tin-Plate Wood Grain. R. F. Higgs and J. A. McCarthy. Plating, v. 47, Nov. 1960, p. 1255-1262.

Effect of melting rate, coating thickness, Sn concentration in the electrolyte, current density, electrolyte temperature and addition-agent activity on

the formation of wood grain, a pattern of bright and dull alternate bands of Sn on finished Sn plate. (L17b; Sn)

33-L. Ni-Al Coating Resists Oxidation. Chemical Engineering, v. 67, Oct. 31, 1960, p. 140.

Electrodeposition of smooth, oxidation resisting Ni-Al coatings on steel capable of withstanding temperatures to 1850° F. Ni is deposited from a Watts bath and Al is electroplated onto the Ni from a fused salt solution containing a mixture of KCl, NaCl and cryolite. (L17, R1h; ST, Ni-b, Al-b)

34-L. Increasing the Life of High Speed Steel Cutting Tools With Carbide Coating. Australasian Manufacturer, v. 45, Oct. 15, 1960, p. 52-55.

Tungsten carbide particles are spark-deposited on the cutting edges of high speed steel tools, to combine the resilience of steel with the hardness and wear resistance of carbides. (L24, T6n; TS-m, W, 14-68)

35-L. The Cleaning of Carbon Steel Wire as Affected by the Metallurgical Nature of the Scale. Allan B. Dove. Wire and Wire Products, v. 35, Nov. 1960, p. 1547-1554, 1589.

Theory of scale formation. Mechanical and chemical descaling of carbon steel wire. Effect of patenting on pickling. 5 ref. (L10, L12; CN, 4-61)

36-L. (Japanese.) Aluminizing of Steel Sheets. Akira Ohmi. Metals, v. 30, Apr. 15, 1960, p. 10-14.

Aluminizing of pickled and electropolished steel sheet and strip with flux melt or flux solution or by the Sendzimer process. Mechanical properties; applications. (L16, Q-general; ST, 4-53)

37-L. (German.) Influence of Film Composition on Alloy Formation in Electrolytic Deposition of Chromium by Other Elements. A. T. Vagramjan, D. N. Ussatschow and N. L. Klimassenko. Zeitschrift fur Physikalische Chemie, v. 215, no. 1-2, 1960, p. 57-62.

Electrolytic decomposition of Cr from cathodic films is investigated by polarization measurements in terms of current density and electrode potential measurements with SeO_3-and H_2SO_4-containing CrO_3 electrolytes. Reaction mechanism; reaction rate. 5 ref. (L17; Cr)

38-L. Influence of Cold-Reduction Practice on Hydrogen Behavior in Enameling Steels. R. M. Hudson, M. Kotyk and G. L. Stragand. American Ceramic Society, Journal, v. 43, Nov. 1960, p. 564-570.

Effect of cold work on hydrogen behavior in steel and influence on hydrogen-caused ground coat reboiling and delayed defect tendency of applied enamel coat. 15 ref. (L26, 9-71, Q26s, 3-68; ST, H)

39-L. Treating Waste From Chromium Plating. Metal Progress, v. 78, Dec. 1960, p. 124.

Process at the Pontiac Motor Division consists of reduction of hexavalent Cr with sulphur dioxide added as a liquid and subsequent precipitation of the Cr as a hydroxide. (L17, A9; Cr)

40-L. Color Anodize or Weld Aluminum Die Castings. Production, v. 1, Dec. 1960, p. 70-71.

Color anodizing of vacuum die castings composed of Hamiloy, a new Al alloy which can also be brazed, porcelain enameled and welded because of its resistance to distortion at high temperatures. (L19; Al-b, 5)

41-L. Institute of Vitreous Enamellers Annual Conference, Birmingham, 1960. Report of the First Technical Session. Metal Finishing Journal, v. 6, Nov. 1960, p. 423-429.

Summaries of papers covering a method of measuring the abrasion resistance of vitreous enamels; acid resistance tests for vitreous enamels used in the chemical industry; the influence of chemical composition of enamel on its alkali resistance. (L27)

42-L. (German.) Nonrigid Fully Automatic Electroplating. H. Henig and F. Kollorz. Metalloberflache, v. 14, Oct. 1960, p. 298-304.

Production of Cd, Cu, brass, Ni and Ag coatings by a fully automatic electroplating process which compensates for measured initial properties, such as surface condition of the material being plated. (L17; Cd, Cu-b, Ni, Ag)

43-L. (English.) Wire Brushing of Aluminum--Mechanism of "Orange Peeling". A. Selwood and J. Molgaard. Wear, v. 3, Sept-Oct. 1960, p. 394-400.

Presentation of experimental results to show that formation of "orange peel" surface finishes during brushing of Al by rotary surface brushes is due to low temperature welding and not to surface melting. 6 ref. (L10e; Al)

44-L. New Anodizing Process Imparts Uniform, Fade-Proof, Built-In Colors. Modern Metals, Nov. 1960, p. 86.

Kaiser Aluminum's Kalcolor process produces color without using organic dyes. Lasting tones are created by converting alloying elements within the metal itself. No perceptible corrosion or fading of Kodacolor occurs during accelerated tests. (L19; Al)

45-L. (German.) General Laws Controlling the Influence of Residual Elements on Reactions in Hot-Dip Galvanizing. Dietrich Horstmann. Stahl und Eisen, v. 80, Oct. 27, 1960, p. 1531-1540.

Kinetics and reaction mechanism of dissolution of pure and alloyed Fe containing P, Ti, Mo, Ni, Mn, Cr, Si and Al in Zn at temperatures from 430-550° C. Influence of heterogeneous precipitations and of phase transformations. 29 ref. (L16, N-general; Fe-b)

46-L. Cleaning Techniques for Stainless Steel. J. M. Henderson. Canadian Metalworking, v. 23, Nov. 1960, p. 56-57.

Chemical cleaning of stainless steel surfaces to prevent rusting and pitting by embedded foreign particles during annealing. (L12; SS)

47-L. Selective Electroplating Saves Time and Dollars. Charles D. LaFond. Missiles and Rockets, v. 7, Nov. 28, 1960, p. 44-45.

Standard or precious metal platings of high purity are selectively deposited on missile components using the Dalic process. Areas are electro-cleaned, etched and made cathodic, then coated by an anode pad saturated with the metal-coating solution. (L17, T24e)

48-L. (Dutch.) Metal Spraying. H. W. Kaletzky. Lastechniek, v. 26, Oct. 1960, p. 199-203.

C35 steel is sprayed with corundum to study the effect of metal spraying on its fatigue strength and the effect of surface roughness and preheating on the adhesion of the sprayed layer. 4 ref. (L23; ST)

49-L. Sandwich Rolling. H. S. Orr and F. R. Romeo. Iron and Steel Engineer, v. 37, Oct. 1960, p. 151-157.

Large, light gage sheets of alloy and stainless steel are rolled to close tolerances with conventional equipment using a sandwich rolling technique in which the plate to be rolled is encased between carbon steel plates prior to hot rolling. Decarburization and crown are minimized and power consumption is reduced. (L22; AY, SS)

50-L. (Czech.) Corrosion Protection by Metal Spraying With Aluminum. M. Zrunek. Strojirenstvi, Oct. 1960, p. 766-768.

Steel constructions are protected by spraying with Al or by spraying a 0.1 mm. thick Al layer over a sprayed Zn layer, also of 0.1 mm. thickness. Data are given for service life of paint protected sprayed layers. 10 ref. (L23, L26; ST, Al, Zn)

51-L. How to Select Steel Abrasives. Steel, v. 147, Nov. 14, 1960, p. 114-115.

Data for optimum hardness, size, density and Mn, P and S content of steel particles for blast cleaning. (L10c; ST, 17-57)

52-L. Blast Descaling Gains as Pre-Inspection Tool. Steel, v. 147, Nov. 18, 1960, p. 126, 129.

Mechanical blast descaling of slabs, billets and bars composed of carbon, stainless and toolsteel, Ti and Zr to produce an exterior that is easy to inspect and has adequate contrast between defect and surrounding material. (L10c; CN, SS, Ti, TS, Zr, 4-52, 4-55)

53-L. Vibratory Finishers for Deburring. Products Finishing, v. 25, Nov. 1960, p. 84-86.

Deburring of Al die castings, steel stampings, machined parts and toolsteels by vibrators which can be loaded to 90% of capacity. Partial suspension of media reduces pressure exerted against the work so that fragile or delicate parts can be batch finished. (L10; Al, ST, TS, 4-59, 5-61)

54-L. Polyester-Glass Coating Saves Corroded Ductwork. Products Finishing, v. 25, Nov. 1960, p. 70.

Application of Atlac 382, a glass-reinforced polyester to badly corroded galvanized iron ductwork to eliminate the

need for replacement of the worn duct system. (L26n, T26r; Fe, 8-65)

55-L. New Gas-Deposition Process for Making Dies. Products Finishing, v. 25, Nov. 1960, p. 66, 68, 70.

Production of pure Ni forming dies and foundry patterns by a gas deposition technique which deposits pure Ni on an eutectic-alloy mold which is then destroyed leaving a pure Ni shell. Reproducibility tolerances average 0.005 in. (L18, E17, W24n; Ni, 17-57)

56-L. Add Color to Your Zinc Plate. Lyne S. Metcalfe. Products Finishing, v. 25, Nov. 1960, p. 62, 64, 66.

Production of colored metallic finishes by a chromating-coloring process which involves dipping Zn plated parts in chromate-coating bath and then immersing them in a dye bath. Colors are fade resistant. (L14c; Zn, 8-62)

57-L. Acid Cleaning of Superheaters and Reheaters. William F. Ashton and Stanley M. Rose. American Society of Mechanical Engineers, Paper no. 60-WA-219, 1960, 4 p.

Chemical cleaning of drainable and nondrainable superheaters and reheaters of carbon and stainless steels using 5% inhibited citric acid or 5% inhibited HCl at 165 and 200° F. for 8 hr. Investigation of corrosion and erosion effects and solvent flow in parallel elements of heaters. (L12g, R6g, W13b; CN, SS)

58-L. When Will Plastic Coated Valves Solve Corrosion Problems? Paul A. Manor. Gas, v. 36, Nov. 1960, p. 112-113.

Coating of steel valves with chlorinated, high molecular weight, linear, crystalline plastic (Penton) to provide a low cost valve with good corrosion resistance. (L26p, R-general, T7b; ST, 17-57)

59-L. Protecting Steel in a Cooling Tower. Crawford Blanchard and M. H. Selby. Gas, v. 36, Nov. 1960, p. 109-111.

Coating of pipes and cooling towers with high solid content, amine-cured epoxy resin, Plasite 712, to protect against severe corrosive and thermal shock conditions. Resin selected is called Plasite 7122. (L26p, R10, T26r, W10h; ST, 17-57)

60-L. Heavy Gold Plating. Goldsmiths Journal, v. 66, Nov. 1960, p. 496.

A new plating process, called Epalex, for depositing 98% pure Au of greater hardness and thickness on any metal surface. Base metal may undergo any operation prior to plating. (L17; Au)

61-L. Protective Coating for High Temperature. Metal Industry, v. 97, Oct. 28, 1960, p. 364.

Production of Ni-Al alloy coating for protecting metals from oxidation at temperatures to 1000° C. by electroplating Ni over the base metal from a water bath and electrodepositing Al from a cryolite bath at 700° C. (L17; Al, Ni)

62-L. (Italian.) Use of Electrolytes Containing Oxalic Acid in the Anodization of Aluminum. E. Sacchi. Aluminio, v. 29, 1960, p. 447-452.

The permissible temperature difference during the anodic oxidation of Al is increased 4° C. by addition of 15 g. per l. of oxalic acid. Effect of oxalic acid on density of oxide produced, wear resistance of anodized samples and corrosion resistance of Al in HCl, H_2SO_4 and a NaCl mist. 7 ref. (L19, R-general, Q9n, 2-66; Al)

63-L. Practical Hints for Electro-Cleaning With Simultaneous Copper Plating. Rene Graner. Electroplating (India), v. 2, Apr-July, 1960, p. 8-10.

Analysis of factors leading to insufficient or too rapid deposition of Cu or to dissolving of the base metal during simultaneous electro-cleaning and Cu plating of Zn. (L13n, L17; Zn, Cu)

64-L. Switch to Automatic Buffing Multiples Output by 20. Steel, v. 147, Dec. 12, 1960, p. 90.

Design of an automatic buffer which polishes stainless steel weights for ultra-precise analytical balances. (L10a; SS)

65-L. Surface Treatment of Germanium for a Diffused Transistor. Osamu Mikami. Electrical Communication Laboratory (Japan), v. 7, Nov. 1959, p. 414-415.

Method for polishing and etching a Ge wafer. (L12, T1k; Ge, 17-57)

66-L. (Pamphlet.) Characteristics of the LW-1N 40 (Extra Tough Tungsten Carbide) Flame-Plated Coating. Linde Flame-Plating Bulletin, Oct. 1, 1960, 2 p. Linde Co., E. 42nd St., New York 17, N. Y.

Coatings contain tungsten carbide with approximately 15-17% Co. Data on surface finish, hardness, mechanical shock resistance, oxidation, corrosion and wear resistance. (L23; W, 6-69)

67-L. (Pamphlet.) Characteristics of the LW-1N 30 (Extra-Strong Tungsten Carbide) Flame Plated Coating. Linde Flame Plating Bulletin, Oct. 1, 1960, 2 p. Linde Co., E. 42nd St., New York 17, N. Y.

Composition, appearance, coating thickness, surface finish, hardness and mechanical shock resistance. Repeated high frequency impacts directly on the coated surface, resulting in considerable plastic flow of annealed steel, Ti alloy and 24S-T4 Al base metals produce no trace of cracking or spalling, while the only damage is mild pitting. (L23; W, 6-69)

68-L (Pamphlet.) Physical Data Flame-Plated Coatings. Linde Flame Plating Bulletin, Oct. 1, 1960, 2 p. Linde Co., E. 42nd St., New York 17, N. Y.

Mechanical and physical properties of LW-1, LW-1N30, LW-1N40 and LW-5 coatings containing tungsten carbide with 6-17% Co. Main features of these coatings are good wear resistance at high temperature and in corrosive media and excellent resistance to high temperature deterioration. (L23; W, 6-69)

69-L. (Pamphlet.) Characteristics of the LW-1 (Tungsten Carbide) Flame-Plated Coating. Linde Flame Plating Bulletin, Oct. 1, 1960, 3 p. Linde Co., 30 E. 42nd St., New York 17, N. Y.

Coatings contain tungsten carbide with 6-8% Co. Data on surface finish, hardness, modulus of elasticity, mechanical shock resistance, thermal conductivity, magnetic characteristics and oxidation resistance. Coatings are generally recommended for service up to 1000° F. under oxidizing conditions. (L23; W, 6-69)

70-L. (Pamphlet.) Tin Mill Products. Steel Products Manual, Nov. 1960, 38 p. American Iron and Steel Institute, 150 E. 42nd St., New York 17, N. Y.

Rolling, annealing and cleaning of steel strip for plating. Manufacture of black plate, tin plate, short terne plate and blue plate. Tolerances for cut sizes and coils. (L16, F23; ST, Sn, 4-53)

71-L (Translation-Brutcher no. 4780.) Development and Testing of an Acid Bath for the Chemical Polishing of V_2A Steel. G. Schmid and H. Steinhausen. Metalloberflache, v. 14, 1960, p. 1-6.

See item 281-L, 1960. (L12f, 2-60; AY, 4-53)

72-L. (French.) Corrosion Protection by Chromium Plating. P. Morissef. Corrosion et Anticorrosion, v. 8, Nov. 1960, p. 407-418.

Effects of surface roughness, bath temperature, current density, thickness of deposited layer and fissure formation on corrosion protection of Cr plated steel. Relationship between residual stress fissures, grooves and plating thickness. 11 ref. (L17, R-general; ST, Cr)

73-L. Novel Technique for Surfacing With Stainless Steel. Engineer, v. 48, Sept. 5, 1960, p. 39-40.

Medium carbon steel shafts for an extrusion press are covered with 18-8 stainless steel at critical areas by submerged arc welding with a heavy duty lathe which carries an automatic arc welding head on the cross carriage. Current setting varies with shaft's diameter. (L24, K1e; CN, SS)

74-L. (German.) Application of "Deposit Welding" by the "Ellira" Process (Under-Powder Welding). Alfred Gschaider. Schweisstechnik, v. 14, Oct. 1960, p. 113-115.

Reconditioning of worn crane wheels, tires for mining vehicles and steel rolls by under-powder welding. Heat treatments to eliminate residual stresses. (L24, J1a, W23k, W12q; ST)

75-L. New Techniques for Cladding With the Gas Shielded Process. Ralph D. Engel. Welding Journal, v. 39, Dec. 1960, p. 1222-1229.

An improved fusion cladding process is developed which combines the extended-electrode gas-shielded process with an oscillating technique to minimize the papillary depression of the fusion line of each

weld bead. Overlay process produces high quality stainless steel, Ni or Cu base alloy overlays on steel bases. (L22, K1d; ST, Cu-b, Ni-b, SS)

76-L. Metallizing Protects Parts From Corrosion. Welding Journal, v. 39, Dec. 1960, p. 1245-1246.

Deposits of Hastelloy alloys are sprayed on new and worn machine parts to increase their service life when exposed to HCl, H_2SO_4, NH_3, Cl_2 and other corrosives used in the chemical industry. (L23, R6, T7; Ni-b)

77-L. Improved Anodizing of Aluminum Extrusions. Charles C. Cohn. Precision Metal Molding, v. 18, Dec. 1960, p. 47, 49.

Survey of anodizing methods including hot water sealing and a dual sulphuric acid anodizing and sealing technique for improved wear and corrosion resistance of Al and Al alloy parts. Discussion of techniques for etching and chemical polishing. (L19, L12; Al-b)

78-L. Painting of Welds. Corrosion, v. 16, Dec. 1960, p. 93-99.

Painted test specimens are exposed to determine methods of obtaining improved paint performance over the weld areas of steel structures. The performance of primers and primer-topcoat systems is observed on various types of welds given various surface preparations and pretreatments before being painted. Residues caused by the electrode coating should be removed from the weld area, preferably by blast cleaning before painting. (L26n; 7-51)

79-L. Glass Linings and Vitreous Enamels. Corrosion, v. 16, Dec. 1960, p. 107-113.

Use and limitations of glass linings and porcelain (vitreous) enamels for metal structures. Nominal composition of glass, production and preparation procedures, application, metal surface preparation, firing atmosphere, equipment design, hydrogen spalling, thermal shock, etching, abrasion resistance, testing techniques, heat transfer characteristics and repair of glassed steel equipment. (L27)

80-L. (German.) Rotating, Longitudinal and Universal Automatic Electroplating. G. Gailert. Metalloberflache, v. 14, Nov. 1960, p. 325-328.

Automatic plants for rinsing, degreasing and electroplating operations. Electroplating of Zn die castings, brass and steel parts with Cu, bright Ni and Cr. (L17, L-general, 1-52; Cu-b, ST, Zn, Ni, Cr)

81-L. (German.) Non-Rigid Automatic Electroplating Machinery. H. Hennig and F. Kollorz. Metalloberflache, v. 14, Nov. 1960, p. 329-332.

Comparison of characteristics of rigid and non-rigid automatic electroplating of ferrous and nonferrous metals with reference to efficiency, output and possible combinations of electroplating programs. (L17, 1-52)

82-L. (German.) Evaporation of Metals in Vacuum as Dependent on Metal Distribution on Evaporation Support. L. E. Preuss and C. E. Alt. Vakuum-Technik, v. 9, Sept. 1960, p. 155-163.

Evaporation of radioactive Au and Cr on a tungsten-wire of 0.5 mm. diameter at 1150-2030° C. and under vacuum of 10^{-2}-9 x 10^{-5} Torr. Autoradiographs are taken with a distillation camera to determine geometry of evaporation. (L25g; W, Au, Cr)

83-L. (Russian.) Cathodic Polarization During Deposition of Copper-Nickel Alloys From Pyrophosphatic Electrolyte. N. Ya. Fedotova and P. S. Titov. Tsvetnaya Metallurgiya, May 1960, p. 126-131.

Mechanism and kinetics of electroplating Cu and Ni (50-70% Ni) simultaneously. Relation of the rate of ion discharge to the composition of the deposit and the electrolyte and of cathodic polarization to the partial activity of the components. 17 ref. (L17; Cu-b, Ni-b)

84-L. When to Choose Ultrasonic Cleaning. H. F. Osterman. Metalworking, v. 16, Dec. 1960, p. 14-15, 22.

Basic principles of the process; pointers in the selection of solutions and solvents; use of transducers; typical applications. (L10f)

85-L. (Russian.) Polarization in the Electrodeposition of Nickel, Cobalt and Iron on a Solid and Liquid Cathode. A. P. Popkov, N. L. Klimashenko and A. T. Vagramyan. Zhurnal Fizicheskoi Khimii, v. 34, Aug. 1960, p. 1741-1744.

Comparison of rate of electrodeposition of Ni, Co and Fe on solid metal

electrode with deposition on liquid Hg electrode. Effect of charge on the surface of the Hg electrode on discharge of Ni, Co and Fe ions. 4 ref. (L17; Ni, Co, Fe)

86-L. Pipe Internally Coated at the Mill. Pipe Line Industry, v. 13, Dec. 1960, p. 34.

Pipe of 16-30 in. o.d. wire is wire brushed and washed, hot air and induction dried and sprayed with epoxy-base paint on an internal coating line incorporating quality control. (L26p; 4-60)

87-L. Successful Internal Roller Burnishing. Metalworking Production, v. 104, Nov. 23, 1960, p. 71-74.

Techniques for roller burnishing of bronze component bores to improve Rockwell C hardness, surface finish, grain structure and dimensional accuracy without extensive honing and lapping. (L10, Q26n; Cu-s)

88-L. Pitting Corrosion on Pellet Mill Dies Can be Curtailed. Inco Nickel Topics, v. 13, no. 8, 1960, p. 9.

Chemical Ni alloy plating on pellet feed mill dies for reducing electrochemical corrosion. (L17, R-general, T29p; Ni)

89-L. Diffusion Coatings Protect Metal to 2300° F. Materials in Design Engineering, v. 51, Dec. 1960, p. 17.

Coatings are metallurgically bonded to the base metal and resist spalling, chipping and thermal shock. Thickness of the coating ranges from 0.001-0.006 in. Ni and Co-base alloys, stainless steels and plain carbon steels have been coated with excellent results. (L15)

90-L. Some Applications of Electropolishing. Machinery (London), v. 97, Nov. 23, 1960, p. 1179-1181.

Use of electropolishing to remove burrs, avoid stress concentration and to remove discoloration caused by heat treatment. Application to stainless, carbon and alloy steels, Ni, Ni alloys, Cu and Cu alloys. (L13p; AY, Cu-b, CN, Ni-b, SS)

91-L. Canning Automatic Hard-Chromium Plating Installation. Machinery (London), v. 97, Nov. 23, 1960, p. 1195-1196.

Cylinder liners of deep drawn steel are plated by hard Cr in a fully automatic installation which also performs turning, boring, grinding and lapping operations prior to plating. (L17, G17; ST, Cr)

92-L. (Russian.) Heat Treatment in Carbon Dioxide. V. A. Shebanov. Metallovedenie i Termicheskaya Obrabotka Metallov, Nov. 1960, p. 37-38.

Experimental hard facing of 45 steel in CO_2 media with and without subsequent heat treatment. Hardness, impact strength, elongation and tensile strength of the deposited and base metals as they are affected by heat treatment. (L24, J-general, Q-general, 2-64; ST)

93-L. (Russian.) Electroplating of Titanium. G. N. Smolenskaya, N. T. Kudryautsev and V. M. Karataev. Metallovedenie i Termicheskaya Obrabotka Metallov, Nov. 1960, p. 42-44.

Preliminary preparation and plating of polished Ti and Ti alloys to obtain Ni, Cu, Zn, Cr, Au and Ag platings which do not scale during filing, grinding or burnishing, show thermal stability at 600-800° C. and can be soldered successfully. (L17; Ti, Ag, Au, Cu, Cr, Ni, Zn)

94-L. (Russian.) Technological Peculiarities in the Production of Fine Tungsten Wire. I. Yu. Klugman. Tsvetnye Metally, Sept. 1960, p. 69-74.

Electrolytic etching of very fine tungsten wire by drawing the wire through a double cell bath with NaOH electrolyte. Uniform wire coating is obtained by decreasing concentration of electrolyte, by switching from a-c. to d-c. and by increasing size of electrolytic bath. 4 ref. (L13q; W, 4-61)

95-L. Electro-Formed Copper Waveguides. L. E. Hall and B. H. Meggs. Metal Industry, v. 97, Nov. 25, 1960, p. 435-438.

Fabrication of Cu waveguides using an electroforming process in which an accurate male mandrel with external dimensions identical with those of the bore required is plated with Cu to the desired thickness. When the mandrel is removed internal surface of the waveguide is an exact replica of the mandrel. (L18, T1; Cu)

96-L. Super Vapor Blasting. Australasian Manufacturer, v. 45, Nov. 5, 1960, p. 104-105.

Removal of forging and heat treating scale from strong, hard and heat resistant alloys for jet engine components by

a vapor blasting machine which shoots a slurry of fine particles against the workpiece. (L10c, T24b; SGA-h, SGB-a, SGB-q)

97-L. One Coat Porcelain Enameling Reaches Production Status at Westinghouse. Metal Products Manufacturing, v. 17, Dec. 1960, p. 42-43, 82.

Direct-on finishing of refrigerator components composed of zero-carbon steels using a new ferric sulphate-sulphuric acid pickling process for metal preparation. Corner brushing and ground coat drain streaking are eliminated. (L27; ST)

98-L. (German.) Decomposition of Anodic (Anodically Produced) Oxide Layers on Tantalum. G. Hahn. Metall, v. 14, Dec. 1960, p. 1171-1174.

Anodic oxidation of rolled and polished Ta sheets by direct current followed by decomposition of oxide layers in boiling 20% NaOH solution. Capacity measurements to determine decomposition times are made with an alternating current (50 cps.) bridge using 1% K_2SO_4 as electrolyte. (L19; Ta, 4-53)

99-L. (Italian.) Surface Treatment of Stainless Steel. Pt. 3. Giampiero Colombo. Acciaio Inossidabile, v. 27, Nov. 15, 1960, p. 497-500.

Descaling and pickling of stainless steel after heat treatment or hot deformation by sand-blasting followed by pickling in a solution containing nitric acid and fluoric acid or descaling in a solution containing 8-10% H_2SO_4 and 2% NaCl at a temperature of 60-70° C. followed by rinsing in water. (L10c, L12; SS)

100-L. (Finnish.) Tinned Containers. Pentti Ranta. Teknillisen Kemian Aikakauslehti, v. 17, Oct. 31, 1960, p. 595-598.

Cans used in the food industry are manufactured from steel sheet containing 0.12% C, 0.20-0.60% Mn, 0.01 max.% Si, 0.005 max.% S, 0.015-0.05% P and 0.06-0.20% Cu then dip-tinned or electro-tin-plated. Effect of tinning process on corrosion resistance. (L17, R-general; ST, Sn, 4-53)

101-L. One-Coat Enameling With Decarburized Steels. L. E. Fussell and F. L. Michael. Ceramic Age, v. 76, Dec. 1960, p. 43-46.

Preparation of steel for one coat enameling by spray pickling, etching and Ni coating. Effect of preparation methods on adherence and texture of the enamel. (L27; ST, 8-62)

102-L. (Japanese.) Structure of Bright Deposits From Nickel, Copper and Iron-Ethanolamine Baths. Akira Nakagawa. Metal Finishing Society of Japan, Journal, v. 11, Nov. 1960, p. 632-637.

Crystal structure, grain size and crystallographic orientation of specimen deposited from TEA-baths for Ni and Fe and MEA-baths for Cu are studied by X-ray diffraction and electron microscopy. Comparisons are made with deposits from the Watts bath for Ni on acid bath for Fe, the cyanide bath for Cu and various bright and leveling baths for each. (L17, M26, M-general; Cu, Fe, Ni)

103-L. (Japanese.) The Effect of Addition Agents on the Electrodeposition of Metals. Pt. 2. The Effect of Addition Agents on Cathode Polarization in Cyanide Zinc Baths. Tadeo Hayashi and Takeo Ishida. Metal Finishing Society of Japan, Journal, v. 11, Nov. 1960, p. 638-643.

Changes in cathode polarization pH of electrolytic solutions by addition of inorganic salts of Se, Ag, Hg, Cd, Ni, Co, W and Mo; inorganic sulphur compounds such as Na_2S and $Na_2S_2O_3$ and various organic compounds. Effect on formation of bright deposits. 10 ref. (L17; Zn)

104-L. (Japanese.) The Effect of Addition Agents on the Electrodeposition of Metals. Pt. 3. The Structure of Bright Zinc Electrodeposits. Tadao Hgyashi and Takeo Ishida. Metal Finishing Society of Japan, Journal, v. 11, Nov. 1960, p. 644-650.

Crystal structure, grain size, preferred orientation and surface smoothness of deposit obtained from cyanide baths are studied by electron diffraction and photomicroscopy. Effect of additions of inorganic salts of Se, V, Ag, Hg and Cd; metallic salts of Ni, Co, Fe, Cu, Mo and W; inorganic sulphur compounds such as Na_2S and Na_2SO_4 and organic compounds. 10 ref. (L17, M26, M-general; Zn)

105-L. Barrel Finishing Offers Efficiency and Low Cost. Design Engineering, v. 7, Jan. 1961, p. 28-32.

Removal of burrs from metal stampings by tumbling a mixture of parts, abrasive media and other compounds in a barrel-like container, a procedure which simultaneously cleans and burnishes the parts. Efficiency depends on shape of abrasive and parts, loading and speed of barrel and size and hardness of part. (L10d; 4-59)

106-L. Electrodeposition of Nickel-Cobalt Alloys. A. J. Steiger. Metal Finishing, v. 58, Dec. 1960, p. 53-55.

Use of separate Ni and Co anodes with individual current supplies for deposition of thick layers of Ni-Co alloy. Variation of alloy composition with electrolyte concentration, pH agitation and current density. (L17; Ni-b, Co)

107-L. Science for Electroplaters. Pt. 62. Adhesion Tests. L. Serota. Metal Finishing, v. 58, Dec. 1960, p. 65-67.

Burgess test, Ollard test, modified Ollard test and cement test for measurement of adhesion of electrodeposited coatings. Adhesion of electrodeposited Ni on various metals. Effect of deposit thickness on adhesion values. (L17, Q10c; Ni, 8-62)

108-L. (German.) Electrolytic Polishing of Heat Resistant Nickel Alloys. Gunter Haussler and Volker Patzold. Neue Hutte, v. 5, Nov. 1960, p. 665-674.

Electrolytic polishing of heat resistant Ni alloys (19.8-21.8% Cr, 0.13-2.99% Ti, 0.15-2.4% Al, 0-1.5% Fe, 0.03-0.19% C) with an apparatus combined with a microscope, using electrolytes containing H_2SO_4, H_3PO_4, HNO_3, HCl, CH_3COOH, CH_3OH and H_2O. (L13p; Ni-b, SGA-h)

109-L. Recent Advances in Arc-Plasma Metallizing. M. A. Levinstein. Metal Finishing Journal, v. 6, Dec. 1960, p. 467-474, 476.

Materials investigated are W, Mo, Hf carbide, Ta carbide, Ce oxide, Zr oxide and Hf oxide. Tungsten and Mo are sprayed in both wire and powder form while the oxides and carbides are in powder form. Spraying parameters are established based on density and microstructure. (L23)

110-L. Satin Finishes on Automatic Polishing Machines. F. W. Anderson. Metal Finishing Journal, v. 6, Dec. 1960, p. 475-476.

Details of the use of water-based liquid polishing compositions. (L10b)

111-L. Technical Developments and Advances in Nickel-Chromium Plating. Metal Finishing Journal, v. 6, Dec. 1960, p. 477-484.

Summaries of four papers presented at a symposium of the Institute of Metal Finishing, Nov. 16, 1960. Topics include a review of recent developments in Ni plating, progress in decorative Cr plating, thick coatings of crack-free Cr, intrinsic porosity of Ni coatings. (L17; Ni, Cr)

112-L. Hardfacing Cuts Maintenance. C. E. Rogers. Pacific Factory, v. 101, Dec. 1960, p. 21-22.

Survey of hardfacing protection of metal parts and equipment using carbides of Cr, Mo, W, Si and V. (L24, 18-72)

113-L. Faraday's Laws Applied to Cleaning. A. Kenneth Graham. Paper from "American Electroplaters' Society, Technical Proceedings", 1960, p. 41-44.

Assuming the removal of the varying amounts of many different organic soils in preliminary cleaning steps, the subsequent electrolytic cleaning and activating treatments determine both the adhesion and the quality of the plated coating. Factors in the development of a successful cleaning cycle. 3 ref. (L13)

114-L. Adhesion of Organic Enamels to Electrodeposited Nickel. F. X. Carlin. Paper from "American Electroplaters' Society, Technical Proceedings", 1960, p. 59-65.

Strong bonds between freshly deposited Ni and subsequent organic enamel finishes are achieved. Various aqueous solutions of organic and inorganic compounds are employed as post-treatments for the electrodeposits. The solutions apparently react either to cause a conversion type film on the Ni surface or to deposit a thin film of material which becomes strongly bonded to Ni. The film produced is receptive to application of a coating of organic enamel. 13 ref. (L26; Ni, 8-62)

115-L. Magnesium Corrosion. E. I. Weed. Paper from "American Electroplaters' Society, Technical Proceedings", 1960, p. 66-67.

Effectiveness of organic coatings in corrosion prevention, with special reference to epoxies and vinyls. Outline of optimum design features to avoid corrosion. (L26, R-general; Mg)

116-L. Recent Developments in Gold Electroplating. Barnet D. Ostrow and Fred I. Nobel. Paper from "American Electroplaters' Society, Technical Proceedings", 1960, p. 68-73.

Relative hardness, thickness and porosity tests on deposits produced by the Bek, acid phosphate Au, Volk, standard cyanide and other principal processes. 16 ref. (L17; Au)

117-L. A Cyanide Bath for Heavy Gold Plating. Robert Seegmiller and James K. Gore. Paper from "American Electroplaters' Society, Technical Proceedings", 1960, p. 74-77.

Deposits are bright to semi-bright with a slightly reddish cast, smooth, fine grained, hard and relatively pore-free. They are more brittle than deposits from industrial type Au baths. Smooth deposits 20-30 mils thick are readily obtained. 4 ref. (L17; Au)

118-L. Acid Gold Plating. R. A. Ehrhardt. Paper from "American Electroplaters' Society, Technical Proceedings", 1960, p. 78-82.

Development of a plating bath for printed circuits. Influence of pH, temperature, current density and bath composition on cathode efficiency and appearance. The bath is formed by the reaction of sodium gold cyanide with citric acid and/or ammonium citrate. 6 ref. (L17; Au)

119-L. A Study of Variations in Certain Characteristics of Bright Nickel Deposits With Variations in Bath Temperature. Richard J. Clauss. Paper from "American Electroplaters' Society, Technical Proceedings", 1960, p. 105-109.

Operation of bright Ni solutions at temperatures above 175° F. Comparison of microstructure, appearance and ductility with the properties of deposits made at normal plating temperatures. The effectiveness of various addition agents at these temperatures is compared to their utility at lower operating temperatures. 9 ref. (L17; Ni)

120-L. Magnetic Properties of Electrodeposited Cobalt Nickel Alloys. Victor Zentner. Paper from "American Electroplaters' Society, Technical Proceedings", 1960, p. 166-169.

Control of plating conditions to produce permanent magnetic coatings on memory drums in digital computers. Effect of plating variables on coercive force and remanence. 5 ref. (L17; Co-b, Ni)

121-L. Plating of Nickel, Cobalt, Iron and Cadmium From Sulphamate Solutions. Richard C. Barrett. Paper from "American Electroplaters' Society, Technical Proceedings", 1960, p. 170-175.

Typical plating baths; effect of addition agents; properties of deposits. 37 ref. (L17; Ni, Co, Fe, Cd)

122-L. The Chemical Reduction of Nickel-Phosphorus Alloys From Pyrophosphate Solutions. Morton Schwartz. Paper from "American Electroplaters' Society, Technical Proceedings", 1960, p. 176-183.

The use of pyrophosphates as complexing agents permits substantial reduction of operating temperatures and increases the deposition rates. The alkaline pyrophosphate-electroless Ni solutions are quite stable and are easily maintained and controlled. Good rates of deposition are obtained. 19 ref. (L29; Ni-b, P)

123-L. Solution Transfer in Barrel Plating. Paul Glab, R. Scott Modjeska and S. P. Gary. Paper from "American Electroplaters' Society, Technical Proceedings", 1960, p. 184-187.

Solution transfer is adequate irrespective of the principal variables in barrel operation. Plating potential decrease in the load from the outside to the center is so sharp that the plating current density must be calculated on the basis of area of periphery rather than the average over the whole load. 8 ref. (L17)

124-L. Cleaning in the Electronics Industry. D. E. Koontz, D. O. Feder and C. O. Thomas. Paper from "American Electroplaters' Society, Technical Proceedings", 1960, p. 188-198.

Practical techniques for the detection, removal and control of contaminants. Application of brushing, grit or vapor blasting, ultrasonic cleaning techniques and chemical removal. 4 ref. (L10f, L12, T1)

125-L. Chromium Plating of Rifle Barrels. Robert J. Girard and Edward F. Koetsch. Paper from "American Electroplaters' Society, Technical Proceedings", 1960, p. 199-206.

Development and adaptation of a process to electropolish and Cr plate the entire bore and chamber of the M14 Springfield rifle. (L13p, L17, T2m; Cr)

126-L. Corrosion Protection With Decorative Chromium. Edgar J. Seyb. Paper from "American Electroplaters' Society, Technical Proceedings", 1960, p. 209-214.

Of the new systems, bright crack-free Cr is not dependent on the sacrificial corrosion of Ni under the Cr; while duplex Cr, like duplex Ni and the older buffed Watts' Ni does depend on sacrificial Ni corrosion. Accelerated tests indicate that greatly improved corrosion resistance is obtained with heavier Cr deposits. 8 ref. (L17, R11; Cr, Ni, 8-62)

127-L. (German.) How to Dye Brass. Thomas Curti-Jung. Metall-Reinigung+ Vorbehandlung, v. 9, Nov. 1960, p. 191-192.

Dyeing of brass by chemical treatment and heating. Processes parameters and composition of dyeing solutions. (L14, L19; Cu-n)

128-L. (German.) Application of a New Bright-Nickel Bath Process. Hans H. Reinsch. Metall-Reinigung + Vorbehandlung, v. 9, Nov. 1960, p. 193-194.

Tests on Steel and Zn die castings coated with bright Ni by the duplex process for comparison of corrosion resistance and adhesion properties with those of conventional Ni coatings. (L17, R11; ST, Zn, Ni)

129-L. Etching Steel for Adherence of Porcelain Enamel. F. W. Beal, R. L. Myers and J. J. Canfield. American Ceramic Society Bulletin, v. 39, Dec. 1960, p. 727-731.

Use of etching, pickling and Ni flashing to improve strength during one-coat porcelain enameling of nonfishscaling, non-boiling steels. (L13q, L12g, L17, L27; ST)

130-L. Chromallize for Heat and Wear Resistance. Metalworking Production, v. 104, Dec. 21, 1960, p. 64-65.

Process for surface alloying by diffusing Cr and/or other elements into a base metal. Coatings will not peel or flake, because they are integral with the base metal and are free from porosity and uniform in depth. (L15; Cr)

131-L. Painting Setup for Diversified Metal Products. Industrial Finishing, v. 37, Dec. 1960, p. 8-9, 12.

Various steel, cast iron and Al components get electrostatic spray painting plus "touch-up" manual hot spray painting, cleaning, draying and baking on conveyorized production line with electrical convection oven. (L26n; Al, CI, ST)

132-L. Painting Components for Steel Buildings. Industrial Finishing, v. 37, Dec. 1960, p. 20-24, 26, 28.

Galvanized sheet steel is unwound from rolls, formed, cut to length, bond coated and automatically painted. Coatings are baked to increase corrosion resistance. (L26n; ST, 4-53, 4-57, 8-65)

133-L. Result of "Doctoring" a Baked Coating. Industrial Finishing, v. 37, Dec. 1960, p. 94-96.

Use of artificial airing agents to obtain complete curing in a short baking cycle results in cracking when a full baking cure is developed at the correct time and temperature. Problem is illustrated by a coating on prefabricated sheet metal which cured satisfactorily at 350° F. but cracked at all formed edges at 375° F. (L26; 4-53)

134-L. (Translation-ConBur.) Phosphatation of Steels in the Presence of Nitrates of Monovalent Metals. I. I. Khain. Journal of Applied Chemistry of the USSR, v. 32, Nov. 1959, p. 2531-2535.

Suitability of Na, K and NH_4 nitrates as phosphatation accelerating agents is investigated. NH_4NO_3 accelerates the phosphate layer formation, increases the phosphatizing solution acidity and decreases the thickness and protective capacity of the phosphate layer. $NaNO_3$ and KNO_3 have no effect. 9 ref. (L14b, 2-66; ST)

135-L. (Translation-ConBur.) Process of Phosphatation of Steel in the Presence of Nitrates of Bivalent Metals. I. I. Khain.

Journal of Applied Chemistry of the USSR, v, 32, Nov. 1959, p. 2542-2547.

Suitability of nitrates of Mn, Zn, Cd, Ca, Sr and Ba as phosphatation accelerating agents is investigated. Rate of phosphate layer formation increases in the presence of $MnNO_3$, $ZnNO_3$ and $CdNO_3$ but decreases in the presence of $CaNO_3$, $SrNO_3$ and $BaNO_3$. With the exception of $ZnNO_3$ all the salts had a deleterious effect on the protective capacity of the phosphate layer. A decorative phosphate layer is obtained in the presence of $CaNO_3$, $SrNO_3$ and $BaNO_3$. 10 ref. (L14b, 2-66; ST)

136-L. (Book.) Mechanical Polishing. Walter Burkart, H. Silman and C. R. Draper. 255 p. 1960. Robert Draper Ltd., Teddington, England. $9.

Detailed account of manual and automatic polishing and buffing, barrel finishing and abrasive blasting of ferrous and nonferrous metals as currently practised in England, America and Germany. Particular attention is paid to the more recent developments such as automatic polishing machines, liquid polishing compositions, wet blasting processes and barrel de-burring and finishing. (L10)

137-L. (Book.) American Electroplaters' Society, Technical Proceedings, 1960. 260 p. 443-445 Broad St., Newark 2, N. J.

Papers and discussions presented at the 47th annual convention, Los Angeles, July 24-28, 1960. Papers abstracted separately. (L-general, L17)

138-L. How Planning Built a Modern, Efficient Barrel Finishing Department. M. M. Patterson. Grinding and Finishing, v. 6, Dec. 1960, p. 26-29.

Grinding, bright homing and coloring of stainless steel, Al and brass parts in barrel finishing machines. Different finishes are achieved by varying the running time, turning speed, size of the work load and type and size of the abrasive used. (L10d; Al, Cu-n, SS)

139-L. The Practical Aspects of Enameling Aluminum. A. H. Symonds. Institute of Vitreous Enamellers Bulletin, v. 11, Dec. 1960, p. 33-38.

Vitreous enamelling of Al to provide corrosion and spalling resistance and durability. Methods of pretreatment, cleaning, spraying and firing, with emphasis on the effect of mill additions on the resistance of the finish. (L27; Al)

140-L. Chemical Conversion Coatings. F. C. Porter. Industrial Finishing, v. 12, Dec. 1960, p. 23-24, 27-28, 30-31.

Characteristics and applications of coating processes suitable for Al including chromate-oxide, chromate-fluoride, chromate-phosphate, zinc-phosphate and Bohmite (deionized water) types. 9 ref. (L14; Al)

141-L. The Controversy About Duplex Nickel. Industrial Finishing, v. 12, Dec. 1960, p. 33-34, 36, 37.

Development of tests comparing the corrosion resistance of Cr, dull Ni and bright Ni platings. Throwing power of plating solutions containing organic compounds. Plating applications in the automobile industry. (L17, R-general; Cr, Ni)

142-L. Vitreous Enamel in Building Design. Industrial Finishing, v. 12, Dec. 1960, p. 40-43.

Fabrication of vitreous enamelled Al panels and their structural application in the building design. (L27, T26n; Al, 4-57)

143-L. How to Stop Molybdenum From Oxidizing. Metalworking Production, v. 104, Nov. 9, 1960, p. 83-84.

Effect of temperature on the oxidation of Mo. Heat resistance and physical and mechanical characteristics of various metal and ceramic coatings. Methods of cladding, electroplating, flame spraying and diffusion coating. (L-general, R1h, 2-61; Mo)

144-L. Bonded Coatings Lubricate Metal Parts. Alfred Disapio. Metalworking Production, v. 104, Nov. 9, 1960, p. 87-92.

Addition of a solid lubricant such as graphite or MoS_2 to a resinous or inorganic binder gives a slippery coating that can be cured in place. These bonded solid film lubricants may be applied to stainless steel and Al, Cu, Mg and Ti alloys for operation under high loads, low speeds and extreme surface temperatures. (L-general, 18-73; Al-b, Cu-b, Mg-b, SS, Ti-b)

145-L. Fast Spin in Cob-Metal Mixture Removes Machining Marks. Iron Age, v. 187, Jan. 12, 1961, p. 60-61.

Directional finishing lines are removed from ball-joint suspensions consisting of a plastic socket mating

with a ball stud made of steel by a spin finishing process in which each processing unit spins parts through a dry, granular compound. (L10h; ST)

146-L. Dry Polishing Increases Metal Removal. William L. Hermann. Production, v. 47, Jan. 1961, p. 86-87, 89.

Flat polishing of 12-gage, 1008 steel bumper blanks using easily replaceable paper belts and wet-type dust collectors to obtain higher metal removal rates at faster polishing speeds. (L10, T21a; ST)

147-L. (French.) Corrosion Proofing of Metal Shapes With Zinc at the Hautmont Plant of Societe Usinor. Manutention, Aug-Sept. 1960, p. 89-94.

Design and operation of continuous automatic installation which shot blasts and metallizes hot rolled sections of different shapes for steel windows. Average thickness of anti-corrosion Zn coating is 20 microns, but 40 microns are applied in certain cases. (L15, L10c, W2; ST, Zn)

148-L. Stran-Steel's Color-Coating Process. Gerard H. Poll, Jr. Products Finishing, v. 25, Dec. 1960, p. 30-47.

Galvanized steel coils are converted into colored ribbed panels for siding and roofing on pre-engineered steel buildings. Procedure includes roll forming, spray priming, baking and vinyl coating. (L26n, G11; ST, 8-65)

149-L. Control of Chromium Plating Baths. Joseph P. Branciardi. Products Finishing, v. 25, Dec. 1960, p. 50-56.

Simplified analytical control methods for Cr plating baths. Procedure for determination of chromic acid, sulphate and fluoride contents in Cr baths. Elimination of plating difficulties. 3 ref. (L17a; Cr)

150-L. Douglas Aircraft Installs Large Hard-Coat Anodizing System. Products Finishing, v. 25, Dec. 1960, p. 58-60.

Hydraulic cylinders for missiles are anodized by a process which creates a relatively thick network of interlocked Al oxide crystals on the surface of Al. The resistance of the Al increases as the thickness of the Al oxide coating increases. (L19, T21b; Al)

151-L. Cleaning and Finishing a Variety of Metal Products. P. J. Hickey. Industrial Finishing, v. 37, Jan. 1961, p. 30-34.

Cold surface cleaning, phosphatizing and electrostatic painting of solid brass, plated or cold rolled steel plated parts using a spinning electrostatic disk to apply final coatings. All coatings are baked at 300° F. (L14b, L26n; Cu-n ST, 8-62)

152-L. Economical Way to a Quality Finish. C. Raymond Syer. Industrial Finishing, v. 37, Jan. 1961, p. 39-40, 42, 44, 46, 48, 50.

Review of methods of surface preparation, mixing and reducing finishing materials, spray painting and testing of finishes. Characteristics of solvents and binders. Cost analysis. (L26n)

153-L. Modern Metal Cleaning: Surface Treatment. Industrial Finishing, v. 37, Jan. 1961, p. 54-55.

Conveyorized washing and phosphatizing of steel components, using a multi-stage power washer and phosphatizing machine operating with pre-established temperatures and conveyor speed. (L14b; ST)

154-L. Touch-Up Smoothing at Wrong Time. Industrial Finishing, v. 37, Jan. 1961, p. 56, 58.

Rubbing Al sheet with steel wool just before spray painting is shown to cause pitting or blistering of the paint film. The phosphate coating is disturbed and particles of steel are embedded on the soft surface of the Al alloy. (L10, L26n; Al, 4-53)

155-L. Finishing Landis Grinding Machines. P. C. Bardin. Industrial Finishing, v. 37, Jan. 1961, p. 98-100, 102.

Shot blast cleaning, solvent cleaning, prime coating, sanding, sealing and enameling of high precision grinders from 1760-183,000 lb. (L10c, L12h, L26n, W25s)

156-L. Cleaning-Phosphatizing; Keep It Going 100%. Industrial Finishing, v. 37, Jan. 1961, p. 111-112.

Use of metering devices to maintain constant strength in the phosphate solution and of sludge tanks and centrifuges to control sludge content during phosphatizing operations. (L14b)

157-L. Controlled Vibration--Key to Parts-Finishing Efficiency. T. W. Black. Tool and Manufacturing Engineer, v. 46, Jan. 1961, p. 77-79.

Deburring and other machining operations are performed on stainless steel and brass components by vibratory barrel finishing, a process in which parts are loaded into a tub filled with abrasives and vibrated during the finishing cycle. (L10d; Cu-n, SS)

158-L. Properties of Plasma-Sprayed Materials. M. A. Levinstein, A. Eisenlohr and B. E. Kramer. Welding Journal, v. 40, Jan. 1961, p. 8s-13s.

Testing of arc-plasma deposited samples of W, Mo, HfC, TaC, CeO ore and ZrO_2 to determine density, Vickers hardness, thermal expansion and microstructure. Tensile properties of sprayed Mo and W at 3000-4500° F. 5 ref. (L23, P10a, Q29n, M27, P11g; Ce, Hf, Mo, Ta, W, Zr, 14-68)

159-L. Hard Surfacing of Blast Furnace Bells and Hoppers. Frank J. Gaydos and Nello Fragasse. Welding Journal, v. 40, Jan. 1961, p. 18-24.

Martensitic, austenitic and 1030 steels and Ni base alloys are used in forming wear-resistant surfaces on blast furnace charging facilities. (L24, W17g, W12b; SS, Ni-b)

160-L. Decorative Plating Abroad. A. C. Benning. Metal Progress, v. 79, Jan. 1961, p. 113-116.

Although some electroplaters still rely on buffed Cu-Ni-Cr systems for decorative parts, many have adopted plating practices such as duplex Ni and crack-free Cr which were developed in this country. (L17, T21; Cr, Ni)

161-L. Blisters in Vitreous Enamels. P. Chu Gordon, E. R. Evans and A. D. Morgan. Metal Progress, v. 79, Jan. 1961, p. 199-200. (Digested from Institute of Vitreous Enamellers Bulletin, Silver Jubilee Conference Edition, p. 1-19, 30, 1960.)

"Fish-scaling" in enameling of five typical steels. Ti-bearing and Si steels are not susceptible to fish-scaling. Effect of hydrogen and of furnace gases. Blistering of cast iron. (L27; ST, CI, 9-71)

162-L. Notes on Improved Ni-Cr Processes. H. J. Bache. Electroplating and Metal Finishing, v. 13, Dec. 1960, p. 451-455, 472.

Evaluation of four electroplating systems including bright Ni, dual Ni, dual Cr and sandwich processes for deposition of corrosion resistant platings on automobile accessories as determined in Cass and Corrodkote accelerated corrosion tests. (L17, R11, T21a; Cr, Ni)

163-L. How to Cut Cost by a Faultless Plating Technique. Horst Schulz and Hans-Wilhelm Leber. Electroplating and Metal Finishing, v. 13, Dec. 1960, p. 456-457.

Prevention of waste in electroplating by keeping the plating solutions in balance, using the ampere hour meter system to indicate all material changes within the electrolyte composition. (L17a)

164-L. Zinc and Cadmium Plating. Electroplating and Metal Finishing, v. 13, Dec. 1960, p. 458-459, 471.

British standard specifications for electroplated coatings of Cd and Zn on Fe and steel. Methods of testing adhesion, local thickness and average thickness of platings. (L17, Q10c, S14; Fe, ST, Cd, Zn)

165-L. Russian Hard Facing Process. Commonwealth Engineer, v. 48, Oct. 5, 1960, p. 48.

Machine components are hard faced using a cellular low-carbon steel electrode containing the hard facing alloy (10% C, 16% Mn, 1.5% Si, 18% Cr) in powder form. (L24, T7)

166-L. Vibratory Finishing Speeds Work on Metals and Plastics. F. D. Hodges. Iron Age, v. 187, Jan. 26, 1961, p. 72-73.

Deburring Al castings, carbon steel, wrought Cu and glass filled melamine parts by a vibratory process in which a vibratory action of a simple container loaded with abrasive media causes a rotary motion that finishes the workpieces. (L10; Al, CN, Cu, NM-d)

167-L. Technical Developments of 1960. Nathaniel Hall. Metal Finishing, v. 59, Jan. 1961, p. 36B-36K, 93.

Review of cleaning, pickling, mechanical, chemical and electrolytic polishing, barrel finishing, anodizing, surface treatment, coating and plating methods for Mg, Al, Zr, Cu, Ti, Au,

Ag, Zn, Sn, brass, bronze and stainless steel. 386 ref. (L-general)

168-L. Organic Finishing Developments of 1960. Daniel A. Marino. Metal Finishing, v. 59, Jan. 1961, p. 36L-36P, 93.

Review of application and testing methods for vinyl and epoxy resins, urethane, fire retardant paints and porcelain enamel finishes on Al and Mg. 123 ref. (L26; Al, Mg)

169-L. Developments in Fluid Bed Coatings. Peter W. Sherwood. Metal Finishing, v. 59, Jan. 1961, p. 42-44.

Complex shapes, glass and steel are coated with plastic resins by a fluid bed process in which a fine plastic powder is blown with nitrogen or air to form a uniform solids-in-gas suspension inside the coating vessel and the object to be coated is submerged therein. (L26p, ST)

170-L. Rhodium Plating Costs. J. Newton Perham. Metal Finishing, v. 59, Jan. 1961, p. 48.

Current density, plating time, cost and weight of Rh platings is calculated for electroplating of an item honing a 100 sq. in. surface area. (L17; Rh)

171-L. Ball Burnishing. Automatic Machining, v. 22, Jan. 1961, p. 39.

Change from steel to carbide balls for burnishing and sizing holes in Al alloy impact forgings results in closer tolerances and greater production. (L10; Al-b, 4-51)

172-L. Barrel Finishing. Automatic Machining, v. 22, Jan. 1961, p. 45-47.

Use of barrel finishing for descaling, deburring, rust removal, generation of radii, surface finish refinement and stress relief operations. (L10d, G23)

173-L. Advances in Materials and Processes Discussed at 22nd PEI Forum. Metal Products Manufacturing, v. 18, Jan. 1961, p. 39-41, 92.

Review of one-coat enameling techniques for decarburized and stainless steels with emphasis on pickling rate as related to weight loss and adherence. Low temperature enameling. (L26, L27, 1-67, L12g; CN-g, SS)

174-L. Evolution of an Infra-Red Porcelain Enameling Furnace. Metal Products Manufacturing, v. 18, Jan. 1961, p. 55-56, 92.

Al sheet, extrusions and castings are porcelain enameled using an Au-lined furnace with an infra-red oven using quartz lamps for firing. (L27; Al, 4-53, 4-58, 5)

175-L. (Spanish.) Use of Molybdenum Bisulphide in Gears and Mechanisms. Francois Gourmel. Metalurgia y Electricidad, v. 24, Dec. 1960, p. 86-88.

Surface treatment of gears by spraying with MoS_2 followed by mechanical polishing or buffing with a paste which also contains MoS_2. The mechanical treatment produces heat which causes the sulphide layer to adhere, thereby increasing wear resistance. (L23, L10, Q9n, T7a)

176-L. (Spanish.) Electrolytic Polishing. Pt. 1. R. Mondon. Metalurgia y Electricidad, v. 24, Dec. 1960, p. 89-96.

Mechanisms of electrolytic polishing. Measurement of friction, wear and corrosion resistance on polished surfaces of steel parts. (L13p, Q9, R-general; ST)

177-L. Electrodeposition of Nickel-Copper Alloys From the Pyrophosphate Bath. S. K. Panikkar and T. L. Rama Char. Journal of Scientific & Industrial Research, v. 19A, Oct. 1960, p. 510-517.

Effect of different variables on alloy composition, cathode efficiency and cathode potential with optimum conditions given for obtaining alloy deposits of 18-55% Ni. X-ray studies indicate that the alloy plates have the same structure as Ni and Cu deposited from the bath. (L17; Ni-b, Cu)

178-L. High Quality Chrome. Metal Industry, v. 97, Dec. 23, 1960, p. 515-518.

Equipment and layout of a plating plant at Jaguar Cars, Ltd., Coventry, England, for producing heavy Cu deposits on steel components and on other materials, Ni and Cr layers much thicker than are customarily met in the automobile industry. (L17, T21c; Cr)

179-L. Production of White-Metal-Lined Camshaft Bearings. Machinery, v. 97, Dec. 21, 1960, p. 1421-1423.

Linings of Pb, Sb and Sn bearing metal are bonded to lengths of steel tubing by a centrifugal casting process. The white metalled tubes are then

rough machined, punched, ground and bored. (L-general, E14; ST, Pb, Sb, Sn, 4-60)

180-L. (Russian.) Hydro-Cleaning and Hydro-Sand Blasting of Castings. L. P. Solovyov. Liteinoe Proizvodstvo, Oct. 1960, p. 22-23.

Efficiency in cleaning as affected by increased water pressure (100-150 atm.), sand additions to the stream of water and the consistency of the core mixture. 13 ref. (L10c; 5)

181-L. Comparative Investigations Into the Chemical and Mechanical Descaling of Rolled Wire, Taking Into Account the Machineability During Subsequent Cold Forming Processes. D. M. Buch. Wire, Dec. 1960, p. 225-232.

Descaling of wire by bending and pickling. Effect of the descaling method on the machinability, taking into account the drawing properties, conditions during galvanizing and cold deformation during bending. (L10, L12, G17k; 4-60)

182-L. Choosing Between Zinc and Cadmium Electroplate for Corrosion Protection of Major Appliance Components. Stanley J. Beyer. Plating, v. 47, Dec. 1960, p. 1361-1363.

Steel appliance components are Zn and Cd plated to protect parts from atmosphere and high humidity. Subsequent chromate coatings provide additional protection. Cd and Zn coatings are compared as to ductility, solderability and susceptibility to embrittlement. (L17, Q23p, Q26s; ST, Cd, Zn, Cr)

183-L. Decorating Anodized Aluminum. Ralph A. Botosan. Plating, v. 47, Dec. 1960, p. 1364-1367.

Al is sulphuric acid anodized, dyed and sealed to produce an abrasion resistant, weather resistant, decorative material. (L19n; Al)

184-L. Photographic Reproduction on Anodized Aluminum. K. S. Indira, A. Jogarao and B. A. Shenoi. Plating, v. 47, Dec. 1960, p. 1368-1371.

An absorbent layer of Al oxide produced by anodic oxidation of Al can be used as a carrier for photo sensitive substances to produce reproductions of all kinds. Detailed description of surface preparation, electrochemical cleaning and film formation methods. (L19; Al)

185-L. Close Control Gives Reproducible Values in Plating Gold Selectively. Otto F. Dingeldein. Plating, v. 47, Dec. 1960, p. 1372-1375.

Production of selectively plated deposits to required specifications after correlation of data on electrolyte agitation, electrolyte temperature, solution composition, electrode geometry and current density. Statistical methods are used to maintain results within narrow limits. (L17; Au)

186-L. Save $30,000 a Year Deburring Die Castings. Precision Metal Molding, v. 19, Jan. 1961, p. 51-52.

Substitution of batch blasting operation in place of individual handling. The matte surface obtained with the blast process provides improved paint adhesion. (L10; 5-61)

187-L. Vibratory Finishing. Precision Metal Molding, v. 19, Jan. 1961, p. 54-55.

Gentle and total agitation between the parts and media takes place in a vibratory hopper which is loaded with parts, media, compound and water as in conventional barrel finishing. The hopper however does not rotate. Among the advantages of this process is an increase in fatigue life of parts due to the absence of stress concentrations caused by the violent agitation of the media in barrel finishing. (L10c)

188-L. Clad Steel: Strength Plus Economy. William J. Powers. Chicago Purchasor, v. 39, Jan. 1961, p. 47-52.

Bonding of plain carbon steel or low alloy steel sheets to high alloy and heat resisting material by pack rolling to produce corrosion resistant, high strength laminates. Specifications for fabrication and flame cutting. (L22, F23, F22g, Q-general; SS, SGA-h, AY, CN)

189-L. Immersion Finish for Trophies. American Jewelry Manufacturer, Jan. 1961, p. 12-13.

Small figures cast in 95-5 Zn-Al or 15% Sb-Pb alloy electroplated with Cu and Ni are surfaced with 24-k. Au by immersion plating. Au deposition occurs through ionic displacement in a

self-stopping process which requires only pH and temperature control with no need for electric current. (L16; Pb-b, Zn-b, Au)

190-L. The Electrodeposition of Precious Metals. P. G. L. Vivian. Product Finishing, v. 14, Jan. 1961, p. 62-67.

Degreasing, washing, pickling, plating and final treatment of Au, Rh and Pd coatings. Data for thickness, adhesion, hardness, porosity and purity of the deposits. (L17, L-general; Au, Pd, Rh)

191-L. Fluid Bed Coating. Product Finishing, v. 14, Jan. 1961, p. 88-91.

Outline of fluidized bed coating, a process in which a fine plastic powder is blown with nitrogen or air to form a solids-in-gas suspension inside the coating vessel. The object to be coated is submerged into this fluid bed under conditions which cause the plastic powder to adhere to its surface. (L26p)

192-L. From Cotton to Convertors. G. D. Broadfoot. Product Finishing, v. 14, Jan. 1961, p. 97-100.

Forming, degreasing, washing and electrostatic enamel spraying of Zn plated sheet steel for heater components. (L26n; ST, 4-53, 8)

193-L. I. M. F. One Day Symposium on Nickel/Chrome Plating. Product Finishing, v. 14, Jan. 1961, p. 101-102.

Review of papers on meeting specifications in Ni-Cr plating, developments in decorative Cr plating, Ni-Cr plating of steel, Cu alloys and Zn die castings and mechanisms of brightening and levelling. (L17; Cr, Ni)

194-L. Electrolytic Polish for Lead Telluride. P. H. Schmidt. Electrochemical Society, Journal, v. 108, Jan. 1961, p. 104-105.

Lead telluride is successfully electropolished in a solution of 100 ml. 85% phosphoric acid containing 10 g. chromic acid at 90-105° C. at a current density of about 3 amp/cm^2. 7 ref. (L13p; Pb, 14-68)

195-L. (German.) Chemical Problems in Electroplating. H. W. Dettner. Angewandte Chemie, v. 72, Oct. 7, 1960, p. 740-744.

Reaction mechanism of and techniques for bright electroplating of Ni, Cu, Zn, Cd, Cr, Ag and Au with emphasis on Ni. Theories to explain levelling effect of electrolytes on metal surfaces. Replacement of cyanide electrolytes by nonpoisonous complex formers. Electroplating of base metals such as Al, Ti and others. (L17)

196-L. Metallizing Gives Worn Parts New Life. Power Transmission Design, v. 2, Dec. 1960, p. 31-33.

Rebuilding worn components including gears, bearing surfaces, drive shafts and other bus and subway components by spraying with steel, Al, Pb, Zn and other common metals and alloys which have been vaporized by an oxy-acetylene flame. (L23, T21d; Al, Pb, ST, Zn)

197-L. Rhodium Plating to Specification. R. R. Benham. Platinum Metals Review, v. 5, Jan. 1961, p. 13-18.

Specifications and recommended procedures for the Rh plating of Ag, Cu, steel and Al components for electrical and electronic applications. Recommendations for Rh thickness and electrolyte composition. (L17; Ag, Al, Cu, ST, Rh)

198-L. (French.) The Treatment of Zamak. H. Richter. Galvano, v. 29, Oct. 1960, p. 577-586.

Electrolytic degreasing, alkaline Cu coating, nickeling and chroming of a Zn die-casting alloy. Effect of bath composition and plating variables on plating thickness and quality. (L17, L13; Zn-b, Cu, Cr, Ni)

199-L. Preparation of Tags for Soldering. Tin and Its Uses, no. 50, 1960, p. 10-12.

The electrodeposition of Sn on Cu, brass or steel tags using an acid stannous sulphate electrolyte at 20° C. Tags are then immersed in hot oil in paraffin. Advantages of precise control of Sn coating thickness and good solderability are attributed to the process. (L17; Cu-n, ST, Sn)

200-L. (French.) Enamelled Copper Conductors for Electrical Construction. Cuivre-Laitons-Alliages, Sept-Oct. 1960, p. 15-19.

Types and principal constituents of insulating varnishes for enameling

electrical conductors. Comparison of dielectric, mechanical, chemical, dimensional and economic characteristics. Thermal classification. (L26, T1; Cu, 17-57)

201-L. Nickel-Silver Brazing Saves $2600. Welding Design & Fabrication, v. 34, Jan. 1961, p. 66.

Repair of worn teeth on the cast iron bull gear of a ball mill by build up with a flux-coated Ni-Ag alloy. Gear is preheated to 600° F. and brazed in alloy flux at 1480-2200° F. using an oxy-acetylene torch. Brinell hardness is increased from 110 to 200 by work hardening. (L24, 18-72, T7a)

202-L. How to Apply Ballizing. Metalworking Production, v. 105, Jan. 11, 1961, p. 59-62.

Sizing and finishing holes in metal by ballizing, a process in which an oversize precision ball is pressed through the unfinished hole to burnish and refine the surface structure. (L10d)

203-L. Vitreous Enameling of Aluminum Is Fast Growing Industry. Arthur Q. Smith. Industrial Gas, v. 39, Jan. 1961, p. 8-9.

Cleaning, enameling and firing procedures for pure Al and several Al alloys with special emphasis on furnace size and design. (L27; Al-b)

204-L. (Hungarian.) Experimental Production of Corrosion-Resistant Titanium Films by Electroplating. P. Csokan and F. Simon. Magyar Kemikusok Lapja, Oct. 1960, p. 442-445.

Electroplating of Ti in solutions of H_2O, of organic compounds such as TiF_3, $TiCl_3$ and of a salt containing K_2TiF_6, using Zn, Al, Fe or Cu as cathode and Pt or C as anode. Quality and quantity of Ti obtained as dependent on current, potential, solution composition. Solution melting point, temperature and time. (L17, R-general; Ti)

205-L. (Czech.) Concentration Changes in Chemical Conversion Coating and Electroplating Baths. Z. Krejci. Strojirenstvi, v. 10, Nov. 1960, p. 838-842.

Concentration computations based on surface area of parts, quantity of solvent adhering to surface unit, concentration of solute adhering to surface unit, starting concentration of bath and concentration changes by evaporation or adsorption on tank walls and components. Concentration as a function of treatment time. 6 ref. (L14, L17a)

206-L. (Czech.) Cladding of Steel With Plastics. Pt. 2. Frantisek Wiesner and Marcela Zezulova. Hutnicke Listy, v. 15, Dec. 1960, p. 971-978.

Cladding of wires by extrusion of half-liquid plastic material while passing the wire through a die. Cladding of heavy parts by sand blasting, application of an adhesive, heating and immersion in molten plastic. Internal cladding and bandaging of pipes. 16 ref. (L22; ST, NM-d30)

207-L. Good Metal Cleaning is Essential. Ceramic Industry, v. 75, Dec. 1960, p. 43-45, 59.

Cast iron, sheet steel and Al are cleaned of oil, grease, pigments, drawing compounds, scale, rust and other oxide films by alkaline cleaners, pickling, deoxidizing, rinsing, neutralizing and drying. New cleaning developments and properties of alkaline cleaners. (L12; Al, CI, ST)

208-L. Report of the Corrosion and Metal Finishing Exhibition, 1960. Corrosion Technology, v. 7, Dec. 1960, p. 385-386, 390.

Finished steel pliable to 180° and autogenously weldable without deterioration of its corrosion resistant qualities after it is coated by the Kenderization process. Industrial cladding by means of a fused plastic coated sheet. Reduction of friction by tin-nickel plating. (L-general, K9s, R-general; ST, Sn, Ni)

209-L. Vitreous Enameling Aluminum. Metal Industry, v. 98, Jan. 6, 1961, p. 7-9.

Production of frits which fire at 560° C. for enameling Al. Application of frit to obtain glass, matte or semimatte finishes in several colors. (L27; Al)

210-L. Molds for Plastics. Copper, no. 10, Winter 1960, p. 2-4.

Electro forming of Cu hollow or cavity molds for use in molding polyvinyl chloride (P.V.C.) and plastic articles. (L18, W19g; Cu, 17-57)

211-L. Centrifugal Force Adds Luster to Barrel Tumbled Parts. R. R. Irving. Iron Age, v. 187, Feb. 2, 1961, p. 84-85.

Centrifugal force is incorporated by a turret which rotates in a counter-clockwise direction at 270 rpm. while the individual barrels move in the opposite direction at only 80 rpm. The barrels are lined with neoprene to keep the parts from abrading. (L10d)

212-L. The Plasma-Arc Torch--Five Years of Evolution. R. M. Gage and J. F. Pelton. American Society of Mechanical Engineers, Paper no. 60-WA-311, Dec. 16, 1960, 5 p. $1.

Application of transferred and non-transferred plasma-arc torches to cutting and plating metals, plating being accomplished by introducing molten metal into the gas stream and propelling it at high velocities as a spray against a surface to form metallic coatings. (L29, 1-52)

213-L. Arc Welding for Overlaying Steel. R. B. Hitchcock. American Society of Mechanical Engineers, Paper no. 60-WA-324, Dec. 16, 1960, 8 p.

Submerged-arc and inert gas-shielded consumable electrode welding processes used to overlay carbon steel flat plates and cylinders with stainless steels and other high alloy materials. Controlled deposition techniques allow the build up of metal layers that have good finishability and resistance to corrosion and wear. (L24; CN, SS)

214-L. Finishing and Forming Aluminum Siding at Wall Master. Modern Metals, v. 16, Jan. 16, 1961, p. 82-83.

High-speed automated line chemically cleans, conversion coats and paints coiled Al stock, then slits and roll forms it to produce siding. (L12, L14, L26, G-general; Al)

215-L. (German.) Method for Extraction of Anodically Produced Tantalum Oxide Films on Tantalum in Terms of Their Capacity Change. G. Hahn. Metalloberflache, v. 14, Dec. 1960, p. 366-367.

Anodic oxidation of Ta sheets in 1% K_2SO_4 solution at 20° C. Stepwise extraction of formed oxide film in boiling 17.5-30% NaOH with capacity measurements made in 1% K_2SO_4 solution. (L19; Ta, 4-53)

216-L. (German.) Microscopic Observation During Deposition of Electrocoatings. Franz Rammele. Metalloberflache, v. 14, Dec. 1960, p. 373-379.

Polished specimens of MS 63 brass are Cd-electroplated in Cd cyanide and Cd sulphate solutions and simultaneously observed at 200 times magnification. Micrographs are taken to illustrate progress of Cd deposition. (L17, M21; Cu-n, Cd)

217-L. (German.) Investigation of Stability of High-Efficiency Brass Plating Solutions. O. Mudroch. Metalloberflache, v. 14, Dec. 1960, p. 380-384.

Current density and potential measurements are made with an anode of cast brass containing 63% Cu and 37% Zn and cathode of steel sheet during brass plating by CuCN, Zn $(CN)_2$ and NaOH containing electrolytes with varying Cu:Zn ratios and constant and varying free CN content. Stabilizing effect of NaCN. (L17a; Cu-n)

218-L. (German.) Electrical Insulating by Phosphate Coatings. Hans H. Reinsch. Metall-Reinigung+Vorbehandlung, v. 9, Dec. 1960, p. 214-218.

Process and machinery for insulating of transformer, generator and core sheets for electrical machines by dip phosphate coating. Testing of maximum insulating voltage for Zn phosphate coatings and alkaline earth metal phosphate coatings containing silicates. (L14b; SGA-n, ST)

219-L. Electroforming as a Quantity Production Method. T. P. Barbicane. Mass Production, v. 36, Nov. 1960, p. 67-70.

Advantages of electroforming for production of wave guides, precision bore tubing and other components requiring fine detail on interior surfaces. Use of permanent and extendable patterns. (L18)

220-L. Finishing Tips for Magnesium Missile Parts. E. I. Weed. Western Metalworking, v. 19, Jan. 1961, p. 23-25.

Corrosion protection finishing of AZ-91 Mg alloy structural parts by dichromate treatment, vinyl wash priming, coating with epoxy phenolic varnish and enamel and, in some cases, anodizing. (L26, L19, T24e; Mg-b, 4-57)

221-L. New Process Shows How Clean a Metal Can be. Western Metalworking, v. 19, Jan. 1961, p. 34.

Use of a new chemical cleaning process for Al alloys to produce greater uniformity of surface resistance and color, higher luster and negligible metal loss. (L12; Al-b)

222-L. Some Metallurgical Aspects of Hot-Dipped Tinplate. J. Le Bas. Australian Institute of Metals, Journal, v. 5, Nov. 1960, p. 246-253.

Application of the coatings; coating characteristics; testing techniques; typical defects. 5 ref. (L16; ST, Sn)

223-L. Prings Develop New "Plating Quality" Wire Plant. Wire Industry, v. 28, Jan. 1961, p. 51-52.

Heat treatment and pickling of steel wire and rod followed by coating with Cu on a versatile through system to produce a quality plating finish which may be hard, interannealed, wet-drawn or coppered with a medium or light weight coat. (L17, J-general, L12g; ST, 4-61)

224-L. How Zinc Fights Corrosion. Ernest W. Horvick. I/EC (Industrial and Engineering Chemistry), v. 53, Feb. 1961, p. 58A-60A.

Hot dip galvanizing, electrogalvanizing, metallizing and painting of steel structural members, tanks, roofing, wire and wire mesh to increase corrosion resistance and reduce maintenance in chemical industry applications. (L16, L23, L26; ST, Zn, 4-57)

225-L. Precision Finishing Parts by Vibration. G. D. DeVere Weston. Metalworking Production, v. 105, Jan. 18, 1961, p. 67-68.

Steel parts are finished in a rubber-lined trough filled with a mash of chips chemicals and water which vibrates at a variable high speed. (L10h; ST)

226-L. Oxidation Prevention During Forming. Metal Industry, v. 98, Jan. 20, 1961, p. 50.

Method of precoating metals used in aircraft production by spraying with Al or Cu to prevent oxidation and material loss during thermal treatment such as hot forming, stress relieving, heat treating or annealing. (L23, T24; Al, Cu)

227-L. Thirty-Five Years of Outplating Experience. Metal Finishing, v. 7, Jan. 1961, p. 5-10, 18.

Description of cleaning, barrel plating, burnishing, barreling polishing, drying and lacquering processes followed in a plating works. Design and layout of conveyor system, barrel shop, spin lacquering machines and disposal system. (L17, L10d, L26n)

228-L. Technical Developments and Advances in Nickel-Chromium Plating. W. G. L. Miller and D. Bouckley. Metal Finishing, v. 7, Jan. 1961, p. 11-18.

Review of specifications for Ni-Cr plating in the automobile industry with emphasis on test methods, causes of brittleness, blistering and contamination. (L17; Cr, Ni)

229-L. Metal Finishing Technology--A Student's Guide. Pt. 6. Metal Finishing, v. 7, Jan. 1961, p. 19-23, 31.

Electrochemistry of dissimilar metals such as Zn and Cu in contact with one another through an electrolytic solution. Application of theory to plating solutions. Effect of brighteners and other organic material. Internal stresses in deposits. (L17)

230-L. Institute of Vitreous Enamellers. Metal Finishing, v. 7, Jan. 1961, p. 26-31.

Review of papers on the influence of water vapor on adherence reactions between enamel ground coat and sheet iron; evaluation of Al enamels; spalling, durability and chemical resistance of Al enamels. (L27; Al, Fe)

231-L. (Japanese.) Hot Dip Aluminum Plating and Aluminizing. Masao Tagaya and Shigeteru Isa. Metal Finishing Society of Japan, Journal, v. 11, Oct. 1960, p. 506-511.

Steel strip is degreased, washed, pickled, pretreated either in an inert gas atmosphere or in a salt bath, aluminized and cooled. Data are given for structure, mechanical properties and corrosion resistance. (L16, L12; ST, Al, 4-53)

232-L. (Japanese.) Tin Plating. Kohzoh Yoshizaki. Metal Finishing Society of Japan, Journal, v. 11, Oct. 1960, p. 512-517.

Hot dip and electrolytic tin plating of steel strip by a sequence of operations including degreasing, pickling, annealing, plating, quenching and polishing. (L16, L17; ST, Sn, 4-53)

233-L. (Japanese.) Hot Dip Lead Plating. Boshin Ryo. Metal Finishing Society of Japan, Journal, v. 11, Oct. 1960, p. 518-521.

Steel is degreased, pickled with HCl and H_2SO_4 and immersed in a solution of $ZnCl_2$ and NH_4Cl, then dipped in a Pb melt bath covered with flux and cooled. Resulting platings are very resistant to corrosion. (L16; ST, Pb)

234-L. (Japanese.) Methods of Cementation. Shigetomo Uyeda. Metal Finishing Society of Japan, Journal, v. 11, Oct. 1960, p. 551-553.

Calorizing, sheradizing and chromizing techniques for steels. Applications. (L15; ST)

235-L. (Japanese.) Chronology of the Anodic Oxidation of Aluminum for the Last Ten Years. Takakado Nakayama. Metal Finishing Society of Japan, Journal, v. 11, Oct. 1960, p. 557-567.

Methods of chemical coating, chemical polishing, electrolytic polishing and anodic coating in H_3PO_4 bath for Al structures. (L19, L14, L12, L13p; Al, 4-57)

236-L. (Japanese.) Surface Hardening of Aluminum. Rihei Tomono. Metal Finishing Society of Japan, Journal, v. 11, Oct. 1960, p. 567-569.

Al is surface hardened by anodic oxidation in H_2SO_4 or HCH_2COOH bath at 1-4° C. and tested to determine resistance to heat, abrasion and corrosion. (L19, 1-67, R-general, Q9; Al)

237-L. (Japanese.) Anodic Oxidation of Optical Instruments. Matao Mitsui. Metal Finishing Society of Japan, Journal, v. 11, Oct. 1960, p. 571-574.

Al rod, sheet, pipe and die castings are anodic coated in H_2SO_4 bath to produce parts of the instruments. (L19; Al, 4-53, 4-60, 5-61)

238-L. (Japanese.) Trends in Anodic Oxidation of Aluminum. Toshio Fukushima. Metal Finishing Society of Japan, Journal, v. 11, Oct. 1960, p. 574-577.

Degreasing, chemical and electropolishing and anodic oxidation techniques for Al alloys. (L19, L12, L13; Al-b)

239-L. (Japanese.) Metallikon I--Theory and Protective Effects. Yoshibumi Mima. Metal Finishing Society of Japan, Journal, v. 11, Oct. 1960, p. 580-584.

Application of flame sprayed Al, Zn, Sn, Ni or Cu coatings to steel to prevent rusting. Data are given for tensile properties and wear, corrosion and heat resistance of the deposits. (L23, Q10c; ST, Al, Cu, Ni, Sn, Zn)

240-L. (Japanese.) Metallikon II--Thickening and Its Devices. Takuzoh Mitsuda. Metal Finishing Society of Japan, Journal, v. 11, Oct. 1960, p. 585-587, 589.

Flame spraying of machine components with a thick layer of carbon steel, 13 Cr high carbon steel or 18-8 stainless steel. Advantages and disadvantages of the process. (L23, T7; CN, SS)

241-L. (Japanese.) Cladding. Shigeru Asou. Metal Finishing Society of Japan, Journal, v. 11, Oct. 1960, p. 587-589.

Rolled mild steel slab is clad with hard stainless steel or high carbon toolsteel by hot or cold rolling, casting, sintering, intermelting or electric arc welding. (L22; CN, SS, TS, 4-52)

242-L. (Japanese.) Immersion Coating in Fluidized Plastics Bath. Masamitsu Nishioka. Metal Finishing Society of Japan, Journal, v. 11, Oct. 1960, p. 598-600.

Preheating temperature and time and composition of plastic as they affect adhesion of immersion plastic coatings on metals. (L16, Q10c)

243-L. (Japanese.) Vinyl Chloride Sol Coating. Masayuki Furuya and Ei-ichi Iida. Metal Finishing Society of Japan, Journal, v. 11, Oct. 1960, p. 600-603.

Metal surface is pickled, sand blasted, degreased and primed, then coated with vinyl chloride either by brushing, spraying or dipping. Applications. (L26p, L12)

244-L. (Japanese.) Recent Methods of Polishing and Honing. Naoharu Kinoshita. Metal Finishing Society of Japan, Journal, v. 11, Oct. 1960, p. 389-394.

Review of grit and sand blasting, buffing, honing and electrolytic polishing techniques for finishing metals. (L10c, L13p, L10a, G19n)

245-L. (Japanese.) Bright Plating. M. Nakamura, K. Saitoh and T. Hayashi. Metal Finishing Society of Japan, Journal, v. 11, Oct. 1960, p. 419-432.

Methods of Cu plating in a $CuSo_4$ bath, Ni plating in a $NiSO_4$ bath and Cr plating in a CrO_3 bath with added fluoride ion. Corrosion testing of Ni-Cr-Cu platings and double layered Ni-platings. (L17; Cr, Cu, Ni)

246-L. (Japanese.) Rust Preventive Platings. Boshin Ryo. Metal Finishing Society of Japan, Journal, v. 11, Oct. 1960, p. 432-438.

Review of Zn, Cd, Sn, Al and Sn alloy plating techniques for steel. Emphasis on composition of baths. Data for corrosion resistance, uniformity, conductivity and hardness of platings. (L17; ST, Al, Cd, Sn-b, Zn)

247-L. (Japanese.) Ornamental Platings. Kinzoh Sadakata. Metal Finishing Society of Japan, Journal, v. 11, Oct. 1960, p. 439-444.

Plating of jewelry with precious metals, Au, Ag, Pt and Rh to improve corrosion resistance, durability and brightness. (L17, T9s; Ag, Au, Pt, Rh)

248-L. (Japanese.) Industrial Chromium Plating. Tohoru Murakami. Metal Finishing Society of Japan, Journal, v. 11, Oct. 1960, p. 444-449.

Machine parts are Cr-plated in a CrO_3 bath containing K_2SiF_6 to improve corrosion and abrasion resistance. (L17, T7; Cr)

249-L. (Japanese.) Recent Advances in Electroforming. Takeshi Kojima. Metal Finishing Society of Japan, Journal, v. 11, Oct. 1960, p. 450-452.

Electrodeposition of Cu, Ni, Fe or Ag from salt solutions onto master patterns. Mechanical properties of deposits. Applications. (L18; Ag, Cu, Fe, Ni)

250-L. (Japanese.) Chemical Plating. Boshin Ryo. Metal Finishing Society of Japan, Journal, v. 11, Oct. 1960, p. 452-454.

Deposition of Ni, Cr or Zn from their salt solutions without use of electrolysis. History, electrochemical theory, composition of salt baths, plating procedure and regulation of baths. (L28; Cr, Ni, Zn)

251-L. (Japanese.) Plating Techniques. Yasuo Noda. Metal Finishing Society of Japan, Journal, v. 11, Oct. 1960, p. 462-466.

Base metal is polished, degreased, washed, dipped in acid or alkaline solution and plated in a filtered bath stirred by a vibrating cathode. (L17, L12)

252-L. (Japanese.) Recent Progress in Priming of Metals. Yoshitaro Nagai. Metal Finishing Society of Japan, Journal, v. 11, Oct. 1960, p. 478-480.

Bonderizing, chromating, phosphatizing and spraying are compared as methods of priming cold rolled sheet steel. Causes of rusting, blistering, mottling and orange peel defects. (L14; ST, 4-53)

253-L. (Japanese.) Painting Processes. Hisao Hachiya. Metal Finishing Society of Japan, Journal, v. 11, Oct. 1960, p. 481-486.

Degreasing, washing with demineralized water, bonderizing or priming, surfacing and electrostatic spray painting of metals. (L26n, L12, L14)

254-L. (Japanese.) Hot Dip Galvanizing. Haruo Gotoh and Kei-ichi Abe. Metal Finishing Society of Japan, Journal, v. 11, Oct. 1960, p. 501-505.

Techniques for galvanizing sheet, strip, wire, tube, tools, machine parts or rods composed of cast iron, malleable iron or steel. (L16, T7; CI, ST, 4-53, 4-60, 4-61)

255-L. Lacromatic Vibrator for Deburring and Polishing Metal Parts. Machinery (London), v. 98, Jan. 11, 1961, p. 78-79.

Gears, stampings and die castings are deburred and polished in a vibrator incorporating a U-shaped, rubber lined container which is oscillated through an elliptical path. Chips and components move relative to each other and also rotate as a complete mass. (L10d, T7a; 4-59, 5-61)

256-L. (Translation-ConBur.) The Physicochemical Processes of Enamelling Aluminum. K. P. Azarov and S. B. Grechanova. Glass and Ceramics, v. 16, Dec. 1960, p. 652-657.

Effect of temperature, coppering, oxidizing and phosphatizing treatments and oxide additions on the wettability of

phosphate enamel coatings on Al and the chemical reaction between the fusion and the metal. Swelling curves are given for phosphate enamels with 10% additions of Al powder. (L27; Al)

257-L. (Translation-ConBur.) Enamelling Steel and Cast-Iron Products in Chinese Factories. E. A. Antonova. Glass and Ceramics, v. 16, Dec. 1960, p. 686-689.

Enamelling of steel and cast iron chemical apparatus and domestic ware. Gravimetric composition analysis and property comparison of various frit and slip materials and priming and finishing enamels, with attention to acid resistance. (L27, T10, T29; ST, CI)

258-L. (Translation-ConBur.) Nickel Plating by Thermal Decomposition of Nickel Tetracarbonyl Vapor. A. M. Verblovskii and A. L. Rotinyan. Journal of Applied Chemistry of the USSR., v. 33, Jan. 1960, p. 98-104.

Preparation of steel surfaces for coating. Rate of formation of coatings as a function of temperature. Chemical composition, structure, porosity, hardness and corrosion resistance of Ni coatings on steel. 16 ref. (L25, Q29n, M27, R-general; ST, Ni)

259-L. (Translation-ConBur.) The Occlusion of Sulphur in Electroplated Metals. A. A. Sutyagina. Academy of Sciences of the USSR., Proceedings, Physical Chemistry Section, v. 131, Mar-Apr. 1960, p. 227-230.

Effect of surface-active agents containing sulphur on the structure and properties of electroplated Ni, Co, Zn and Cu. 9 ref. (L17; AD-p, Co, Cu, Ni, Zn)

260-L. (Translation-ConBur.) Study of Cathodic Films Obtained in the Electrolysis of Chromic Acid. A. N. Sysoev, N. T. Diobantseva and O. A. Platonina. Journal of Applied Chemistry of the USSR., v. 33, Feb. 1960, p. 368-373.

Composition, mechanical properties and dynamics of formation of cathodic Cr films using Cu on steel cathodes and Pt or Pb anodes. 15 ref. (L17; Cu, ST, Cr)

261-L. (Translation-ConBur.) An Attempt to Introduce the Radioactive Isotope W^{185} Into an Anodic Coating of Al_2O_3 During Its Formation. A. F. Bogoyavlenskii and G. N. Dobrotvorskii. Journal of Applied Chemistry of the USSR., v. 33, Feb. 1960, p. 338-341.

Specimens are stamped from sheet duralumin, grade D16AT, degreased and subjected to anodic passivation in Na_2CO_3 solution containing radioactive W^{185} in the form of WO_4^{-2} ions. W^{185} content of the coating is determined with a B-2 apparatus using an end-face counter. 6 ref. (L19; Al)

262-L. (Translation-ConBur.) Chrome Plating of Aluminum With Superimposition of Alternating Current on Direct Current. A. F. Bogoyavlenskii, B. E. Ivanov and V. L. Khudyakov. Journal of Applied Chemistry of the USSR., v. 33, Feb. 1960, p. 364-367.

Study of rectifying effect of the cell with a standard Cr electrolyte and an Al cathode; polarization of the Al cathode in the Cr electrolyte on superimposing the alternating current on the efficiency, microhardness of the cathodic deposit and strength of its bonding with the base metal. (L17; Al, Cr)

263-L. Cleaning, Polishing and Metal Protection. Frank H. Slade. Food Processing & Packaging, v. 29, Nov. 1960, p. 409-411.

Methods and equipment for jet cleaning, grit and soap polishing and Cr or P-Ni electroplating of machinery made of stainless, mild or alloy steel, cast iron, Al, Cu, Ti, U, Zr, glass and ceramics. (L12e, L10c, L17; Al, AY, CN, Cu, SS, Ti)

264-L. Ultrasonic Cleaning Cuts Service Cost. George Spasink. Ultrasonic News, v. 4, Winter 1960, p. 5-6.

Cast iron castings are cleaned at 140° F. by an ultrasonic generator with 16 Type B transducers, rinsed with hot water and dried by compressed air. Rust caused by cleaning is removed with oil. (L10f; CI, 5)

265-L. Physics of Ultrasonic Cleaning. L. D. Rosenberg. Ultrasonic News, v. 4, Winter 1960, p. 16-20.

Mechanisms during ultrasonic cleaning of Al, Pb, Au, ceramics, plastics and varnish are examined by high-speed photography to study acceleration, erosion, bubble penetration and bubble coalescence as affected by temperature,

solubility coefficient and cavitational noise pressure. (L10f; Al, Au, Pb)

266-L. (German.) Grinding and Polishing in Drums. Werner Ulrich and Hans Pimishofer. Fertigungstechnik und Betrieb, v. 10, Dec. 1960, p. 728-731.

Deburring, polishing and grinding of die castings and forged and stamped parts of Fe, steel, Cu, Zn or Al in steel or wooden drums, using stones or metallic bodies and chemicals as grinding media. Operation experiences; limit of applicability. (L10d; Al, Cu, Fe, ST, Zn)

267-L. Barrel Finishing Die Castings. Precision Metal Molding, v. 19, Feb. 1961, p. 43-44.

Barrel finishing Zn die castings using a new finishing compound which was developed to hold better color and improve luster and a special chip which cuts moderately without gouging or peening soft metal. (L10d; Zn, 5-61)

268-L. Jewelry Finish Plating on Zinc Die Castings. Jossel Gerber. Precision Metal Molding, v. 19, Feb. 1961, p. 45-46.

Die design and casting technique as they affect plating finishes. Casting, trimming, polishing and Cu plating methods. (L17; Zn, Cu, 5-61)

269-L. Chromate Coating Has High Corrosion Resistance. Australasian Manufacturer, v. 45, Dec. 24, 1960, p. 21.

Chromate conversion coating process for treating Al and Al alloys produces coating with high corrosion resistance, low electrical resistance and good paint bonding properties. Intensity of coating color is controlled by the immersion time and the pH of the solution. (L14c; Al-b)

270-L. Two Million Pounds of Nickel Anodes Annually. Products Finishing, v. 25, Feb. 1961, p. 58-60.

Automobile bumper parts and springs are Cr and Ni plated in an automatic operation which includes cleaning, rinsing, etching and plating. (L17, T21a; Cr, Ni)

271-L. Plating--A Vital Part of Aircraft Engine Overhaul. Ezra A. Blount. Products Finishing, v. 25, Feb. 1961, p. 42-55.

Outline of Ag, Pb-Sn, Cr, Cu and Cd plating procedures for refinishing aircraft engine components to original specifications. (L17, T24a; Ag, Cd, Cr, Cu, Pb, Sn)

272-L. An Efficient Painting System in 6000 Square Feet. Products Finishing, v. 25, Feb. 1961, p. 72, 74, 76.

Stamped steel parts are painted and finished on a conveyorized finish baking line with a phosphatizing machine, dry-off oven, prime electrostatic booth, double finish electrostatic unit and finish-baking oven. (L26n; ST, 4-59)

273-L. Improve Your Phosphate Coatings. David L. Cramer, Hal Frost, George Pimbley, Archie K. Beard and Robert Jackson. Products Finishing, v. 25, Feb. 1961, p. 78-86, 90, 92, 94.

Metallurgical conditions, bath temperature and composition, sludge contamination and rinsing as they affect the quality of phosphate coatings on Fe, Al, Mn and Zn. Specifications for coating weight. (L14b; Al, Fe, Mn, Zn)

274-L. Weight-Buffing: A Precision Operation. Grinding and Finishing, v. 7, Feb. 1961, p. 34-35.

Buffing and polishing of nonmagnetic stainless steel alloy weights using an automatic machine with 24 spindles on which weights are placed. Rotation of spindles carries weights to the buffing wheels. (L10a; SS)

275-L. The Phosphate-Coating and Lubricating of Steel for Cold Extrusion. D. James. Machinery (London), v. 98, Jan. 18, 1961, p. 137-139.

Discussion of simple immersion, tipping basket, transfer type and rotary barrel methods of phosphate coating and lubricating for mild and Ni, Cr, Mo alloy steels. (L14b, G5, 18-73; AY, CN)

276-L. (Czech.) Dip Aluminum Plating of Cast Iron. Karel Janecky. Slevarenstvi, v. 8, Dec. 1960, p. 446.

Iron castings are sand or shot blasted and dipped in an Al bath at 700-900° C. Effect of bath temperature, dipping time and the ratio of bath volume/cast iron volume on the uniformity and thickness of platings, thickness of diffusion layer and corrosion resistance. (L16; CI, Al, 5)

277-L. Pickling and Descaling of High-Strength, High-Temperature Metals and Alloys. J. A. Gurklis and L. D. McGraw. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 85, Feb. 8, 1961, 16 p. (Available as PB 161235 from U. S. Office of Technical Services, Washington 25, D. C.)

Cleaning of Be, Ti, Mo, Cb, Ta, W, V and highly alloyed metals such as stainless steel and Ni, Co and Fe base alloys using H_2SO_4, HCl, HF and HNO_3 in pickling and sodium hydroxide in descaling. Temperature, agitation, chemical properties of metals and surface desired are influencing factors. 28 ref. (L12g, L12k; SGB-a, SGA-h)

278-L. New Surfacing Process Uses Oxy-acetylene Flame. Materials in Design Engineering, v. 53, Feb. 1961, p. 17.

Brazing and hard surfacing of pistons, valves and saw blade guides using a new oxy-acetylene process in which powdered alloys of Ag, Co and Fe are sprayed and fused onto base metal by an oxy-acetylene flame. (L24, K8; Ag, Co, Fe)

279-L. Evaluation of Electrodeposited Coatings. Lester F. Spencer. Metal Finishing, v. 59, Feb. 1961, p. 38-44.

Review of electrolytic, magnetic, radiation and chemical methods for determining thickness, uniformity, structure, porosity and adhesion of electrodeposited coatings. 78 ref. (L17c)

280-L. Finishing and Marking of Meter Dials. James Lind. Metal Finishing, v. 59, Feb. 1961, p. 45-49.

Description of enameling, baking and printing techniques used in finishing Al, brass and steel dials. (L26n; Al, Cu-n, ST)

281-L. Hardness of Electroless Nickel Deposits. Larissa Domnikov. Metal Finishing, v. 59, Feb. 1961, p. 52-54.

Review of Russian experiments concerning the effect of heat treatment conditions on microhardness of Ni-P coatings on steel parts. X-ray analysis is used to study phase transformations in the Ni-P deposits. 5 ref. (L17c, Q29q, 2-64, S11p; ST, Ni)

282-L. Anodizing Aluminum Alloys. Irving Machlin and Neal J. Whitney. Metal Finishing, v. 59, Feb. 1961, p. 55-57.

Measurement of thickness, abrasion resistance, dielectric breakdown strength, Knoop indenter penetration and salt spray corrosion resistance of thick anodized coatings on 2024-T3 and 6061-T6 alloys. (L19; Al-b)

283-L. Science for Electroplaters. Pt. 63. Nickel Plating. L. Serota. Metal Finishing, v. 59, Feb. 1961, p. 61-64.

Detailed explanation of plating mechanisms in the Watts bath, with emphasis on the action of $NiSO_4$, $NiCl_2$ and boric acid. (L17a)

284-L. Flame Spraying of Alumina. National Bureau of Standards, Technical New Bulletin, v. 44, Dec. 1960, p. 202-203.

Flame deposition of heat resistant coatings on glass, platinum and stainless steel using an air gun at very high temperature. Data are given for bond strength, thermal properties and thickness of coating as a function of temperature, pressure, particle velocity and cooling characteristics. Application to jet engine components. (L23; Pt, SS, NM-f42, Al)

285-L. Determination of the Thickness of Thin Porous Oxide Films on Aluminum. M. S. Hunter and P. F. Towner. Electrochemical Society, Journal, v. 108, Feb. 1961, p. 139-144.

Measurements of film thicknesses down to 7 Å. are made by a technique employing interferometry and precisely controlled anodic oxidation. Applications of the method in measuring film growth in various solutions and electrolytes. 11 ref. (L19, S14; Al)

286-L. A Study of Pore Structures on Anodized Aluminum. I. A. Renshaw. Electrochemical Society, Journal, v. 108, Feb. 1961, p. 185-191.

Presence of surface oxide films on Al prior to anodizing in a pore-forming electrolyte can reduce the number of surface pores and the surface roughness as compared to that normally obtained with fresh Al surfaces. 15 ref. (L19, 9-68; Al)

287-L. (Book.) Institute of Metal Finishing, Transactions, 32, Great Ormond St., London, W. C. 1, England, v. 36, 1958-1959, 246 p.

Papers presented at the 34th Annual Conference on Metal Finishing. Papers

abstracted separately. Topics include mechanical, chemical and electrochemical cleaning and chemical conversion, chemical reduction, electroplating and synthetic resin coating. Technological parameters of processes; properties of coatings. (L-general, A-general)

288-L. The Properties of Nickel Electrodeposited From Sulphamate Bath. D. A. Fanner and R. A. F. Hammond. Institute of Metal Finishing, Transactions, v. 36, 1958-1959, p. 32-42.

Effect of plating variable, acidity, current density and temperature on the internal stress and microstructure of Ni sulphamate deposits. Tensile properties and their effect on fatigue strength of EN 25 (Ni-Cr-Mo) steel are compared with properties of Watts bath deposits. 18 ref. (L17, Q7; ST, Ni)

289-L. The Analysis of Nickel Sulphamate Plating Solutions. G. H. Bush and D. G. Higgs. Institute of Metal Finishing, Transactions, v. 36, 1958-1959, p. 43-47.

Spectrophotometric, polentiometric, absortimetric and titrimetric methods for determination of total N, free NH_4, Ni, H_3BO_3, Cl and 1:3:6 trisulphonic acid in Ni sulphamate plating solutions; examples for analysis of synthetic mixtures. 6 ref. (L17a)

290-L. Hardness of Electrodeposited Speculum Metal and Other Tin-Copper Alloys. V. R. Ramanathan. Institute of Metal Finishing, Transactions, v. 36, 1958-1959, p. 48-50.

Effect of deposit composition on hardness of Sn-Cu alloys containing 10-86% Sn electrodeposited on brass plates. Homogeneity, isotropy, compactness and thickness values are determined with hardness by diamond pyramid microindentation. 4 ref. (L17c; Cu-b, Sn-b)

291-L. Bronze Plating From Modified Stannate Cyanide Baths. W. T. Lee. Institute of Metal Finishing, Transactions, v. 36, 1958-1959, p. 51-57.

Variation in composition of bronze deposits with solution composition and plating variables, including solution metallic content, carbonation, free cyanide and soda, time, temperature and cathode density. Methods for achieving correct balance of anode and cathode efficiencies. Effect of using K and Li based solutions. Comparison with quality of Cu and Ni plating. 8 ref. (L17; Cu-s)

292-L. An Electro-Chemical Method of Obtaining an Index of Porosity of Metal Coatings. M. Clake and S. C. Britton. Institute of Metal Finishing, Transactions, v. 36, 1958-1959, p. 58-66.

Porosity of coatings of Sn, Sn-Ni alloy, speculum, Cu and Ni on steel is determined in an electrolytic solution by measuring the corrosion occurring in the base metal at pores in the coating under the influence of anodic polarization. The ratio of shift of potential to applied current in the solution is measured as an index of porosity. 5 ref. (L17c, P10m; ST, Cu-b, Sn-b, Ni, 8-62)

293-L. Some Experimental Observations on the Effect of Addition Agents on Stress and Cracking in Rhodium Deposits. F. H. Reid. Institute of Metal Finishing, Transactions, v. 36, 1958-1959, p. 74-81.

The effects of Al and Mg sulphate, Cu and selenic acid on internal tensile and compressive stress and cracking of Rh deposits from sulphate electrolytes are measured electrographically and by deflection tests on flexible Be-Cu strip cathodes. 7 ref. (L17c, Q25, Q26; Rh)

294-L. Electroless Palladium Plating. Richard N. Rhoda. Institute of Metal Finishing, Transactions, v. 36, 1958-1959, p. 82-85.

Deposition of Pd by chemical reduction on catalytic surfaces composed of metals, alloys and ceramics using a plating solution containing as essential ingredients a palladium-amine complex, a reducer and a stabilizing agent. Pure Pd deposits of good ductility, adherence, freedom from blistering on heating and of uniform thickness are attributed to the process. (L28; Pd)

295-L. The Properties of Bright Nickel Electrodeposits in Relation to the Period of Service of the Plating Bath. Pt. 3. Composition and Microstructure. J. Edwards. Institute of Metal Finishing, Transactions, v. 36, 1958-1959, p. 86-92.

Determination of C, O, H and N contents of bright Ni deposits from two proprietary solutions by vacuum extraction and vacuum fusion analysis. Effect of organic material incorporated in the bath due to extended service life and of stress reducing additions on deposit ductility, inclusion content, microstructure and internal stress. 3 ref. (L17a, L17c; Ni)

296-L. Electrodeposition of Copper-Nickel Alloys From Citrate Solutions. B. H. Priscott. Institute of Metal Finishing, Transactions, v. 36, 1958-1959, p. 93-96.

Hardness, uniformity, contractile stress, soundness, composition and adherence examined for Cu-Ni alloys deposited from solutions containing Cu and Ni sulphates and tri sodium citrate with a small sodium chloride addition. Effect of solution concentration pH variation, temperature, current density, electrode efficiency and throwing powers on deposit properties. 4 ref. (L17c; Cu-b, Ni-b)

297-L. Developments in Metal Pre-Treatment. R. E. Shaw. Institute of Metal Finishing, Transactions, v. 36, 1958-1959, p. 107-112.

Survey of mechanical and chemical cleaning, conversion coating and surface sealing processes for preparing steel, Al and Zn surfaces for finishing treatments, with particular reference to painting. 12 ref. (L10, L12, L19, 10-54; Al, ST, Zn)

298-L. The Impact of Organic Chemistry on Metal Finishing. R. L. Yeates. Institute of Metal Finishing, Transactions, v. 36, 1958-1959, p. 119-127.

Review of developments in organic finish formulation particularly in the use of synthetic organic chemicals, including nitrocellulose, solvents, plasticisers, phenolic, alkyd, amino, epoxide, vinyl, styrenated, acrylic, polyurethane, polyester and silicone resins. Summary of properties and applications in the automobile and aircraft industries and in the production of other consumer goods. 5 ref. (L26p)

299-L. Anodized Aluminium Mirrors. J. J. Dale, L. H. Esmore and I. J. Howell. Institute of Metal Finishing, Transactions, v. 36, 1958-1959, p. 128-134.

A procedure based on anodizing, stripping and re-anodizing is developed to produce mirror surfaces on super pure Al for use in a camera telescope. The surface quality of the mirror is judged satisfactory for the purpose, but is characterized by a ripple or orange peel effect caused by grain coarsening and preferred orientation and is accentuated by electrochemical treatment. Photographic and X-ray diffraction methods are used to assess and record the severity of the ripple. 8 ref. (L19, 9-71; Al)

300-L. Recent Advances in Fused Plastic Coatings for Metals. D. E. J. Cunningham. Institute of Metal Finishing, Transactions, v. 36, 1958-1959, p. 189-197.

Review of thermoplastic and thermosetting compounds and other synthetic resins used to form homogeneous fused coatings on metals, in particular, steel. Applications and fabrication technique including flame spraying and powder spraying and dipping. Data are given for physical, mechanical and chemical properties and corrosion, heat, abrasion and impact resistance characteristics. (L26p, 17-52; ST)

301-L. Some Techniques in Studying Rates of Deposition and Formation of Inorganic Films on Metal Surfaces. H. R. Thirsk and W. F. K. Wynne-Jones. Institute of Metal Finishing, Transactions, v. 36, 1958-1959, p. 198-202.

Review of relaxation methods including potential step, current step, galvanostatic and a-c. techniques for studying the electrochemical kinetics of metal deposition. Theoretical determination of rate constant, exchange current, transfer coefficient interface potential difference and reaction stoichiometry as a function of time, concentration, current density, polarization and other variables. Application to deposition of Ag, Cu, Zn and Cd and inorganic films. 18 ref. (L17b, P13, P15; Ag, Cu, Zn, 14-62)

302-L. Sealing Anodic Oxide Films on Aluminium. G. C. Wood. Institute of Metal Finishing, Transactions, v. 36, 1958-1959, p. 220-229.

Review of the literature on anodic oxide film formation, structures and composition and sealing methods. Theoretical analysis of sealing mechanisms using physical and electrical models. Summary of electrical, permeability, corrosion, abrasion, dye absorption, weight charge and metallographic studies. 127 ref. (L19, M-general, P-general; Al, 8-73)

303-L. The Application of Tin Coatings in the Manufacture of Tinplate. G. E. Jones. Paper from "Production of Wide Steel Strip". Iron and Steel Institute, London, England. May 1960, p. 151-160.

Operation and advantages of alkaline, acid-ferrostan and acid-halogen electrolytic Sn plating lines. Review

of hot dip tinning processes. (L16, L17; ST, Sn, 4-53)

304-L. Galvanizing: A Review of the Hot Dip Process With Some Reference to Electrogalvanizing. H. Edwards, E. D. Harry and E. Jenkins. Paper from "Production of Wide Steel Strip". Iron and Steel Institute, London, England. May 1960, p. 161-172.

Hot dip galvanizing of rimmed steel sheets in bath of Zn, Al and Pb by various industrial processes. Mechanical and physical properties. Effect of bath temperature, Al content, immersion time and surface variables on alloy growth. (L16; ST-d, Al, Pb, Zn)

305-L. Plastic-Coated Steel: A Promising New Sheet Material. S. S. Carlisle and W. Bullough. Paper from "Production of Wide Steel Strip". Iron and Steel Institute, London, England. May 1960, p. 173-180.

Cold reduced steel strip is coated with polyvinyl chloride, cured at 200-425° C. in radiant or forced air furnaces and tested to determine adhesion strength and abrasion and blistering resistance. (L22, Q10c; ST, 4-53)

306-L. Measurement of the Thickness of Electroplates by Electrolytic Stripping Method. P. B. Mathur and N. Karuppanan. Plating, v. 48, Feb. 1961, p. 170-172.

Current efficiency and the actions of different stripping solutions on Ag electroplates over Cu, brass, mild steel and Ni are measured in terms of stripping time and plating thickness as related to different current densities. Anodic thickness values are tabulated with those obtained by microscopic methods. (L17c; CN, Cu-b, Ni, Ag)

307-L. Effect of Addition Agents in Copper Plating From the Sulphamate Bath. S. Venkatachalam and T. L. Rama Char. Electroplating and Metal Finishing, v. 14, Jan. 1961, p. 3-5.

Effect of gelatin, glue, EDTA, sulphosalicylic acid and other addition agents on the bath performance, cathode polarization and nature of deposit. (L17; Cu)

308-L. Nickel Plating--A Review of Recent Developments. H. C. Castell. Electroplating and Metal Finishing, v. 14, Jan. 1961, p. 6-13.

Study of corrosion resistance of Ni and Cr coatings during accelerated tests; bath levelling power, throwing power and deposit brightness in relation to various concentrations of organic agents; mechanisms involved in bright Ni plating. (L17; Ni)

309-L. Experiences With Some Bright Nickel Plating Solutions. G. Buss. Electroplating and Metal Finishing, v. 14, Jan. 1961, p. 15-17.

Comparison of optimum operating data used with three bright Ni plating baths, one being Efco-Udylite No. 66 bath which avoids the use of wetting agents and can be filtered continuously through active carbon. (L17; Ni)

310-L. (French.) Carbide Coating for Prolonging the Useful Life of High-Speed Steel Tools. Charles H. Wick. Machine Moderne, v. 54, Dec. 1960, p. 16-18.

Spark deposition methods and equipment for applying carbide coating to high speed steel tools using a carbon electrode. Data are given for coating, thickness and wear resistance of tools. (L29, T6n; TS-m)

311-L. The Protection of Structural Steel Against Corrosion. J. C. Hudson. Chemistry & Industry, Jan. 7, 1961, p. 3-11.

Application of Zn, Al, Pb, Sn, paints, bitumens and pitches, vitreous enamel, cement and concrete, plastics and organic and inorganic compounds as coatings on hot rolled structural steel for protection against corrosion by air, soil and water. 8 ref. (L-general, R-general; ST)

312-L. Vibration Finishing Ends Deformation of Light Parts. Steel, v. 148, Feb. 27, 1961, p. 116-117.

Vibration deburring is used for cleaning, descaling, radiusing, coloring and internal finishing of small spring metal parts. (L10; SGA-b)

313-L. (German.) Electrolytic Process for Metal Cleaning. A. Pollack. Metall-Reinigung + Vorbehandlung, v. 10, Jan. 1961, p. 1-3.

Review of electrolytic degreasing by cathodic, anodic and combined cathodic-anodic treatment. Electrolytic descaling with acid and alkaline electrolytes by an automatic operation with reaction

gases removed as generated. Electrolytic cleaning of cast iron by anodic and cathodic melting in "Kolone-E" salt at 450-500° C. (L13n; CI)

314-L. (German.) Pretreatment of Aluminum for Welding. Hans H. Reinsch. Schweisstechnik, v. 15, Feb. 1961, p. 19-22.

Mechanical cleaning, chemical degreasing by alkaline and neutral (organic) solutions at 20-120° C. and pickling by H_2SiF_6, HNO_3 and H_3PO_4 solutions at 23-82° C. of Al sheets, profiles and cast parts. (L10, L12; Al, 4-53, 5)

315-L. Mechanical Descaling of Steel Wire Rod in France. Andre Line and Jean Peignier. Wire and Wire Products, v. 36, Feb. 1961, p. 181-190.

Scale cracking and rod cleaning procedures for descaling low carbon steel wire rod as related to scale composition and heat generated during wire cold drawing. Lubrication processes for descaled rod and wire drawing and factors governing them. (L10; CN-g, 4-61)

316-L. Production by Autogeneous Extrusion. Alvin N. Gray. Wire and Wire Products, v. 36, Feb. 1961, p. 202-204.

Wire coating by a new type autogenous extrusion screw with its own back pressure, heat direction and feeding, mixing and pumping features. Advantages of process include uniform discharge temperature at any screw speed, simplified operation, design and installation, material conservation and higher production potential. (L22; 4-61)

317-L. Processing and Painting AC Air Cleaners. Herbert Chase. Industrial Finishing, v. 37, Feb. 1961, p. 24-26, 28, 30-31.

Production of a heat and corrosion resistant finish on steel automobile engine stampings by a sequence of operations including cleaning, phosphatizing, rinsing, drying, electrostatic painting and baking. (L26n, T21b; ST, 4-59)

318-L. Sulphamate Nickel: Boon to Electroformed Microwave Components. David G. Brown. Electronic Design, v. 9, Jan. 18, 1961, p. 140-143.

Precision parts of Ag, Cu, brass and ferrous materials with complicated shapes fabricated by the Barrett sulphamate-nickel plating process. Effect of bath, formulation on deposit stresses, chemical purity, grain structure and ductility, high and low temperature stability, machinability and corrosion resistance. (L18, T1; Ag, Cu-b, Fe-b, Ni)

319-L. Flame Spray Alumina Coatings. Industrial Finishing, v. 13, Jan. 1961, p. 36.

Thermal protection of jet and rocket engine components by flame-spray coating with alumina at 2050-1800° C. using oxy-acetylene powder gun and rod gun. Influence of surface roughness, particle temperature and cooling characteristics on the strength of the bond between alumina and Fe, Pt and glass substrates. (L23; Fe, Pt, Al)

320-L. New Technique Increases Gold Deposits. Industrial Finishing, v. 13, Jan. 1961, p. 47-48.

Cu and Cu-base alloys are covered with Au deposits up to 3 mg/in^2 using a special plating bath which operates at 35-47° C. and pH 7-8 or 80-100° C. and pH 5.0-5.2. (L17; Cu-b, Au)

321-L. Vitreous Enamelled Aluminum. Metal Industry, v. 98, Feb. 3, 1961, p. 87-89.

Preparation of sheet and spraying and drying of frit in the production of architectural panelling. (L27; Al)

322-L. (Japanese.) Treatment of Metal Surface by Hydrogen Peroxide Solution. Kaichi Kawamura. Japan Institute of Metals, Journal, v. 24, Nov. 1960, p. 710-714.

Aqueous solutions of hydrogen peroxide, with various acids and additional reagents are used for descaling, chemical polishing and etching of stainless, heat resisting and plain carbon steels and alloys of Cu, Ti, Ni, Mg, Al and Pb. Metal and oxide dissolution rates are determined with optimum bath composition for efficient chemical action. (L12; Al-b, Cu-b, Mg-b, Ni-b, Pb-b, Ti-b, ST)

323-L. Physical Metallurgy of Refractory Metals. The Removal of Interstitial Impurities From Niobium by Zinc-Niobium

Compounds. R. J. Goode, A. J. Pollard and R. A. Meussner. Report of NRL (Naval Research Laboratory) Progress, Jan. 1961, p. 32-34.

Removal of O, N and C and N in combination from Cb by coating with Zn is examined for specimens coated by vapor deposition at 1600° F. with subsequent heating at 1800° F. for various times. The inclusions are extracted by electrolytic isolation, with their identification and identification of phase formation and microstructure of the specimen being achieved by X-ray diffraction. (L25, C26, M22g, 3-69; Cb, Zn)

324-L. Plastic Coated Steel Wire. Dartrey Lewis. Wire and Wire Products, v. 36, Jan. 1961, p. 41-46, 120-121.

Corrosion protection and decoration of steel wire with plastics of various compositions, lacquer and vitreous enamel coatings, using rust inhibiting primer, galvanized Zn or phosphate undercoatings. Process parameters and resultant corrosion resistance, water permeability, thickness and other properties of the coatings. (L26, L23, R-general; ST, 4-61)

325-L. Low-Temperature Metal Cleaning Pays Off. Industrial Gas, v. 38, Feb. 1961, p. 5.

Proofing and cleaning sheet metal furnace and air-conditioning parts at 120-400° F. in a burn-off oven resulting in increased cleaning efficiency and lower operating costs by ridding the parts of soot, dirt and grease in a single operation. (L10g; 4-53)

326-L. Radiant Firing Doubles Kettle Life. J. Atkinson. Industrial Gas, v. 38, Feb. 1961, p. 7.

Hot dip galvanizing of low-carbon steel grave vaults in direct radiant fired kettles. Gradiation heating by radiant gas burners with ceramic cups permits better temperature distribution and prevents bath turbulence. (L16; CN-g)

327-L. (French.) Protection of Structural Parts by Painting and Zn Plating. P. Blancheteau. Corrosion et Anticorrosion, v. 8, Dec. 1960, p. 455-461.

Permissible pitting corrosion of painted parts after a certain service time. Protection by galvanizing, painting and Zn metal spraying. Repair of Zn platings damaged in welding operations by metal spraying. (L16, L23, L26, R2j; ST, Zn)

328-L. (French.) Corrosion Protection of Gasholders by Painting. Henri Prim. Corrosion et Anticorrosion, v. 8, Dec. 1960, p. 462-471.

Protection by various paints on drying oil, bitumen and polymer bases. Samples are tested in humidity saturated atmospheres containing CO_2 and SO_2, atomized sea water, a dry atmosphere at 20-80° C., an emulsion of benzene in water containing SO_2 and in sea water at 25° C., for 1-15 hr. 11 ref. (L26, R11)

329-L. Acceptance Requirements for Nickel-Chromium Plating. W. G. L. Miller. Electroplating and Metal Finishing, v. 14, Feb. 1961, p. 40-47.

Specifications for Ni-Cr plating of steel, Cu alloys and Zn-based die castings. SO_2, acetic acid salt spray and Cu accelerated salt spray tests to determine corrosion resistance. Methods of measuring coating thickness. (L17, R11j; Cu-b, ST, Zn-b, Cr, Ni)

330-L. Pretreatment of Polished Copper Alloy and Zinc Components for Bright Nickel Plating. H. Reymond. Electroplating and Metal Finishing, v. 14, Feb. 1961, p. 53-54.

Development of treatment cycles for Cu and Zn alloy components based on electrolytic degreasing in a cyanide bath. This is followed by alkaline Cu plating, in the case of Zn, and by weak treatment in citric acid in the case of Cu. (L13n, L17; Cu-b, Zn-b, Ni)

331-L. Plating of Magnesium. Arthur S. Dwyer. National Conference on Aeronautical Electronics, Proceedings, May 1958, p. 530-533.

Methods of overcoming porosity in the deposited metal and lack of adhesion of the plate during plating of Mg alloys by applying an immersion Zn coating followed by a Cu strike, then electroplating in standard baths. (L17; Mg-b, Cu, Sn, Zn)

332-L. (Russian.) Electroplating of Structural Steels. M. A. Figelman. Metallovedenie i Obrabotka Metallov, Dec. 1960, p. 21-25.

Samples of 38KHA, 30KHGSA, 18KHNVA and 1KH18N9T structural steels are heat treated and electroplated with Cd, Zn and Cd with Zn. Effect of coating composition on plasticity, impact and bend strength, elongation, reduction in area and tensile strength at elevated temperatures (200-700° C.) (L17c, Q-general; ST, Cd, Zn)

333-L. Hard Chromium Plating of Piston Rods. Preparation and Finishing. Machinery (London), v. 97, Dec. 28, 1960, p. 1466-1467.

Plating of steel rods used in high and low pressure hydraulic installations to improve corrosion resistance and wear properties. Work surfaces of 5-10 micro-inches are obtained by finishing on a centerless polishing machine. (L17, T7; ST, Cr)

334-L. How de Havilland Hard Anodize Missile Parts. W. J. Campbell. Metalworking Production, v. 105, Feb. 1, 1961, p. 59-62.

Al alloy missile forgings are hard anodized by the Hardas technique at 10-30° C. using 30-300 amp. per sq. ft. The Hardas process prescribes rates of flow of electrolyte in relation to the size of the anode and specifies blends of d-c. and a-c. currents which permit the production of hard coatings on alloys containing Si and Cu. (L19, L24, T24e; Al-b, 4-51)

335-L. (Italian.) Electrodeposition of Nickel. L. Peraldo Bicelli and G. Serravalle. Metallurgia Italiana, v. 52, Nov. 1960, p. 703-709.

Electrolytic Ni deposit obtained at different temperatures and current densities from hydrochloric-sulphamic and hydrochloric-perchloric baths, with different $NiCl_2$ contents and at different pH. Determination of cathodic current yields with preferred orientation investigation by X-ray. 17 ref. (L17; Ni)

336-L. (German.) Pickling Plants With Particular Reference to Modern Pickling. W. Heynemann. Draht, v. 12, Jan. 1961, p. 16-25.

Wire is pickled by H_2SO_4 at 70° C. in steam heated Pb coated steel containers. Pickling vapors are removed by plastic exhausters and waste acid is neutralized by slaked lime or carbide mud. (L12g; ST, 4-61)

337-L. (Italian.) Bright Nickel Plating of Fused Castings. Gianluigi Galli. Fonderia, v. 9, Dec. 1960, p. 533-535.

Investigation of the composition and surface properties of fused castings of bronze, brass and aluminum-bronze, welded with lead-tin alloys for nickel plating. Effect of porosity, passivity, composition and crystal structure on coating adherence. (L17c; Cu-b, Pb-b, 5)

338-L. Color Finishing of Galvanized Steel Sheet Panels. Engineer, v. 211, Feb. 10, 1961, p. 228-229.

Steel ribbed panels are coated with a high-molecular weight vinyl acetal resin combined with active compounds such as phosphoric acid, chromates and alcohols prior to coloring. Three color coats are then applied by automatic spray guns. (L26; ST, 4-53, 8-65)

339-L. (French.) Electrolytic Polishing and Brightening. H. Richter. Galvano, v. 29, Dec. 1960, p. 709-713.

Mechanism of electrolytic surface treatment. Application of acid baths and proprietary solutions, such as Alutol (for Al) and Brytol in metal brightening processes. Methods of process control, including heating, cooling and feeding the bath. (L12f)

340-L. (French.) Electrolytic Deposition of "Monel". A. P. Van Peteghem and H. F. Demeyre. Galvano, v. 29, Dec. 1960, p. 715-716.

Electrodeposition of Monel from $NiSO_4$ baths on cathodes of Cu, Zn-Cu, Fe, steel and zamac. Optimum bath composition, plating conditions and preparation of cathode surface. (L17; Cu-b, Fe, ST, Zn-b, Ni)

341-L. (French.) Electrolytic Deposits on Aluminum and Its Alloys. Guy Bacquias. Galvano, v. 29, Dec. 1960, p. 719-722.

Electroplating of Al and AG3, AG5, AUG4G, ASG and AUGT Al alloys using Zn, Cu, Ni and Cr baths. Methods of surface preparation and metal deposition. Selection of optimum bath composition and plating variables. (L17; Al-b, Cr, Cu, Ni, Zn)

342-L. (French.) New Process of Galvanizing Steel Wire. R. Lourdin. Galvano, v. 29, Dec. 1960, p. 729-731.

Hot dip galvanizing of wire in a line incorporating surface preparation, oxidizing preheating, annealing in a reducing atmosphere, galvanizing in a molten Zn bath and cooling. Design and operation of wire handling and heating equipment. Properties of the Zn coated wire. (L16; ST, 4-61)

343-L. (French.) Macrodispersion, Microdispersion and Leveling in Electrolytic Baths. Galvano, v. 29, Dec. 1960, p. 732-734.

Review of process, kinetics and variables during electrodeposition, including genuine and apparent leveling, limit between macro and microdispersion, effect of ion concentration in the bath and conditions in the diffusion layer. 10 ref. (L17b)

344-L. Measurement of the Thickness of Electroplates by Electrolytic Stripping Method. Prem Behari Mathur and Nithiyanandan J. Paul. Electroplating (India), Aug-Dec. 1960, p. 19-21.

Experimental results on the use of a 17% NaOH stripping solution for testing Cr coatings of various industrial thicknesses over Cu and brass bases. 7 ref. (L17c; Cu-b, Cr)

345-L. Anodizing and Coloring of Aluminum. K. C. Srevastava. Electroplating (India), Aug-Dec. 1960, p. 22-28.

Bright polishing by mechanical and chemical methods, anodizing, coloring and sealing techniques for Al surfaces. Design of equipment. 6 ref. (L10, L12, L19; Al)

346-L. (Russian.) Chromium Coatings for Engine Cylinders. A. A. Polyakov. Vestnik Mashinostroeniya, v. 41, Jan. 1961, p. 9-15.

Evaluation of porous and solid Cr coatings and the efficiency of Cr plating on knurled surfaces by friction and wear resistance tests. Study of lubricant distribution on the surface and computation of lubrication power. 21 ref. (L17, T21b; Cr)

347-L. (Japanese.) Ultrasonic Electroplating. Genrokuroh Nishimura. Ohm, v. 47, Nov. 1960, p. 67-74.

Use of ultrasonic vibration during electroplating of brass or steel plates or Mo wire with Cu, Cr, Ni, Au or Ag at various temperatures, times and current densities. Data are given for current efficiencies, surface roughness, microstructure, hardness, porosity, thickness and abrasion resistance of the deposits. (L17, 1-74; Cu-b, ST, 4-53, Mo, 4-61, Ag, Au, Cr, Cu, Ni)

348-L. Refractory Coatings for High-Temperature Protection. John V. Long. Metal Progress, v. 79, Mar. 1961, p. 114-121.

Base metals can be made more heat resistant by converting them to "composites" with techniques that modify the surface or apply a refractory coat, such as glassy and matte ceramics, cermets, metallic and diffused metallic coatings. (L27, L15, L23, 2-62)

349-L. Quantity Production of a Varied Range of Wirework. Wire Industry, v. 28, Feb. 1961, p. 151-155.

Mass production of forms composed of wire which are coated with Cu, Zn, brass or Cr are painted by dipping or hand spraying. Method is determined by the complexity of the form. (L17, L16, L23; Cu-b, Cr, Zn, 4-61)

350-L. Cleaning Bares Flaws in Missiles. John F. Judge. Missiles and Rockets, v. 8, Mar. 6, 1961, p. 32.

Ultrasonic solvent and acid cleaning, demineralized water rinsing and infrared drying operations are used to clean critical steel missile system components. (L12, T24e; ST, 17-57)

351-L. Try the Advanced Coating Methods. L. McD. Schetky. Metalworking, v. 17, Mar. 1961, p. 14-19.

Ceramic and refractory metal coating by vapor phase deposition, plasma flame spraying and electron beam evaporation at 70-1650° F. to produce films of high purity, precise thickness and low porosity. Examination of photomicrographs. (L-general)

352-L. (German.) Influence of Ultrasonic Vibration on Electroplating. R. Weiner. Metall, v. 15, Feb. 1961, p. 97-101.

Investigation of electroplating with Cu, Zn, Ni, Ag and Au during ultrasonic oscillation of acid and complex electrolytes at a frequency of 20 kHz

and 5 W per cm^2 intensity by a supersonic generator, having magnetostrictive and pizoelectric agitators. Influence of ultrasonics on current recovery and current density, potential and quality of coating. (L17, 1-74; Ag, Au, Cu, Ni, Zn)

353-L. Republic Installs 74-In. Sheet Polisher. Iron and Steel Engineer, v. 38, Feb. 1961, p. 147.

Polishing of steel sheet at 20-60 ft. per min. on a pinch roll sheet polisher used as either a through feed or reciprocating machine. (L10b; ST, 4-53)

354-L. Preparing Metal for Vinyl Lamination. James I. Maurer. Production, v. 47, Mar. 1961, p. 68-69.

Treatment of steel, Al and Zn surfaces by cleaner bath, water rinse, coating bath and chromate-containing rinse. Coating systems are varied to give high quality bonding, an iron phosphate being used for steel, an oxide chromate for Al and a zinc phosphate coating for Zn. (L14, L26p; Al, ST, Zn)

355-L. Finishing Supplement: Cleaning of Surfaces. E. E. Bishop. Metal Industry, v. 98, Feb. 17, 1961, p. 127-130, 132.

Cleaning mild and alloy steel, Cr, Ca and Ni by solvent degreasing, alkali degreasing and pickling. Ultrasonic and mechanical methods. (L12, L10; AY, CN, Cr, Cu, Ni)

356-L. (French.) Cleaning of Steel Bars and Wires. Chaleur & Industrie, v. 41, Dec. 1960, p. 334-342.

Solvent acid and blast cleaning methods and surface qualities of the cleaned semi-finished articles. Reconstitution of the acids from the baths used. (L10c, L12; ST, 4-55, 4-61)

357-L. Rhodium Plating to Specifications. R. R. Benham. Metalworking Production, v. 105, Feb. 15, 1961, p. 63-65.

Recommended procedures for undercoating, masking, cleaning and plating on steel, Al and a Sn-Ag-Pb solder. (L17; Al, ST, SGA-f)

358-L. (Russian.) Separation of Slag Crust From the Weld. N. A. Grinberg and E. M. Rogova. Svarochnoe Proizvodstvo, Nov. 1960, p. 18-20.

Factors influencing separation of slag crust which is fastened to the seam during hard facing because of oxide film formed between slag and melt during solidification. Effect of Mn content in the oxide film, acidity of slag, heterogeneity of granulation of electrode components and the ratio of slag and metal volume on solidification. 3 ref. (L24, K1)

359-L. (Translation-Brutcher no. 4881.) Shot Blasting and Subsequent Cleaning of Steel Strip for Cold Rolling. G. Hohle. Stahl und Eisen, v. 80, no. 14, 1960, p. 913-918.

Development work on the mechanical descaling of steel strip in a cold rolling mill and the difficulties encountered and finally overcome in removing the resulting black coating of very fine dust. Best shot-blasting speed and shot size for hot rolled low-carbon steel strip. Yield point, tensile strength, elongation, hardness distribution in depth and surface condition of strip before and after shot blasting. (L10c; ST, 4-53)

360-L. (Translation-Brutcher no. 5023.) Hot Dip Aluminizing of Steel Wire. K. Janecky. Hutnik, v. 10, Feb. 1960, p. 61-64.

Czech work on fluxes for hot aluminizing, based on borax plus ammonium chloride; composition data. Best temperature of Al bath in connection with this flux. Cracked ammonia atmosphere for cleaning the surface of the stock. (L15; ST, 4-61, Al)

361-L. Protective Coating Service for Food, Brewery Industries. Corrosion Prevention & Control, v. 8, Jan. 1961, p. 36.

Coating and metal and flame spraying methods and equipment for applying synthetic resin and metallic coatings to food processing equipment for corrosion and contamination prevention. Materials used include epoxy resins, phenolics, PVC and PTFE compounds, silicones, polythem, nylon, Zn, Al and stainless steels. (L-general, T29p)

362-L. Special Reciprocator for Coating Office Furniture. Industrial Finishing, v. 13, Feb. 1961, p. 23-24.

Description of degreasing, electrostatic spray painting and stoving operations on office furniture made from sheet steel. Design of reciprocator used

to supply paint with only 5% wastage. (L26n, T10b; ST, 4-53)

363-L. Mechanization in Metal Cleaning. Industrial Finishing, v. 13, Feb. 1961, p. 32-33.

Comparison of degreasing and other cleaning operations including soaking, spray washing, machine cleaning and gyro-vertical cleaning. Swarf separation. (L12, L10)

364-L. Degreasing. Pt. 1. Industrial Finishing, v. 13, Feb. 1961, p. 37-38.

Description of degreasing methods, materials and equipment at two German plants, one using ultrasonic methods to clean cold rolled steel band and the other using a high-speed process and a special plastic additive to eliminate need for an alkaline soak. (L12)

365-L. Organic Finishing Zinc and Aluminum Die Castings. P. J. Provin. Precision Metal Molding, v. 19, Mar. 1961, p. 46-47.

Chemical cleaning, conversion coating and organic painting of Al and Zn die castings to improve appearance and resistance to corrosion by detergents and in humid atmospheres. (L26; Al, Zn, 5-61)

366-L. How to Polish Long Extrusions Automatically. Precision Metal Molding, v. 19, Mar. 1961, p. 63-64.

Buffing of 5-30 ft. Al extrusions using a automatic reciprocating straight line buffing machine. Design and operation of equipment. (L10a; Al, 4-58)

367-L. Grinding With Cup-Wheels. R. R. Cole. Machinery, v. 67, Mar. 1961, p. 134-140.

Electrolytic grinding of tempered carbon steel by a phosphor bronze diamond cup wheel and an electrolyte containing potassium nitrate and nitrite. Measurements are made with a dynamometer to determine effect of current density on metal removing rate and Faraday current efficiency. (L13p, W25c; CN)

368-L. Recent Developments in Phosphating. H. A. Holden. Corrosion Technology, v. 8, Feb. 1961, p. 40-44.

Surface preparation methods including pickling and derusting with HCl, HSO_4 and H_3PO_3 and cleaning with alkaline cleaner and a Ti phosphate complex. Phosphating of Fe and steel with Zn, Mn and Fe phosphate. Corrosion testing of phosphated products. (L14b, L12; Fe, ST)

369-L. One-Coat Porcelain Enameling in Commercial Refrigerator Production. Metal Products Manufacturing, v. 18, Mar. 1961, p. 49, 54, 96.

Coating steel components with one coat of porcelain enamel in a direct-on application. Equipment and technique used in the citric acid pickling of the steel in preparation for the enamel coating. (L27, L12g; ST)

370-L. New Strip Coating Line for Aluminum and Steel. Metal Products Manufacturing, v. 18, Mar. 1961, p. 59-61, 73.

Surface preparation and organic roll coating of Al and steel strip on an automic, continuous coating line. (L26; Al, ST, 4-53)

371-L. Machine Steps Up Point Mileage. E. A. Zahn. Iron Age, v. 187, Mar. 16, 1961, p. 116-117.

Advantages of flow casting for painting automobile frames and other sheet metal parts. Oscillating jets of paints coat articles with very little waste. (L26n, T21a)

372-L. Protective Coatings for Chemical Service. L. S. Van Delinder. Paper from "Short Course on Process Industry Corrosion, Proceedings". National Association of Corrosion Engineers, Houston 2, Texas, 1960, p. 365-406.

Surface preparation. Application of lacquer, enamel, plastic, Zn, rubber and other coatings to chemical processing equipment. Tests for determining adherence, abrasion and corrosion resistance, thickness and flexibility of coatings. 24 ref. (L-general, R10, Q10c, T29)

373-L. (German.) Influence of Hydrogen Produced in Pickling on Properties of Silicon Alloyed Sheet. S. Bohmer. Neue Hutte, v. 6, Jan. 1961, p. 56-60.

Measurements of magnetic permeability, induction, coercive force and magnetizing losses of transformer sheet specimens (3.93-4.42% Si) after H_2SO_4 pickling at various pickling times and

acid concentrations and after varying aging times to evaluate effect of hydrogen pick-up during pickling. (L12g, P16; SGA-n, Si)

374-L. (Croatian.) Plating of Aluminum Sheet by Rolling. Milan B. Pajevic and Niloka Voroncov. Saopstenja, v. 7, June 1959, p. 3-13.

Theoretical background and experimental testing of Al sheets plated with Cu by rolling. Results indicate that cleanliness, homogeneity of surface contact, temperature, heating time and speed and compression of rolling are factors related to achieving high quality platings. Doubling of plated metal is recommended as a technique for quality control. 12 ref. (L22, F23; Al, Cu, 4-53)

375-L. (French.) Electrolytic Deposits on Tungsten and Molybdenum. Galvano, v. 30, Jan. 1961, p. 27-30.

Heat treatment, mechanical and chemical treatment of the surface before electroplating. Deposition of Cu, Ni, Cr, Au and Pt, with subsequent annealing. 9 ref. (L17, L-general, J-general; Mo, W, Au, Cr, Cu, Ni, Pt)

376-L. Gelled Primers Prevent Sag, Speed Up Painting Time. Corrosion Prevention & Control, v. 8, Feb. 1961, p. 49-51.

Gelled or thixotropic primers give thickness equivalent to four or five coatings of normal primer with only two coatings. Performance on seagoing vessels and structural steel work. (L26n, T22; ST, 4-57)

377-L. (Translation-ConBur.) Cathode Processes During Electrodeposition of Titanium From Aqueous Solutions. N. T. Kudryavtsev, R. G. Golovchanskaya and N. K. Baraboshkina. Academy of Sciences of the USSR, Proceedings, Physical Chemistry Section, v. 132, May-June 1960, p. 441-443.

Electrodeposition of Ti from alkaline or acidic solutions of titaniferrous salts as affected by cathode composition, current distribution and addition of surface-active agents. (L17; Ti)

378-L. (Polish.) Effect of Process Conditions on the Properties of Aluminum and Zinc Coatings. S. Socha. Prace Instytutow Hutniczych, v. 12, May 1960, p. 239-247.

Selection of adequate temperature, time and media for annealing of low carbon steel wires prior to hot dip plating. Effect of plating in hydrogen atmosphere and time and temperature of the process on the thickness, density, structure, corrosion resistance and mechanical properties of coatings. 13 ref. (L17; CN-g, Al, Zn, 4-61)

379-L. The Purpose, Theory and Application of Nickel Dip. N. S. C. Millar. Metal Finishing Journal, v. 7, Feb. 1961, p. 49-55.

Use of Ni dip in ground and cover coating of steel by enamels. Description of pickling cycle, plating parameters and application methods. Methods of determining Ni content in dip solution and on steel plates. (L16, L26n; ST)

380-L. A Survey of Progress in the Electrodeposition of Precious Metals. W. T. Lee. Metal Finishing Journal, v. 7, Feb. 1961, p. 63-70.

Plating of precious metals from acidic and alkaline aqueous solutions. Effect of agitation, current density, metal concentration, pH, cathode efficiency, time cycle and temperature on the brightness, ductility and corrosion resistance of Ag, Pt, Rh, Pd and Au deposits. 17 ref. (L17; Ag, Au, Pd, Pt, Rh)

381-L. Evaporated Chromium Films on Hot Substrates. Dorothy M. Hoffman and J. Riseman. Paper from "Vacuum Technology Transactions". Pergamon Press, New York, 1959, p. 218-221.

Electrical properties of thin Cr films have been shown to depend primarily on conditions and method of preparation. Films here obtained behave as thin metal foils which differ from the bulk material only because of geometrical effects. 10 ref. (L25g; Cr)

382-L. Gas Absorption by Vacuum Evaporated Magnetic Films. F. R. Gleason, J. H. Greiner and L. R. Yetter. Paper from "Vacuum Technology Transactions". Pergamon Press, New York, 1959, p. 222-227.

Mass spectrometric determinations are made of the types and amounts of gases absorbed during the deposition of thin Ni-Fe films. (L25g, S11r; Ni-b, Fe-b, 14-62)

383-L. Flow Coating Beats Dip Five Ways. American Machinist/Metalworking Manufacturing, v. 105, Mar. 6, 1961, p. 81.

Application of paint primer to automobile body parts by flow coating process. Paint is deposited on the upper areas of each part by fixed nozzles as the parts pass by on a conveyor, then flows downward to complete coverage. (L26, T21a)

384-L. Hard Chrome Plating of Cast Iron. T. J. Glover. BCIRA Journal (British Cast Iron Research Assoc.), v. 9, Jan. 1961, p. 95-102.

Results show that surface finish is a very important factor in ease of plating cast iron; size and distribution of flake graphite appear to have little effect and matrix structure none at all. Nodular graphite irons can be plated at lower current densities than flake graphite irons; a high phosphorus content leads to difficulty in plating. (L17; CI, Cr)

385-L. (Italian.) Surface Treatment of Stainless Steel. Giampiero Colombo. Acciaio Inossidabile, v. 27, Nov-Dec. 1960, p. 533-535.

Comparison of descaling methods for stainless steel, with emphasis on the Virgo process in which workpiece is immersed in fused NaOH containing NaH, then rapidly cooled in water. Other treatments include immersion in H_2SO_4, followed by rinsing. (L12; SS)

386-L. Jelled Plating Solutions for Barrel Plating Precision Parts. Harry J. West and Richard F. Gieselman. Products Finishing, v. 25, Feb. 1961, p. 44-45.

Plating of precision parts with Ag, Cd, Ni, Ca and Sn using a colloidal plating bath jelled to an extent which protects the parts from damage. Addition of the colloid to the bath also improves the appearance of the plating and the throwing power of the bath. (L17a)

387-L. An Electrochemical Index for Porosity. Products Finishing, v. 25, Mar. 1961, p. 74, 76, 78, 80.

Detection of pores in Sn, Cu and Ni electroplates by a test method in which a small current is passed from the plated panel under test to a separate cathode. Comparison of pore count, pore resistance and thickness of specimens. (L17c, 9-68; Cu, Ni, Sn)

388-L. Refrigerated Dip Tank Solves Finishing Problem. Gilbert C. Close. Products Finishing, v. 25, Mar. 1961, p. 49-51.

Application of epoxy resin primer to small aircraft parts by dipping in a refrigerated tank containing the resin. Refrigeration increases pot life of resin to one week. (L16, L26p; T24)

389-L. Finishing to a Microinch. Eric H. Sieke. American Machinist/Metalworking Manufacturing, v. 105, Feb. 20, 1961, p. 118.

Precision finishing of watch parts using rotary lapping machines and Linde A alumina powder as abrasive. Shellac is used as the clamping fixture to hold parts on flat round steel blocks. (L10b)

390-L. Metallizing Nickel Powder Involves Vacuum Blasting to Prepare Steel Before Surfacing With Metal Spray-Gun. W. B. Keyser. Welding Journal, v. 40, Mar. 1961, p. 229-231.

Surface preparation and metal spraying methods for applying a metallizing Ni powder coating to steel to increase corrosion resistance properties. Metallographic and X-ray diffraction examination and bend testing are used to evaluate the microstructure and tensile and bond strength of the coating. 3 ref. (L23, L-general; ST, Ni)

391-L. (Translation-ConBur.) Copper Plating of Aluminum by Contact Reduction. N. S. Tsvetkov and O. S. Zarechnyuk. Journal of Applied Chemistry of the USSR, v. 33, Mar. 1960, p. 641-648.

Conditions are given for formation of compact contact deposits of Cu on Al from alcoholic cupric chloride solutions. Amount of Cu formed is a linear function of water concentration in the solution. 20 ref. (L17; Al, Cu)

392-L. (Translation-ConBur.) Microinvestigation of the Cathode Process in Electrodeposition of Chromium. M. A. Shluger and V. A. Kazahov. Journal of Applied Chemistry of the USSR, v. 33, Mar. 1960, p. 649-655.

Direct microscopic observations of the cathode surface are used to study reduction of chromic acid solutions in two different ranges of cathode potential as affected by SO_4^{-2} ion concentration, current density and electrolysis temperature. 14 ref. (L17; Cr)

393-L. (Translation-ConBur.) A Method of Improving Resistance to Corrosion and Friction of Protected and Unprotected Surfaces of Articles. A. F. Krutikov. Journal of Applied Chemistry of the USSR, v. 33, Mar. 1960, p. 690-693.

Techniques of phosphate passivation, oxidation phosphatation and block phosphatation for improving the protective and antifrictional properties and adhesiveness of Cd and Zn surface layers. 5 ref. (L14b)

394-L. (Translation-ConBur.) Kinetics of Scale Removal From 1Cr18Ni9Ti Stainless Steel Ribbons in Nitric Acid Solutions. A. I. Matantsev. Journal of Applied Chemistry of the USSR, v. 33, Mar. 1960, p. 679-689.

Scale is formed during heat treatment of a cold rolled steel ribbon in an oxidizing atmosphere at 1110-1120° C. Efficiency of scale removal is then compared in HNO_3 solutions at concentrations varying from 0.4-40% and temperatures from 18-80° C. 35 ref. (L12g; SS)

395-L. New Plating Process for High Strength Steel. Western Metalworking, v. 19, Mar. 1961, p. 36-38.

Development of a Cd plating technique for aircraft components which eliminates hydrogen embrittlement problems and permits use of less steel at critical airframe juncture points. Process uses a nitrate compound and a throwing power additive to increase bath plating efficiency. (L17, T24; ST, Cd)

396-L. High-Temperature Insulation for Wire. K. N. Harris and J. D. Walton, Jr. Georgia Institute of Technology (Wright Air Development Division). U. S. Office of Technical Services, PB 161788, Mar. 1960, 40 p. $1.

High-temperature frit-resin insulation coating for electric wire, effective at 800° F., developed in a search for new insulating materials capable of meeting demands imposed by increasing air and space vehicle speeds. Applied to wire anodized with sulphuric acid and magnesium chloride, the coating gives low dielectric constant, low dissipation factor and good continuity. Wire thus treated is capable of operating after 750 hr. at 800° F. (L26p; 4-61)

397-L. (English.) Research on Buffing. (111). Yukio Tanaka. Kansai University, Technology Reports, Sept. 1960, p. 21-48.

Relationships between buffing temperature and time is obtained from experiments on Al, Cu and steel plates. Effect of adding fatty grease to buffing compound. Deformation processes during buffing. 14 ref. (L10a; Al, Cu, ST, 4-53)

398-L. Specifications and Physical Tests for Copper Plating Rotogravure Rolls. Harold T. Wilson. Plating, v. 48, Mar. 1961, p. 271-276.

Description of porosity, thickness, hardness, tensile and ductility tests made on steel tubes plated first with cyanide Cu or Ni, then acid Cu and finally with a layer of Cr. 3 ref. (L17c; ST, Cr, Cu, 4-60)

399-L. Belt Grinder Deburrs 28 Types of Aluminum, Steel and Titanium. Grinding and Finishing, v. 7, Mar. 1961, p. 35.

Deburring of Al, steel and Ti parts to 120-250 micro-in. finishes, using a belt grinding machine. Description of production tests on the grinder. (L10; Al, ST, Ti)

400-L. Heavy Parts--Deburring by Vibration. Paul C. Moushey. Grinding and Finishing, v. 7, Mar. 1961, p. 44-46.

A method of deburring castings and heavy components of engine, turbines and hydraulic rotors and others using a vibrator machine and an abrasive mixture. Surface finish quality and appearance of the parts. (L10; 5)

401-L. Surface Finishes for Aluminum. Aluminium Courier, Dec. 1960, p. 16-19.

Summary of mechanical and chemical treatments, vitreous enamelling, painting, anodizing and electroplating techniques for Al. (L-general; Al)

402-L. Electrodeposition of Tin From the Potassium Stannous Pyrophosphate Bath. Vasanta Sree. Journal of Scientific & Industrial Research (India), v. 20D, Jan. 1961, p. 18-22.

Comparison of the electrodeposition of Sn on Pt or Cu from pyrophosphate and stannate plating baths. Baths are compared as to cathode efficiency, plating speed, bath voltage, resistivity, throwing power and anode control. 11 ref. (L17; Cu, Pt, Sn)

403-L. (English.) Electrolytic Deposition of Alpha and Beta Modifications of

Cobalt. N. Pangarov and S. Rashkov. Comptes Rendus de l'Academie Bulgare des Sciences, v. 13, July-Aug. 1960, p. 439-442.

Electrodeposition from a $CoSO_4$ + H_3BO_3 + NaCl solution using two Co plates as anodes and a 0.5 mm. diameter (Pt) wire as a cathode. The effects of temperature, current density and the addition of low-surface tension substances on the structure of Co deposits are studied by means of X-ray diffraction. 6 ref. (L17c; Co)

404-L. A New Stellite Hard-Facing Process. Machinery (London), v. 98, Mar. 8, 1961, p. 538-539.

Powder welding of Co based and Ni based deposits on oxidation resistant stainless steel. The steel is cleaned and preheated to 600-700° C. prior to hard facing at 1170-1020° C. with oxy-acetylene torch. A protective coating is deposited which is heat, abrasion and corrosion resistant. (L24; SS, Co-b, Ni-b, 6)

405-L. Jaguar Buys Big Stake in Chrome's Future. Metalworking Production, v. 105, Mar. 8, 1961, p. 68-69.

Design and operation of a semi-automatic Cu-Ni-Cr electroplating installation for automobile components and trim. (L17, 1-52, T21a; Cu, Cr, Ni, 17-57)

406-L. Barrel Plating With Gold. P. G. L. Vivian. Product Finishing, v. 14, Mar. 1961, p. 64-66.

Barrel plating of contacts for electronic apparatus using an Au-KCN solution to obtain corrosion and wear resistant deposits. Formulas are derived for calculating average batch thickness. (L17, Ti; Au)

407-L. Pick the Right Paint for the Job. J. E. Spector. American Machinist/Metalworking Manufacturing, v. 105, Mar. 20, 1961, p. 135-137.

A guide to surface preparation, selection, application and drying of organic and synthetic resin paints for metal surfaces. Suggestions are made for repainting machine tools, office and plant equipment, furnishings and other fabricated metal products. (L26, T-general)

408-L. Current-Distribution Improving Aids. Robert H. Rousselot. Metal Finishing, v. 59, Mar. 1961, p. 57-63.

Fundamental principles of current distribution during electrodeposition. Effects of shield, conducting shell, bipolar conductor, auxiliary anodes and auxiliary cathodes on the current distribution in a two-dimensional field. (L17b)

409-L. Science for Electroplaters. Pt. 64. Nickel Plating--Watts Bath. L. Serota. Metal Finishing, v. 59, Mar. 1961, p. 66-70.

Effect of current density and temperature on the concentration gradient in the electrolyte at the cathode. Influence of temperature, current density and pH on the characteristics of deposited Ni. (To be continued.) (L17; Ni)

410-L. Produce One-Coat PE Products on New Low-Carbon Steels. Ceramic Industry, v. 76, Mar. 1961, p. 54-57.

Production experiences with one coat porcelain enameling of decarburized steels. Control of metal preparation processes. (L27; ST)

411-L. (Japanese.) Spangles in Hot-Dip Galvanized Coating. Genjiro-Mima, Kazuo Kajikawa and Tadashi Kato. Tetsu-to-Hagane (Iron & Steel Institute of Japan, Journal), v. 47, Feb. 1961, p. 129-133.

Influence of Al and Sn additions to the electrolytic Zn bath on the shape, size and aesthetic appearance of spangles (flowers of Zn) formed on hot dip galvanized coatings. Nucleation and growth rates are determined as a function of super cooling and time. 4 ref. (L16; ST, Zn)

412-L. Anodic Oxidation of Palladium. A. Hickling and G. G. Vrjosek. Faraday Society, Transactions, v. 57, Jan. 1961, p. 123-129.

The anodic oxidation of Pd in acid, neutral and alkaline solutions is investigated by the charging-curve technique using the cathode-ray oscillograph and the breaks in the oscillograms are compared with the experimental potentials of redox systems which are likely to be formed. 11 ref. (L19)

413-L. Sprayed Metal Coatings in the Gas Industry. R. E. Mansford. Chemistry & Industry, Feb. 11, 1961, p. 150-160.

Protection of steel structures and equipment of gas plants from corrosion

by atmosphere and gas by-products using sprayed Al and Zn coating. Survey of paint systems for application over sprayed metal coatings. Use of sprayed Al and Ni alloy coating for protection of steel, cast iron and Cu alloys against oxidation at elevated temperatures. 14 ref. (L23, T29; ST, CI, Cu, Al, Zn, 17-57)

414-L. Chromallizing Protects Missile Probes From High Temperature Damage. Product Engineering, v. 32, Feb. 20, 1961, p. 17.

Alloy diffusion process development which lessens problems of oxidation and metal erosion of Mo alloy probes for guided missiles. The process is based on diffusion of complexes of Cr and other metals into the surface of the probe. (L15; Mo, Cr)

415-L. Maritime Foundry Slashes Cleaning Costs. Canadian Metalworking, v. 24, Mar. 1961, p. 38-39.

Use of a machine with abrasive separation facilities for knocking out sand cores and blast cleaning of gray iron castings. (L10c, 1-52; CI-n, 5-60)

416-L. Phosphate Coating and Lubricating Steel for Cold Extrusion. D. James. Sheet Metal Industries, v. 38, Mar. 1961, p. 171-189, 207.

Chemistry of Zn phosphate coating process and properties of phosphate coatings and lubricant films in degreasing, pickling, coating and lubricating treatment of steel slugs. 17 ref. (L14b, 18-73; ST)

417-L. A Survey of Recent Developments in Chromium Plating. L. W. Baier. Metal Finishing Journal, v. 7, Mar. 1961, p. 89-95.

Plating solutions and conditions for obtaining decorative and wear resistant coating. Effect of plating temperature and current density on quality and durability of Cr overlays and porosity and cracking of plating. Plating procedures for steel, cast iron and Al, including barrel and alloy plating. 18 ref. (L17, 10-54; ST, CI, Al, Cr)

418-L. Metal Finishing Technology--A Student's Guide. Pt. 7. A. Alexander. Metal Finishing Journal, v. 7, Mar. 1961, p. 97-100.

Analysis of conditions at the interface between a metal and an electrolyte, with calculation of potential differences at the metal-solution juncture. Effect of polarization and passivity of the electrodes, decomposition voltage and overvoltage. (L17)

419-L. Plastic Coated Metal Sheet. Corrosion Prevention & Control, v. 8, Mar. 1961, p. 47-48, 49.

Steel, Al and Mg sheets are coated with polyvinyl chloride plastic foil by heating the foil and the sheet which is pretreated for adherence to 160° C. and rolling. In another method, a p.v.c. plastisol or organosol is applied by roller and curtain coating or by spraying on cold or preheated sheets which are then heated to coalesce the plastic particles into a continuous film. (L26p; ST, Al, Mg, 4-53)

420-L. Flame Sprayed Plastics Coatings. Corrosion Prevention & Control, v. 8, Mar. 1961, p. 49-50.

Large metal valves, pump bodies, rollers, impellors and mixers are coated with plastic powder and nylon by flame spraying techniques. (L26p)

421-L. Range of Dip-Coated Plastics Extended. Corrosion Prevention & Control, v. 8, Mar. 1961, p. 50-51.

Wire and other metal articles are dip coated with polythene, cellulose acetate butyrate, p.v.c. and plastisol thermoplastics. Properties of plastics and epoxy resin powders are reviewed for application to electronic apparatus. (L26p, T1; 4-61)

422-L. Vinyl Resin and Glass Fiber Properties Combined. Corrosion Prevention & Control, v. 8, Mar. 1961, p. 51-52.

A formulated polyester resin for bonding glass fiber reinforcement intimately to a prepared vinyl sheet producing a strong homogeneous laminate. Application in tanks, containers, pipes and allied equipment in chemical, food and processing industries. (L26p, T-general, 17-57)

423-L. Metallic Pigments for Anti-Corrosion Primers. Corrosion Prevention & Control, v. 8, Mar. 1961, p. 54-56.

Flake Al and Mg and powdered Fe are alloyed with Zn dust to produce a metallic paint for application to Al, Mg and steel to prevent corrosion. Similar

paints under research would include a binder, Fe powder, Mg, Cu, Zn, Pb oxide or powder and active charcoal. (L26p, R-general; Al, Mg, ST)

424-L. Recent Developments in the Electrodeposition of Zinc and Cadmium. T. E. Such. Electroplating and Metal Finishing, v. 14, Mar. 1961, p. 79-83.

Survey of plating methods and properties of coatings; baths and coatings, including corrosion protection offered by Cd and Zn coatings; composition and characteristics of cyanide, sulphate, chloride, pyrophosphate and fluoberate solution for Zn plating and a bath for deposition of Sn-Zn alloys. (To be continued.) (L17; Cd, Zn)

425-L. Mechanical Polishing of Precious Metals. W. Burkart, H. Silman and C. R. Draper. Electroplating and Metal Finishing, v. 14, Mar. 1961, p. 85-88.

Review of surface conditions and defects of Au, Ag and Pt metal surfaces and methods and compounds for cleaning and surface finishing, including causes of spotting, staining and clouding and sanding, brushing and barrel polishing techniques. (L10, 10-54; EG-c31, Au, Ag, Pt)

426-L. Polishing of Steel With a Jet of Electrolyte. E. Yu. Yuganson. Electroplating and Metal Finishing, v. 14, Mar. 1961, p. 96-97.

Jet of orthophosphoric acid-sulphuric acid solution used for electropolishing of steel parts. Design and operation of electropolishing apparatus. (L12g, L13p, 1-52; ST)

427-L. Spread of Molten Tin on Mild Steel Reduced in Hydrogen or Treated With Molten Fluxes. E. T. Turkdogan and Susan Zador. Iron and Steel Institute, Journal, v. 197, Mar. 1961, p. 233-239.

Effects of reduction for various lengths of time and at 750° C. in dry or wet hydrogen and treatments with molten chloride fluxes on the tinning of mild steel strips. Electromotive force of measurement of Fe-flux-Sn galvanic cells to determine reactions occurring during tinning operations in the presence of fluxes. 10 ref. (L16, P13h, P15g, 2-64; CN, Sn)

428-L. Mechanical Plating: A Solution to Hydrogen Embrittlement? Iron Age, v. 187, Mar. 30, 1961, p. 107-109.

Use of mechanical plating, a process in which small metal-powder particles are cold welded onto parts in a wet tumbler, to prevent embrittlement when applying thickly plated protective coatings. (L29)

429-L. Upgrading Materials With Wear-Resistant and Refractory Coatings. Western Machinery and Steel World, v. 52, Mar. 1961, p. 46-48.

Flame and plasma processes for applying thin resistant coatings of metals, oxides and carbides to ordinary metals and other base materials to increase wear, abrasion and corrosion resistance. (L29)

430-L. (Translation-ConBur.) Cathodic Liberation of Vanadium Compounds. A. S. Goncharenko and O. A. Suvorova. Journal of Applied Chemistry of the USSR, v. 33, Apr. 1960, p. 847-850.

Study of the electrolysis of alkaline solutions containing quinquevalent vanadium to determine polarization curves and the nature of the resulting vanadium compounds. 14 ref. (L17; V)

431-L. (Translation-ConBur.) Influence of Impurities in Sulphamate Electrolyte on the Quality of Cathodic Tin. A. I. Levin and Chang Kuo-heng. Journal of Applied Chemistry of the USSR, v. 33, Apr. 1961, p. 855-860.

Influence of Cu, Fe, Pb, Sb, As, Bi and Zn impurities in the electrolyte on the composition and structure of the Sn deposit. 5 ref. (L17; Sn)

432-L. (Japanese.) Effects of Pattern Shape and Dimensions on Nickel Electroplating. Naoji Kinoshita and Isoji Toyoshima. Institute of Physical and Chemical Research, Reports, v. 36, Sept. 1960, p. 444-449.

Electrodeposition of Ni on a notched pattern from a 50° C. salt bath which is agitated by rotation of the cathode, bubbling with air or supersonic vibration. Data are given for the effect of agitation, current density and pattern shape on plating efficiency. (L17; Ni)

433-L. (Polish.) Defects of Galvanized Bull-Rope Cables. Zygmunt Jasiewicz, Adam Mazur and Boleslaw Mazela. Hutnik, v. 27, Oct. 1960, p. 368-372.

Technological causes of defects in Zn coatings on steel cables for use in

mines. Effects of patenting and electroplating conditions on uniformity, thickness, porosity, microhardness and adhesion (particularly during twisting) of the coatings. 3 ref. (L16, T7g; ST, 17-57)

434-L. Burrs Spur Finishing Progress. Iron Age, v. 187, Apr. 13, 1961, p. 77.

Use of bearingizing tools and high-speed steel cutting blades to deburr materials of 300 Bhn. and above. (L10; SGB-q)

435-L. Superior Plating Shows the Way. Metal Finishing, v. 59, Apr. 1961, p. 45-48.

Plating of Au, Ag, Rh, Pt and other precious metals on electronic and missile parts. Plating thickness is determined using an electronic thickness tester. Automatic Zn, Cd, Cu and Nichrome platings are also produced. (L17, T1, T24e; Ag, Au, Pt, Rh)

436-L. Electroplated Coatings in Boriding of Steel. Larissa Domnikov. Metal Finishing, v. 59, Apr. 1961, p. 49-51, 53.

Study of Ni and Cu platings as a means of protecting local areas during the boriding of steels. (L17, J28; ST, Cu, Ni)

437-L. Electroless Gold Plating. S. Duffield Swan and E. Lamar Gostin. Metal Finishing, v. 59, Apr. 1961, p. 52-53.

Electroless Au platings are deposited on small electronic and missile parts by chemical reduction of the Au in solution. Deposition of electroless Au over electroless Ni produces a very high finish. (L28, T24e; Au)

438-L. Production of Coated Aluminum. James S. Nelson. Metal Finishing, v. 59, Apr. 1961, p. 61-63.

Roll coating of Al strip with a thermosetting acrylic resin. The finished product has good exterior durability and a good balance of characteristics for formability. (L26p; Al)

439-L. Science for Electroplaters. Pt. 64. Nickel Plating--Watts Bath. L. Serota. Metal Finishing, v. 59, Apr. 1961, p. 64-66.

Effect of temperature, pH and current density on the cathode efficiency of a Watts electroplating bath are determined by measuring the weight of Ni deposited on an Au rod. The relationship between the cathode efficiency and the throwing power of the bath is shown. (L17a; Ni)

440-L. Low Cost Way to Coat Pipe. Materials in Design Engineering, v. 53, Apr. 1961, p. 10-11.

Development of a powder process for coating the inside of metal pipe with various thermoplastics. (L26p; 4-60)

441-L. (German.) Electrolytes for Polishing and Etching of Austenitic Chromium-Nickel and Manganese Steels. Guido Bassi. Zeitschrift fur Metallkunde, v. 52, Feb. 1961, p. 141-142.

Electrolytic polishing and etching of CrNi steel (10.5% Ni, 18.8% Cr) and Mn steel (11.7% Mn, 1% C) using electrolytes free of perchloric acid which allow polishing at low voltages (5-15 volts) at polishing times from 2-5 min. Composition of electrolytes. (L13; SS-e)

442-L. Electroplating Technique and pH Value. Corrosion Technology, v. 8, Mar. 1961, p. 92.

Effect of hydrogen ion concentration in plating bath on pH discoloration, brittleness and roughness of plated parts. (L17a)

443-L. Organic and Metallic Finishes. R. J. Brown. Metal Industry, v. 98, Mar. 24, 1961, p. 229-230.

Electroplating of automotive Zn-alloy die castings, steel, brass and stainless iron with Ni, Cr and Cd. Review of corrosion and thickness tests for castings. Use of metallized plastic materials. (L17, T21; Cu-b, Fe, ST, Zn-b, Cd, Cr, Ni)

444-L. (French.) Throwing Power of Nickel and Other Solutions Used in Electroplating. S. A. Watson. Galvano, v. 30, Jan. 1961, p. 24.

The throwing power of Ni, Co-Ni, Sn-Ni, Cu and Cr baths as investigated by a new method using the Hull cell. (L17b; Ni-b, Co-b, Cr-b, Cu-b, Sn)

445-L. (French.) Structure of Electrolytic Copper Deposits. G. G. Storey and S. C. Barnes. Galvano, v. 30, Jan. 1961, p. 26.

Influence of working conditions on the structure of Cu deposits from acid baths,

determined by microscopic, X-ray diffraction and optical goniometric examination. (L17c, M-general; Cu)

446-L. (Italian.) Departmental Modernization and Reorganization by Introduction of White-Metal Coatings. F. Forti and R. Indrigo. Fonderia Italiana, v. 9, Dec. 1960, p. 475-483.

Centrifugal casting, vibration solidification, degreasing, surface treatment by sand blasting and by $ZnCl_2$ dip tinning methods in a plant for steel friction-wear resistant parts for Diesel engines and turbines. 13 ref. (L16, L-general, E14, T21e; ST, Sn-b, 17-57)

447-L. Electrocleaning: A Report on Current Practice. Products Finishing, v. 25, Jan. 1961, p. 50-52, 54, 56, 58, 60.

Review of principles and application of cathodic and anodic electrocleaning and factors which affect cleaning quality. (L13n)

448-L. Painters' Problems. Pt. 2. Products Finishing, v. 25, Jan. 1961, p. 62, 64, 66, 68, 70, 72, 74.

Panel discussion of chemical conversion, dip galvanizing, anodic coating, painting and organic coating. Problems such as blistering and poor adherence and resistance to corrosion. Methods are evaluated for obtaining coating with optimum qualities. (L-general, 10-54)

449-L. Nickel Plate Cuts Buffing Costs. Products Finishing, v. 25, Jan. 1961, p. 76-79.

A bright nickel deposit, Superlume, with good leveling properties is used to fill in roughness on brass hardware items, eliminating much of the subsequent buffing operation. (L17; Cu-n, Ni)

450-L. Why Barrel Zinc Plating of Carbonitrided Steel Is Difficult. Products Finishing, v. 25, Jan. 1961, p. 84, 86, 88, 90.

Incomplete coverage or complete lack of deposition of Zn caused by deplating that takes place in the cyanide solutions when no current is passing from anode to cathode, resulting in anodic dissolution, because of the cathodic reaction of carbonitrited steel with Zn. (L17; ST, Zn)

451-L. (Russian.) Electrodic Polarization During Electrolytic Deposition of Cd, Sn and Sb. P. N. Kovalenko and K. N. Bagdasarov. Ukrainskii Khimicheskii Zhurnal, v. 26, May 1960, p. 573-578.

Electrodeposition of Cd, Sn and Sb using cathodes of Al, Nichrome or Pt plated either with Cu or Ni. Effect of cathode, temperature and pH on cathodic voltage, effective activation energy and deposition rate. 11 ref. (L17; Cd, Sb, Sn)

452-L. Present and Future Problem Areas for High Temperature Inorganic Coatings. J. D. Walton, Jr. American Ceramic Society Bulletin, v. 40, Mar. 15, 1961, p. 136-141.

Thermal and corrosion protection of rocket and missile parts with high-temperature inorganic coatings which are effective at 2500-5000° F. Substrates being coated are graphite, W, Mo, Cb and Tb. Deposition of $SiCl_4$, Rh, Al-Si, Teflon, Micarta, phenyl silane and silica is by vapor plating, electroplating, cementation, arc spraying, flame spraying and arc evaporation followed by sintering. (L-general, T24e)

453-L. Vapour Plating the Nuclear Metals. Australasian Manufacturer, v. 45, Mar. 4, 1961, p. 91.

Dry plating of uranium by diffusion bonding with Ni carbonyl, Mo carbonyl and W carbonyl at 600-650° C. Coating by deposition of Zr and Ti vapors. Coating by reduction of Mo halide, W halide, Ta halide and Cb halide. (L15, L18, L25g; U, Mo, W, Ni, Zr, Ta, Cb, Ti)

454-L. Lacquer Coating of Aluminum Magnesium Alloys. R. D. Guminski and F. M. P. Meredith. Oil & Color Chemists' Assoc., Journal, v. 44, Feb. 1961, p. 93-110.

Failure of lacquer coatings on Al-Mg alloys during deformation is traced to a hard, brittle and slightly alkaline oxide film formed during production. Correction of poor lacquer adhesion by applying an acid, chemical or electrochemical pretreatment. (L26n; Al-b, Mg)

455-L. Spray Phosphoric Acid Pickling. H. J. McVey. Paper from "Porcelain Enamel Institute Forum, Proceedings". v. 20. Porcelain Enamel Institute, Inc., Washington, D. C., 1958, p. 26-28.

Application of acid pickling by spraying instead of immersion for surface preparation of Fe for subsequent porcelain enameling. Method offers continuous sludge-free operation with constant solution composition, a high rate of pickling with uniform and consistent metal loss and a more economical process. (L12g; Fe)

456-L. Pickling Procedures--Adjustments for Various Soils. Harold C. Wilson. Paper from "Porcelain Enamel Institute Forum, Proceedings". v. 20. Porcelain Enamel Institute, Inc., Washington, D. C., 1958, p. 29-31.

Methods for removing various types of soil that are incurred during drawing and forming operations. Metal preparation for porcelain enameling. (L12g)

457-L. Growth of Aluminum During Porcelain Enameling. A. L. Sopp, Jr. Paper from "Porcelain Enamel Institute Forum, Proceedings". v. 20. Porcelain Enamel Institute, Inc., Washington, D. C., 1958, p. 88-91.

Factors affecting dimensional change in Al alloy specimens during firing. Measurements by a dial-gage extensometer are made of initial length, length after firing at 980° F. for 10 min. without coating and length after firing with porcelain enamel coating. Influence of alloy composition, metal thickness and enamel processing variables on the magnitude of change of length. (L27, P10d; Al-b)

458-L. Base Metals for One Coat Porcelain Enameling. R. L. Myers. Paper from "Porcelain Enamel Institute Forum, Proceedings". v. 21. Porcelain Enamel Institute, Inc., Washington, D. C., 1959, p. 38-39.

Review of the properties of various base metals (enameling sheet, cold rolled sheet, Univit and Ti Namel) as they affect one coat enameling. Properties discussed are uniformity, chemical composition, bond development, sag resistance, enamel fishscaling and boiling and workability range. (L27; 4-53)

459-L. Ultrasonic Cleaning Improves Reliability of Precision Ball Bearings. M. Tamas. Microtecnic, v. 15, Feb. 1961, p. 12-14.

Ultrasonic cleaning of miniature ball bearing parts in aqueous solutions, trichlorethylene or perchlorethylene excited by ceramic transducer. (L12, 1-74, T7d)

460-L. Electroforming Waveguide Parts. N. J. Pierce. Bell Laboratories Record, v. 39, Apr. 1961, p. 138-141.

Electroplating of Cu on Al, stainless steel, wax and plastic mandrels in an acid bath of copper sulphate. (L17, T1; Al, SS, Cu)

461-L. Chromizing Turns Steel Into Stainless. Chemical Engineering, v. 68, Mar. 20, 1961, p. 188-192.

Effect of a Cr coating applied by a diffusion process on corrosion resistance, Rockwell hardness, wear and heat resistance of carbon steels. (L15; CN, Cr)

462-L. Electrocrystallization of Copper on Single Crystal Spheres. Pt. 1. Morphology of the Deposit. N. A. Economou and D. Trivich. Electrochimica Acta, v. 3, Jan. 1961, p. 292-297.

Study of electrodeposition of Cu from an acid Cu bath on single crystal Cu spheres in the current density range of 1-20 mA per cm.^{2} Resulting growth structures are dependent on the base crystal and determined by a principal pole representing one of the densest planes of Cu (100), (110) and (111). 14 ref. (L17; Cu, Cu)

463-L. Electrocrystallization of Copper on Single Crystal Spheres. Pt. 2. Tracer Measurement of Distribution of the Deposit. N. A. Economou and D. Trivich. Electrochimica Acta, v. 3, Jan. 1961, p. 298-306.

Use of tracer techniques to study the distribution of Cu electrodeposited on single crystal Cu spheres from an acid Cu bath. Results indicate that minimum deposit thickness is dependent on average current density rather than plating time. 5 ref. (L17; Cu, Cu)

464-L. Calculation of Potential Energy Profile Diagrams for Processes in Electrolytic Metal Deposition. B. E. Conway and J. O'M. Bockris. Electrochimica Acta, v. 3, Jan. 1961, p. 340-366.

Construction of potential and free energy profile diagrams for successive and alternate steps in electrolytic metal deposition. Processes considered include ion transfer to different types of

metal surface sites, surface diffusion of adsorbed ions and successive dehydration of adsorbed ions in lattice building. 66 ref. (L17)

465-L. "Triple Threat" Protection for Cooling Water Systems. Chemical Processing, v. 24, Apr. 1961, p. 90-91.

Chemical pretreatment of surfaces in cooling water systems by a compound for removing organic and inorganic deposits and by rendering the metal surface inert to all chemicals except the filming inhibitor contained in the solution. (L12, W10g)

466-L. (French.) Protection of Surfaces Against Oxidation at Elevated Temperatures. J. Tragnan. Metallurgie, v. 22, Mar. 4, 1961, p. 43-46.

Application of coatings of plastic, Al, Ni-Cr alloy, cermets, refractories by the Schoop process. Choice of coating is dependent upon temperature. (L23)

467-L. (Japanese.) Observation of the Appearance of the Boundary Surface Between Enamel-Glass and Metal. Mechanism of Adherence of Aluminum Enamels. Toshio Yamada. Ceramic Association of Japan, Journal, v. 69, no. 781, 1961, p. 29-33.

Effect of oxide film compactness and uniformity as formed by anodic oxidation on the base metal on the adherence of enamel to Al plate. Metal-oxide-enamel interface bonding and diffusion are compared by metallographic and electron microscopy with conditions produced by surface chemical treatment. 3 ref. (L19, L27, M-general; Al-b, 4-53)

468-L. Phosphating in Cold Solutions. Robert C. Gibson. Metal Progress, v. 79, Apr. 1961, p. 100.

Improved techniques such as cold phosphating have resulted in expanded applications for phosphate coatings in protecting metal surfaces from corrosion and in preparing them for paints, vinyl and plastisol finishes. (L12, L14b)

469-L. Phosphating in a Nonaqueous Solution. Metal Progress, v. 79, Apr. 1961, p. 103.

Nonaqueous phosphating solutions based on trichlorethylene combine fast action and low operating costs. They can be used in separate tanks to process parts in batches or in automatic machines which degrease, phosphate and finish parts with paints thinned with trichlorethylene. (L12, L14b)

470-L. (Dutch.) The Fine-Honing of Surfaces. J. Tiedemann. Metaalbewerking, v. 26, Jan. 19, 1961, p. 286-290.

In the surface perfection of automotive parts such as crankshafts, camshafts, piston pins and valve stems, honing is given preference to other polishing methods because it reduces the roughness without creating a heat influenced surface layer. Effects of rotation speed, contact pressure, stone frequency and amplitude on surface quality. (L10h)

471-L. (German.) Processing Techniques in Nonferrous Semifinished Product Industry. Pt. 3. Ernst Muller. Zeitschrift fur Metallkunde, v. 52, Mar. 1961, p. 147-152.

Continuous extrusion of Pb and Al cable coatings 10-12 mm. diameter by a process which eliminates stop marks on coatings caused by recharging of press. Design and operation of the extruding mechanism. (L22, T7g; Pb-b, Al-b, 17-57)

472-L. Kaiser West Virginia Plant Coats Coil 66 Inches Wide. Metal Products Manufacturing, v. 18, Apr. 1961, p. 67-68, 96.

Design and operation of a strip coating line which paints aluminum strip up to 66 in. in width at speeds up to 100 ft. per min. (L26n; Al, 4-53)

473-L. Control and Techniques in Barrel Finishing. J. Burr. Industrial Finishing, v. 13, Mar. 1961, p. 29-32.

Effects of chip size, mass level, water level, speed of rotation, work load, compound type and processing time on the finish obtained on metal components. (L10d)

474-L. "Stripping Problems" in Industry. W. B. Hanley. Industrial Finishing, v. 13, Mar. 1961, p. 37.

Use of hot alkali and solvent type strippers for the removal of durable finishes. (L12h, L12k)

475-L. Automatic Solvent Degreasing Plant. Industrial Finishing, v. 13, Mar. 1961, p. 38-41.

Equipment for immersion and vapor degreasing with trichloroethylene. (L12, 1-53)

476-L. Vibratory Movement Speeds Finishing. G. D. de Vere Weston. Industrial Finishing, v. 13, Mar. 1961, p. 42-45.

Rubber lined steel trough is coupled to vibrator mechanism to vibrate parts in a mass of chips, compound and water. Reduced damage and entanglement of parts, shorter processing times and other advantages of vibrator process compared to precision barreling. (L10d)

477-L. Spray Cleaning in Automation. C. Holman. Industrial Finishing, v. 13, Mar. 1961, p. 46.

Aqueous degreasing materials suitable for spraying. Their application to metal cleaning. Limitations of spray techniques. (L12)

478-L. Exceptional Choice of Pretreatments. G. Turner. Industrial Finishing, v. 13, Mar. 1961, p. 53.

Special degreasing materials for prephosphating, precleaning, pre-electroplating, previtreous enamelling, pregalvanizing and aluminum processing treatment. (L12)

479-L. (Russian.) Mechanism of Electrodeposition of Cr. A. V. Pamfilov and A. I. Lopyshanskaya. Ukrainskii Khimicheskii Zhurnal, v. 26, Apr. 1960, p. 461-465.

The significance of cathodic films during Cr electrodeposition is investigated using Cr, Pt and Hg electrodes and Cr^{51} radioactive tracers. Determination of electrode capacities and relation to current, electrode and electrolyte. 15 ref. (L17b, 1-59; Cr)

480-L. Reaction Studies of Ceramic-Coated Tungsten. C. G. Bergeron, V. J. Tennery and A. L. Friedberg. American Ceramic Society, Journal, v. 44, Apr. 1961, p. 156-160.

Microstructural and X-ray diffraction analyses of glass and zircon-coated tungsten wires after oxidation testing in air at 3000° F. Glass, monoclinic zirconia and tungsten oxides are present in the coating, suggesting the gradual migration of oxygen through the coating. 5 ref. (L27, M-general, R1h; W, 4-61)

481-L. Electropolishing and Chemical Polishing of High-Strength, High-Temperature Metals and Alloys. J. A. Gurklis, L. D. McGraw and C. L. Faust. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 98, Apr. 12, 1961, 14 p. (Available as PB 161248 from U. S. Office of Technical Services, Washington 25, D. C.)

Chemical and electropolishing of 300 and 400 stainless steels, Nimonic 80, Waspalloy, S-816 alloy, AMS 5615 alloy, Be, Ti and Te alloys, Cb, Ta, V and W to remove burrs, provide dependable antifriction surfaces and improve corrosion resistance because of the absence of differential surface stresses caused by mechanical finishing. 30 ref. (L12, L13p; Be, Cb, Ni-b, SS, Ta, V, W, SGA-h)

482-L. Flame-Sprayed Alumina. Metal Industry, v. 98, Mar. 31, 1961, p. 249-250.

Adhesion testing of flame-sprayed alumina coatings on metals to determine the effects of metal substrate roughness, alumina particle velocity and alumina layer cooling rate on band strength and coating characteristics. (L23)

483-L. Thick Chromium Plating for Better Corrosion Resistance. Precision Metal Molding, v. 19, Apr. 1961, p. 59-61.

Increased bath operating temperature, current density and chromic acid to sulphuric acid ratio are used to produce thick, crack-free Cr platings. (L17; Cr)

484-L. (Italian.) Control of Sealing Processes of Anodic Oxidation Layers by Drop Tests. F. Sacchi and G. Paolini. Alluminio, v. 30, Jan. 1961, p. 9-17.

Quality control testing of anodic oxidation layers on Al after immersion into HNO_3 by a 2% alcoholic solution of methyl violet. Effect of Ni salt sealing and aging of oxidation layers. 4 ref. (L19, 1-54; Al)

485-L. (French.) Anodes. Galvano, v. 30, Feb. 1961, p. 81-86.

Review of inert, insoluble, auxiliary and bipolar anodes. Survey of applications and roles in the electrolytic process. 22 ref. (L17, W3h)

486-L. (French.) Chromium-Plating Baths. Guy Bacquias. Galvano, v. 30, Feb. 1961, p. 89-90.

Composition and application of baths based on chromic and sulphuric acid, sulphates, fluosilicide and potassium fluoride. Evaluation of classical, self-regulating high speed and Bornhauser baths. (L17c; Cr)

487-L. (French.) Defects in Electrolytic Deposits: Pinholes. H. Richter. Galvano, v. 30, Feb. 1961, p. 91-93.
Role of hydrogen in pinhole formation. Preventive measures in the electrodeposition of Cd. (L17, 2-60, 9-68; Cd, H)

488-L. Molten Caustic De-Sands Cylinder Heads. Metalworking Production, v. 105, Apr. 5, 1961, p. 54-55.
Leaching of sand particles from diesel engine cylinder head castings by pickling the castings in molten NaOH at 500° C. for 25 min. (L12g; 5)

489-L. (Translation-Brutcher no. 4930.) Diffusional Boride Coatings on (NF) Metals. A. N. Minkevich. Izvestiya Vuz-Chernaya Metallurgiya, July 1960, p. 171-179.
Production and properties of boride coatings on refractory metals obtained by liquid boronizing in fused borax with boron carbide additions and by vacuum treatment in powders of metallic boron or boron carbide. (L15; EG-d37)

490-L. (Italian.) Standard Specifications for Nickel Plating on Copper and Zinc Base Alloys. Nickel, Dec. 1960, p. 13-14.
Minimum thickness requirements for Ni deposits. (L17c, S22; Cu-b, Zn-b, Ni)

491-L. Designing With Vinyl-Metal Laminates. James K. Baker. Machine Design, v. 33, Apr. 27, 1961, p. 102-107.
Design factors in selecting and specifying vinyl films for lamination to cold rolled, aluminized and stainless steels, galvanized Zn tinplate, Al and Al alloys and Mg. Technique for welding brackets, studs and body joints in vinyl-metal parts. (L22; Al-b, Mg, ST)

492-L. Nickel Dip. N. S. C. Millar. Institute of Vitreous Enamellers Bulletin, v. 11, Mar. 1961, p. 77-84.
Flash coating of Ni on sheet steel by galvanic and chemical reduction processes in preparation for enameling. Coating prevents oxidation and results in consistently good adhesion. 7 ref. (L16; ST, Ni, 4-53)

493-L. Applications of Tin-Nickel. Product Finishing, v. 14, Apr. 1961, p. 54-56.
Corrosion resistance, low coefficients of friction and high reflectivity in infrared region make Sn-Ni suitable for plating analytical weights, watch parts, musical instruments, drawing instruments, domestic hardware and reflectors for infrared ovens. (L17; Ni, Sn)

494-L. Electroless Nickel Plating. G. Fitzgerald-Lee. Product Finishing, v. 14, Apr. 1961, p. 60-61, 79, 99, 101.
Techniques for plating by chemical reduction. Properties and applications of chemically deposited Ni. Response of deposits to heat treatment. (L28; Ni)

495-L. Adherence of Electrolytic Coatings. Product Finishing, v. 14, Apr. 1961, p. 81-84.
Obstacles to good adherence. Importance of reactive surfaces. Electrolytic degreasing with and without cyanide. Degreasing combined with electrodeposition of Cu. (L17, L12; Cu)

496-L. A Service to Industry. Product Finishing, v. 14, Apr. 1961, p. 88-90.
Hard anodizing of Al. Properties of hard anodic films. Applications; decorative anodizing. (L19)

497-L. A New Cobalt-Nickel Sulphamate Bath. Ignatius Tsu. Plating, v. 48, Apr. 1961, p. 379-381.
Sulphamate bath for electroplating of Co-Ni films having a wide range of magnetic properties. Effect of chloride ions on bath performance. 13 ref. (L17; Co, Ni)

498-L. Porosity of Electrodeposits. Causes, Classification and Assessment. Artur Kutzelnigg. Plating, v. 48, Apr. 1961, p. 382-387.
System of classification and symbols for different types of pores and cracks encountered in electrodeposits. Causes of and principle method of assessing porosity. 30 ref. (L17, 9-68)

499-L. Deposition of Iron From Salts of Fluoro Acids. Jean H. Connor and Vernon

A. Lamb. Plating, v. 48, Apr. 1961, p. 388-389.

Performance of Fe plating baths based on ferrous salts of several fluophosphoric acids and of trifluoroacetic acid and heptafluorobutyric acid. Nature of deposits. (L17; Fe)

500-L. Seal Leakage Reduced by Blasting. Grinding and Finishing, v. 7, Apr. 1961, p. 32-33.

Wet blasting with ultrafine glass beads produces a nondirectional finish on steel shaft which reduces leakage between the shaft and the rubber seal. (L10c; ST)

501-L. Plating Aluminum for Exterior Service. Products Finishing, v. 25, Apr. 1961, p. 34-37.

Al is electroplated by various techniques using Cu-Ni-Cr plate. Preparatory processes are either zincate immersion or phosphoric anodizing. It is found that Al panels plated heavily with Zn prior to regular Cu-Ni-Cr plating show best corrosion resistance. (L17; Al, Cr, Cu, Ni)

502-L. Precision Buffing of Weight for Analytical Balances. Products Finishing, v. 25, Apr. 1961, p. 82, 84, 86.

Permanent-mass, nonmagnetic stainless steel alloy precision-made weights are buffed to a smooth bright finish by an automatic buffing machine equipped with 24 spindles. Production rate 500 per day. (L10a; SS)

503-L. Refractory Metal and Non-Metal Coatings Deposited at Higher Rates With New Electron Beam Evaporator. Industrial Heating, v. 28, Feb. 1961, p. 352.

Remote controlled electron beam gun is capable of producing a thin film coating on microminiaturized electronic circuitry, optical filter film and similar thin metallic or nonmetallic materials. (L29, T1)

504-L. (Translation-ConBur.) Electroplating of Copper and Cadmium on Solid Electrodes Using High Current Densities. G. A. Emel'yanenko and E. Ya. Baibarova. Academy of Sciences of the USSR, Proceedings, Physical Chemistry Section, v. 129, Nov-Dec. 1959, p. 1045-1047.

Study shows that under the above conditions electrochemical changes occurring on the solid electrodes may be explained by delayed discharge and concentration polarization. When solution in vicinity of cathode becomes deficient in discharging metal ions, making the potential more negative, the process rapidly becomes controlled by diffusion instead of by the electrochemical reaction. At the same time, the electroplated metal changes from a compact to a loose deposit. (L17; Cd, Cu)

505-L. Drying Ovens Facilitate New Technique for Rust-Proofing Automobile Bodies. Industrial Heating, v. 28, Mar. 1961, p. 537-538, 540, 551.

Rust proofing sequence includes cleaning in alkaline solution, rinsing, bonderizing at 130° F., chromic acid conditioning and dip and spray coating with rubber-base water emulsion. Parts are baked in gas-fired ovens with four control zones. (L16, L26n, T21a)

506-L. (German.) Roughening of Metal Surfaces by Pickling. H. Psille. Feinwerk Technik, v. 65, Jan. 1961, p. 1-4.

Review of pickling and etching of metal surfaces as influenced by pretreatment of metal, grain size, concentration and temperature of acid and alkaline pickling solution and after-treatments such as rinsing and drying. Measurement and assessment of surface roughness. (L12g, L12k, S15)

507-L. Painting Structural Steel on Conveyor Line. Industrial Finishing, v. 37, Apr. 1961, p. 30, 34.

Huge structural steel assemblies and subassemblies are spray painted from above and below as the steel moves along on a large cross bar conveyor measuring 15 ft. wide and 400 ft. long. (L26n; ST, 4-57)

508-L. Cleaning and Painting Steel and Aluminum Strip. Nathan Becker. Industrial Finishing, v. 37, Apr. 1961, p. 40-42, 44, 46, 48.

Steel and Al coiled strip is coated with baking enamel on both sides before shearing and forming operations are performed. Unwinding, splicing, cleaning and surface preparation. Paint is applied by roller coaters in a clean pressurized room and baked in an eight zone convection oven. Application of the strip for awnings, patio covers, boat shelters, carports and small airplane hangers. (L26n; Al, ST, 4-53)

509-L. Hardfacing Now With Flame-Sprayed Rod. Metalworking Production, v. 105, Apr. 19, 1961, p. 61-63.

A three stage spray flow process including preparation of steel workpieces by cleaning and machining, spraying of Stellite alloy in rod form by a spray pistol and fusing of the deposit by an oxy-acetylene torch, furnace or induction heating. Control of deposit thickness in the range 0.010-0.060 in. and of metallurgical structure. (L24; ST, Co-b)

510-L. Vapor Degreasing. H. E. Linsley. American Machinist/Metalworking Manufacturing, v. 105, Apr. 17, 1961, p. 127-140.

Trichlor and perchlor used in degreaser for metals. Description of various setups for installation, operation and maintenance of portable and vibratory degreasers. Vapor cycles, cleaning processes, toxicity and health hazards discussed. (L12j)

511-L. Vibratory Finishing. A. A. Poluchka. American Machinist/Metalworking Manufacturing, v. 105, Apr. 17, 1961, p. 141-142.

Rotation and vibration combine to produce a spiral orbital motion which reduces deburring and polishing time on cast iron, hardened steel and other metal parts. (L10d; CI, ST)

512-L. The Adhesion of Sprayed Molybdenum. R. T. Allsop, T. J. Pitt and J. V. Hardy. Metallurgia, v. 63, Mar. 1961, p. 125-131.

Study of the interfaces between Mo and mild steel, Co and brightray bases. Examination of the interfaces using both optical and electron microscopy reveals that interfacial layers are present. X-ray microanalysis indicates that the layer between the Mo deposit and the steel base is probably an alloy of Mo and Fe. (L23; CN, Co, Mo)

513-L. (French.) Electrolytic Polishing, a Process for Many Purposes. H. W. Bredin. Machine Moderne, v. 55, Mar. 1961, p. 48-50.

Adaptability of electrolytic polishing. Its effect on surface defects and surface brilliance. Lack of orientation of deposits. (L13p)

514-L. The Carbonyl Nickel Story. Union Carbide Metals Review, v. 4, Winter-Spring, 1961, p. 10-12.

Thermal decomposition of nickel carbonyl to electroform patterns and dies of pure Ni with speed, versatility, economy and accuracy. (L18; Ni)

515-L. A Note on Flame Spraying Developments. Lloyd Manuel. British Welding Journal, v. 8, Apr. 1961, p. 121-122.

Review of applications and advantages of wire powder and plasma flame metal spraying processes. Spraying material analyses and melting points are tabulated. (L23)

516-L. (German.) Cleaning and Passivation of Stainless Steels. Hans H. Reinsch. Metall-Reinigung+Vorbehandlung, v. 10, Mar. 1961, p. 33-34.

Cleaning of steel surface from oil, flux, scale, welding slag and metallic lubricants (Cu, Pb, Cd). Results of passivation tests using HNO_3 and HNO_3 + HF pickles and of anodic oxidation tests. Special treatment for passivation against H_2O_2. (L12g, R10c; SS)

517-L. (German.) Bright or "Lapidary" Polishing of Metal Goods. Thomas H. Curti. Metall-Reinigung+Vorbehandlung, v. 10, Mar. 1961, p. 35.

Bright polishing with and without after treatments (bright chromizing) of hard metals such as stainless steel, Pt alloys, Ni and Ni alloys, bronze, Au and Au alloys, using high-speed paper-covered steel polishing wheels. (L10b; Au-b, Cu-s, Ni-b, Pt-b, SS)

518-L. Zinc-Coated Steel. Southern Power & Industry, v. 79, May 1961, p. 74-75.

Application of Zn coatings to structural steel by hot dip galvanizing, electrogalvanizing, metallizing or spraying, sherardizing and painting. Zn coatings protect iron and steel by forming a mechanical barrier to exclude the corrosive attack of various atmospheres and by galvanic action. (L-general; Fe, ST, Zn)

519-L. Ultrasonics, the Sound You Cannot Hear. R. B. Allured. Detroit Engineer, v. 25, May 1961, p. 10-12.

Generation of ultrasonic energy and its use in cleaning, cutting, machining, welding and inspection. (L-general, G17, K-general, S13, 1-74)

520-L. (French.) Present State of Brass Plating and Some Applications. C. B. Hiott. Galvano, v. 30, Mar. 1961, p. 169-172.

Composition of the bath, current density, temperature and properties of the brass deposit on a Zn base metal. (L17; Zn, Cu-n)

521-L. Chromium Blanket Protects Missile Probe. Machine and Tool Bluebook, v. 56, May 1961, p. 106-107.

Diffusion alloy process using W-2 Cr surface alloy for the protection of Mo missile probes against oxidation and metal erosion caused by exposure to airstream temperatures of 1400° F. (L15, T24e; Mo, Cr)

522-L. Successful Joining of Aluminum With Stainless Steel. Light Metal Age, v. 19, Apr. 1961, p. 10.

Description of molecular bonding of Al sheet to stainless steel to produce stainless clad Al or Al clad stainless. Metallurgical characteristics and applications of the material. (L22; Al, SS, 4-53)

523-L. Recent Development in the Electrodeposition of Zinc and Cadmium. T. E. Such. Electroplating and Metal Finishing, v. 14, Apr. 1961, p. 115-118, 122.

Electrodeposition of Cd alloy. Preplating and postplating treatments to prevent corrosion, rust, galling, delayed fracture and hydrogen embrittlement in Zn and Cd plated parts. 24 ref. (L17; Cd, Sn, Zn)

524-L. The Effects of Some Addition Agents in Bright Nickel Plating. T. Shimuzu and K. Azada. Electroplating and Metal Finishing, v. 14, Apr. 1961, p. 126-128.

Testing of certain organic agents such as saccharin, butyne diol, naphthalene sodium sulphonate, gelatin and ethylene cyanhydrin in Ni plating solutions to determine their effects on brightness, leveling and stresses in the Ni deposit. 5 ref. (L17a; Ni)

525-L. Theory and Practice in Chromium Plating. J. Nugent. Electroplating and Metal Finishing, v. 14, Apr. 1961, p. 131-132.

Measurement of solution efficiency and throwing power in the electroplating of Cu, Ni and steel articles of varied size and shape with Cr. Determination of the optimum solution concentration. Use of air agitation to prevent gas pockets and deposit porosity. Reprocessing of rejects. (L17; Cu, Ni, ST, Cr)

526-L. Before Hardfacing...Analyze the Job. Welding Engineer, v. 46, May 1961, p. 70, 72, 74.

Factors of size and location of the area to be hardfaced, hardness of base material and wear, abrasion and corrosion resistance requirements as they affect choice of material for deposition and deposition techniques. (L24)

527-L. Heat Fused Ceramic Coatings for Aluminum Components of Rocket Launchers. T. Rice and T. Turner. Rock Island Arsenal Laboratory. U. S. Office of Technical Services, PB 171047, Oct. 1960, 15 p. $.50.

Ceramic coatings containing Pb-bearing and Pb-free frits, addition agents and pigments are applied to Al test panels. Coatings show excellent heat resistance but are deficient in abrasion resistance. (L27, T2p; Al)

528-L. Protective Coatings for Refractory Metals. C. G. Bergeron. Department of Ceramic Engineering (Wright Air Development Division). U. S. Office of Technical Services, PB 171193, Aug. 1960, 45 p. $1.50.

Evaluation of various ceramic coating systems for tungsten metal. These include silicide coatings, ceramic crystals in a glass matrix, zirconia clad coatings, vapor-deposited SiO and recrystallizing glasses. The most effective coating, which is effective for tungsten at temperatures of 3000° F., or higher, is a coating consisting of 35% glass and 65% zircon. (L27; W)

529-L. Factory Color Coating for Prefab Buildings. Haviland F. Reves. Metal Finishing, v. 59, May 1961, p. 61-65.

Description of forming, bonding, finishing and baking operations involved in color coating of galvanized steel panels. (L14; ST, 8-65)

530-L. Chrome Plating High-Loaded Components. Larissa Domnikov. Metal Finishing, v. 59, May 1961, p. 66, 73.

45 and 45 CrNi steels plated with Cr are tested to determine the effect of strengthening the parts by use of

rollers on the corrosion-fatigue resistance of the plated part. 4 ref. (L17; ST, Cr)

531-L. Science for Electroplaters. Pt. 65. Variables in the Watts Bath. L. Serota. Metal Finishing, v. 59, May 1961, p. 76-78.

Review of studies on the effects of bath current, pH and composition on physical properties of the Ni deposit. Causes and prevention of stress in deposits. (L17a; Ni)

532-L. Some Recent Advances in Anodizing Practice and Knowledge. F. C. Porter. Metal Finishing Journal, v. 7, Apr. 1961, p. 145-151.

Data are given for anodizing characteristics of wrought and cast Al. Compositions for chromic, sulphuric and oxalic acid baths. Brightening processes. Continuous anodizing. (L19)

533-L. (German.) Electroplating Processes Used in Screw Manufacturing. J. Garnier. Draht, v. 12, Mar. 1961, p. 95-101.

Review of processes for bolts and screws of carbon steel; Cr, Ni, Mo alloyed steel and nonferrous metals such as Al and Cu and their alloys. Topics include pretreatments such as pickling, descaling and degreasing; and plating operations and electrolytes for Cd, Cr, Ni, Zn, Cu and brass electrocoating. (L17, L-general, T7f; ST, Al-b, Cu-b, Cd, Cr, Ni, Zn, 17-57)

534-L. (German.) Duplex Electrocoating. Karl Muller. Draht, v. 12, Mar. 1961, p. 103-108.

Review of properties and production of duplex Ni, Cr and combined Ni and Cr electrocoatings in terms of corrosion mechanisms (current-potential curves), corrosion resistance (results of surface corrosion tests) and duplex electrocoating processes (Harshaw Chemical process; DeWeKa-Doniplat process). (L17, R-general; Ni-b, Cr-b)

535-L. (German.) New Method of Deburring, Punching and Drawing Die Forgings. Werner Funke. Fertigungstechnik und Betrieb, v. 11, Feb. 1961, p. 95-99.

Tool and method for simultaneous deburring, punching and drawing of steel die forgings. Tool design and mode of operation. Savings of ball bearing steel in manufacture of ball bearing rings. (L10, F27, F22k; ST)

536-L. Recent Developments in Nickel/Chromium Plating. G. Fitzgerald Lee. Product Finishing, v. 14, May 1961, p. 83-84, 148.

Brief review of the technical implications of the British Standards applicable to Ni/Cr plating. Improvement of the resistance of Ni/Cr coatings to atmospheric conditions. (L17; Cr, Ni)

537-L. Tin-Nickel Plating for Railway Signal Relays. Tin and Its Uses, no. 51, 1961, p. 6.

Effect of electroplating brass railway signal relays with a Ni-Sn alloy on their dust, fume, moisture and corrosion resistance. (L17; Cu-n, Ni, Sn)

538-L. Choice of Surface Treatment Method. D. G. Cox. Corrosion Prevention and Control, v. 8, Apr. 1961, p. vi-vii.

Surface preparation of steel for coatings using hand or power brushing and scraping, chemical cleaning and polishing, flame descaling and blasting with flint, iron and steel shot, sand or Si free abrasives. (L-general; ST)

539-L. Electrodeposition of Iron-Zinc and Nickel-Zinc Alloys: Cathode Potential and Structure. Vasanta Sree, S. K. Panikkar and T. L. Rama Char. Electrochemical Society, India Section, Bulletin, v. 10, Jan. 1961, p. 8-10.

Deposit composition and structures and related cathode potential curves as a function of current density are studied for alloys in the systems deposited from chloride-pyrophosphate baths. 23 ref. (L17; Fe-b, Ni-b, Zn)

540-L. Metal Finishing for the Electronics Industry. J. Dawson. Metal Industry, v. 98, Apr. 28, 1961, p. 331-334.

Techniques and problems involved in finishing electronic components with Cd, Au, Cu, Ni, Pt, Rd, Ag, Pd, Co and alloys of Sn-Zn and Sn-Cd. (To be continued.) (L-general, T1)

541-L. Vibratory Finishing the Key to Smoother Surfaces. W. E. Brandt. Iron Age, v. 187, May 18, 1961, p. 135-137.

Finishing of airfoil parts to strict tolerances by vibratory process to increase efficiency and blade life. Profilometer readings given as a function of time. (L10, T24b)

542-L. Large Wind Nozzles Made by Electroforming Nickel. G. E. Sutila and J. F. Goodwin. Materials in Design Engineering, v. 53, May 1961, p. 145.

Large, one-piece Ni nozzles are produced by electrolytically depositing Ni on a conductive pattern. (L18; Ni)

543-L. High-Temperature Nickel Aluminum Coatings. Products Finishing, v. 25, May 1961, p. 82-87.

Formation of an oxidation resistant coating capable of protection to 1000° C. on steel panels by electrodeposition of Ni from a Watts bath and plating Al onto the Ni from a fused salt bath at 700° C. (L17, R1h, 2-62; ST, Ni-b, Al-b)

544-L. Plastic Coatings for Electrical Insulation. W. R. Pascoe. Electrical Engineering, v. 80, May 1961, p. 360-363.

Application of the fluidized bed process to coating of electrical components with cellulosic, vinyl, epoxy, nylon, polyethylene and chlorinated polyether. System produces a coating of uniform thickness that closely follows the contour of the part. (L26p, T1)

545-L. Getting the Most From Chlorinated Solvents. Metalworking Production, v. 105, Apr. 26, 1961, p. 61-62.

Automatic and semi-automatic solvent degreasing methods and machinery using tri and perchloroethylene as solvents. (L12h, 1-52)

546-L. What's New in Metal Cleaning. G. A. Cairns. Industrial Finishing, v. 37, May 1961, p. 39-40, 42, 44.

Development of cleaning solutions utilizing glassy phosphates as sequestering agents. Classification of wetting agents according to their most effective pH range. Cleaning of ferrous and nonferrous materials using soaps made from resinous fatty acids. (L12)

547-L. (German.) New Corrosion Protection of Aluminum Sheathed Cables. Wilhelm Birnthaler and Georg Falk. ETZ Elektrotechnische Zeitschrift, v. 13, Mar. 6, 1961, p. 112-114.

Corrosion protection by coating with a thin wash primer film followed by a bitumen base adhesive layer and sheathing with PVC. Comparative corrosion testing at 50° C. in NaCl solution of cables with and without wash primer coating. (L26, R-general, T1b; Al, 17-57)

548-L. Dry Drawing Compounds. William D. Wilson. Paper from "Porcelain Enamel Institute Forum, Proceedings". v. 22. Porcelain Enamel Institute, Inc., Washington 6, D. C., 1960, p. 24-25.

Description of spray and roller coat methods used to apply dry lubricants composed of soap, borax and other chemical additives when drawing steel, Cu, Al and brass. Lubricants reduce cost, increase die life and improve drawn material. (L26c, 18-73; Al, Cu-b, ST)

549-L. Nickel Reduction. J. P. Finley, Jr. Paper from "Porcelain Enamel Institute Forum, Proceedings". v. 22. Porcelain Enamel Institute, Inc., Washington 6, D. C., 1960, p. 88-90.

Deposition of electroless nickel on steel by reducing $NiSO_4$ using NaH_2PO_4. The amount of Ni deposition per sq. ft. increases with temperature. (L28)

550-L. (English.) Note on the Field-Emission Microscopic Observation of Nickel Deposited on Tungsten. Katuhiko Azuma. Hokkaido University, Research Institute for Catalysis, Journal, v. 8, Dec. 1960, p. 264-267.

Effect of temperature on field emission patterns of Ni deposited onW as observed by microscopic examination of Ni clusterings. Phase formation of resulting alloys. (L17; W, Ni)

551-L. End White-Layer Problems on Nitrided Parts. R. F. Erxleben. Iron Age, v. 187, May 25, 1961, p. 106-107.

Grinding of the white layer from nitrided steel parts is eliminated by electroplating with Cu or bronze or coating with a tin base paint and heating at 975-1100° F. (L17; ST, Cu, Sn)

552-L. Electrolytic Polishing of Bismuth. G. A. Hare and H. D. Mallon. Metallurgia, v. 63, Apr. 1961, p. 208-209.

Because of the depth of the effect of surface deformation during grinding, the production of metallographic specimens of Bi is very difficult. Technique suggested involves alternate grinding and

etching, followed by electrolytic polishing. (L13p; Bi)

553-L. Chemical Polishing of Lead and Its Alloys. R. C. Gifkins. Metallurgia, v. 63, Apr. 1961, p. 209-210.

Technique for obtaining a satisfactory chemical polish using the Worner and Worner reagent, comprising a mixture of glacial acetic acid and hydrogen peroxide. (L12; Pb-b)

554-L. Roll-Coating Line Primes, Paints, Embosses in One Pass. Modern Metals, v. 17, May 1961, p. 43, 46.

New finishing line at Hunter Engineering, Riverside, Calif., applies epoxy primer to one or both sides of Al strip before finish coating and can also emboss it before re-coiling. (L26p; Al, 4-53)

555-L. Mechanization Is Keynote of Today's Finishing. Metalworking Production, v. 105, May 10, 1961, p. 11-12.

Sheet, strip, wire and tube of Cu, Ni, steel, brass, Sn, Al and Cr are finished by a variety of automatic, mechanized processes including degreasing, chemical polishing, electroplating, pickling, etching anodizing, vitreous enamelling and coating with organic finishings. (L-general, 18-74; Cu-b, ST, Ni, Sn, Al, Cr)

556-L. To Cut Deburring Costs, Mechanize! V. C. Spears and D. E. Keener. Metalworking, v. 17, May 1961, p. 15-16, 24.

Comparison of four deburring methods (barrel and vibratory finishing and airless and liquid blast) in terms of selection factors. (L10; 5)

557-L. The Relative Reactivity of Various Nickel Electrodeposits. V. Hospadaruk and J. V. Petrocelli. Plating, v. 48, May 1961, p. 479-487.

Potentiostatic and galvanostatic techniques are used to determine the reactivities and relative pitting intensities of Watts-type, semibright and bright Ni deposits as a function of sulphur content. 27 ref. (L17; Ni)

558-L. Electroplating Onto Zinc-Titanium-Copper Alloy. R. Scott Modjeska and Simon P. Gary. Plating, v. 48, May 1961, p. 488-490.

Polishing, buffing, cleaning and plating techniques for plating onto a newly developed Zn rich alloy which is easily fabricated. (L17; Zn-b)

559-L. The Nature, Cause and Effect of the Porosity in Electrodeposits. Pt. 7. Microscopic Examination of Nickel-Chromium Coatings After Atmospheric Corrosion. Donald W. Ernst and Fielding Ogburn. Plating, v. 48, May 1961, p. 491-497.

Ni-Cr coatings on steel are examined for pitting and cracking after exposure to sea coast and industrial atmospheres. Laboratory examinations of galvanic cells, in which polarity of the Ni-steel couple changes with variations in the electrolyte, are used to explain differences in pit shapes and rust exudation. (L17, 9-68; ST, Cr, Ni)

560-L. (Translation-ConBur.) Overvoltage in the Electrodeposition and Solution of Metals. A. T. Vagramyan and A. P. Popkov. Academy of Sciences of the USSR, Bulletin, Division of Chemical Science, May 1960, p. 765-770.

Study of the rate of reduction and rate of anode solution during electrodeposition of Ni, Co, Fe, Cu, Zn, Cd, Tl and Sn from 1 N sulphate solutions to obtain quantitative data with respect to overvoltage. 12 ref. (L17, P15; Cd, Co, Cu, Fe, Ni, Sn, Tl)

561-L. A New Production Method of Metal Preparation for Special Steels and Conventional Enameling. Jason M. Zander and Richard Delott. Porcelain Enamel Institute Forum, Proceedings, v. 22, 1960, p. 98-102.

Surface preparation prior to the enameling of steel by pickling in a ferric sulphate-sulphuric acid bath. The firing range over which satisfactory adherence is obtained may be lowered by 30-60° F. by this method of preparation. (L12g; ST)

562-L. Molten Salt Jet-Sprayed for Cleaning Steel. Machinery, v. 67, May 1961, p. 140.

Annealing scale is removed from continuously moving stainless steel strip by jet-spraying with molten salt, followed by acid-pickle bath and hot water rinse. (L12n, L10; ST)

563-L. Precision Finishing by Vibration. Australasian Manufacturer, v. 46, Apr. 15, 1961, p. 76-78.

Burnishing and deburring of phosphor bronze bearing cages, zinc die castings

and steel stampings, circlips and screw inserts with vibrator machine results in much faster processing time then with barrelling machine. (L10; Cu-s, ST, Zn)

564-L. Many Electronic Equipment Problems Solved by Magnesium With Electroplated Finish. Magnesium Products, May 1961, p. 9-10.

Electronic equipment made of AZ31B or HM21A alloys is electroplated with Cd, Cu, Zn, Au, Ag or Ni to increase the weldability of the equipment. Thin vapor-deposited films of Cr, SiO and Al are formed on the electroplated coatings. (L17, L25; Mg)

565-L. Electrolytic Etching of Dense Tantalum. A. L. Jenny and R. A. Ruscetta. Electrochemical Society, Journal, v. 108, May 1961, p. 442-445.

A method of etching for the purpose of increasing effective surface area and thereby increasing capacitance. The increase is related to electrolyte composition (especially the amount of water present), current density, temperature and hardness of the Ta. The decrease in surface area following post-etch anodizing gives a clue to the size of the etch pits. 4 ref. (L13q; Ta)

566-L. Mass and Heat Transfer During the Chemical Vapor Deposition of Metals. J. H. Oxley and J. M. Blocher, Jr. Electrochemical Society, Journal, v. 108, May 1961, p. 460-464.

A general mathematical treatment of mass and heat transfer rates in a deBoer-Van Arkel refining cell is presented. On the basis of this, it is possible to correlate yield, time of run, rate of deposition and power losses. 14 ref. (L25)

567-L. The Production of the SIMCA Aronde. P. A. Sidders. Machinery (London), v. 98, May 17, 1961, p. 1104-1113.

Painting automobile body-shells and other components by flow coating and spraying. The coatings are oven-dried at 180° C. (L26n, T21a)

568-L. Aluminum Finishing Progress. Norman I. Gaynes. Metal Finishing, v. 59, June 1961, p. 75-78, 80.

Evaluation of surface and mechanical properties of organic films on Al alloys with attention to corrosion, abrasion and impact resistance and reflectance. Comparison with anodizing in terms of applicability and production costs in the automotive industry. (L26, L19, 10-54; Al-b)

569-L. Analysis of Rhodium Baths. Volumetric Metal Determination. Harold G. Rackett. Metal Finishing, v. 59, June 1961, p. 79-80.

Determination of Rh content of phosphate-type Rh plating baths by an oxidation-reduction reaction, using NaOH and by titration in 0.05 N sodium thiosulphate solution. 3 ref. (L17a, S11j; Rh)

570-L. Control of Alkaline Tin Plating Baths. Larissa Domnikov. Metal Finishing, v. 59, June 1961, p. 90-91.

The luminescence spectrum of bivalent Sn in solutions determined by photoelectric methods after excitation by ultraviolet light. Application of the method to composition control in Sn plating systems. 5 ref. (L17a; Sn)

571-L. Science for Electroplaters. L. Serota. Metal Finishing, v. 59, June 1961, p. 94-95.

Stress values as a function of deposit thickness are obtained for Ni deposited on stainless steel and Cu specimens from a Watt's bath. Mechanisms are considered for grain boundary inclusion and Co-deposited impurities as stress causing factors. (L17c, Q25h; Ni)

572-L. Need Precision? Don't Overlook Electroforming. W. H. Safranek. Product Engineering, v. 32, June 5, 1961, p. 44-49.

Review of electroforming methods and applications with emphasis on selection of mandrel systems and plating alloys. Design considerations for depositing Ni, Ag, Cu, Fe, Co and composite materials using stainless steel and plated steel, nylon, glass and plastic mandrels with data given for tolerances, shape, finish and mechanical properties. (L18, 10-54; Ni, Ag, Cu, Fe, Co, SS, NM, 17-57)

573-L. (German.) Carbon Content of Steel Sheet, Enamel and Enamelling Temperature During Vitreous Enamelling. Dietrich Horstmann. Stahl und Eisen, v. 81, May 11, 1961, p. 629-640.

Investigation of influence of carbon content of sheet, type of enamel and

enamelling temperature on enamel defects, adhesion to steel, impact strength of enamel and deformation during enamelling of 1 and 2 mm. thick rimming and killed basic Bessemer steel, air refined special steels and openhearth steel of 0.015-0.29% carbon. (L27; ST)

574-L. (German.) Anodic Treatment Forms Oxide Layers on Platinum. K. Nagel and H. Dietz. Electrochimica Acta, v. 4, May 1961, p. 1-11.

Study of formation of PtO_2 and other oxides on Pt electrode by anodic treatment with direct or superposed a-c. Effect of charge magnitude and rest values on establishment of Galvani and equilibrium tensions. 28 ref. (L19; Pt)

575-L. (English.) An X-Ray Diffraction Study of the Anodic Oxidation of Ag in H_2SO_4 Solution. G. W. D. Briggs, I. Dugdale and W. F. K. Wynne-Jones. Electrochimica Acta, v. 4, May 1961, p. 55-61.

X-ray diffraction patterns of the anodic oxide layer on Ag are obtained from oscillating Ag electrodes during polarization in H_2SO_4 solution and are compared with those obtained from Ag in KOH and from an inert electrode in acid Ag_2SO_4 solution. 12 ref. (L19, M22g; Ag)

576-L. (French.) Electrolytic Deposit of Zinc Ion on a Mercury Jet Electrode. A. Rius, I. M. Tordesillas and A. Sacristan. Electrochimica Acta, v. 4, May 1961, p. 62-71.

Study of Zn ion reduction at the mercury jet electrode in KCl and KNO_3 solution as related to influence of temperature and concentration of electrolyte. 19 ref. (L17, 2-61; Zn, Hg)

577-L. Automatic Immersion and Degreasing Plant. Corrosion Technology, v. 8, May 1961, p. 149-150.

Degreasing of metal parts by suspension in perchlorethylene or trichlorethylene solvent vapor or by immersion in boiling solvent. For superfine immersion cleaning, ultrasonic vibrations are produced in the solvent by a transducer unit. (L12h)

578-L. (English.) Refractory Coatings for Tungsten. C. G. Goetzel and P. Landler. Planseeberichte fur Pulvermetallurgie, v. 9, Apr. 1961, p. 36-38.

Production of WSi_2 coatings to protect tungsten against oxidation at temperatures up to 1815° C. by vapor plating, dipping into Cu-Si alloy and by a pack method, using halide compounds melting near siliconizing temperature (900° C.), such as NaF and NaCl, and Si powder as packing material. Fusion of coating with ZrO_2 to increase melting temperature of coating. (L15, L16, L25p; W, Si)

579-L. (German.) Surface Protection of Molybdenum at High Temperatures. K. Sedlatschek and H. J. Stadler. Planseeberichte fur Pulvermetallurgie, v. 9, Apr. 1961, p. 39-43.

Method for silicide-coating of Mo to prevent oxidation of the metal up to 1600° C. by dipping Mo into a Cu-Si melt at 1000-1500° C. Investigation of formation of $MoSi_2$ layer as influenced by dipping temperature and concentration of dipping alloy. Microstructure and surface structure of MoSi coating. (L16; Mo, Si)

580-L. (English.) Oxidation Protection of Columbium Alloys Through Coating by Pack Diffusion Technique. H. Blumenthal. Planseeberichte fur Pulvermetallurgie, v. 9, Apr. 1961, p. 44-46.

Coating of Cb metal, Cb-8% Ti, Cb-0.75% Zr, Cb-10% Mo-10% Ti and Cb-33% Ta-0.75% Zr alloys by the "W-2" coating process, a pack method consisting of embedding parts in a powder mixture containing coating agent, inert substance to prevent baking and an energizer. Testing of ductility by 180° bending and of oxidation resistance by 2000° F. heating in air. (L15; Cb-b, Mo, Ta, Ti, Zr)

581-L. Chromium Fluoride Used for Diffusion Coatings. Corrosion Prevention & Control, v. 8, May 1961, p. iii.

Diffusion coating of Ni, Cd and Mo base alloys, Ti, Ta and W carbides and Zr, Cr and Ti borides with Cr, using Cr powder and a substance such as NH_4F which generates a gaseous halogen that helps to transfer the Cr. 4 ref. (L15; Cd-b, Mo-b, Ni-b, 14-68)

582-L. Diffusion--Alloy Process Protects Guided Missile Probes. Corrosion Prevention & Control, v. 8, May 1961, p. i-iii.

Chromallizing of a 0.5 Ti Mo alloy missile probe with Chromalloy W-2 surface alloy reduces heat transfer rate and protects the alloy from oxidation at temperatures as high as 3850° F. (L15, T24e; Mo-b, Ti)

583-L. Adhesion Problems With Plastic Coatings. Corrosion Prevention & Control, v. 8, May 1961, p. viii.

Adhesion of polyfluoroethylene to steel, Inconel, Monel, Cd, Zn, Al, Mg, asbestos, glass and temperature resistant plastics can be improved by using a primer consisting of perfluorochloroolefine and cobalt oxide. The cobalt oxide reduces the corrosion resistance of the plastic. 6 ref. (L26p; Al, Cd, Mg, Ni-b, ST, Zn)

584-L. Sprayed Steel Engine Liners. Light Metals, v. 24, May 1961, p. 137.

Flame spraying of Mo (Sprabond wire) and steel (Sprasteel LS) on Al cylinder walls utilized in the fabrication of light-weight internal combustion engines. Advantages include reduced weight and improved piston lubrication. (L23; Al, Mo, ST)

585-L. Surface Coatings Protect Parts During Heat Treatment. Etric L. Stone and Leopold Albertin. Metal Progress, v. 79, June 1961, p. 103-106, 124, 128, 131-A, 131-B.

Protective coatings applied to steel and superalloy parts before heat treating have proved effective in facilitating scale removal or preventing oxidation. Their use can result in economies in heat treating where production quantities are low but surface protection of parts is needed. (L-general, J-general; ST, SGA-h)

586-L. New Shot-Blasting Unit Yields Low Cleaning Costs. Metal Progress, v. 79, June 1961, p. 112.

Use of a single 15 cu. ft. unit instead of two 7 cu. ft. shot-blasting barrels to cut costs and improve cleaning. (L10c, 1-53)

587-L. Protective Coatings in Petroleum Production. Corrosion, v. 17, May 1961, p. 251t-266t.

Recommendations for surface preparation and pretreatment, coating application and inspection. Properties and suggested uses of oil, alkyd, chlorinated rubber, epoxy, vinyl, silicone, coumarone-indene, acrylic, cement, galvanized and metallized coatings. (L-general, T28)

588-L. Scale on Wire Rod and Its Removal by Mechanical Means. Pt. 3. S. Garber and G. M. Sturgeon. Wire Industry, v. 28, May 1961, p. 467-470.

Wire rods are descaled by deformation and shot blasting. Deformation involves flexing, twisting or stretching of the rod and must be supplemented with some secondary treatment to completely remove the scales. Brushing, tumbling, vibration and magnetostriction are secondary scale removal processes. 44 ref. (L10c, L10h; 4-61)

589-L. Continuous Hot Dip Galvanizing of Hot-Water Tanks at American-Standard Plant. Industrial Heating, v. 28, May 1961, p. 904, 906, 908, 910.

Galvanizing of 20-50 gal. capacity tanks in a Zn bath. Effect of bath temperature and immersion time. Construction of galvanizing kettle to prevent corrosion of refractory material by Zn and to minimize heat loss. (L16, 1-66, 1-52, T26q)

590-L. Finishing Steel Slip Covers for Air Conditioning Units. Industrial Heating, v. 28, May 1961, p. 953-954.

Steel sheet cabinets are electro-Zn-coated and painted to resist corrosion, vibration, banging, condensation, scuffing and chipping. (L17, L26n, R10b, W10d; ST, 4-53, 17-57, Zn)

591-L. Widest Aluminum Strip Coating Line Installed by Kaiser Aluminum & Chemical Corp. Industrial Heating, v. 28, May 1961, p. 958, 960, 962, 964, 966, 968, 970, 972.

Al strip up to 66 in. wide is coated at a rate of 100 ft. per min. Equipment and finishing operations, including cleaning and preparation, coating and baking. (L-general, L26n, 1-52; Al, 4-53)

592-L. Oxidation of Molybdenum. I. Sprinz and R. L. Wachtell. Metal Industry, v. 98, May 19, 1961, p. 396.

Missile probes of Mo are chromallized with W-2 alloy by a diffusion process to provide oxidation resistance at 2120° C. (L15, R1h; Mo, Cr)

593-L. Acid Cutting and Acid Polishing of Copper Crystals. F. W. Young, Jr., and T. R. Wilson. Review of Scientific Instruments, v. 32, May 1961, p. 559-562.

Acid saw and polish are used to prepare Cu crystals without introducing dislocations. Cu with a dislocation density of 5×10^3 per cm. sq. has been prepared. (L12g; Cu, 14-61)

594-L. Non-Embrittling Plating for Prop-Jet Spheres. Western Metalworking, v. 19, May 1961, p. 39.

Vacuum Cd plating technique eliminates the potential for inducing hydrogen embrittlement during coating of 8630 steel starter bottles for pro-jet aircraft. (L17, T24b; ST, Cd)

595-L. How to Porcelain Enamel Magnesium. H. K. DeLong. Metal Products Manufacturing, v. 18, June 1961, p. 60-61, 100.

Development of a surface preparation treatment for Mg alloys which permits application of low-temperature porcelain enamels to them. Surfaces are cleaned in alkali, rinsed, prepickled and chromate treated prior to ground coating. (L27; Mg-b)

596-L. (German.) Current Status in Precipitation of Crack-Free Chromium Coatings in Decorative Corrosion Protection. A. Strauch. Elektrie, v. 15, Mar. 1961, p. 71-74.

Investigation of crack formation and porosity in electrodeposition of Cr on smooth Fe strip from a conventional bright Cr electrolyte (CrO_3 in 1% H_2SO_4) and from self-controlling electrolyte (CrO_3, K_2SiF_6 and $SrSO_4$) from 40-45° C. and 15 amp. per diameter sq. current density. Surface examination by the "Dubpernell" testing method. 15 ref. (L17c; ST, Cr)

597-L. (German.) Measurement of Thickness of Composite Copper-Nickel Films by the "Liquid Jet Method". W. Zimmer. Elektrie, v. 15, Mar. 1961, p. 78-81.

Measurement of Cu and Ni film thickness on 0.2 mm. thick steel sheet specimens plated by various baths, including Cu electrolytes on NH_4SCN and tartrate bases, cyanidic standard Cu electrolyte and acid Cu plastic electrolyte using a microscopic method (DIN 50950) by the DIN 50951 liquid jet method and by the GOST 3003 liquid jet method. Comparative evaluation of testing methods and results. (L17c; Ni, Cu)

598-L. Heat-Resistant Coverings for Iron. A. A. Appen, E. A. Antonova and L. A. Kuznetsova. Glass and Ceramics, v. 17, Apr. 1961, p. 467-471.

High temperature gaseous corrosion of Fe is reduced by applying a heat resistant glass-metal covering by enameling. The covering is obtained from a mixture of finely dispersed metallic powder and a silicate bond. (L27; Fe)

599-L. (Translation-ConBur.) Improved Deposition of Uranium and Thorium Layers by the Method of Atomization in an Electric Field. Yu. A. Selitskii. Soviet Journal of Atomic Energy, v. 7, Apr. 1961, p. 1019-1020.

Deposition of thin layers of U and Th on collodion or celluloid films and on metal foils by atomizing a solution of the substance from a capillary under the action of an electric field. Th or U can be dissolved in a small volume and atomization can be performed with relatively small loss of the substance. 4 ref. (L25k; Th, U)

600-L. New Process for Ti-Clad Steel Plate. Roy V. Hughson. Chemical Engineering, v. 68, May 15, 1961, p. 194, 196, 198.

Production of Ti-clad A-204 steel plate by bonding the Ti directly to the steel backing using an argon flush to prevent the formation of oxides or nitrides on the Ti-steel interface. The clad steel may be cut by abrasive methods or by machining and may be welded using Ag to prevent contact between Ti and the steel. (L22; ST, Ti, 4-53)

601-L. Galvanized Panels Improved by Magnesium Additions. Iron Age, v. 187, June 8, 1961, p. 100-102.

Mg ingot reacts with Zn in a hot galvanizing bath forming a new bath alloy, 50% Mg and 50% Zn. Corrosion testing of the resulting galvanized steel panels by exposure to salt spray and humidity indicates Mg improves corrosion resistance of coating. (L16; ST)

602-L. New Technique Buffs Beauty on Stainless Strip. Steel, v. 148, June 19, 1961, p. 92.

Bright, corrosion resistant finish is achieved on stainless strip on a five-station buffing line on which metal is

removed from the strip surface in the process. (L10a; SS, 4-53)

603-L. The Structure of Some Electrodeposited Tin Alloy Coatings. R. F. Smart, R. M. Angles and D. A. Robins. Institute of Metals, Journal, v. 89, May 1961, p. 349-353.

Microstructure and crystal structure of deposits containing 6-95% Sn in various combinations with Pb, Zn, Cd and Cu are examined metallographically and by X-ray diffraction. Phase dispersion is determined as a function of surface atom migration. 16 ref. (L17c, M-general, N-general; Sn-b, Pb, Zn, Cd, Cu)

604-L. (German.) Investigation of the Use of Inhibitors Used in the Textile Industry in the Pickling of Steel, Copper and Brass Sheet. H. Gunther. Elektrie, v. 15, Mar. 1961, p. 86-89.

Measurement of metal weight loss during pickling with and without addition of various proprietary substances used in the textile industry as inhibitors. 8 ref. (L12g; CN, Cu, Cu-n, 4-53)

605-L. Rhodium Plating to Specification. Australasian Manufacturer, v. 46, Apr. 29, 1961, p. 33-34.

Electroplating of steel, Al and other metals to produce coatings of Rh with thickness from 0.00001 to over 0.001 in. following a protective deposition of Ag, Ni or Cu. (L17; Rh)

606-L. Internal Roller Burnishing. Australasian Manufacturer, v. 46, Apr. 29, 1961, p. 68-69.

Burnishing and sizing of holes drilled in medium carbon steel, cast iron, bronze and Al with an internal roller that displaces peaks into valleys to produce bores with close tolerances and good surface finishes. (L10; CN, CI, Cu-s, Al)

607-L. (Russian.) Preparation of the Surface of Silver Alloys for Enamelling. R. B. Laskovaya. Isvestiya VUZ-Tsvetnaya Metallurgiya, Feb. 1961, p. 123-130.

Preparation by etching with nitric acid. Change of surface relief and surface composition of Cu alloyed Ag etching time. Their effect on wettability in liquid enamel. (L12g; Ag-b, Cu)

608-L. Metallurgical Bonding in Cylinder Construction. M. G. Whitfield. SAE Paper no. 369A, 1961, p. 7 p.

Bonding of Al and Mg and their alloys to cores of cast irons, steels, high-temperature alloys and refractory metals by immersion of the core material in molten Al to form the alloy bond with subsequent casting of light metal alloys against the prepared surface to make engine parts. Data are given for bond strength, thermal expansion, harndness and shear and tension properties. (L22, E-general, T21b; CI, ST, SGA-h, EG-d37, Ab-b, Mg-b, 17-57)

609-L. The Development of Tibon Hard Chrome Plated Cylinder. L. W. Raymond and A. K. Wood. SAE Paper no. 369B, 1961, p. 9 p.

Review of Al alloy and Cr plating developments for application in internal combustion engines. Technology of Cr electrodeposition on Al. Evaluation of mechanical and physical properties, particularly wear and corrosion resistance, heat transfer and adherence of coatings. (L17c, T21b, Q-general, 10-54; Al, Cr, 17-57)

610-L. Transplant Coated Aluminum Cylinder Bores-Physical Properties of This New Protective Coating in Comparison to Known Processes. A. F. Bauer. SAE Paper no. 369C, 1961, p. 10 p.

Ferrous wear-resistant protective coatings are produced on bores of die cast Al cylinder barrels and liners by spraying the coating onto the die and transferring the coating to the molten Al during casting. Wear resistance, shear strenght of bond, tensile strength and thermal coefficient of expansion of Al cylinders with various thicknesses of the coating are compared with cylinders coated by spraybond (Mo), Bimetallic Interlock Bond and Cr plating processes. (L23, T21b; Al-b, Fe-b, Mo, Cr, 5-61, 17-57)

611-L. Polishing Stainless Steel Made Easier. J. P. Dewar. Engineering, v. 191, Apr. 28, 1961, p. 586.

Preliminary bright and final polishing or coloring of stainless steels using sisal buffs and fast cutting abrasives. (L10a, L10b; SS)

612-L. The Preparation of Nickel-Coated Powders. B. Meddings, W. Kunda and V.

N. Mackiw. Paper from "Powder Metallurgy". Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 775-798.

Description of the Sherritt process for the reduction of Ni from solution by hydrogen indicates how this technique has been extended to the Ni coating of powders. Surface activation required for noncatalytic powders. 12 ref. (L25k, N15; Ni, 6)

613-L. Alloy Improves Service of Galvanized Products. Steel, v. 148, June 12, 1961, p. 154, 157.

Small additions of Mg to Zn baths for galvanizing improve the corrosion resistance of the product. The appearance of the coating is improved; mechanical properties are not harmed; the addition and replenishment of the Mg are not difficult. The combination of Al and Mg gives smooth, more attractive coatings than either does alone. (L16)

614-L. (German.) Pickling of Iron and Steel by Phosphoric Acid. M. Apperloo and H. Benninghoff. Metall-Reinigung + Vorbehandlung, v. 10, Apr. 1961, p. 49-57.

Pickling of Fe and steel with HCl, H_2SO_4 and H_3PO_4 with emphasis on the latter is discussed in terms of reaction mechanism and equipment requirements. Regeneration of H_3PO_4 by ion exchanger. Cost analysis. (L12g; Fe, ST)

615-L. (French.) Electrolytic Polishing of Aluminum and Its Alloys at Room Temperature. M. Wrzecian. Galvano, v. 30, Apr. 1961, p. 231-233.

Polishing in an electrolyte containing 350 g. NaOH per l. of H_2O at a terminal voltage of 15. Current density as a function of time. (L13p; Al)

616-L. (French.) Tin Plating by Chemical Displacement. H. Richter. Galvano, v. 30, Apr. 1961, p. 243-249.

Metal parts to be plated are descaled in HNO_3 in a mixture of H_2CrO_4 and H_2SO_4 and depassivated by immersion in HCl and in a solution of NaCN. The parts are then brought into contact with Al and immersed in a solution containing $SnCl_2$, $P_2O_7Na_4$ and NaCN from 30-35° C. (L17; Sn)

617-L. Chemicals in Metallurgy--Vapor-Phase Deposition. H. W. Schultze. I/EC (Industrial and Engineering Chemistry, v. 53, June 1961, p. 48 A-51 A.

High purity metals, refractory metal compounds and coatings on a variety of substrates are produced by vapor-phase deposition or gas plating using chemicals. Commercial applications and potential of the process. (L25)

618-L. Preparation of Some Metals for Painting. J. Glossop. Oil and Colour Chemists' Assoc., Journal, v. 44, Apr. 1961, p. 269-278.

Variety of methods for pretreatment of metals, particularly Fe, steel, Al and Zn. Mechanical or chemical degreasing. Removal of corrosion products by shot blasting or by acid or alkaline treatment. Phosphating, metal spraying or electroplating to improve corrosion resistance. (L-general; Fe, ST, Al, Zn)

619-L. The Sprayflow Stellite Hardfacing Process. Machinery (London), v. 98, May 24, 1961, p. 1180-1181.

Stellite is deposited on 18/8 stainless steel, Nitralloy steel and free-cutting steels by flame spraying. Deposits are alloyed to the base metal by heat treatment after application. (L23; ST, Co-b)

620-L. (Translation-ConBur.) Changes of Cathode Potential on Connection and Disconnection of Polarizing Current in Chromium Plating. M. A. Shluger. Journal of Applied Chemistry of the USSR, v. 33, June 1960, p. 1337-1341.

Influence of temperature, current density and sulphate concentration on the formation and adsorption of the cathodic film and the value of the cathode potential when current is applied. 10 ref. (L17; Cr)

621-L. Zinc Coatings for Protection of Columbium From Oxidation at Elevated Temperatures. W. D. Klopp and C. A. Krier. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 88, Mar. 3, 1961, 19 p. (Available as PB 161238 from U. S. Office of Technical Services, Washington 25, D. C.)

Zn coating of Cb by vacuum distillation (at 1450° F.), hot dipping (from 1000-1300° F.), aqueous electroplating or cladding eliminates contamination hardening of Cb substrate by forming intermetallic layers. 8 ref. (L25j, L16, L17, L22; Cb, Zn)

622-L. Low Pressure Spray Application of Vitreous Enamel. J. Muirhead. Institute

of Vitreous Enamellers, Bulletin, v. 11, May 1961, p. 97-101.

Review of past spraying technique and the introduction of low-pressure spraying. Proper equipment selection and spraying technique. Effect of supervision and enamel slip control. Material, labor and equipment savings. (L26n)

623-L. Better Bores Seen for Aluminium Cylinders. SAE Journal, v. 69, July 1961, p. 40-43.

Plating, bonding and coating techniques for finishing Al engine cylinder bores. (L-general, T21b; Al, 17-57)

624-L. Electrostatic Setup for Painting Refrigerators. Industrial Finishing, v. 37, June 1961, p. 29-30, 34.

Electrostatic painting of mixed sizes of refrigerator doors and cabinets by reciprocating electrospray bell atomizers. Limit switches control the repositioning of the atomizers and electric eyes control paint flow. (L26n, T10c)

625-L. Coating Small Metal Items. P. C. Bardin. Industrial Finishing, v. 37, June 1961, p. 39-40, 42, 44, 46.

Methods of coating buttons, buckles, screws and various hardware pieces. Open-end barrel tumble coating, combination dip-whirl coating, manual and automatic spray coating and multiple dip-coating. (L-general, T6)

626-L. Boat Trailers Get Corrosion Resistant Paint Job. Industrial Finishing, v. 37, June 1961, p. 62-64, 66.

Cleaning, phosphating, painting and drying of boat trailers on an automatic conveyor line. (L-general, R10g, T22m)

627-L. Electrodeposition of Aluminum on Magnesium. E. W. Cooke and S. Kritzer. North American Aviation, Inc. (Wright Air Development Center). U. S. Office of Technical Services, PB 161892, Nov. 1959, 26 p. $.75.

Tests to develop a method of plating Al on Mg without the use of intermediate coatings to fill the need for a protective system for Mg with good mechanical properties, both at elevated temperatures and when in contact with more noble metals. The major problem in electrodepositing adherent Al directly on Mg and Mg alloys is the necessity to clean all Mg surfaces and keep them clean until the substrate is plated. (L17; Mg, Al)

628-L. Electroplating Chromium Directly on Aluminum. Charles L. Faust, Glenn R. Schaer and Donald E. Semones. Plating, v. 48, June 1961, p. 605-612.

A Cr plating process using d-c. is described. The electrodepositing current is related to the Cr hydride mechanism of deposition, providing a relatively soft Cr coating of low stress for direct deposition on 3003 Al alloy. The Cr plating has a lustrous sheen and is free from porosity and cracks at thicknesses offering a significant increase in corrosion protection. 8 ref. (L17; Al, Cr)

629-L. The Present Status of Decorative Nickel-Chromium Coatings. William Blum. Plating, v. 48, June 1961, p. 613-624.

A survey and analysis of all available information on the behavior of decorative Ni-Cr platings. Topics include methods of corrosion testing and of rating and correlating the data from such tests, variables in plating schedules and the effect of a Cu layer. Comparison of Watts, semi-bright, bright and duplex Li platings and of regular, microcracked, crack-free and sandwich Cr platings. 62 ref. (L17; Cr, Ni)

630-L. Recent Developments in Nickel/Chromium Plating. Pt. 2. G. FitzGerald Lee. Product Finishing (London), v. 14, June 1961, p. 77-80.

Review of articles covering electrodeposition of coatings on steel samples and Zn-base die castings. Measurement of coating thickness by an electron probe. Assessing adhesion and tendency to blister. (L17; ST, Zn, Cr, Ni)

631-L. Vacuum Coating Deposition Process on Metal and Plastics. C. Blitz. Product Finishing (London), v. 14, June 1961, p. 91-92; 97.

Cleaning, degreasing, base coating, deposition and top coating procedures for deposition of tarnish resistant coatings on dials, reflectors and jewelry. (L25)

632-L. Theoretical Aspects of the Pickle Lag Phenomenon. W. G. Hines. Paper from "Physical Chemistry of Process Metallurgy". Pt. 2. v. 8. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 1291-1311.

Concepts of "pickle lag" and "lag layer" are re-examined in the light of experimental results with annealed black plate steel

with interpretation in terms of a nonuniform layer theory based on reaction rates. Cathodic polarization is suggested as the controlling factor in the production of pickle lag. (L12g; ST)

633-L. Forming and Finishing Aluminum Auto Trim. Metal Progress, v. 80, July 1961, p. 67-72.

Though simple in concept, the bright anodizing process--electrolytic oxidation of Al--requires close control of all operations from incoming inspection through final sealing to produce trim that will stand up in the severe service environment encountered by most automobiles. (L19, G4, T21c; Al)

634-L. Tankless Plating Gets a New Job. Cloyd A. Snavely. American Machinist/Metalworking Manufacturing, v. 105, June 26, 1961, p. 86-88.

Description of the Dalic process for tankless plating, especially with precious metals. Surface preparation. Production applications including use of Cu for carburizing stopoff, plating to size and plating of electrical components. (L17; Cu, EG-c31)

635-L. Metallizing Protects Conduit, Boosts Sales. Henry Lefer. Welding Design & Fabrication, v. 33, Dec. 1960, p. 50, 54.

Metallizing threaded end of galvanized pipe gives uniformity, rustproofing and good appearance. (L23; 8-65, 4-60, Zn)

636-L. Measurement of the Thickness of Electroplates by Electrolytic Stripping Method: Stripping Solution for Copper Plate Over Mild Steel. Prem Behari Mathur and N. Karuppannan. Current Engineering Practice, v. 3, Apr. 1961, p. 24-26.

Effect of temperature and current density on time required for removal of measured amounts of Cu, using a 10% $NaNO_3$ + 0.5N HNO_3 solution. 7 ref. (L17c; CN, Cu)

637-L. PH Change in Nickel Plating. R. G. Maling. Electroplating and Metal Finishing, v. 14, June 1961, p. 191-196.

Effect of small quantities of alkali or acid additions on rate of pH change in Ni solutions with high chloride and high sulphate content is measured at 60° C. (L17a; Ni)

638-L. Institute of Metal Finishing Annual Conference, 1961 (Llandudno, Wales). Electroplating and Metal Finishing, v. 14, June 1961, p. 198-199.

Review of papers on electrodeposition covering influence of addition agents on the composition of Ni deposits, levelling action during electrodeposition in Ni and acid-Cu solutions. Corrosion of decorative Ni plus Cr coatings, a metallographic and potential study and electrodeposition of Ru. (L17, 10-54; Ni, Cu, Cr, Ru)

639-L. Fixture Barrelling Diecast Aluminum Plates. Electroplating and Metal Finishing, v. 14, June 1961, p. 213-214.

New barrel finishing operation for diecast Al alloy bottom plates. Deflashing and polishing are completed in one operation in a rubber-lined welded steel barrel. Barrelling medium comprises 1 1/2-ton of 1/8 in. to 7/32 in. mixed steel balls in H_2O plus ball cleaning compound. (L10d, 17-57; Al-b)

640-L. Chemical Polishing. P. F. Walmsley. Metal Industry, v. 98, May 12, 1961, p. 371-374.

Procedure for polishing Al and Cu alloys with Phosbrite 155, 156, 159 and 184. Plant layout and equipment for adapting process to polishing of automobile components. (L12g, 1-52, T21; Al-b, Cu-b)

641-L. Protective Properties of Vacuum Coatings--Present and Future Techniques. N. A. Lockington and I. J. Toth. Corrosion Technology, v. 8, June 1961, p. 168-171.

Description and operation of basic equipment in the vacuum coating process. Techniques for producing thicker protective coatings. Properties and applications of commercially produced Al and Cd coatings. 15 ref. (L25g, 1-52, R10; Al, Cd)

642-L. Scale on Wire Rod and Its Removal by Mechanical Means. Pt. 4. S. Garber and G. M. Sturgeon. Wire Industry, v. 28, June 1961, p. 571, 573, 596.

Review of mechanical descaling methods including mounting and polishing. Description of operation of various commercially available descaling machines. (L10, 1-52; 4-55)

643-L. Internal Mechanism of an Electrolytic Cell. A. Alexander. Metal Finishing Journal, v. 7, May 1961, p. 176-180.

Mechanism of a cell relative to plating a metal part with Ni, Cr, Cu and Al. Anodic oxidation of Al. Electro and chemical polishing. (To be continued.) (L17, L19, L13p, L12; Ni, Cr, Al, Cu)

644-L. Some Advantages of Automatic Plant Using Solvents for Degreasing. J. Pickup. Metal Finishing Journal, v. 7, May 1961, p. 187-191.

Fully automatic double-immersion machine used for degreasing and cleaning metal parts in quantity. Machine utilizes hot or boiling trichlorethylene as a solvent. (L12h, 1-52)

645-L. (German.) Recent Advances in Plating Practice in the U. S. A. W. H. Safranek and Ch. L. Faust. Metall, v. 15, June 1961, p. 539-542.

Review of electrodeposition technology including properties and usefulness of duplex Ni deposits on exterior steel car parts and Zn pressure castings and of crack-free and microcracked Cr platings of increased thickness, corrosion and wear resistance of deposits, electroplating using Co-Ni alloys for magnetic tapes and Au alloys for electrical contacts and switches and brightening and polishing techniques. 30 ref. (L17, L-general, 10-54)

646-L. (German.) Geometry of Microscattering and Leveling by Electroprecipitated Metal Deposits. J. Elze. Metall, v. 15, June 1961, p. 542-550.

Investigation of deposit profiles and leveling rates in electroplating with Ni (Watts type), acid (sulphate) Cu and two commercial leveling electrolytes using Ni-Ag cathodes with scratches of defined profile. (L17; Ni, Cu)

647-L. (German.) Modern Techniques for Surface Treatments of Magnesium and Its Alloys. W. H. Gross. Metall, v. 15, June 1961, p. 551-555.

Review of anodic oxidation techniques for corrosion protection and primer purposes with emphasis on the "Dow no. 17 Anodize" method, bright pickling using $Fe(NO_3)_3$ ("Dow Chemical Treatment no. 17"), enameling, currentless Ni plating and touch up treatments in surface treatment of Mg alloy parts. (L-general, 10-54; Mg-b)

648-L. (German.) Wear Reduction by Hard Chromium Plating on Rail Vehicles. W. Schmitt. Metall, v. 15, June 1961, p. 555-559.

Application of hard Cr deposits, obtained by anodic plating, on mechanically or chemically stressed steel locomotive and rail coach parts to improve wear resistance. 11 ref. (L17c, Q9, Q29n, T23; ST, 17-57)

649-L. (German.) Modern Developments in the Field of Chromium Plating. H. W. Dettner. Metall, v. 15, June 1961, p. 560-561.

Review of electrodeposition technology with emphasis on use of self-controlling electrolytes, precipitating bivalent and trivalent Cr to improve electrical efficiency, cold and porous Cr plating, crack-free and microcracked Cr coatings and duplex Cr plating. 25 ref. (L17, 10-54; Cr)

650-L. (German.) Dyeing of Chromated Zinc Surfaces. G. Woldt. Metall, v. 15, June 1961, p. 562-565.

Dyeing of chromated electrodeposited Zn films or Zn pressure die castings by organic salt solutions and testing of colored surfaces for stability in light and against water attack and wear. 11 ref. (L14; Zn)

651-L. (German.) Metal Degreasing and Phosphating Plants. R. Reichle. Metall, v. 15, June 1961, p. 578-581.

Survey of processes and plant design of plants for continuous gas degreasing by vaporized organic solvents, alkaline dip, drum and spray degreasing in chamber and belt plants and automatic and continuous washing, phosphating and drying in dip processes. (L12, L14b, 1-52)

652-L. Printed-Circuit Plating. J. E. Philpott. Electronic Technology, v. 38, June 1961, p. 221-223.

Electrodeposition of Rh, Pd, Au and Pt on printed Cu circuits, plugs and switches to form hard, inert contact points. (L17; Cu, Rh, Pd, Au, Pt)

653-L. (German.) Experiences in Surface Treating of Semifinished Products

of Alloy Steel by Flame Scarfing and Grinding. Hans Geipel. Stahl und Eisen, v. 81, June 8, 1961, p. 787-794.

Automatic hot flame scarfing of ingots, cold flame scarfing with powder additions of slabs and semi-automatic grinding of slabs in the production of alloy steel broad strip. Characteristic operational data of the three processes with cost comparison. (L10g, G18; AY, 4-52)

654-L. Functional Coatings by Vacuum Metallizing. Philip J. Clough. Society of Vacuum Coaters, New York, Jan. 26-27, 1960, p. 1-3.

Review of vacuum metallizing of Al and Cd on panels of 1030 mild steel, H-11 alloy, 1000 Vascojet and AISI 8740 alloy. Evaluation of thick film Al coatings for reproducibility, salt spray corrosion resistance, adherence and ductility. (L25g, 1-73, R11j, Q23p, Q10c; Al, Cd, 8-74, ST)

655-L. Lacquer Automation and Vacuum Metallizing. R. J. Perkel. Society of Vacuum Coaters, New York, Jan. 26-27, 1960, p. 6-10.

Automation in racking, cleaning or degreasing, flow coating, flow-out and rotation and curing processes. Description of a cross-bar conveyorized immersion degreaser, an automatic flow coater and an automatic rotator and drier. (L-general, 1-52, 18-74)

656-L. Vacuum Chamber Problems in Decorative Metallizing. Pt. 1. Discoloration. Leslie Winters. Society of Vacuum Coaters, New York, Jan. 26-27, 1960, p. 11-14.

Chamber pressure, outgassing rate, firing speed and tolerance of the plastic as factors which cause visual discoloration of Al metallized coatings on plastic parts. Selection of size and shape and method of cost evaluation of filaments in decorative metallizing. (L25g; Al, 8-74)

657-L. Vacuum Deposited Protective Films. Richard A. Denton. Society of Vacuum Coaters, New York, Jan. 26-27, 1960, p. 31-35.

Protective and insulating films of SiO, MgF_2, Al_2O_3, Cr and Au are vacuum deposited on mirrors and glass articles. Influence of films on reflectivity, electrical conductivity and radiation susceptibility. (L25g, P15g, P17a; Cr, Au, NM-f42)

658-L. Vacuum Chamber Problems in Decorative Metallizing--Discoloration, Filaments and Techniques. Morton B. Gilbert. Society of Vacuum Coaters, New York, Jan. 26-27, 1960, p. 36-38.

Firing pressure and technique, chamber cleanness, number of filaments, racking method and filament design and condition as factors which affect discoloration and work coverage. Corrective measures. (L25g)

659-L. Multicolored Effects on Anodized Aluminum. A. Jogarao, B. A. Shenoi and K. S. Indira. Metal Finishing, v. 59, July 1961, p. 42-45.

Suitability of films for dyeing, optimum anodizing conditions, coloring with organic dyes, inorganic pigmentation, multicolor processes (photographic and resist processes), superimposition techniques, bleaching process, relief designs, mottled effects, sprayed effects, silk screen printing and printing processes. 14 ref. (L26; Al, 8-73)

660-L. Automating a Paint Line for Discontinuous Operation. Donald J. Fumagalli. Metal Finishing, v. 59, July 1961, p. 61.

Automation of precleaning, painting and baking operations on equipment and components for telephone systems and related electrical apparatus. Use of electrostatic booths and photoelectric eyes. Paint thickness and uniformity control. (L-general, 18-74, X15r)

661-L. Control of a Copper Fluoborate Plating Bath. Larissa Domnikov. Metal Finishing, v. 59, July 1961, p. 62.

Method of rapid deposition of Ca from a bath containing copper fluoborate and free boric and fluoboric acids based on electrolytic deposition of Cu from the solution sample and subsequent hydrolytic decomposition of fluoboric acid by boiling in the presence of magnesium sulphate. Method of analysis of the electrolyte. Conversion coefficients. (L17a; Cu)

662-L. Institute of Metal Finishing Conference, Llandudno, 1961. Nathaniel Hall. Metal Finishing, v. 59, July 1961, p. 63-66.

Abstracts of 16 papers presented at the 1961 Annual Conference of the

British Institute of Metal Finishing, held at Llandudno, Wales, from May 2-6. (L-general)

663-L. (English.) Repairing the Surfaces of Calender Rolls. Paul Metschke. Werkstatt und Betrieb, v. 94, May 1961, p. 111-112.

Imperfections in steel calender rolls caused by wear and foreign bodies in the mixture are eliminated by a metal spraying method using Sprabond adhesive without dismantling. Treated spots have a Brinell hardness of about 500. (L23, T29q, 18-72)

664-L. Principles of Electrostatic Spraying of Vacuum Metallizing Coatings. John Scharnberg and T. E. Hayden. Society of Vacuum Coaters, New York, Jan. 26-27, 1960, p. 22-27.

Theory and process of electrostatic spraying. Description of essential components of electrostatic spray equipment including the reciprocating disk unit and the atomizer. Advantages and disadvantages of electrostatic application. (L26n, W4)

665-L. Design and Plan to Metallize. Fred Borries. Paper from Winter Meeting, New York, Jan. 26-27, 1960, Society of Vacuum Coaters, p. 28-30.

Evaluation of premetallizing operations. Location of equipment for clean operations, selection of correct coating and effect of surface area on coating smoothness. (L25g, 1-52)

666-L. Mechanized Metal-Finishing Operation. S. C. Poulsen. Machinery (London), v. 98, June 28, 1961, p. 1452-1460.

Machines and auxialary equipment used for automatic polishing of electric iron cowls and toaster bodies. Layout and methods used in related Ni and Cr plating plant. (L10, L17, 1-52, T10c; Ni, Cr)

667-L. (Translation-Brutcher no. 5011.) Spray Coating on Gray Iron Castings With Aluminum. F. L. Al'ter-Petsotskii. Metallovedenie i Termicheskaya Obrabotka Metallov, Dec. 1959, p. 51-52.

Previously abstracted from original. See item 139-L, 1960. (L15; CI-n, Al)

668-L. (Translation-Brutcher no. 5164.) Electrolytes for the Polishing and Etching of Austenitic Chromium-Nickel and Manganese Steels. G. Bassi. Metalloberflache, v. 52, Feb. 1961, p. 141-142.

Previously abstracted from original. See item 441-L, 1961. (L13; SS-e)

669-L. Dyed Zinc Coatings. Heinz W. Dettner. Electroplating and Metal Finishing, v. 14, July 1961, p. 233-234.

Operations for chromate treatment of Zn castings and coatings. Selection of colors to suit application. Light fastness. (L14c, P17; Zn, 5, 8-62)

670-L. Painting Metal Sprayed Surfaces. L. Valentine. Electroplating and Metal Finishing, v. 14, July 1961, p. 236.

Paint and substrate parameters relative to durability and protection efficiency of the coating. Evaluation of several coating systems. Weathering tests. (L26, R3; 8-67)

671-L. Protecting Steel by Sprayed Metal Coatings. J. F. Stanners. Electroplating and Metal Finishing, v. 14, July 1961, p. 237-238.

Protection of steel by unpainted and unsealed sprayed coatings of Zn and Al. Comparison of corrosion resistance of coatings in industrial atmospheres. Effect of coating thickness and surface roughness. (L23, R3n; ST, Zn, Al)

672-L. Institute of Metal Finishing Annual Conference, 1961. Electroplating and Metal Finishing, v. 14, July 1961, p. 239-242.

Summaries of nine papers covering the influence of composition and heat treatment of carbon and low-alloy steels upon their response to the A. R. D. E. smoothing process, influence of preplating processes on the porosity of electrodeposits on steel, selection and testing of coatings and painting car bodies. (L-general)

673-L. How to Exploit New Technology in Surface Preparation. Steel, v. 149, July 10, 1961, p, 70-73.

Grinding, blast cleaning, brushing, tumbling, vapor honing, galvanizing and phosphatizing of metal surfaces for plating, painting, or other finishing operations. Finishing defects are

minimized by adequate knowledge of metal surface characteristics. Effect of grinding variables on surface preparation. (L-general, G18)

674-L. Pneumatic Controls Automate Enamelstrip Line. Steel, v. 149, July 10, 1961, p. 82-83.

Pneumatic, variable speed controls are used to automate continuous processing lines of a drying oven. Strips are given smooth, uniform coatings. Output from the line is determined by the time-temperature curing cycle required for each product. Individual drive speeds can be regulated to correct for roll wear. (L26n, 18-74; 4-53)

675-L. Chromate Coatings--Aircraft and Missiles. Products Finishing, v. 25, July 1961, p. 40-45.

Process details and controls, acceptance tests, equipment, adhesion and recoating of damaged areas of 6061, 7075, 2024, 5052 and 5056 Al alloys. (L14c, Q10c, T24; Al-b, 17-57)

676-L. Hot Spray Speeds Production, Improves Quality. Products Finishing, v. 25, July 1961, p. 54-55, 57.

Vending machine parts are sprayed with acrylic lacquer which is kept at 160° F. Cleaning, painting and baking procedures. Advantages include reduction of orange peel, runs and sags. (L26n, 1-66, L12)

677-L. Gold Coating Fights Heat in Scout Research Rocket. Products Finishing, v. 25, July 1961, p. 58, 60.

Inner skin of a research rocket (NASA's "Scout") is Au coated to a thickness of 0.00001 in. by spraying a Au resinate on the part and then baking in an oven at 375° F. for 15 min. The coating turns to pure Au in a second bake at 700° F. for 1 hr. (L23, T2p; Au)

678-L. Improved Nickel Plating With Ball Anodes. Charles T. Walker. Products Finishing, v. 25, July 1961, p. 70-71.

Simplification of replacement, elimination or production of scrap anodes, remelt and recovery of metal and more uniform deposition are achieved by using ball Ni anodes in a Ti basket instead of solid Ni anodes. Balls are fed into basket as balls in solution corrode. (L17, W3h; Ni)

679-L. How Small Castings, Big Sheets Are Painted Quickly, Efficiently, Inexpensively. K. B. Rhodie. Modern Metals, v. 17, June 1961, p. 68, 70, 72, 74.

Electrostatic painting of Al and steel castings, stampings and sheets. Paint is pumped onto a spinning disk and forced to the edge by centrifugal force. The electrostatic field atomizes the paint and conducts the mist to the oppositely-charged workpiece. (L26n, 1-52; Al, ST, 5, 4-53, 4-59)

680-L. Nickel-Ball Anodes Aid Plating. Iron Age, v. 187, July 13, 1961, p. 97.

Anode consists of 2-in. diameter Ni balls in a perforated Ti basket. As the anode corrodes at the bottom, the supply of Ni balls is replenished through the top. (L17, W3h; Ni, 17-57)

681-L. (German.) Recent Investigation of Flame-Spraying of Steel Wire. W. Pungel, H. Krautmacher and W. Knebelkamp. Draht, v. 12, May 1961, p. 215-219.

Autogeneous spray tests for shot blasted 5 mm. thick St 37 steel plates using steel spray wires containing 0.07-0.77% C, 0.02-0.28% Si, 0.23-0.89% Mn, 0.015-0.024% P, 0.015-0.03% S. Investigation of microstructure, surface quality, composition changes, hardness, adhesion, machinability, porosity and slag inclusions of coatings. (L29n; ST)

682-L. (German.) Electrocoatings on Welded Parts. J. Ruge and P. Hildebrandt. Schweissen und Schneiden, v. 13, May 1961, p. 195-199.

Salt water (3% NaCl) spray testing of arc, autogeneous, thermit powder and Mig welded steel sheet specimens (thickness 6 mm.) after electroplating with Cu, Ni and Cr. Corrosion resistance is influenced by coating material and layer thickness. (L17c, R11j, 2-60, 3-73; ST, Cu, Ni, Cr)

683-L. (Translation-ConBur.) Simultaneous Liberation of Metal and Hydrogen. B. I. Skirstymonskaya and M. F. Lantratov. Journal of Applied Chemistry of the USSR, v. 33, May 1960, p. 1119-1123.

A study of the kinetics of simultaneous cathodic discharge of Zn and H_2 during electrodeposition from solutions of low and high acidity. Determination of the effect of cathode potential on the rates of simultaneous liberation and on current efficiency for Zn with H_2. Liberation of Zn is complicated by concentrational effects. 15 ref. (L17b, N16, 2-60; Zn, H)

684-L. (Translation-ConBur.) Deep Anodizing of Aluminum at Room Temperature. N. P. Fedot'ev, S. Ya. Grilikhes and B. Ya. Zil'berman. Journal of Applied Chemistry of the USSR, v. 33, May 1960, p. 1124-1130.

Al specimens are anodized in an electrolyte containing 170 grams per liter of H_2SO_4 at -2 to 20° C. with investigation of variations of cell voltage and anode temperature in anodizing. The influence of current strength on the quality of oxide films and the effect of stirring of the electrolyte on the anode temperature. 5 ref. (L19, 2-61; Al)

685-L. (Translation-ConBur.) Production of Galvanic Coatings on Titanium. S. M. Burdina and A. G. Samartsev. Journal of Applied Chemistry of the USSR, v. 33, May 1960, p. 1131-1135.

A method for producing firmly bonded Cr, Cu and Ni coatings on Ti. The Ti specimens are prepared for electrodeposition by chemical etching and anodic treatment in ethylene glycol, HF, HNO_3, CH_3COOH, HCl and ZnF_2 from 18-90° C. for current density of 1-10 amp./dm.^{2} Plating is done in two stages with a vacuum heat treatment following the first stage to improve adhesion. 7 ref. (L17; Ti, Cr, Cu, Ni)

686-L. (Translation-ConBur.) Copper Plating of Steel in an Ammoniacal Electrolyte Containing Cuprous Ions. V. D. Kamkin and M. L. Pertsovskii. Journal of Applied Chemistry of the USSR, v. 33, May 1960, p. 1204-1206.

Electrodeposition of Cu on steel at 25° C. from an electrolyte with a cuprous ammine complex. Typical bath composition is Cu_2Cl_2(106 g/l), NH_4Cl(132 g/l) and NH_3(52 g/l). The bath is cyanide free and gives a high rate of Cu deposition with good adhesion. 11 ref. (L17; ST, Cu)

687-L. (Translation-ConBur.) Internal Stresses in Chromium Coatings Deposited From a Tetrachromate Electrolyte. M. A. Shluger, A. Ya. Ryaboi and V. A. Kazakov. Journal of Applied Chemistry of the USSR, v. 33, May 1960, p. 1206-1208.

Internal stresses in Cr deposits formed in a tetrachromate electrolyte investigated by the flexible-cathode method in which steel cathodes are coated with Cr from 15-30° C. from an electrolyte containing CrO_3(400 g/l), NaOH(20-100 g/l), H_2SO_4-sugar(3-5 g/l). Effects of temperature, current density and caustic soda concentration. 8 ref. (L17c, 3-66; ST, Cr)

688-L. (German.) A More Exact Bath Phosphate Coating Process for the Application of Slide Lacquer Films. Hans H. Reinsch. Metall-Reinigung + Vorbehandlung, v. 10, May 1961, p. 73-75.

Production methods for wear and corrosion resistant slide-lacquer to metal parts including preparation of phosphate coating bath, phosphate dip coating at 95-98° C. with subsequent alternating hot and cold water rinsing and spray application of a MoS_2 containing slide-lacquer (temperature resistant from -70 to 260° C.) (L16, L26n)

689-L. Functional Finishes for Metals. Herbert L. Kee. Product Engineering, v. 32, July 17, 1961, p. 39-50.

Use of organic and inorganic coatings for corrosion, abrasion, wear, heat and oxidation resistant finishes. Specification of paint coatings to suit applications. Comparison of painting costs and paint, coatings in terms of physical properties, resistance to environment and chemicals and ease of application. Mechanical finishes including strengthening and surface treatment. Electrical and solderable finishes, lubricating films and coatings for thermal radiation. (L-general, Q9, R-general; NM-a, NM-b)

690-L. (Japanese.) Types of Chromium Plating Baths and Their Corrosion Protection. Pt. 3. Corrosion Protection of Decorative Chromium Plating. Mamoru Saito and Minoru Nakamura. Metal Finishing Society of Japan, Journal, v. 12, May 1961, p. 169-172.

An acetic acid salt spray test is made on Cu-Ni-Cr plated steel panels having Cr layers of varying thicknesses and differing in cracking tendency as obtained from baths of different composition. Thicker Cr coatings deposited from highly concentrated crack-free baths show higher corrosion resistance but have higher residual stress and cracking tendency. 5 ref. (L17c, R11j, 2-60, 3-73; Cr)

691-L. (Japanese.) Determination of Thickness of the Alloyed Layer in Aluminum Diffusion Coated Steel. Hiroshi Ichikawa and Shigetomo Ueda. Metal Finishing Society of Japan, Journal, v. 12, May 1961, p. 181-185.

Microscopy, electromagnetic and electrolytic methods are used with microhardness measurements to determine thickness of alloy layers in specimens diffusion coated with Al by the packing method. 4 ref. (L15, S14, 1-54; ST, Al)

692-L. (Japanese.) Elongation and Stress in Nickel Deposits. Saburo Konishi. Metal Finishing Society of Japan, Journal, v. 12, May 1961, p. 185-190.

The effect of bath constituents such as brightening, leveling and surface active agents on hardness, stress and elongation and resultant cracking susceptibility is determined for Ni specimen coatings on Cu by tensile testing. 12 ref. (L17a, L17c, 2-60, 3-66, 9-72; Ni)

693-L. Circumferentially Uniform Electroplating of Tube Bores. John P. Young and Harry I. Salmon. Plating, v. 48, July 1961, p. 783-784, 787-788.

Procedures for plating the internal surface of gun tubes having an inside diameter of 0.3 in. and a bore length of 20 in. Data are given for the degree of circumferential uniformity of thickness of deposits of Cr obtained with newly designed fixtures. Methods are applicable to commercial tubes. 5 ref. (L17; Cr)

694-L. Mechanical Finishing of Metal Surfaces. Pt. 1. Zinc Base Die Castings. William C. Geissman, R. Scott Modjeska and Kenneth Gatchel. Plating, v. 48, July 1961, p. 794-798.

Equipment and procedures for buffing and polishing of Zn die castings using bar compounds. (L10a, L10b, 1-52; Zn, 5-61)

695-L. Sixth International Galvanizing Conference. Metal Industry, v. 99, July 7, 1961, p. 9-11.

Summaries of four papers presented at the conference on the effects of alloy additions, bath temperature, immersion time, Al concentration, agitation and cooling on properties of hot galvanized coatings. Various systems of bath heating are discussed. (L16, 1-66, 2-61, 3-67; 8-65)

696-L. Recent Developments in Tin-Nickel Plating. G. FitzGerald-Lee. Product Finishing, v. 14, July 1961, p. 65-67, 91.

Review of papers covering process parameters and applications, including codeposition from organic and mixed aqueous organic solutions, corrodibility and solderability as influenced by storage. (L17, 10-54; Ni-b, Sn-b)

697-L. I. M. F. Conference. Product Finishing, v. 14, July 1961, p. 75-76, 90-91.

Review of papers discussing the electrodeposition of Ni, Cu, Cr, Ag and Ru, the mechanism of levelling, corrosion of decorative Ni-Cr coatings, an ion exchange process for the recovery of waste water, techniques for measuring cathodic overpotential and coating thickness and the influence of preplating processes on porosity of deposits. Selection of finishes for communications equipment, for autos and for domestic appliances. (L-general, 10-54)

698-L. Coating Before Coiling. Copper, no. 12, Summer 1961, p. 10-11.

Automatic plant for Cu dip coating of ferrous wire before coiling. Process is continuous and deposit thickness is controlled only by travel speed. (L16, 1-52; Fe, 4-61, Cu)

699-L. This Barrel Spins and Vibrates. A. A. Polucha. Metalworking Production, v. 105, July 5, 1961, p. 83.

A combination of rotary and vibratory motions producing a "waterfall" effect is used to polish and deburr metal parts. Description of vibratory finishing machines. (L10, 1-52)

700-L. The Influence of Addition Agents on the Composition of Nickel Deposits. A. H. DeRose. Metal Finishing Journal, v. 7, June 1961, p. 210-215.

Effect of carbon, sulphur and nitrogen additions to organic-type bright Ni solutions on the crystal structure of deposits. Polarization studies. (L17a, M26, 2-60; Ni)

701-L. Levelling Action During Electrodeposition in Nickel and Acid-Copper Solutions. S. A. Watson. Metal Finishing Journal, v. 7, June 1961, p. 215-218.

Effects of variations in agitation, pH and temperature on leveling. Cathode-potential measurements are made with 60 addition agents in Ni solutions and with 30 in acid-Cu solutions. (L17b; Ni, Cu)

702-L. (Translation-ConBur.) Determination of the Surface State of Metals Before Electroplating. A. M. Yampol'skii. Journal of Applied Chemistry of the USSR, v. 33, July 1960, p. 1551-1555.

Rectangular Al plates are subjected to surface treatments including natural oxide film formation; anodic treatment in an H_2SO_4 electrolyte; etching in NaOH solution; treatment with zincate solution and treatment in zincate followed by electroplating with Zn. Surfaces are then compared by an oscillographic method to determine electrode capacity and suitability of the surface for electroplating. 7 ref. (L-general, S15; Al-b)

703-L. (Translation-ConBur.) Bright Cadmium Plating From Acid Baths. A. V. Pamfilov, V. S. Kuzub and L. P. Tovmach. Journal of Applied Chemistry of the USSR, v. 33, July 1960, p. 1649-1651.

Mirror-bright deposits obtained in the electrodeposition of Cd from acid baths using naphthalene mono or disulphuric acids and gelatin as additives and with the aid of periodic current reversal. Deposits are harder and less porous. 5 ref. (L17; Cd)

704-L. Sixth International Galvanizing Conference. Metal Industry, v. 98, June 30, 1961, p. 511-514.

Summaries of nine papers presented at the conference on the effect of hot galvanizing on the mechanical properties of steel sections, the adhesion of galvanized coatings, weldability of hot galvanized steel, assembly of galvanized steel by welding, reconditioning of damaged galvanized surfaces, tests on wet storage stain, corrosion of Zn in dilute aqueous solutions, painting of hot galvanized steel and chromating. (L16, 1-66, K-general, L-general, Q-general, R4; ST, 8-65)

705-L. (Russian.) Manufacture of Bimetals Composed of an Antifriction Aluminum Alloy and Steel. A. D. Kuritsyna, F. V. Korolev, K. N. Korsunskaya and N. M. Rudnitskii. Tsvetnye Metally, Feb. 1961, p. 66-68.

Semicontinuous casting of ingots from pure AV000 Al alloys with 20-30% Sn, and Moren 400 AMK and ASS6-5 alloys. Cladding of a 10 mm. thick alloy sheet containing 30% Sn with a 2 mm. AMK sheet. Manufacture of the bimetal by cold and hot rolling together with a 6 mm. clean steel sheet. (L22; Al-b, ST)

706-L. Immersion Plating of the Platinum Group Metals. R. W. Johnson. Electrochemical Society, Journal, v. 108 July 1961, p. 632-635.

Bright, adherent, replacement deposits of Pd, Rh, Ru and Pd are obtained in thicknesses of 50, 30, 100 and 65 millionths inch, respectively, on Cu, brass, Cu-Be, phosphor bronze and nickel silver. The coatings are sealed by immersion in NH_4OH or boiling distilled water or by replacement deposits of Au. (L17; Cu-b, Ni-b, EG-c)

707-L. Barrel Plating by Means of Electroless Palladium. R. N. Rhoda. Electrochemical Society, Journal, v. 108, July 1961, p. 707-708.

Deposition of Pd from various bath formulations and under different operating conditions on substrates of Al, C, Au, graphite, Mo, Ni, Kovar, Pd, Ag, Ta and Ti in sheet, rod, wire and plate form. (L17; Pd)

708-L. (German.) Compounding of Metal and Ceramics. Technica, v. 10, June 9, 1961, p. 797-798.

Application of Mo-Mn coatings on ceramic parts by spraying as an emulsion of metal powder in amylacetate and subsequent sintering from 1300-1600° C. Coating of ceramics by Ti and Zr by decomposition of metalhydride at 900° C. (L23, L29, K11b; NM-f40, Mo-b, Ti, Zr)

709-L. Bluckets for Aft-Fan Jet Engines Plasma-Metalized. L. W. Collins. Machinery, v. 67, July 1961, p. 92-95.

Flame spraying a modified A286 superalloy jet engine turbine at 30,000° F. with a water cooled plasma gun to prevent galling and seizing. Determination of adhesion, thickness and uniformity of coating. (L23, Q10c, T24b; SGA-h)

710-L. (German.) Preparation of Metals for Application of Paints. W. Wiederholt. Fette-Seifen-Anstreichmittel, v. 63, Apr. 1961, p. 364-372.

Review of treatments for cleaning and roughening metal surfaces including

brushing and sand blasting; thermal techniques such as flame blasting with subsequent mechanical treatment and flame priming; and chemical and electrochemical procedures. Classification of surface quality of metals. (L10, L12, L13, 10-54)

711-L. Lubrication at High Temperatures With Vapor-Deposited Surface Coatings. D. J. Baldwin and G. W. Rowe. Journal of Basic Engineering (ASME Transactions), Series D, v. 83, June 1961, p. 133-138.

Inorganic films with lubricating properties are formed on clean surfaces of Cr, Ti, Cb, WC, B, Zr, Mo, U and stainless steel by heating the metal in a reactive vapor atmosphere of I_2, H_2S, Cl_2 or CCl_2F_2 from 200-850° C. Lubrication properties and thermal stability of film are tested using loads of up to 12 tons. 6 ref. (L25, 2-62, 18-73; Cr, Ti, Cb, B, Zr, Mo, U, SS, W, 14-68, NM-a, 17-57)

712-L. Efficient Degreasing Essential for Quality Finishing. W. B. Hanley. Industrial Finishing (London), v. 13, June 1961, p. 46-47.

Alkaline, solvent and emulsion cleaning. Agitation by air, by solution circulation, by an impeller and by mechanical movement of the parts being processed. Ultrasonic and steam cleaning. (L12, L10f)

713-L. Pretreatment for Aluminum. J. Edwards. Industrial Finishing (London), v. 13, June 1961, p. 54.

Oil removal, etching, smutting and precipitation elimination, cleaning, coating and deoxidation with various types of cleaners and etchants. (L-general; Al)

714-L. New Mechanized Enameling Line for Pressed Steel Bath Tubs. Nat Wood. Western Metalworking, v. 19, July 1961, p. 36-38.

Dry enameling of cast iron products; wet enameling of steel tubs. (L27, 1-52, T10; CI, ST, 17-57)

715-L. Hard Surfacing Cam Shafts Hikes Wear Life. Western Metalworking, v. 19, July 1961, p. 41.

Reclamation hard surfacing with Colmonoy no. 4 Sprayweld powder. From the spray pistol nozzle the powder is propelled through an oxy-acetylene flame in a narrow cone pattern. The powder is then welded to the shaft by application of a conventional oxy-acetylene torch. (L24, T7, 18-72; ST, Cr, 17-57)

716-L. New Chemicals Speed Cleaning, Plating; Cuts Costs. Austin Porter. Western Metalworking, v. 19, July 1961, p. 42-43.

Electrolytic cleaning of steel parts; use of Burnek 452, a steel and ferrous metal burnishing compound and Dubrite, a bright dip sealing compound in the finishing of chain saw parts. (L12p, L13; ST)

717-L. (German.) Processes in Nonferrous Semi-Finished Products Industry. Pt. 6. Newer Pickling Processes in Nonferrous Industry. Peter Petri. Zeitschrift fur Metallkunde, v. 52, June 1961, p. 437-439.

Plant design and mode of operation for automatic and nonautomatic pickling of nonferrous products including small brass parts and tubes, and Cu sheet and wire. (L12g, 1-52; Cu-b)

718-L. Hardsurfaced OEM Parts and Products: A Big Market Getting Bigger. Welding Design & Fabrication, v. 34, July 1961, p. 45-46.

Advantages and limitations of hardsurfacing; applications in the chemical, aircraft and missile and steel industries. List of surfaced original equipment manufacture parts and products. (L24)

719-L. Creative Applications of OEM Hardsurfacing. Welding Design & Fabrication, v. 34, July 1961, p. 49-57.

Case histories of original equipment manufacture hardsurfacing applications in mining equipment, cutting machines, oil refining equipment, automobile parts and fittings, extrusion screws, drill heads and other parts and products. (L24, T-general)

720-L. Broad Plating Economies Demonstrated by Huge Plating Operation. Asarco Digest, v. 3, no. 1, p. 2-4.

Operations and equipment for plating metal products of various sizes and shapes. Zn plating using the Zimax brightener process. Conversion coating. (L-general, 1-52)

721-L. Tips for Better Electroplating. Steel, v. 149, July 31, 1961, p. 56.

Factors to be considered in electroplating quality control including surface and other properties of the base metal, properties of the diffusion alloy of the base metal and properties of the deposited coating to suit particular applications. (L17)

722-L. (German-French.) Anodic Oxidation of Aluminum and Its Alloys. Aluminium Suisse, v. 11, May 1961, p. 113-120.

Measurement of the thickness of surface layers obtained by anodic oxidation using microscopes or electrical instruments generating eddy currents in the base metal by determining the spark voltage necessary for puncturing the oxide film or by resistivity measurements. (L19, S14; Al-b)

723-L. Powder Diffusion Coating. Australasian Manufacturer, v. 46, June 17, 1961, p. 52-55.

Heat, corrosion, abrasion and wear resistance are imparted by chromallizing, a process for surface alloying by diffusing Cr and/or other elements into a base metal. Examples are given for steel. (L15. P11h, Q9n; ST, Cr)

724-L. (Translation-ConBur.) Determination of the Strength of Adhesion of Nickel Coatings to Aluminum and Its Alloys. N. P. Fedot'ev and A. M. Yampol'skii. Journal of Applied Chemistry of the USSR, v. 33, Aug. 1960, p. 1823-1828.

Method based on determination of the force required for progressive removal of the coating is used to determine the composition and treatment of the Al surface in zincate solutions for giving the highest adhesion strength. 5 ref. (L17c, Q10c; Al-b, Ni)

725-L. (German.) Combined Hot Dip Galvanizing and Lacquering--An Ideal Corrosion Protection. K. A. van Oeteren. Seifen-Ole-Fette-Wachse, v. 87, May 10, 1961, p. 278-281.

Application of protective paint coatings on galvanized Fe and steel surfaces. Mechanical and chemical preparation of galvanized surface to improve adherence of paint, galvannealing (diffusion annealing at 600° C.) and selection of paint and primer are reviewed in terms of corrosion resistance. (L-general, L16, L26n; Fe, ST)

726-L. (Russian.) Effect of the Mechanical Properties of Solid Metals and Alloys on Rate of Their Ultrasonic Treatment. N. M. Rostovtsev and G. I. Epifanoz. Doklady Akademii Nauk SSSR, v. 136, Apr. 1961, p. 807-809.

Agitation of Pb, Al, Fe, Cu, Zn, Sb, glass and Pb-Sb alloys in boron carbide solution to determine speed of ultrasonic cleaning as a function of plasticity and brittleness. 4 ref. (L10f)

727-L. Metal Finishing Conference. F. H. Reid, J. C. Blake, P. G. Forrester, A. A. Pearson and G. G. Parker. Metal Finishing Journal, v. 7, July 1961, p. 269-277.

Summaries of three papers presented at the Annual Conference of the Institute of Metal Finishing at Llandudno, May 2-6, 1961. Included are Electrodeposition of Ru; Electrodeposition in Plain Bearing Manufacture; Experience With an Ion-Exchange Process for the Recovery of Water Polluted in Metal Finishing Operations. (L17, A8b, T7d; Ru)

728-L. Interfacial Reactions. S. E. A. Ryder, A. Biddulph, H. H. Johnson, N. S. C. Millar and B. K. Niklewski. Metal Finishing Journal, v. 7, July 1961, p. 257-260.

Experiments are carried out on specially produced titanium steel to assess the possibility of its use for direct-application cover-coat enameling. (L27; AY, Ti)

729-L. The Scope for Further Study of Anodic Oxide Films on Aluminum. G. C. Wood. Metallurgia, v. 63, May 1961, p. 221-222.

Review of recent studies on the anodizing of Al including the mechanism of porous film formation, aging, dye absorption, sealing and adequate pore closure. 15 ref. (L19, 10-54; Al)

730-L. How to Deposit Hardfacing Alloys. Pt. 2. Welding Engineer, v. 46, July 1961, p. 40-41.

Preparation of mild, medium, high carbon and manganese steel parts by cleaning, grinding, depression filling and build-up for hardfacing. Selection of electrodes to suit desired resistance. (L24, K9p)

731-L. Small Plater Handles Odd Jobs. Iron Age, v. 188, Aug. 3, 1961, p. 77.

Application of selective Au and Rh plating using a power pack, stylus with graphite anode and a small amount of electrolyte, to preparation of electrical switch components. (L17, 1-52, T1; Au, Rh)

732-L. (Russian.) Hard Facing of Steel With Nichrome. E. I. Leinachuk and A. T. Gabchak. Avtomaticheskaya Svarka, Apr. 1961, p. 71-77.

Effect of electrode composition and flux on the composition of filler metal, its microstructure, tensile and yield strengths, elongation and area reduction determined at 20-800° C. Oxidation resistance of Nichrome faced carbon steel held at 900-1100° C. for 8-48 hr. 4 ref. (L24, 2-60, M27, Q-general, R-general; CN, Ni-b)

733-L. (German.) Important Factors in Enameling of Welded Products. Ian Wachtmeister. Glas-Email-Keramo-Technik, v. 12, June 1961, p. 189-193.

Poor enamel quality (porosity) caused by gases, particularly hydrogen, dissolved in the weld. Control of defects by proper solution and drying of electrodes and by pickling and degassing at 200-250° C. (L27, L12, 9-68; 7-51)

734-L. The Protective Treatment of Metals Against Corrosion. Pt. 1. H. Silman. Wire Industry, v. 28, July 1961, p. 679, 681-682.

Electroplating of metals with subsidiary processes including cleaning and pickling and degreasing for increasing corrosion resistance. Survey of Ni-Cr and Cr plating processes and solutions and pickling baths and solvents. (To be continued.) (L-general, L17, R-general 10-54)

735-L. Plated Wire for Bolt, Nut and Screw Production. Wire Industry, v. 28, July 1961, p. 692.

Procedure for electroplating stainless steel wire with Cu to provide a lubricant in cold heading operation. Wire is preplated with Ni, Cu-plated and cold headed into bolts, nuts and screws from which the Cu is removed with HNO prior to marketing. (L17, G10, 18-73; ST, Cu, 4-61)

736-L. (Czech.) Removal of Grinding and Polishing Pastes by Electrolytic Methods, Previous to Electroplating. J. Klicka and O. Mudroch. Strojirenstvi, v. 11, Feb. 1961, p. 119-125.

Cathodic degreasing and anodic finish cleaning at a current density of 10 amp. per sq.dm. and a temperature of at least 90° C. for 40 sec. Both operations are carried out in pH 10 electrolytes containing NaOH, Na_2CO_3, Na_3PO_4 and Na_2SiO_3. 4 ref. (L13n)

737-L. (German.) Currentless Nickel Plating Using Nickel Sulphate. C. Kalauch. Maschinenbau, v. 10, Apr. 1961, p. 150-153.

Currentless electrolytic deposition of Ni layers of various thickness on metal surfaces at 90° C. using an aqueous $NiSO_4$ and NaH_2PO_2 solution at 4-4.5 pH. Study of reaction mechanism and properties of the Ni coatings. 5 ref. (L17; Ni)

738-L. Chemical Cleaning of Metal Parts. Lester F. Spencer. Machine Design, v. 33, July 20, 1961, p. 134-141.

Review of methods for removing contaminants from surfaces of brass, Al, Zn, stainless steel, W, Mo, Zr and Ti alloys. Processes discussed include vapor degreasing and solvent, alkaline, emulsion, electrolytic and ultrasonic cleaning. (L12, L13, 10-54)

739-L. (German.) Smoking (Smoke Pickling) of Steel Wire. Paul Rump. Stahl und Eisen, v. 81, July 6, 1961, p. 939-942.

Reaction mechanism and mode of operation of the 19th century technique of "smoking" of annealed steel wire over charring wood (pickling by acetic acid contained in smoke) in preparation for drawing. (L12g; ST, 4-61)

740-L. Use of Electron Beams in Vacuum Coating. M. H. Hablanian. Paper from "Society of Vacuum Coaters. Fourth Annual Technical Conference and Meeting". Society of Vacuum Coaters, Chicago, Ill., p. 22-33.

Evaporating difficult materials such as W, Ta, Pt, Ir, Si and aluminum oxide in ultra high vacuum electron beam evaporator. Thermal conductivity, melting point, melting power and evaporation rate are given for 17 metals. (L25g, N16m, P11h, P12n; W, Ta, Pt, Zr, Si, 17-57)

741-L. The Protective Treatment of Metals Against Corrosion. H. Silman. Production Engineer, v. 40, July 1961, p. 433-453.

Review of electroplating and chemical conversion processes including cleaning, pickling, degreasing, plating with Ni, Cr, Zn and Cd, polishing, electrogalvanizing and electrotinning of brass, steel and Zn alloy and anodizing of Al to prevent corrosion. 13 ref. (L-general; SGA-g, Cu-b, ST, Al, Ni, Cr, Zn, Cd)

742-L. Painting and Plating Steel Furniture. Ezra A. Blount. Products Finishing, v. 25, Aug. 1961, p. 50-58.

Zn-coated tubular steel and plain carbon steel is finished by automatic processes which obviate the need for preparatory buffing and polishing; electrostatic painting or plating with bright nickel and chrome. (L26n, L17, T10b; ST, 1-52, 4-60, 18-74)

743-L. Recent Reports on Plating and Anodizing Aluminum and Magnesium. Gerard H. Poll, Jr. Products Finishing, v. 25, Aug. 1961, p. 64-78.

Talks presented at the 48th Annual Convention, American Electroplaters' Society. Review of techniques for protecting and decorating these nonferrous metals including a process for depositing Ni directly over an anodic coating. (L17, L19; Al, Mn, 1-52, 10-54, 17-57)

744-L. (German.) Electrolytic Deburring and Polishing of Metals. C. Striegler. Maschinenbau, v. 10, Apr. 1961, p. 140-148.

Review and theoretical analysis of anodic erosion with comparison of properties of mechanically and anodically polished surfaces. Survey of polishing and deburring techniques and equipment; process technology such as electrical data, temperature conditions, course of operation and efficiency and reconditioning of electrolytes. (L13, 10-54)

745-L. Extrusion Cladding With Aluminum. R. J. Fiorentino, C. J. Slunder and H. J. Wagner. Modern Metals, v. 17, July 1961, p. 38, 40.

Extrusion cladding of a uranium core. Effect of pressure of the cladding material on the core in the space between the die and mandrel. Photomicrography is used to illustrate diffusion layers between an Al cladding and a Ni plated uranium core. (L22, Ni; U, Al)

746-L. Brushing Gear Burrs and Radii. Edward P. Fisher. Grinding and Finishing, v. 7, Aug. 1961, p. 28-30.

Use of power-driver wire brushes with finishing machines to remove burrs and produce adequate blends and radii in automotive gear and component parts after hobbing and broaching. (L10e, 1-52, T7a)

747-L. The Anodic Surface Oxidation of Gold. H. A. Latinen and M. S. Chao. Electrochemical Society, Journal, v. 108, Aug. 1961, p. 726-731.

Au is anodized at constant potential and cathodically charged at constant current in perchloric acid. 18 ref. (L19, L21; Au)

748-L. Mechanism of Addition Agent Reaction in Bright and Leveling Nickel Deposition. Pt. 1. Studies With Radioactive Sodium Allyl Sulfonate. Seward E. Beacom and Bernard J. Riley. Electrochemical Society, Journal, v. 108, Aug. 1961, p. 758-763.

Sodium allyl sulphonate containing C^{14} and S^{35} is used with N-allyl quinaldinium bromide as a leveling agent in the bright plating of Ni on steel. Analysis of deposits and gaseous products indicates a mechanism which may account for the synergistic effect on leveling by various combinations of addition agents. 23 ref. (L17a; ST, Ni)

749-L. Electroless Deposition of Gold From Aqueous Solution on Base Metals of Nickel and Iron-Nickel-Cobalt Alloys. Robert F. Walton. Electrochemical Society, Journal, v. 108, Aug. 1961, p. 767-774.

Main constituents of the solution are potassium gold cyanide, citric or tartaric acid, tungstic acid and sodium N, N-diethylglycine. Deposition rate and deposit thickness, adherence and quality are dependent upon concentration, pH, temperature and immersion time. 4 ref. (L28, 2-60, 2-61, 2-67; Ni, Fe-b, Co, Au)

750-L. Porosity Measurements on Gold Plated Copper. Martin S. Frant. Electrochemical Society, Journal, v. 108, Aug. 1961, p. 774-778.

Porosity of the plate from seven types of bath is determined in an ammonia-ammonium persulfate solution which attacks only Cu so that amount of Cu dissolved is a measure of coating porosity. 17 ref. (L17a, 1-5; Cu, Au)

751-L. Influence of Thiourea on the Deposition Reactions of Iron and Nickel. Richard D. DeMars. Electrochemical Society, Journal, v. 108, Aug. 1961, p. 779-782.

Effects of thiourea on the deposition rates and reactions from mixed and unmixed chloride solutions are studied polarographically. 14 ref. (L17a, S11m; Fe, Ni)

752-L. Some Factors Affecting the Surface Chromium Content of Electrochemically Treated Tin Plate. P. R. Carter. Electrochemical Society, Journal, v. 108, Aug. 1961, p. 782-787.

The surface Cr content of cathodic-dichromate treated tin plate depends upon temperature, pH, Coulomb level and current density. Higher Cr content usually imparts greater oxidation resistance. 6 ref. (L17b, R10d; Sn, Cr)

753-L. Photoetching and Plating of Gallium Arsenide. R. W. Haisty. Electrochemical Society, Journal, v. 108, Aug. 1961, p. 790-794.

Plating (by Cu) occurs at the dark and etching at the lighted sections of n-type material; the reverse is true for p-type. 8 ref. (L17, P15g; EG-j, Ga, As, Au)

754-L. (French.) Some Advice for Electrodepositing. Guy Bacquias. Galvano, v. 30, June 1961, p. 391-393.

The amount of metal deposited on the cathode is calculated as a function of immersion time, current intensity, the molecular weight of metal to be deposited and its valence within its salt, forming the main component of the electrolyte. Experiments performed with the Hull cell. Addition of sodium cyanide or potassium cyanide to alkaline baths weakened by use. (L17c)

755-L. (French.) Print and Photographs on Aluminum. H. Richter. Galvano, v. 30, June 1961, p. 403-409.

Anodic oxidation and subsequent printing on the surface of Al or its alloys. Impregnation of the porous oxide film with substances sensitive to light prepares it for use as a photographic medium. (L19, L26b; Al)

756-L. (French.) Vacuum Evaporation. Pierre Arnold. Galvano, v. 30, June 1961, p. 411-416.

Equipment used in the vacuum evaporization of metals and their deposition on metals and non-metals. Applications in the manufacture of anti-reflection coatings in optical apparatus, mirrors, reflecting coatings on reflectors, catadioptric instruments, metallized plastics, piezoelectric quartz crystals and Se rectifiers. (L25g, 17-57)

757-L. How to Get the Most From Phosphating Systems. Pt. 1. George H. Pimbley. Metal Progress, v. 80, Aug. 1961, p. 103-107, 116, 118, 120, 122.

Recommended practices for Zn phosphate dip baths. (L14b)

758-L. Electrostatic Painting of Refrigerators. Metal Progress, v. 80, Aug. 1961, p. 112.

Automatic system for painting refrigerator cabinets and doors at the Kelvinator Div. of American Motors, Grand Rapids, Mich. The installation employs 33 Ransburg electrostatic painting units and replaces a battery of hand spray and automatic air guns. (L26n, T10a)

759-L. (German.) When to Use Metal Spray? F. Nagel. Maschinenbau, v. 10, Apr. 1961, p. 154-156.

Review of spraying of liquid metals including steel, Mo, Zn, Al, Cu-base metals, on cold (20-100° C.) metal or nonmetallic (ceramic, glass, wood) surfaces to improve wear resistance, corrosion resistance and surface quality. (L23, 10-54; ST, Mo, Zn, Al, Cu, 14-60)

760-L. Recommended Practices for Shop Cleaning and Priming. Corrosion, Aug. 1961, p. 119-120.

Methods of surface preparation of steel including solvent cleaning, flame cleaning and sand blasting. Methods of primer application including brush, spray and roller painting. (L10, L12, L26n; ST)

761-L. (Italian.) Diffusion Processes of Solid State. L. Matteoli. Metallurgia Italiana, v. 53, June 1961, (Atti-Notizie, v. 16, May-June 1961, p. 99-103.)

Parameters for the coating of metallic materials by lattice and interstitial diffusion using metallic halides. Various exchange reactions are described and the kinetics and thermodynamics of the diffusion processes are examined. (L15)

762-L. (Italian.) Siliconizing of Steel. L. Matteoli. Metallurgia Italiana, v. 53, June 1961, (Atti Notizie, v. 16, May-June 1961, p. 104-108.)

Survey of the siliconizing processes (from gas, fused and solid phase, and by electrolysis) on steel, U, Mo and Fe. Characteristics of the material before and after the process, and its application in industry are examined. 11 ref. (L15, L17; ST, U, Mo, Si)

763-L. (Italian.) Calorizing and Aluminizing Processes of Iron and Steel. D. Gualandi. Metallurgia Italiana, v. 53, June 1961, (Atti Notizie, v. 16, May-June 1961, p. 109-112.)

Classification and characteristics of various methods used in Al coating of Fe and steel in order to achieve a corrosion and heat resistant surface. (L15, L17; ST, Al)

764-L. (Italian.) The Sherard Process of Diffusion Galvanizing for Protective Coating of Iron. A. Bianchini. Metallurgia Italiana, v. 53, June 1961, (Atti-Notizie, v. 16, May-June 1961, p. 113-125.)

Apparatus, control, cost and application of the Sherardizing process of galvanizing-hot dipping used in coating Fe material with Zn. Structure of the Sherardized strata is examined. 18 ref. (L16; Fe, Zn)

765-L. Wire Insulating by the Fluidized Bed Process. C. A. Brown. Wire and Wire Products, v. 36, June 1961, p. 750-752.

Method of coating Cu wire by heating to a temperature above the melt and flow points of the plastic, immersing in a bed of air-suspended plastic powder, removing and subjecting the coating to more heat and then introducing it into the fluidized bed to form a coating. Investigation of effect of powder composition and size on the quality of the coatings. (L29; Cu, 4-61)

766-L. Some Fundamentals in the Preparation and Usage of Sheet Iron Ground Coats. A.I. Blackburn. Institute of Vitreous Enamellers, Bulletin, v. 11, July 1961, p. 117-120.

Method of enamelling Fe sheet or steel pressings. Preparation of enamel and pressings. Techniques and equipment used for dipping, drying and firing the ware to prevent ground coat contamination and to control coating thickness. (L26n, S14; Fe, 4-53, ST, 4-57)

767-L. Galvanized Strip Production. Metal Industry, v. 99, July 28, 1961, p. 69-70.

Methods of bath analysis, coating thickness control and cooling treatments in the production of hot dip galvanized sheet and strip. (L16, J2, S11, S14; ST, 8-65)

768-L. (German.) Roll-Polishing Surface Improvement by Working. Arthur Neischner and Horst Neumann. Fertigungstechnik und Betrieb, v. 11, June 1961, p. 371-376.

Review of roll polishing of steel, cast iron, Al, brass, bronze and other alloys having a tensile strength below 140 kp. per mm.^{2}. Descriptions of equipment and operating procedures including possible problems of application. (L10, 1-52; ST, CI, Al, Cu-b)

769-L. (Book.) Industrial Finishing Year Book 1961. 1961. 415 p. Arrow Press Ltd., Stamford House, 65-66 Turnmill St., London, S. E. 1, England.

Annual reference book on workshop practice, materials and processes including plastic coating, anodizing, electroplating, painting, dyeing, finishing, cleaning and polishing of metals and nonmetals. (L-general, 11-68)

770-L. Vacuum Plating of Metals and Plastics. Australasian Manufacturer, v. 46, June 24, 1961, p. 44-46.

Vacuum plating with Al by an automatic process which provides a glass base and a bright chrome-like finished surface which can be altered to any color. (L25q, 1-52; Al)

771-L. (English.) A Design Guide for Specifying Mechanical Finishes for Metal Parts. Lester F. Spencer. Machine Design, v. 33, Aug. 17, 1961, p. 164-172.

Review of mechanical finishing. Types of finishes and finishing methods including abrasive blasting, grinding, polishing, buffing and barrel finishing. Abrasive belts and contact wheels. Surface finishing characteristics of Al, Mg, Cu, Ni and their alloys, Zn alloys, Ag, steel and stainless steel. Mechanical finish specifications for stainless steel, Cu and Al parts. (L10, 1-52; Al, Mg, Cu, Ni, Zn-b, Ag, ST, SS)

772-L. Mechanical Plating--New Method Kneads Coating Material to Surface. Canadian Machinery and Metalworking, v. 72, Aug. 1961, p. 76-78.

Steel parts are covered with a protective metal coating of Zn, Cd, Sn or Pb of predetermined thickness (0.0001-0.003 in.) by mechanical plating in a cold welding process requiring no heat or electricity. A weighted amount of plating metal in powdered form is tumbled with promoter chemical additives and water causing metal dust to migrate to the surface of the steel part. (L17; ST, Zn, Cd, Sn, Pb)

773-L. Cold Galvanizing Comparable to Hot Dip. Canadian Machinery and Metalworking, v. 72, Aug. 1961, p. 84, 86.

Protection of Fe and steel by application of a Zn-rich paint coating through "cold galvanizing" which produces tough, adhering films containing 92% metallic Zn. Better corrosion protection is obtained by covering the galvafroid coating with a micacious Fe ore paint. (L16, L26n; ST, Fe, Zn)

774-L. Watch for More Automatic Cleaning. Canadian Machinery and Metalworking, v. 72, Aug. 1961, p. 85-86.

Application of multistage cleaning processes incorporating alkaline washing, degreasing, rinsing and phosphatizing operations on metal products and consumer goods. (L-general, 18-74)

775-L. Ultrasonics Clean Molds Quickly and Efficiently. Canadian Machinery and Metalworking, v. 72, Aug. 1961, p. 87.

Flat plate and book type molds made of low-carbon and chrome-plated steel are cleaned ultrasonically in alkaline-base cleaner at 160° F. Thoroughly cleaned surfaces without change in the shape of the molds are attributed to the high frequency ultrasonic energy used during cleaning. (L10f)

776-L. Discover Vibratory Finishing. William E. Brandt. Machinery, v. 67, Aug. 1961, p. 81-89.

Vibratory finishing with loose abrasives is used for cleaning, descaling, deburring, radius forming, coloring and burnishing of ferrous and nonferrous, cast, forged, stamped, pressed or machined metal parts. The workpieces are embedded in a mixture of fused Al_2O_3, SiC, ceramic triangles and H_2O and are subjected to controlled gyratory vibration in specially designed equipment. (L10h)

777-L. Three Steps Vital in Cleaning Steel for Electroplating. Canadian Machinery and Metalworking, v. 72, Aug. 1961, p. 119-120.

Precleaning procedure using alkaline or emulsifiable solvents and anodic electrocleaning with reverse current for producing a high degree of cleanliness on steel surfaces. The unplating tendency of reverse current cleaning is assisted by the wetting, emulsifying and suspending action of suitable cleaning solutions. (L12, L13; ST)

778-L. Recent Developments in Wire and Strip Anodising of Aluminum. B. A. Shenoi and P. V. S. Subramanian. Current Engineering Practice, v. 3, June 1961, p. 15-17.

Methods of producing satisfactory inert and insulating coatings for use in transformer windings, contactor coils, cycle dynamos, relay coils, wattmeters, electric magnets, laboratory gages, wire cloth, brake coils, anodes and cans. 8 ref. (L19, T1; Al, 17-57)

779-L. Alloy Plating in Metal Finishing. S. Venkatachalam and T. L. Rama Char. Current Engineering Practice, v. 3, June 1961, p. 18-21.

Review of developments in electrodeposition of Sn, Fe, Cr, W, Mo, Ni, Zn, Cu-Pb, Sn-Zn-Cu, Pb-Sn, Sb,

Fe-Cr-Ni alloys and In. (L17; Sn, Fe, Cr, W, Mo, Ni, Zn, Cu, Pb, Sb, In)

780-L. Plastic Coated Pipe Shows Strong Growth Potential. Steel, v. 149, Aug. 21, 1961, p. 86.

Steel pipe is degreased, blasted, undercoated with adhesive and coated with polythylene plastic which forms a corrosion resistant, tough covering which remains flexible in all kinds of weather. (L26p; ST, 4-60)

781-L. Hardsurfacing, With Alloy Flux, Extends Life of Shaker Screens. Machine Production, v. 20, Aug. 1961, p. 35-37.

Wear areas are hardsurfaced to resist abrasion and increase toughness. Application to manufacture of screen decks from heavy steel plates. (L24, 17-57; ST, 4-53)

782-L. (German.) Directions for Designing Electroplating Plants. K. Elkner. Maschinenbau, v. 10, June 1961, p. 148-149.

Plant capacity, purpose and thickness of electrocoatings, technological requirements and part applications are considered in designing a plant used for Cu, Ni, Cr, Zn, Sn, Ag and P coating. (L17, 18-67, 17-51; Cu, Ni, Cr, Zn, Sn, Ag, P)

783-L. Electrodeposition of Nickel-Iron Alloys From the Pyrophosphate Bath. Vasanta Sree and T. Rama Char. Metal Finishing, v. 59, Aug. 1961, p. 49-55.

Determination of deposit composition, current efficiency and electrode efficiencies as a function of current density (6.9-2.6%), agitation, temperature (40-60° C.), and Fe-Ni concentration and pH (7.2-9.2%) of the plating solution, for codeposition of alloys from nickel chloride-ferric chloride-pyrosphosphate baths using soluble and insoluble anodes. 33 ref. (L17; Ni-b, Fe-b)

784-L. Finishing to Government Specifications. Boris B. Joffe. Metal Finishing, v. 59, Aug. 1961, p. 61-64.

Bath compositions, plating variables and standards and testing for adhesion, color, thickness, corrosion and abrasion resistance, gloss structural continuity and residual stresses are specified for black and gray Cr, black Ni, Cu and Au electroplating and for Sn electroplating and dip coating, on various substrates including steel, brass, bronze, Zn, Cd, Al, Ni and Cu. (L17, 15-74; Cr, Ni, Cu, Au)

785-L. Science for Electroplaters, Pt. 66. Nickel-Hardness Tensile Strength. L. Serota. Metal Finishing, v. 59, Aug. 1961, p. 70-74.

Review of data for tensile strength, elongation and hardness measurements on electrodeposits obtained from Ni sulphate and Watts type baths. Relation between hardness and tensile properties. Effect of solution composition, pH, temperature and current density on mechanical properties. Influence of 1000° C. annealing on recrystallization microstructure and embrittlement. (L17b, L17c, 2-60, 2-61, 2-64; Ni)

786-L. (Japanese.) Experimental Method for Studying Leveling Power of Plating Baths. Minoru Nakamura and Mamoru Saito. Metal Finishing Society of Japan, Journal, v. 12, June 1961, p. 215-218.

The depths of surface scratches in electrodeposits of Cu and Ni, obtained from cyanide and chloride baths, respectively, are compared to data for leveling power curves obtained by conventional methods to derive a numerical method for ascertaining leveling power of baths with more reproducible results. 6 ref. (L17a, 1-54; Ni, Cu)

787-L. (Japanese.) Leveling Power of Copper Cyanide Plating Baths. Minoru Nakamura and Mamoru Saito. Metal Finishing Society of Japan, Journal, v. 12, June 1961, p. 218-222.

Effect of cathodic concentration polarization on the leveling power of Cu cyanide baths is determined by numerical analysis of scratch test leveling power curves. 5 ref. (L17a, 1-54; Cu)

788-L. (Japanese.) Reducing Agents in Electroless Nickel Plating Solutions. Satoru Ishibashi, Hiroharu Yokoyama and Yasutoshi Nagase. Metal Finishing Society of Japan, Journal, v. 12, June 1961, p. 222-225.

Various reducing agents selected on the basis of chemical equilibrium in Ni reduction reactions are tested in electroless plating solutions with formic acid being compared favorably with sodium hypophosphite for reducing action. 8 ref. (L28; Ni)

789-L. Oxidation Resistance of Aluminum Dip Coated (Aldico) Columbium Alloys. Robert G. Carlson. Paper from "Columbium Metallurgy". v. 10. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 119-137.

Effectiveness of a 15% Si-Al dip coating on F-48, F-50, Fansteel 82, 7.5% Ti-5% Mo and 8% Ti alloys is studied by varying the time (1-13 min.) and temperature (815-1150° C.) of dip and the post treatment. Results indicate an optimum dip time and temperature and post treatment to be, respectively, 3 min. at 925° C. and a treatment in vacuum for 1 hr. at 1040° C. (L16; Cb-b, Al)

790-L. Preclean Metals and Plastics for Adhesive Bonding. J. N. Kempf. Product Engineering, v. 32, Aug. 14, 1961, p. 44-46.

Cleaning techniques including degreasing, descaling, pickling, etching, rinsing, drying and gloss removed for steels, stainless steels, Al, Mg, Ti, Cu and their alloys, brass, Zn, galvanized metal, cured polyester, linear and medium density, rigid or flexible vinyl and natural and synthetic rubber. (L12; ST, Al, Mg, Ti, Cu, Zn, 8-65, NM-d)

791-L. (Italian.) Surface Treatment of Stainless Steels. Giampiero Colombo. Acciaio Inossidabile, v. 28, Mar.-Apr. 1961, p. 37-40.

Mechanical and physical properties of carbon and stainless steels. Grinding, tumbling, polishing and degreasing stainless steel without changing its properties. (L10, L12g, G18k, P-general, Q-general; SS, CN)

792-L. Electrodeposition of Nickel-Iron-Tungsten Ternary Alloys From the Pyrophosphate Bath. K. I. Vasu and T. L. Rama Char. Journal of Scientific & Industrial Research, v. 20D, June 1961, p. 241-242.

Deposit composition and cathode efficiency and potential relations are examined for obtaining bright deposits of Ni-Fe-W alloys as a function of bath concentration and voltage, current density, temperature and agitation time. (L17; Ni-b, Fe-b, W-b)

793-L. The Reaction Between Anodic Aluminum Oxide and Water. Walter J. Bernard and John J. Randall, Jr. Electrochemical Society, Journal, v. 108, Sept. 1961, p. 822-825.

The action of water at 100° C. on barrier anodic oxide is studied for reaction time up to 30 min. The hydrated product is the same as that formed when Al metal reacts with water and the rate of hydration of anodic oxide is similar to the rate of aqueous oxidation of the metal, suggesting that the same mechanism produces the hydrated film in each case. 8 ref. (L19, R1h; Al)

794-L. A Study of the Formation of Anodic Oxide Films on Titanium. W. Mizushima. Electrochemical Society, Journal, v. 108, Sept. 1961, p. 825-829.

The relation between current and electrostatic field during formation of anodic oxide films on KS-50 Ti sheet at high potentials is studied using a nonaqueous electrolyte at 12-85° C. An equation is derived for the rate determining mode at high and low temperatures in terms of a Cabrera-Mott model and the effects of space charge. 9 ref. (L19; Ti)

795-L. Some Observations of Copper Deposits on Single Crystals of Copper. Isaac Giron and Fielding Ogburn. Electrochemical Society, Journal, v. 108, Sept. 1961, p. 842-846.

Isolated faces of Cu single crystals are plated with Cu from Cu sulphate-sulphuric acid solutions. Deposits on (100) and (110) faces, despite the presence of grain boundaries, give X-ray diffraction patterns showing uniform lattice orientation. The grain boundaries are associated with topographic features of the deposits. 5 ref. (L17, M26, M22g, 3-72; Cu, 14-61)

796-L. Oxidation-Resistant Silicide Coatings for Columbium and Tantalum Alloys by Vapor Phase Reaction. R. H. Lorenz and A. B. Michael. Electrochemical Society, Journal, v. 108, Sept. 1961, p. 885-893.

Substrates of Cb, Ta, Tantaloy, 82 alloy (Cb-Ta-Zr) and a Cb-Ta-W-Zr alloy are coated by conversion of a thin layer of the surface to its silicides or by depositing a Mo-rich layer on the substrate and converting this to Mo disilicide. The silicides are formed by vapor phase reaction with $SiCl_4$ and H at 1450° C. Coating techniques are discussed, with the structures, oxidation mechanisms and mechanical properties

of the coatings. 8 ref. (L25, N15g, R1h, 2-62; Ta-b, Cb-b, Si, 17-57)

797-L. Variation of Composition With Thickness in Thin Electrodeposited Films of Nickel-Iron Alloys. G. H. Cockett and E. S. Spencer-Timms. Electrochemical Society, Journal, v. 108, Sept. 1961, p. 906-908.

Composition gradients of 15-40% Fe-Ni films, deposited from sulphate baths at pH 2.3 and constant current density at room temperature, are examined by X-ray diffraction after annealing and related to thickness as a function of plating variables. 5 ref. (L17c, M22g, 2-60; Ni-b, Fe, 14-62)

798-L. Single Coat Porcelain Enameling of Steel Sheets. Industrial Heating, v. 28, Aug. 1961, p. 1522, 1524.

Bonding enamel to steel by techniques which eliminate fish scaling and prevent primary boiling. Etching, control of composition and decarburization during box annealing are discussed in various applications. (L27, 1-52, 2-60; ST, 8-71, NM-g34)

799-L. Coating Metal Parts With Polyvinyl Chloride Requires Uniform Heating. F. A. Pyecroft. Industrial Heating, v. 28, Aug. 1961, p. 1531-1532, 1534, 1536, 1538.

Dip coating of large metal parts with PVC for protection against corrosion and abrasion in various applications. Importance of preheating and post-heating stages in the production of quality coatings is reflected in a system of temperature control for gas-fired preheating and curing ovens. (L26p, 1-52; NM-g33)

800-L. Continuous Processing of Transmission Castings Aided by Special Washer With External Conveyor. Industrial Heating, v. 28, Aug. 1961, p. 1542, 1544.

Description of a two-stage washer having a capacity of 2800 lb. (133 sets of castings) per hr. and a monorail conveyor whose external arrangement protects it from corrosion while the washer performs multiple functions. Hangers of the conveyor simultaneously carry unmachined castings above the washer and machined castings through the washer. (L12e, 1-52)

801-L. Functional Surfaces by Vacuum Metallizing. Philip J. Clough. Metals Engineering Quarterly, v. 1, Aug. 1961, p. 7-14.

The vacuum deposition of thick films of Al on various metallic bases is demonstrated as practical. Properties obtained from vacuum metallized parts are superior in that hydrogen embrittlement is completely eliminated, the strength of the base is not affected and no brittle interface is developed. (L25, 1-73; Al)

802-L. How to Get the Most From Phosphating Systems. Pt. 2. George H. Pimbley. Metal Progress, v. 80, Sept. 1961, p. 108-111, 128-134.

Principles governing spray systems for Zn phosphating are similar to those of dip baths. One difference is that the reactions must be accelerated to make up for the short processing time. In contrast, Mn phosphating can only be done in dip baths because of the large amounts of sludge which is always present. (L14b; Mg, Zn)

803-L. Flow-Coat Line Boosts Quality, Speed on Jet Parts. Western Metalworking, v. 19, Aug. 1961, p. 41-42.

Corrosion protective epoxy-resin paint and Zn chromate coatings are applied to fuselage components and structural materials for jet transport planes on a flow coating line, which also provides for cleaning, deoxidizing, alodizing and drying. (L14c, L26n, L-general, 1-52, T24a)

804-L. Vacuum Metallizing. Stokes Bulletin no. 584, F. J. Stokes Corp., 5500 Tabor Rd., Philadelphia 20, Pa., 1961, 15 p.

Deposition of metallic coatings or films of Ag, Se, Au, Sn, Al, Cd, other nonferrous metals and metallic compounds, on prepared surfaces of steel, coated metals, nonferrous metals, plastics, glass and other materials by vaporization of the plating material in a vacuum chamber at high temperatures. Properties of the coatings and efficiency of the process are compared to other plating methods for producing functional and decorative coatings. Process parameters are reviewed with design and operation of equipment. (L25k, 1-73)

805-L. The Protective Treatment of Metals Against Corrosion. Pt. 2. H. Silman. Wire Industry, v. 28, Aug. 1961, p. 783-784, 800.

Review of Zn and Cd plating, conversion coating and anodizing for protecting metals such as steel and Al alloys; and development of automatic plating methods and problems of mechanization. (L17, L14, L19; Al-b, ST, 10-54)

806-L. (German.) Zinc-Dust Paints. K. Ruttewit. Metall, v. 15, Aug. 1961, p. 753-756.

Use of fine Zn dust (0.002-0.006 mm. particle size) as pigment in paints for corrosion protection of Fe and steel is discussed in terms of production and composition of paint, mechanism of corrosion protection and examples of application including paint for ship bodies, steel structures and railroad coaches. (L26n; ST, Zn, 17-57)

807-L. (German.) The "Hansson-Robertson" Press for Continuous Cable Sheathing With Lead Alloys. Sch. Radtke. Metall, v. 15, Aug. 1961, p. 790-796.

Design, mode of operation and technological features of plant for continuous cable sheathing using pure Pb or Pb alloy containing As, Te and Sb. Mechanical properties and microstructure of cable sheaths. (L22, Q-general, T1b; Pb-b, 17-57)

808-L. Rinsing Effectiveness in Metal Finishing. John A. Tallmadege, Jr., and Bryan A. Buffham. Journal of Water Pollution Control Federation, v. 33, Sept. 7, 1961, p. 817-828.

Effect of mixing procedure, contaminants, contact time and flow rate on the rinsing effectiveness of an aqueous bath used in rinsing Cu plate. 4 ref. (L12e; Cu, 8-62)

809-L. Coextrusion Comes to Nonmetals. Iron Age, v. 188, Sept. 7, 1961, p. 99-101.

Techniques and equipment for cladding into tubing, rod, flat, hexagon and channel form with a metallurgical bond. Materials bonded include stainless steel, Zr, U, refractory metals, powder metals and ceramics. (L22, K11; SS, Zr, U, EG-d37, 6, NM-f, 8-66)

810-L. Precoated Metal Gets New Line. Iron Age, v. 188, Sept. 7, 1961, p.112.

Description of a metalcoating line that single or double coats stainless and cold rolled steel, Al, Mg, Zn, phosphor bronze and brass with alkyds, vinyls, epoxies, acrylics, organsols and plastisols. (L26, 1-52; ST, Al, Mg, Zn, Cu-s, Cu-n)

811-L. (Italian.) Department of Surface Treatments. Istituto Sperimentale dei Metalli Leggeri--Rapporto Annuale 1960, 1961, p. 108-114

Anodizing, galvanizing and chemical polishing of Al alloy castings. Effect of anodizing on corrosion of AC-63 alloy after exposure to HCl vapor. (L12, L16, L19, R6g; Al-b, 5)

812-L. Barrel Finishing Operations on Bearing Rollers. Machinery (London), v. 99, Aug. 2, 1961, p. 252-253.

Finishing of heat treated bearing rollers using two machines for descaling with compound plus water, polishing, rinsing and dewatering prior to grinding. (L10d, 1-52)

813-L. (Translation-ConBur.) Anode Processes in Electrochemical Polishing of Aluminum. N. P. Fedot'ev, S. Ya. Grilikhes and N. L. Foroponova. Journal of Applied Chemistry of the USSR, v. 33, Sept. 1960, p. 2050-2053.

Anode potential during polishing is measured as a function of electrolyte temperature and composition. In all cases the polishing effect occurs under conditions favoring the formation of an oxide film on the anode. 7 ref. (L13p, L19, 2-60, 2-61; Al)

814-L. Low Stress Rhodium Plating. Metal Industry, v. 99, Aug. 18, 1961, p. 128.

Base metal preparation and plating techniques using an electrolyte which permits heavy Rh deposits of low stress with a hardness of 700-800 d-p-n. (L17, Q25, Q29n; Rh)

815-L. Review of Recent Developments on Oxidation-Resistant Coatings for Refractory Metals. W. D. Klopp. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 120, July 31, 1961, 5 p.

Survey of silicide-base coatings for forming protective glasses on oxidation of Co, Ta, Mo and W. Review of vacuum pack, fluidized bed, pack cementation and duplex coating processes with data presented for coating life, thickness and temperature effects. 11 ref. (L-general, R1h; EG-d37, Si-b, 14-68, 17-57)

816-L. (German.) Production of Thick Films of Thorium, Uranium, Neptunium, Plutonium and Americum. G. I. Chlebnikov and E. P. Dergunov. Kernenergie, v. 4, June 1961, p. 512-514.

Investigation of deposition of thick layers of oxides of heavy metals by electrolysis (Th, Np), by mechanical methods with organic additions such as lacquer (U, Th, Np, Pu, Am), by precipitation (of Th) from alcohol-acetone suspension. (L17, L26n, L28; EG-h, Am, Np, Pu, Th, U)

817-L. The Structure and Hardness of Electrodeposited Chromium. C. P. Brittain and G. C. Smith. Institute of Metals, Journal, v. 5, July 1961, p. 407-416.

Optical and electron microscopy and microhardness measurements or Cr specimens electrodeposited at 45-85° C. and annealed at 1050° C. Effect of deposition and annealing temperature on grain size and of resultant grain size on hardness. (L17c, M-general, M27c, Q29n, 2-61, 2-64; Cr)

818-L. For Steel Finishes, These Low-Firing Porcelain Enamels. Product Engineering (Design Digest Issue), v. 32, Sept. 4, 1961, p. 108-109.

Two major classes of low temperature frits are those firing from 1250-1350° F. and those that fire at 1000-1100° F. Low cost furnace construction and maintenance yield the greatest savings from the use of the extra low temperature frits. (L27, 2-61; ST, NM-f, 17-57)

819-L. Metallizing Symbols. Product Engineering (Design Digest Issue), v. 32, Sept. 4, 1961, p. 162-163.

Standard symbols used to indicate undercutting, threading and grooving, blasting, bonding and coating thickness. (L-general, L23, 11-62)

820-L. Finishes for Aluminum. Product Engineering (Design Digest Issue), v. 32, Sept. 4, 1961, p. 111-113.

Survey of 19 types--applied coatings, electrochemical, mechanical and chemical finishes--with the surface preparation needed, method of production and applications for each. (L-general; Al)

821-L. Don't Overlook Electroforming. W. A. Safranek. Metalworking Production, v. 105, Aug. 9, 1961, p. 48-53.

Electrodeposition on a mandrel which is subsequently separated or removed, to reproduce detail with dimensional precision in the production of photo-engravings, radar waveguides, dies and other products requiring high finished accuracy. Design factors, process steps and mandrel selection guides. (L18, 1-52, 17-57)

822-L. Automatic Plants Apply Paint Finishes. E. C. Hall. Metalworking Production, v. 105, Aug. 9, 1961, p. 54-56.

Metal washing machine components are pretreated and then coated with acrylic paint or Ni-plated and porcelain enameled, depending on their intended use. (L26q, L27, T10c, 1-52)

823-L. Improved Corrosion Resistance for Cars Using Galvanized Strip. Corrosion Technology, v. 8, Aug. 1961, p. 246-248.

Use of hot dip galvanized and electrogalvanized strip, galvannealed sheet and Zn-rich paints to prevent corrosion in motor car bodies as depended on choice of steel, the coating width and finish desired and durability for spot welding. Galvanized, Cu-bearing and cold rolled steel are compared with plastics and primer coated materials for corrosion resistance in terms of humidity cycles and hours of salt spray exposure. (L16, L26n, T21a; ST, Zn, 17-57)

824-L. New Plant for Continuous Aluminising. Corrosion Technology, v. 8, Aug. 1961, p. 248-249.

Continuous dip coating production of corrosion resistant Aludip steel sheet on automatic line incorporating uncoiling, shearing, oxidizing, reduction and pickling operations. (L16, L-general, 1-52; ST, Al, 4-53)

825-L. What's New in Surface Finishing? Precesion Metal Molding, v. 19, Sept. 1961, p. 76-112.

Cr plating of Zn die castings; Zincate baths for the deposition of Zn on Al; anodizing of die castings; porcelain enameling on Al; paint and lacquer finishes. (L-general, 10-54; Al-b, Zn-b, 5-61)

826-L. New Porcelain Enamel for Steel Extrusions. Precision Metal Molding, v. 19, Sept. 1961, p. 91-94.

New extra low temperature frits that fire at 1000-1100° F. give excellent coverage of corners and sharp angles. Lower firing temperatures cause less distortion which means that only one side of a part needs to be coated. This can be a special benefit for hollow items such as sash and window frames. (L27, 2-61; ST, 4-58, NM-f40, 17-52)

827-L. Elastomeric Coatings for Aluminum Components of Rocket Launchers. T. Rice and T. A. Turner. Rock Island Arsenal Laboratory. U. S. Office of Technical Service, AD-255653, Jan. 1961, 23 p. $ 75.

Field tests to determine the best coating from among a group of fluoroelastomers, polyruethanes, fused epoxy coatings (fluidized) and epoxy-polysulphide blends. Al panels of 4 x 6 in. coated with test substances are fixed vertically 4 ft. from the blast end of 3.5 in. practice rockets in order to observe blast effects on coated Al components of launching frames and trails. (L26p, T2p; Al, NM-d, 17-57)

828-L. (English.) Radioisotope Tests for Determining the Cleanliness of Steel Surfaces. Hisashi Mori and Sadaichiro Taira. Yawata Technical Review, no. 231, June 1960, p. 109-112.

Electrolytic and chemical cleaning procedures for steel sheet are checked for efficiency by coating the sheet with stearic acid containing a C^{14} isotope and measuring the radioactivity after cleaning. (L12, L13n, 1-59; ST, C, 17-57)

829-L. (Translation-ConBur.) Influence of Manganese in Electrodeposition of Zinc. V. V. Stendor, G. Z. Kir'zakov and R. S. Vakhidov. Journal of Applied Chemistry of the USSR, v. 33, Oct. 1960, p. 2206-2213.

Effect of various Mn compounds (Mn^{2+}, MnO_2, MnO_4) on the corrosion of Zn in a standard Zn electrolyte and on the cathodic deposition of Zn from this electrolyte at current densities of 100-10,000 amp. per $m.^2$ and 20-70° C. 48 ref. (L17b, 3-69; Zn, Mn)

830-L. (Translation-ConBur.) Effects of the Surface State of the Cathode and Nature of the Electrolyte on the Quality and Properties of Zinc Coatings. P. F. Kallyuzhnoya. Journal of Applied Chemistry of the USSR, v. 33, Oct. 1960, p. 2221-2228.

Electrolytic deposits of Zn from pyrophosphate, zincate and acid electrolytes are studied by metallographic and microscopic means to determine grain size, dispersity and porosity. Cathodic polarization is measured during deposition. 14 ref. (L17b, L17c; Zn)

831-L. (Translation-ConBur.) Self-Regulating Tetrachromate Electrolyte. A. N. Sysoev and N. T. Drobantseva. Journal of Applied Chemistry of the USSR, v. 33, Oct. 1960, p. 2229-2235.

Development of a self-regulating electrode produced by joint additions of $CaSO_4$ and $CaCO_3$ to chromic anhydride solution. The high density of the deposits make possible direct Cr plating of steel without Cu or Ni undercoatings. 10 ref. (L17b; ST, Cr)

832-L. (Translation-ConBur.) Evaluation of Various Methods for Determining the Throwing Power of Electrolytes in the Light of the Similarity Theory. N. P. Gnusin. Journal of Applied Chemistry of the USSR, v. 33, Oct. 1960, p. 2236-2245.

Consideration of various methods for establishing relationships between the uniformity of current distribution and criteria of electrochemical similarity for various cells. The resulting formula determines the throwing power without requiring data on cell geometry. 4 ref. (L17b)

833-L. (Italian.) Sprayed Metal Coatings for Abrasion, Corrosion and Oxidation Resistance. G. R. Bell. Trattamenti Termici e Protettivi dei Metalli, v. 4, May-June 1961, p. 17-24.

Cleaning, thermal cycling, sand blasting, tapering and degreasing of metallic specimens (proton rods, cylinders and jackets) which are to be coated with Ni-Co-B-Si alloy. Techniques are described and specifications given for material to be deposited and steel and alloy bases to be used for spray welding. (L10, L23, L24, 1-52, 17-57; ST)

834-L. (Italian.) Recent Developments in Electrostatic Varnishing. M. R. Morel. Trattamenti Termici e Protettivi dei Metalli, v. 4, May-June 1961, p. 25-31.

Portable or fixed electrostatic spray guns are used to varnish various metallic shapes and surfaces. Surface tension, point of inflammability and electrical

resistance of paints. (L26n, 1-52, 17-57; NM-g30)

835-L. Repair of Kraft Digesters by Welded Overlay. Wayne L. Wilcox and Hallock C. Campbell. Welding Journal, v. 40, Aug. 1961, p. 839-844.

Technique for repairing kraft paper digesters (cylindrical batch-type pressure cookers) by manual or automatic weld deposition of stainless steel overlays. Emphasis on weld metal chemistry and its effect on corrosion properties and microstructure of the overlay. (L24, M27, T26q; SS)

836-L. Powder Metal Flame Spray Gives Fast, Efficient Cover. Hugh Canning. Canadian Machinery and Metalworking, v. 72, Sept. 1961, p. 100-101.

Base metals are plated with high-purity alloy powders following cleaning, roughening and precoating. Evaluation of resistance to wear, abrasion, erosion and corrosion for ferrous metals to which metal powder has been bonded. (L23, L10, Q-general)

837-L. New Developments in Wetting Agents. Carl Alex Fischer. Wire and Wire Products, v. 36, Sept. 1961, p. 1146-1148, 1187-1189.

Acid activators in pickling solutions as they influence the pickling rate, the H_2SO_4 consumption and the metal surface finish. Agents tested include HW 592 and Marlophene 89 and 810. Effect on foam formation, flotation additives and pickling bath temperature. (L12g, 17-57; AD-n42)

838-L. The Oxidation of Zirconium Alloys in Dry Oxygen. C. J. Kubit and E. Landerman. American Nuclear Society, Transactions, v. 4, June 1961, p. 91.

Processing Zircaloy-2 and Zircaloy-4 in dry oxygen gas at 750° F. to produce a nuclear core having a black, adherent, continuous oxide film without hydrogen pickup. (L14a, 1-66, T11; Zr-b)

839-L. Economising in Electroplating by the Use of High Grade Fully Automatic Equipment. Wire World International, v. 3, June 1961, p. 138-140.

Types and applications of automatic equipment for metal surface finishing including linear, reversing and circular machines and Zn-plating installation for Fe and steel strip and wire. (L17; Fe, ST, 4-53, 4-61, Zn)

840-L. Uptake of Hydrogen by Certain Organic Inhibitors During Pickling of Steel in Hydrochloric Acid. R. H. Anderson, E. R. Allen and P. A. van der Meulen. Corrosion, v. 17, Sept. 1961, p. 437t-440t.

Determination of the volume of hydrogen evolution and steel corroded by inhibited and uninhibited HCl as functions of apparatus design and the influence of variables including DHQ and hexamine. 10 ref. (L12q, Q26s, 1-53, 2-66; ST)

841-L. $15 Million Mill at Stelco Now in Full Production. William W. Craig. Canadian Metalworking, v. 24, Sept. 1961, p. 35-39.

New galvanizing line at the Steel Co. of Canada, Ltd., anneals, coats, chemically treats, coils or shears continuous low carbon steel strip. (L16, 1-52; CN-g, 4-53)

842-L. Acid Gold Plating. Metal Industry, v. 99, Aug. 4, 1961, p. 90-92.

Development of an electrolyte that does not attack adhesive used in printed circuits. Pure Au deposit has high hardness, low electrical resistance, low stress, freedom from porosity and good soldering qualities. (L17a, Q-general, T1c; Au, 1-64)

843-L. The Prevention of Exfoliation Corrosion of Aluminum Alloys by Sprayed Metal Coatings. V. E. Carter and Hector S. Campbell. Institute of Metals, Journal, v. 89, Aug. 1961, p. 472-475.

Atmospheric corrosion tests for up to 6 yr. on extruded D. T. D. 683 and HE15 Al alloy specimens sprayed with high purity Al or Al-1% Zn alloy or painted. Excellent protection is attributed to the metal coatings, provided they are not damaged. 8 ref. (L23, R2n, R11j; Al-b)

844-L. Plating of Precision Parts. Pt. 1-2. Robert D'Agostino. American Machinist/Metalworking Manufacturing, v. 105, Sept. 4, 1961, p. 127-129.

Formulas are derived for estimating the optimum amount and location of plating deposits to assure proper assembly

and performance of precision parts. Machining dimensions and tolerances are determined for noncritical, marginal, critical and supercritical parts. (L17, 1-52)

845-L. (German.) Problems in Electroplating. Technica, v. 10, Aug. 4, 1961, p. 1015-1016.

"Problem" area include pretreatment of parts by grinding, sand blasting, pickling and anodic cleaning; control of concentration and pH value of electrolyte; improvement of operation by the use of auxiliary electrodes. (L17a, L10, L12, 1-52)

846-L. (German.) Zinc as a Metallic Coating. Technica, v. 10, Aug. 18, 1961, p. 1093-1094.

Corrosion protection by Zn coating of steel sheet, tube, wire and steel constructions by galvanizing, electroplating and spray coating. Magnetic, microscopic and mechanical testing of thickness and mechanical strength of coatings. (L16, L17, L23, R10g, S14; ST, Zn)

847-L. Cleaner Beams Ease Fabrication. Iron Age, v. 188, Sept. 28, 1961, p. 88-89.

Mechanical cleaning system for descaling steel bridge structurals used in line with a light pickling on parts that require galvanizing. (L10, L12g; ST, 4-57)

848-L. Clear Plastic Protects Metal. Iron Age, v. 188, Sept. 28, 1961, p. 98.

Strong and ductile, a roll-on polymer film prevents marring or scratching of highly polished surfaces. It is sufficiently rough to stay in place during stamping, bending and drawing operations. (L26p)

849-L. (German.) Good Priming for Better Corrosion Protection. Hubert Strzelba. Chemische Technik, v. 13, June 1961, p. 350-352.

Mechanical and chemical surface pretreatment techniques including brushing, sand-blasting, flame descaling, degreasing and use of primers in corrosion protection by coating of steel and Fe parts. (L10, L12, L26n, R10; Fe, ST)

850-L. Growing Metal Parts by Electroforming. David Fishlock. New Scientist, v. 11, Aug. 31, 1961, p. 533.

Use of cathodic deposition to electroplate and electrorefine is related to electroforming where substrate is removable and/or expendable. Techniques and applications to forming of Cu, Ag and Ni. (L18, 1-52, 17-57; Cu, Ag, Ni)

851-L. Clean Parts. Milton Werner. Automatic Machining, v. 22, Sept. 1961, p. 41-42.

A solvent dripping and vapor degreasing system cleans metallic inserts for plastic molding. Small parts are carried through the cleaning cycle in a tumbling basket. (L12h, L12j, 1-52)

852-L. Agricultural Finishes. R. A. Fidler. Product Finishing, v. 14, Sept. 1961, p. 56-60, 63.

Priming and painting of sheet and cast steel for agricultural equipment with oxide primer and epoxy resins to protect against corrosion by weather and fuels. Pretreatment, priming and enameling in terms of service requirements. (L26, R10, T3; ST, 4-53, 5)

853-L. Electrodepositing Tin. Product Finishing, v. 14, Sept. 1961, p. 61-63.

Coating steel, brass, Cu and other metals with Sn and Sn alloys to obtain minimum porosity for a given thickness of deposit. Structure of the base alloy and of the deposit is examined. (L17, P10m, 3-73; ST, Cu-b, Sn)

854-L. Flow-Coating of Water Based Stoving Finishes. Herman Hayek and Johannes Eisenwiener. Product Finishing, v. 14, Sept. 1961, p. 64-66, 72.

Pretreatment involves degreasing, phosphating and rinsing. Parameters for application in the automobile industry including control of viscosity and of paint consumption. (L26n, T21, W4k, 1-52)

855-L. Acrylic One-Coat Finish. Product Finishing, v. 14, Sept. 1961, p. 67.

White enamel sprayed or dipped on bright steel and Al without pretreatment is tested at 300° F. for 5 hr. Results indicate resistance to heat, corrosion, impact and stain in various household appliance applications. (L26p, T10c, 1-52, 17-57; ST, Al)

856-L. Derusting. J. Q. Radcriffe. Product Finishing, v. 14, Sept. 1961, p. 68-72.

Chemical methods using hydrochloric, sulphuric and phosphoric acids and various other compounds for removal of corrosion products from ferrous components and oxide film from light alloys such as Al. (L12)

857-L. Tin Alloy Coatings. G. Fitzgerald-Lee. Product Finishing, v. 14, Sept. 1961, p. 89-92, 102.

Hot dip and hot barrel tinning in production of Sn plate and Sn alloy coatings. Studies of corrosion resistance of various metals to Sn indicate that Ti has good resistance at 300° C. Grain size of coating is examined as it affects Sn-Fe compound. (L16, R2, M26q; Ti, Sn)

858-L. Industrial Application of Abrasive Belt Polishing and Grinding. George Saxby. Electroplating and Metal Finishing, v. 14, Sept. 1961, p. 313-318, 329.

Survey of types of belts available, abrasives and adhesives and backstand polishing machinery of the platen, contact wheel and flexible belt types with emphasis on use of abrasive belts for finishing continuous strip including stainless steel strip, turbine blades, welds, tubes, rods, organic coatings and cutlery and for superfinishing crankshafts and journals. (To be continued.) (L10b, T-general, W25c; SS, 4-53, 4-55, 4-60, 7-51)

859-L. Recent Developments in Decorative Chromium Plating. S. W. Baier. Electroplating and Metal Finishing, v. 14, Sept. 1961, p. 330-335.

Comparison of conventional Cr coatings to H.T.H.R. Cr coatings on Duplex Ni and bright Ni. Self-regulating high speed solutions with mixed silicofluoride-sulphate catalyst are compared to straight chromic acid-sulphate solutions in terms of cathode efficiency. Spray suppressing agents, exposure tests, mechanism of protection and thickness limits. 26 ref. (L17; Ni, Co)

860-L. Low Friction Coatings With Good Bond Strength. J. E. Brophy, R. W. Ingraham and C. Pettus. Materials in Design Engineering, v. 54, Sept. 1961, p. 10-11.

Durable, self-lubricating disulphide films are produced by converting Mo or W electroplates at 400° F. (L17, Q10c; Mo, W)

861-L. Organic Conversion Coatings for Improved Paint and Adhesive Bonding to Aluminum Surfaces. R. J. Lipinski. Metal Finishing, v. 58, Sept. 1961, p. 44-51.

The composition and mechanism of coatings on Al as related to applications as bonding bases for paints and adhesives. Determination of lap shear tensile strength after bonding and peel strength and environmental resistance after painting. 14 ref. (L14d, L26; Al)

862-L. Finishing Procedures for Magnesium and Magnesium Base Alloys. Lester F. Spencer. Metal Finishing, v. 58, Sept. 1961, p. 56-59, 62.

First of a three-part series. Surface preparation, mechanical finishing and chemical treatment for Mg-base alloys. Operations include pickling and alkaline cleaning, polishing and buffing and chemical anticorrosion treatment. (L-general, R10, 1-52; Mg-b)

863-L. Abrasive Blast Cleaning. David E. Neustadt. Metal Finishing, v. 58, Sept. 1961, p. 60-62.

Use of shot and grit composed of Fe or steel for blast cleaning metal parts. Consideration of the required finish, abrasive consumption, production rate and equipment wear in determining choice of abrasive. (L10c)

864-L. Anti-Seize Coatings for Chrome Alloy Bolts of Elevated Temperatures. W. B. Stephenson, Jr. Metal Finishing, v. 58, Sept. 1961, p. 63-64.

Testing of nuts and bolts of chrome alloy A-286, used bare; plated with bronze, Ag, Rh, Pt or Ni; or coated with graphite preparations or Ag in penetrating oil. Measurement of the running torque, seating torque and release torque of various combinations of nuts and bolts which had been heated to 1000° F. (L17c, Q9q, 2-62, 18-73; SS, 8)

865-L. Science for Electroplaters. Pt. 67. Bright Nickel. L. Serota. Metal Finishing, v. 58, Sept. 1961, p. 70-74.

Electroplating of steel, brass and Zn-base die castings with bright Ni. Determination of the factors which affect the brightness of the Ni plating, especially plating conditions, grain size, hardness, atom orientation and cathode potential. (L17c; ST, Cu-n, Zn-b, Ni, 5-61)

866-L. Vibratory Finishing Equipment. William E. Brandt. American Machinist/ Metalworking Manufacturing, v. 105, Sept. 18, 1961, p. 118-121.

Applications and operation of machines which imbed the work in abrasive media and, by controlled vibration, deburr, descale and finish the work. Design of equipment as related to material to be finished and type of finish desired. (L10, 1-52, 17-51)

867-L. Yes! You Can Solder Magnesium. American Machinist/ Metalworking Manufacturing, v. 105, Sept. 18, 1961, p. 130.

Solderability of Mg is improved by a hot tinning technique which seals the pores of an electrodeposited Cu coating on the Mg workpiece and produces a bright, solderable, corrosion-resistant coating which prevents Mg sublimation. Electronic applications of tin-coated magnesium. (L16, L17, K7; Mg, Cu, Sb, 8)

868-L. (Russian.) Surface Structure of Gray Iron Die Castings. A. G. Kolesnichenko. Liteinoe Proizvodstvo, Feb. 1961, p. 20-21.

Prevention of structural changes in white iron die castings using insulating coatings. Relation of coatings to thermal conductivity, cooling rate and graphite flake structure of castings and to surface finish and machinability. 5 ref. (L-general, E25q, M28; CI-n, 5-61)

869-L. (German.) Brightening of Copper and Copper Alloys. Thomas H. Curti. Metall-Reinigung + Vorbehandlung, v. 10, July 1961, p. 119-120.

Removal of oxide films on the surface of Cu and Cu alloy parts (brass, bronze, nickel-silver) by prepickling in dilute H_2SO_4 with subsequent pickling in $H_2SO_4/HNO_3/HCl$ mixtures of various concentrations. (L12g; Cu-b)

870-L. A New Approach to the Protection of Refractories Against Erosion by Molten Glass. P. E. Gainsbury. Engelhard Industries, Inc. Technical Bulletin, v. 1, Mar. 1961, p. 136-138.

Applications and technique of Pt cladding, two-stage key and paste coating for protection of glassworking refractory materials. Testing results indicate that a coating thickness of 100-200 microns is adequate to resist erosion of molten glass at temperatures up to 1450° C. (L-general, R6r, T29a; Pt)

871-L. (Translation-ConBur.) Investigation of the Influence of Ultrasonic Vibrations on the Electrodeposition of Chromium. A. M. Smirnova and N. T. Kudryavtsev. Journal of Applied Chemistry of the USSR, v. 33, Nov. 1960, p. 2484-2489.

Influence of ultrasound during Cr plating on the current efficiency for Cr, deposit quality and the degree of cathodic polarization. 11 ref. (L17b, 1-74; Cr)

872-L. Sleek Finish Sells Luxury Cruisers. Modern Metals, v. 17, Sept. 1961, p. 31-32.

Sand-blasting, deoxidizing, conversion coating and antifouling methods of pretreatment for finishing of Al yacht hulls. (L10c, L14, L26, T22g, 1-52; Al)

873-L. Surface Preparation of Aluminum Alloys for Metal Spraying. Hector S. Campbell. Royal Aeronautical Society, Journal, v. 65, Sept. 1961, p. 633.

Specimens of D.T.D. 683 high-strength Al alloy are satisfactorily protected against stress corrosion by sprayed metal coatings of Al or Al alloy after previous grit blasting. (L10c, L23, R1d; Al-b, Al)

874-L. How to Control the Aluminum Bright Dipping Process. G. D. Nelson and C. J. Knapp. Modern Metals, v. 17, Sept. 1961, p. 46, 48, 50, 52-53.

Operating variables and control techniques for the reliable and economical operation of H_3PO_4, HNO_3 bright dippings baths for Al. Effect of bath composition on bath performance and the effect of operating variables on equilibrium levels of $AlPO_4$ and H_2O. Dipping is followed by anodizing and sealing. (L12f, L19n, 1-52; Al-b)

875-L. Current Coated Coil Boom Calls for Wide Paint Lines. Modern Metals, v. 17, Sept. 1961, p. 70, 72-73.

Pretreatment of coil stock in gages from 0.010-0.062 in. by phosphate conversion coating in an automated process adaptable to either Al or steel. (L14b; ST, Al, 17-57, 18-74)

876-L. Molybdenum Disulphide Dry Film Bonded Coatings. H. J. Winch and L. A. Hicks. Engineer, v. 212, Sept. 8, 1961, p. 392-394.

Use of MoS_2 dry film bonded coatings for lubrication of metal bearing surfaces. Physical and chemical properties of MoS_2 are considered with cleaning, abrasive pretreating, bonding and stoving stages of processes, attention being given to the bonding agents, heating temperature and curing time. (L-general, 18-73; Mo, 14-62, 14-68)

877-L. Coating Line for Aluminium Strip. Engineer, v. 212, Sept. 8, 1961, p. 423-424.

Application of epoxy resin primer and an enamel finish coat to coiled Al sheet on a continuous roll coating line, incorporating a curing oven, strip embossing station and shear and tandem rewinders with collapsible mandrels. Effect of coating on corrosion resistance, formability and glass and color control. (L26n, 1-52; Al, 14-53)

878-L. Terne Coated Strip. Metal Industry, v. 99, Sept. 1, 1961, p. 171.

Continuous terne plating of cold rolled Cu-bearing steel strip in 50 ft. seamless rolls for roofing applications. (L16, T26n; ST, Cu, 4-53, Pb-b, Sn)

879-L. (Japanese.) Deteroriation of Anodic Films and Chemical Films on Aluminum Alloys by Heating. Ryuzo Amano and Ryuhei Ito. Metal Finishing Society of Japan, Journal, v. 12, Aug. 1961, p. 299-303.

Protective films formed on 24S-T4 and 2S Al alloys by sulphuric and chromic acid anodizing and by chemical coating are subjected to 80-200° C. heating for 8-100 hr. Film breakdown as a function of temperature is examined by salt spray corrosion tests running continuously for 800 hr. (L19, L14, R11j, 2-61; Al-b)

880-L. (Japanese.) Effects of Nonionic Surface Active Agents and Halogen Ions on Electrodeposition of Tin in H_2SO_4-$SNSO_4$ Bath. Ariya Kozawa, Shunzo Mase and Takehiko Takahashi. Metal Finishing Society of Japan, Journal, v. 12, Aug. 1961, p. 303-307.

Deposition of semibright Sn deposits from stannous sulphate baths in the presence of Pluronics (nonionic surfactants) with the beneficial action of the surfactant being overshadowed by addition of a small amount of halogen. Polarization associated with the reaction is studied as a function of Pluronics concentration and the ratio of the hydrophobic and hydrophilic molecule, halogen content, bath temperature, current density and metal-solution interface absorption of halogen ions. 8 ref. (L17a; Sn)

881-L. (Japanese.) Hard Anodizing of Aluminum and Its Alloys. Hiromu Kanematsu and Junji Togashi. Metal Finishing Society of Japan, Journal, v. 12, Aug. 1961, p. 308-313.

Electrolytic conditions are analyzed for anodizing pure Al and 17S, 52S and 61S Al alloys in sulphuric acid. Voltage-amperage-time curves are derived for film growth rates with optimum parameters given for obtaining wear resistant films. 4 ref. (L19; Al-b)

882-L. Developmental Flame-Spray Powders. Space/Aeronautics R & D Technical Handbook, v. 4, 1961-1962, p. I24-I15.

Adhesion, porosity, texture, melting point and thermal expansion coefficient of flame sprayed coatings of Cr, Co, Mo, Ni, W, carbides (Cr, W), oxides (rare earth, Al, Zr, Ti, Ce), zirconium silicate, magnesium zirconate and calcium zirconate are listed with applications in environmental protection. (L23, Q10c, P10, P11, R-general)

883-L. Functional Aluminum Coatings by Vacuum Evaporation. Philip J. Clough. Paper from "Vacuum Metallurgy Conference, Transactions, 1960". Interscience Publishers, Inc., New York 1, 1961, p. 333-337.

Corrosion and heat resistant, protective and decorative coatings deposited on metal bases by vacuum metallizing with Al. Application to H11, Vascojet 1000, 5740 and mild steels, 7075 Al alloys and Mg. Physical and mechanical properties are compared for coated and uncoated specimens after heat treatment with corrosion resistance being determined by salt spray fog and oxidizing atmosphere tests. (L25g, R11, 2-62; ST, SGA-h, Mg, Al-b, Al, 17-57)

884-L. (French.) Corrosion Protection of Wet Surfaces. Germain Quiroga-

Galdo. Trempe, no. 37, May 1960, p. 15-21.

Corrosion protection by coating with Rust Veto Film 377, calculating surface tensions at the various liquid-solid-air contacts. Application, covering power, thickness and drying time of the coating. (L26, R10)

885-L. (Spanish.) Hard Chromium Plating of a 7.92 MM. Rifle. Luis Lobato Morales. Metalurgia y Electricidad, v. 25, May 1961, p. 152-158.

The bore is electrolytically polished, rinsed in water and Cr plated using a 2.5 mm. diameter Cu or steel electrode with Pb-Sn coating and an electrolyte containing 250 g. per liter H_2CrO_4 and 2.5 g. per liter H_2SO_4 which is circulated by pumping or by bubbling with hydrogen. (L17a, T2m; Cr)

886-L. (Italian.) Mercury and Its Alloys. Applications of Mercury in Corrosion Protection. M. Mazzoleni. Metallurgia Italiana, v. 53, July 1961, p. 349-352.

Coating of Fe, steel and cast iron with Pb, Pb alloys, Cd, Sn, Zr and Cu in order to increase Hg solubility of the metallic base surface. Specimens treated in this way are compared with Zn-coated specimens after immersion in sea water for 8 months. (L-general, R4b; Fe, ST, CI, Hg)

887-L. Composite Materials Offer Rust Resistance, Strength. Steel, v. 149, Oct. 2, 1961, p. 67.

Steel pipe sections are spray-coated with epoxy resin compound to combine corrosion resistance with weldability. (L26p, K9s, R-general, T26r; SS, 4-60)

888-L. Three Coating Processes Provide Properties "To Order". R. S. Zuchowski and R. L. Wolfe. Metalworking, v. 17, Oct. 1961, p. 14-16.

Plasma arc and flame plating and plasma arc welding surfacing processes used for depositing hard surfaces on base metals and for building up metal shapes and composites to precision tolerances. Application to steel, W, Ta, Cb, brass, Mo, Al, graphite and phenolic resins using refractory metals, oxides, carbides, nitrides, borides, cermets, stainless steels and Fe, Ni, Co and Cu alloys as deposits. Data are given for technological parameters of the processes and physical and mechanical properties of the coatings with emphasis on heat, abrasion, corrosion and oxidation, shock and wear resistance. (L29; EG-d37, SGA-h, SGA-g, SGB-q)

889-L. Selecting Media and Compounds for Barrel Finishing of Stampings. Metalworking, v. 17, Oct. 1961, p. 79, 81.

Natural stone, synthetic or artificial abrasives and metals are considered for cleaning, polishing and finishing of ferrous metals, brass, Ag, bronze, Zn, Mg, Al and Al alloys and stainless steel parts. Survey of chip, triangle, sphere and ball and special shapes of abrasive materials such as natural stone, Al_2O_3, SiC, granite, lime stone, agricultural products and metals. Effect of media size, composition and type; ratio of work to media, mass height in barrel, water level and barrel speed on process efficiency. (L10d; 4-59)

890-L. Can Molybdenum Be Protected From "Puff of Smoke" Ending? Gerald Geltman. Iron Age, v. 188, Oct. 5, 1961, p. 74-75.

A chrome diffusion technique with hydrogen flushing in batch-packed retorts produces oxygen-free diffusion coats on Mo, tested at 2200° F. for 10-12 hr. Other treatments include combinations of Cr and ceramic coatings. (L15, R3, 1-54, 2-62; Mo, Cr)

891-L. New Descaling Method Cuts Surface Attack on Super Alloys; Saves Costs, Manhours. Western Metalworking, v. 19, Sept. 1961, p. 39-40.

Sodium hydride RW 77 process minimizes or eliminates deleterious surface conditions by working the descale material itself. The method adequately descales precipitation hardening stainless steels and successfully descales superalloys such as Rene 41 and Hastelloy X. Comparative tests on descaled Rene 41 reveal loss of 0.001 in. thickness after processing 25 min. in RW 77 solution and 0.0002 in. after immersion in nitric-hydrofluoric acid. (L12g; SS, SGA-h, Ni-b)

892-L. Spray Metallizing Steel Hub Hikes Part Life. Western Metalworking, v. 19, Sept. 1961, p. 40.

Colmonoy C-290 metallizing powder is sprayed on bearing surface inner diameters using a hand-held Spraywelder pistol. The method replaces a bronze type gas rod build-up with service life improved 2 to 3 times compared with the bronze overlay. (L23, 1-52, T21e)

893-L. The Cleaning of Carbon Steel Wire as Affected by the Metallurgical Nature of the Scale. A. B. Dove. Paper from "Regional Technical Meetings, 1960". American Iron and Steel Institute, New York 17, 1961, p. 29-57.

Review of scale formation theory and mechanisms of scale layer growth during cooling. Speed of pickling and amount of scale loss as affected by cooling rate. Study of a batch rod pickling process with data given for $FeSO_4$ saturation values and operation temperatures. Scale growth mechanisms during patenting. 5 ref. (L-general, L12g, R1h, 9-52; CN, 4-61)

894-L. Continuous Spray Priming of Rolled Steel Strips. Norman C. McGregor. Industrial Finishing, v. 37, Sept. 1961, p. 30-32, 34, 39.

Automatic spraying of a prime coat on both sides of formed sheet steel as it travels by conveyor through a tunnel. The coating is baked as the stock goes through a tunnel of infrared electric heat lamps. (L26, 1-52; ST, 4-53)

895-L. Coating Long Propeller Shafts Automatically. Herbert Chase. Industrial Finishing, v. 37, Sept. 1961, p. 40-42, 44, 46.

Continuous spraying and baking of automobile parts to provide a uniform coating for corrosion protection. (L26, T21b)

896-L. Low Heat Cleaning and Phosphating. Industrial Finishing, v. 37, Sept. 1961, p. 66-67.

Temperatures in power washers and phosphatizing machines may be reduced from 135-180° F., at various stages to room temperature, without reducing effectiveness of process. (L12e, L14b, 1-52, 1-67)

897-L. Molten Salt Bath and Rinse Clean Metal. P. C. Bardin. Industrial Finishing, v. 37, Sept. 1961, p. 130-131.

Metal parts are immersed in caustic or salt melted by heating to 700-900° F., then in boiling water, in a conveyorized operation to prepare surfaces for painting. (L12, 1-52)

898-L. (French.) Cathodic Yield and Polarization of Cyanide Baths for Cadmium Plating. L. Ades. Corrosion et Anticorrosion, v. 9, June 1961, p. 185-194.

Cathodic yield curves as a function of Cd concentration, of the relation between cyanide and metal, of soda, Na carbonate and Na sulphate and Fe concentration and of temperature. Influence of density, time and voltage on anodic and cathodic polarization. (L17c, 2-60, 2-61, 3-67)

899-L. (French.) Galvanic Coating on Aluminum. H. Richaud. Corrosion et Anticorrosion, v. 9, June 1961, p. 195-202.

Surface preparation of Al by chemical Zn coating in alkaline bath. Electrolytic techniques for Ni-Cr, hard Cr, Sn, Ag and Pb plating. (L16, L17, 1-52; Al, Ag, Cr, Ni, Pb, Sn, Zn)

900-L. (French.) Development of Phosphatizing. R. Lagarde. Corrosion et Anticorrosion, v. 9, June 1961, p. 203-205.

Review of techniques of phosphatizing and of characteristics of phosphate coatings. Advantages of crystalline over amorphous phosphatization. (L14b, 10-54)

901-L. Review of Recent Developments on Oxidation-Resistant Coatings for Refractory Metals. W. D. Klopp. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 120, July 31, 1961, 5 p.

Study of silicide and silicide-base coatings for Cb, Ta, Mo and W and their alloys applied by vacuum pack, fluidized bed and pack cementation processes. Investigation of glass forming characteristics and oxidation resistance at 2700-2900° F. 11 ref. (L29, R1h, 2-62; EG-d37, Cb, Mo, Ta, W, Si, 17-57)

902-L. Reinforced, Refractory, Thermally Insulating Coatings. E. W. Blockel, C. Kallup, S. V. Castner and S. Sklarew. Society of Automotive Engineers, 417D, 1961, 6 p.

Development of a composite material system of metal reinforced, insulating ceramic that exhibits a high degree of thermal stability at 3000-4000° F. Low

thermal conductivity and thermal shock resistance measurements are made at 0-5000° F. Substrate materials for the ceramic coating consist of mild steel, 300 and 400 series stainless steel, N-155, 19-9 DL, L-605, Mo-base alloys, Ta and W. (L29, 2-62; ST, EG-d37, SGA-h, NM-f, 17-57)

903-L. Protective Coatings. Francis Scofield. I/EC (Industrial and Engineering Chemistry), v. 53, Oct. 1961, p. 846-847.

Review of new materials including polyesters, urethane, epoxy, vinyl resin, oxidized rubber, silicone and polysulphide for use as protective coatings of paints for steel and of developments in fire-retardant coatings and in fungicides for paints. Preparation of the surface to be painted and methods of coating. 59 ref. (L26, R1, 10-54, 17-57; ST, NM-q)

904-L. Measurement of Thickness of Electroplates by Electrolytic Stripping Method. Pt. 2. Stripping Solution for Zinc Electroplate Over Mild Steel and Copper. Prem Behari Mathur and A. S. Lakshmanan. Science and Culture, v. 27, June 1961, p. 300-302.

Current efficiency relation determined for stripping of Zn electrodeposits from Cu and steel for thickness measurements using a 10% NaCl solution. Effect of current variables on plating thickness is studied for Zn deposits on steel. 5 ref. (L17c; Cu, ST, Zn)

905-L. (Translation-ConBur.) Brass Plating of Titanium by a Combined Electrolytic and Diffusion Process. I. S. Anitov and A. G. Maksimova. Journal of Applied Chemistry of the USSR, v. 33, Dec. 1960, p. 2688-2691.

Process in which the surface of VT1 Ti is etched and then covered with a Cu layer of the required thickness deposited electrolytically in two stages with intermediate vacuum annealing. The Cu is subsequently converted into brass by diffusion annealing in a special mixture containing Zn. (L17, L16; Ti-b, Cu-n)

906-L. (Translation-ConBur.) Electrolysis of Acid Zinc Sulphate Solutions at Very Low Current Densities. G. N. Znamenskii and V. V. Stender. Journal of Applied Chemistry of the USSR, v. 33, Dec. 1960, p. 2692-2694.

Current efficiencies and cathode potentials determined as a function of current density and impurity content of the electrolyte during electrodeposition of Zn. Effect of current density on the H and Zn polarization curves. 12 ref. (L17b; Zn)

907-L. (Translation-ConBur.) Metal Distribution on the Cathode Surface in Electrodeposition of Nickel. N. T. Vagramyan and G. I. Kobosnidze. Journal of Applied Chemistry of the USSR, v. 33, Dec. 1960, p. 2695-2697.

Determination of the throwing power and coating uniformity of several electrolytes, taking into account the effect of the direction, of convection currents during electrolysis on the metal distribution over the electrode surface. 11 ref. (L17b; Ni)

908-L. (Translation-ConBur.) Cathodic Deposition of Rhenium-Nickel Alloy From Ammonium Perrhenate Electrolyte. N. V. Korovin and M. N. Ronzhin. Journal of Applied Chemistry of the USSR, v. 33, Dec. 1960, p. 2698-2702.

Electrodeposition of Re-Ni alloy using an electrolyte containing $KReO_4$, $NiSO_4$ and $(NH_4)_2SO_4$ at a pH above 2. Current efficiency is given as a function of hydrogen overvoltage, pH, current density and temperature. 11 ref. (L17a, L17b; Re-b, Ni-b)

909-L. (Translation-ConBur.) Bright Nickel Plating of Small Parts and Articles in the Presence of Cd Salts. S. V. Trubman, P. M. Mel'nik and B. E. Shreiber. Journal of Applied Chemistry of the USSR, v. 33, Dec. 1960, p. 2763-2765.

Bright Ni coating at 18-25° C. using an electrolyte composed of $NiSO_4$, Na_2SO_4, H_3BO_3, NaCl, NaF and either $CdSO_4$ or $CdCl_2$. The deposits obtained are not brittle and have a satisfactory color with no yellowish tinge. 4 ref. (L17, 3-69; Ni)

910-L. (Translation-ConBur.) Electrochemical Deposition of Metals on Glass and Porcelain. B. P. Kryzhanovskii, A. YA. Kuznetsov and D. N. Tret'yakov. Journal of Applied Chemistry of the USSR, v. 33, Dec. 1960, p. 2766-2767.

Deposition of Cu, Cr, Cd and Ag coatings on glass and porcelain electrodes covered with SnO_2 films to provide electrical conductivity. 4 ref. (L17; NM-f40, Cu, Cr, Cd, Ag)

911-L. Bronze Coated Rod. Machine Production, v. 20, Sept. 1961, p. 50.

High quality bronze is sprayed and fused to the surface of a steel rod, giving lubricating qualities for bearings applications. (L23, T7d, 17-51; ST, Cu-s)

912-L. The Anodic Oxidation of Building Component. E. Zurbrugg. Light Metals, v. 24, Sept. 1961, p. 248-249.

Temperature and time variables in the anodizing and dyeing of Al alloy building components are considered as they affect porosity, thickness and opacity of the film. Color and light-fastness are studied as a function of the composition of both alloy and dye. Techniques for sealing the film pores and the prevention of film damage by heat during anodizing. (L19, 2-60, 3-67; Al-b)

913-L. (Dutch.) Penetration of Hydrogen Into Steel, During Enameling. C. L. Bij. Metalen, v. 16, Jan. 31, 1961, p. 24-28.

Stainless, carbon and Al-alloyed steel are coated with Ca-Na glass or B-Si glass. Effect of H_2O in the coating material, temperature, furnace atmosphere humidity and steel composition on hydrogen absorption and formation of fish scales. 15 ref. (L27, 1-52, 2-60, 2-66, 3-69; SS, CN, ST, Al)

914-L. Electrodeposition of Molten Metals and Alloys From Glycerine Solutions. George L. Schnable. Electrochemical Society, Journal, v. 108, Oct. 1961, p. 964-969.

Various metal solders and alloys including In, In-Cd, In-Sn, In-Ga, Sn-Cd, Sn-Zn, Sn, Sn-Pb, Pb-Cd, Pb-Sb and Cd-Zn are electrodeposited in molten form on small wires and strips from glycerine solutions of metal halides. In contrast to conventional processes for electrodeposition of solid metals, deposition of molten metals can be very rapid since high current densities can be employed. 21 ref. (L17; In-b, Pb-b, Cd-b, Sn-b, Ga, Zn, Sb, 14-60)

915-L. Effects of Saccharin on the Structural and Magnetic Properties of Iron-Nickel Films. R. S. Smith, L. E. Godycki and J. C. Lloyd. Electrochemical Society, Journal, v. 108, Oct. 1961, p. 996-998.

Influence of saccharin content of plating bath on surface roughness, crystal size, strain and gas content, with consequent effects on coercive force, is determined for 20% Fe-Ni films by polarographic and magnetic measurements and electron microscopy. Saccharin reduces the decomposition potential of hydrogen and decreases the plating efficiency. 8 ref. (L17, P16; Ni-b, Fe)

916-L. What Precoated Metal Shall I Use? Metal Progress, v. 80, Oct. 1961, p. 128.

Preplated, prepainted and vinyl-laminated metals offer product designers an unlimited choice of colors, textures, patterns and finishes. (L-general, 17-57)

917-L. Brass Plating of Titanium. Engineering Materials and Design, v. 4, Oct. 1961, p. 698.

HCl is used as pick ing for surface preparation and for Cu electroplating. Cu is then converted tc brass by high-temperature (to 800° C.) diffusion with powders of fire clay and Zn, ferrosilicon and ammonium chloride. (L15, L17, 1-53; Ti, Cu-n)

918-L. Flame Sprayed Metals and Ceramics. Engineering, v. 192, Sept. 22, 1961, p. 382.

Journals, rollers, press cranks and babbit-bearing shells are built up by flame spraying with Al, Cu, Ni, Zn and chromium-nickel stainless steel alloys. Binding is obtained using alumina, tungsten carbide, Co and Mo. Coatings are then machined to desired finish and heated to 1050° C. with O_2 and acetylene. (L23, 1-52, 17-57; SS, Al, Cr, Cu, Ni, Zn)

919-L. (German.) Investigation of Hot Dip Aluminizing of Steel With and Without Subsequent Annealing. ("Aluminizing" and "Alitizing"). K. Wellinger and A. Schweizer. Werkstattstechnik, v. 51, Jan. 1961, p. 23-29.

Production of wear, scale and corrosion resistant steel and cast iron parts by hot dip Al coating ("alitizing") at 700-900° C. using a flux of 15% KCl, 39% NaCl, 10% AlF_6Na_3 ("Vibral" process). Investigation of bonding characteristics and of corrosion and wear resistance of aluminized and alitized parts. (L16; ST, Al)

920-L. (German.) Pretreatment of Aluminum for Welding. Hans H. Reinsch. Metall-Reinigung + Vorbehandlung, v. 10, Aug. 1961, p. 129-131.

Mechanical cleaning by brushing, filing and sand or Al blasting; chemical cleaning and degreasing by pickling using H_2SiF_6, HNO_3 and H_3PO_4; and degreasing by using volatile hydrocarbons and washing suds. (L10, L12, K9p; Al)

921-L. (German.) Direct Chromizing of Zinc Pressure Die Casting. Pt. 1. A. M. Shams El Din. Metalloberflache, v. 15, July 1961, p. 198-201.

Cr electrocoating of Zn pressure die castings and measurement of cathode potential versus current density curves using various electrolytes. Comparative corrosion testing (by salt spray test) of uncoated, Cr, Cu and Ni-coated specimens. (L17, R11j; Zn, 5-61, Cr, Cu, Ni)

922-L. (German.) Direct Chromizing of Zinc Pressure Die Castings. Pt. 2. A. M. Shams El Din. Metalloberflache, v. 15, Aug. 1961, p. 241-242.

Measurement of hardness and scratch hardness of Zn, Cu, Ni and Cr electrocoatings obtained by precipitation from four different electrolytes. Comparison of hardness and corrosion resistance of coatings obtained from various electrolytes. (L17c, Q29d, Q29n, R-general, 1-54; Zn, 5-61, Cr, Cu, Ni)

923-L. (German.) New Metal Pigment for Production of Electrically Conductive Coatings. Chemische Rundschau, v. 14, Sept. 1, 1961, p. 466-469.

Review of metal coating of plastics by precipitation from salt solution, by evaporation, metal spraying, lacquering with metal-pigment lacquers and electrodeposition. Properties and use of a new metal pigment, Kontaktargan. (L-general, 10-54; NM-d)

924-L. (German.) Platal--A New Steel-Plastic Compound Material. Werner Sieckmann. Chemische Rundschau, v. 14, Sept. 1, 1961, p. 471-474.

Plastic (PVC) coating of cold rolled steel strip (0.3-1.5 mm. thickness) to achieve properties including workability, conductivity and resistance to high and low temperatures, chemicals, corrosion and wear. (L26, Q9n, Q23q, P15g, R-general, 2-61; ST, 4-53)

925-L. Study of Coatings Formed by Cathodic Protection. Technical News Bulletin (National Bureau of Standards), v. 46, Sept. 1961, p. 156-157.

Coatings on cold rolled steel rods are measured for corrosion resistance by polarization technique indicating usefulness of anodic data in the logarithmic relation. (L21, R10, 1-54; ST, 4-55)

926-L. (German.) Effect of Manganese and Sulphur Content of Steel on Fish-Scale Formation in Enamel. Friedrich Erdmann-Jesnitzer and A. Petzold. Bergakademie, v. 13, May 1961, p. 303-307.

Measurement of hydrogen permeability of cold rolled 1 mm. thick low-carbon steel sheet with varying S (0.03-0.07%) and Mn (0.3-0.9%) content by cathodic hydrogen charging and subsequent investigation of defects after coating with fish-scale sensitive enamel. (L27, P10m, 1-53, 2-60, 9-71; CN-g, 4-53, Mn, S)

927-L. Planned Expansion of Die Casting Facilities. Machinery (London), v. 99, Sept. 27, 1961, p. 735-747.

Finishing, polishing, electroplating, galvanizing, paint spraying and radiographic examination of Al and Zn alloy die cast cylinder blocks, crankcases, wheels, shoe heels, housings, hinges and lock barrels. (L-general, E13, S13, 1-52, 17-57; Al-b, Zn-b, 5-61)

928-L. Automobile Bright-Work Gets a New Lease. Precision Metal Molding, v. 19, Oct. 1961, p. 73-74.

Comparison of wear and corrosion resistance of Zn die castings Cr plated by several methods. (L17, Q9n, R-general, T21c; Zn, 5-61, 8-62, Cr)

929-L. Horizontal Barrel and Vibratory Finishing. Gene Olson. Precision Metal Molding, v. 19, Oct. 1961, p. 77-79.

A comparison of the two finishing processes on the basis of the type of finish and the size of the parts processed. (L10, 1-52)

930-L. High-Purity Vacuum Evaporation of Silver Nickel and Nichrome Thin Films. J. I. Amato and C. M. Herbert. Report of NRL (Naval Research Laboratory) Progress, Sept. 1961, p. 58-59. (Available as PB 171322 from U. S. Office of Technical Services, Washington 25, D.C.) $1.25.

Vacuum deposition of high opacity, high purity coatings for electron equipments by evaporation of metals in alumina-coated tungsten basket at about 1500° C. Shorter evaporating time cycles and reduced contamination of the film are achieved by the Al_2O_3 coatings which insulate the materials from the tungsten and at the same time overcome the lack of wetting action between the basket and the vaporized metal. 4 ref. (L25g, N15g; Ag, Ni-b, 14-62)

931-L. IVE Anglo/Russian Exchange Visit. Foundry Trade Journal, v. 111, Sept. 14, 1961, p. 325-328.

Report of the Institute of Vitreous Enamellers on the Novocherkassk Polytechnic Institute and the Artyom Factory at Lugansk covering research and plant equipment and processes for the enameling of steel. (L27, 11-63; ST)

932-L. Cleaning and Brightening Stainless Steels. Corrosion Prevention & Control, v. 8, Sept. 1961, p. vii.

Specimens of 18-8 stainless steel are subjected to baths of varing concentrations of hydrochloric, nitric, phosphoric and acetic acid for cleaning and polishing. Comparison with corundum polishing on the basis of time and expense. (L12g, L10b, 1-52; SS)

933-L. Ford Experience With Coated Body Steels. R. J. Saxon. Corrosion Prevention & Control, v. 8, Sept. 1961, p. 45-49.

Effects of corrosion on various types of stainless or clad steels with coatings of Al or Cu or with plating of terne or Zn. Particular applications of Zn to plating of auto bodies, leading to the development of a special galvanizing process. (L16, L17, R-general, 1-52; SS)

934-L. Line Plates 2000 Pipes an Hour. Iron Age, v. 188, Oct. 12, 1961, p. 170.

The design and operation of an automatic electrogalvanizing line which cleans, rinses, electrogalvanizes, hot dip galvanizes, threads, prints and bundles tubes and rigid steel conduits. The use of a chromic acid bath to prevent white rust. (L-general, 1-52; ST, 4-60)

935-L. Automatically Painting Big Structural Sheets. Gilbert C. Close. Products Finishing, v. 26, Oct. 1961, p. 72-79.

Layout, equipment, conveyor and ventilation systems and automatic controls of a painting installation in which 3003 Alclad Al alloy or steel structural sheets are cleaned, deoxidized, conversion coated, spray painted and baked. (L-general, 1-52; Al-b, ST, 4-53)

936-L. EM + IT = 3F/ALC. Products Finishing, v. 26, Oct. 1961, p. 82-90.

Layout, equipment and operations of a metal finishing plant in which sheet steel stampings are cleaned, pickled and Zn plated in a plating unit or are washed, phosphatized, chromic acid dipped and spray painted in a painting unit. Capacity, automatic controls and transfer system of the plant. (L-general, 1-52; ST, 4-53, 4-59, Zn)

937-L. Hinac Coatings: Improved Corrosion Resistance for Zinc. P. G. Rech. Products Finishing, v. 26, Oct. 1961, p. 104-110.

Composition of Cr-containing castings and methods of application to galvanized steel, Zn die castings and Zn-plated wire and parts. Testing of coated parts to determine effects of the coating on corrosion resistance and resistance of the coating to organic solvents, acids, alkalis and weathering. (L16, R-general, 1-52; ST, Zn, Cr, 4-61, 5-61)

938-L. Ceramic Coatings With Conrolled Reflective and Emissive Properties. D. G. Burgess, J. R. Jasperse and E. P. Flint. American Ceramic Society, Journal, v. 44, Sept. 1961, p. 446-450.

Ceramic coatings formulated from barium silicate frit are applied to heavily oxidized Inconel. Emittance as a function of temperature and enameling and reflectance characteristics are determined for black and white enamels with an infrared spectrometer. 6 ref. (L27, P17, 1-53; Ni-b, NM-g34)

939-L. Armco Unveils Wide Continuous Zinc-Coating Line. Blast Furnace and Steel Plant, v. 49, Oct. 1961, p. 994.

Galvanizing of 72-in. sheet steel at 300 ft. per min., producing 30 tons of sheet or coil per hr. Inspection by various devices including radioactive

gages employing Strontium 90 to check the weight of the coating. Uncoiling, welding, cleaning, heat treating, coating, cooling, shearing or recoiling and inspection in a round-the-clock operation. (L16, 1-52, S14e; ST, Zn)

940-L. Anti-Corrosive Elastomeric Linings for Industrial Use. Pt. 2. Corrosion Technology, v. 8, Sept. 1961, p. 278-281.

Methods of applying chlorinated rubbers, neoprene and Hypalon linings to wood, concrete and metal sheets, vessels and pipes prior to shrink curing and vulcanization. Physical, chemical and mechanical design limitations of the linings and the lined materials. (L26r)

941-L. Chromallizing Molybdenum Simplifies Glass-to-Metal Seals. S. J. Koch. Ceramic Age, v. 77, Oct. 1961, p. 116-118.

Production of vacuum-tight seals for application in electronic parts such as ionization gages. Other materials such as carbon and alloy steels, tungsten, Kovar, Fernico, quartz and graphite may be chromallized by diffusion of Cr and other elements. (L15, K11a, 1-52; ST, Ni-b, Mo, W, Cr)

942-L. (Italian.) Surface Treatment of Stainless Steels. Giampiero Colombo. Acciaio Inossidabile, v. 28, July-Aug. 1961, p. 65-68.

Grinding, polishing, roughing and cleaning of austenitic, martensitic and ferritic stainless steels, plates and seams. Use of CSi_2 and Al_2O_3 grinding wheels, for which velocity, grain size and working angle are given. (L10, G18, 1-52; SS, 4-53)

943-L. New Anodizing Technique Cuts Costs. Industrial Finishing, v. 13, Sept. 1961, p. 56-57.

Toro anodizing process using current densities of 500-4000 amp. per sq. ft. to apply on aluminum oxide film of 0.001 in. in 1 min. at 70° F. to Al reel. Physical and chemical properties of the coating with attention to color, electrical resistance and refrigeration requirements. (L19; Al)

944-L. Applying Radiation Resistant Coatings. Industrial Finishing, v. 13, Sept. 1961, p. 63-64.

A nuclear radiation resistant epoxy resin coating for withstanding exposures to high intensity gamma radiation is developed for coating steel and concrete. Application specifications are given for painting steel reactor quadrants and canals based on a catalyst cure epoxy system. Evaluation of radiation resistance for two epikote resins and a chlorinated rubber, an acrylic proprietory and two vinyl mastics. (L26p, T11; ST, NM-f43)

945-L. Some Thoughts on the Economics of Low-Pressure Spraying. J. Muirhead. Metal Finishing Journal, v. 7, Sept. 1961, p. 325-328; 336.

Suggestions for saving on enameling costs by employing low-pressure spraying procedures to reduce dust and overspray. Importance of retraining personnel in proper spraying techniques. Discussion of equipment necessary for low-pressure spraying. (L26, 1-52)

946-L. Metal Finishing Conference. G. Krijl, J. L. Melse, J. A. Whittaker, J. M. Kape and W. Marchand. Metal Finishing Journal, v. 7, Sept. 1961, p. 337-344, 348.

Reports at the Annual Conference of the Institute of Metal Finishing, Llandudno, May 2-6, 1961. Topics include the determination of the thickness of metal coatings on small objects by measuring the heat of solution of the coating; one-year exposure tests on 12 sulphuric-acid anodized Al alloys; and electroplating, metal spraying, chemical treatment and organic finishing of communications equipment made of Fe, steel and Cu and Al alloys. (L-general, S14, R-general, Ti, 1-53, 17-57; Fe, ST, Cu-b, Al-b)

947-L. Electrodeposition of Metals From Nonaqueous Media. Metal Finishing Journal, v. 7, Sept. 1961, p. 345.

Passage of electrical current through anhydrous organic solutions to determine the products formed and to test the feasibility of using such solutions as baths for the electrodeposition of metals. Plating of Zn on metal from a bath of zinc acetate and potassium acetate in formamide. (L17a, 1-52; Zn)

948-L. Control in Aluminum Anodizing Processes and Coatings. J. M. Kape. Metal Finishing, v. 10, Oct. 1961, p. 54-60, 62.

Review of techniques in pretreatment, anodizing, dyeing and sealing processes. Suggested methods for testing abrasion and corrosion resistance, adhesion, thickness and reflectivity. 19 ref. (L19, Q9, R-general, S13, S14, 1-54; Al)

949-L. Finishing Procedures and Magnesium Base Alloys. Lester F. Spencer. Metal Finishing, v. 10, Oct. 1961, p. 63-66.

Review of surface conditioning, surface activation, immersion Zn coating, Cu strike and electroplating techniques for applying Ni, Cr, brass, Zn, Cd, Rh, Au and Ag coatings. (L-general, L17; Mg-b, Mn-b, Ag, Au, Cd, Cr, Cu-n, Ni, Rh, Zn)

950-L. New Methods of Determination of Adhesion and Fatigue Strength of Electrodeposited Antifrictional Coatings. Larissa Domnikov. Metal Finishing, v. 10, Oct. 1961, p. 67-70.

Dynamic test method in which the properties are measured by shearing or tearing the coating from the base metal under a dynamic load; application to Zn-Cu coatings on Cu, cast iron, brass and steel bases. (L17c, 1-54; CI, ST, Cu, Cu-n, Cu, Zn)

951-L. Synthetic Resins. The Backbone of Modern Finishes. Pt. 11. Alkyds (Section A). Harold P. Preuss. Metal Finishing, v. 10, Oct. 1961, p. 71-74.

Tabulation of the solid content, acid number, viscosity, wettability and toughness of various alkyd resins. Applications in enamels, lacquers, textile finishes and water emulsion paints. (L26n, L26p, P10, Q-general, 17-57; NM-g33)

952-L. Finishing Pointers: Volumetric Determination of Zinc and Copper in Brass Plating Solutions. J. R. Luck and E. H. Lindemann. Metal Finishing, v. 10, Oct. 1961, p. 75.

Determination of Zn and Cu in cyanide plating solutions by complexing the Cu with ascorbic acid, then permitting the Zn to react with ethylene dinitrilo tetra acetic acid. 4 ref. (L17a, S11j; Cu, Zn)

953-L. Science for Electroplaters. Pt. 68. Brighteners. L. Serota. Metal Finishing, v. 10, Oct. 1961, p. 76-78.

Review of the effectiveness of bright and semibright Ni deposits used to smooth the surface of the base metal. (L17a; Ni)

954-L. New Flame Retardant Coating. Materials in Design Engineering, v. 54, Oct. 1961, p. 17, 151.

Development of a coating composed of an ammonium phosphate, a polyol and an amine. Coating may be applied by brushing, spraying or dipping and keeps the temperature of the coated metal below 350° F. when exposed to flame temperatures of over 2000° F. for more than 1 hr. (L26, 17-57; SGA-h)

955-L. Polyester Coatings for Metals. Materials in Design Engineering, v. 54, Oct. 1961, p. 11-13.

Mechanical properties, chemical, corrosion and weather resistance, dielectric strength and flexibility of polyester coating resins sprayed on metal surfaces. (L26, 17-52, 17-57; NM-d)

956-L. (German.) Metallic Plastic Coatings. Technik und Betrieb, v. 13, Sept. 1961, p. 132-134.

Review of means of metal coating of plastics by precipitation from aqueous solution with emphasis on Cu plating of resins and Ag plating of cellulose acetate. Metal spraying and evaporation are alternative methods considered. (L17, L23, L25, 10-54; NM-d, Cu, Ag)

957-L. Automatic Machine Deburs Tube Ends. Modern Machine Shop, v. 34, Oct. 1961, p. 154-156.

Use of indexing wheels loaded with 80-grit Al oxide abrasive cloth to debur cut-off ends of rectangular and circular mild steel tubing. (L10, 1-52; CN)

958-L. Spotting. William K. Murray and George W. Taylor. Plating Management, v. 6, Oct. 1961, p. 7-8.

Influence of porosity and inclusions in the base metal and of the plating process on the spotting of plated wire. (L17c, 3-69, 4-61, 9-69)

959-L. Interfacial Reactions. Institute of Vitreous Enamellers Bulletin, v. 12, Sept. 1961, p. 141-146.

Rolling, annealing and testing of titanium steel sheet in order to assess its use for direct application cover-coat enameling. Test results and discussion of future applications and research on titanium steel. (L27, 1-52, 17-57; ST, Ti, 4-53)

960-L. The Economics of Low Pressure Spraying. T. Muirhead. Institute of Vitreous Enamellers Bulletin, v. 12, Sept. 1961, p. 135-140.

Comparison with the established high-pressure equipment and techniques in terms of quality of finish and ease of operation. (L26, W4g, 1-52)

961-L. Industrial Applications of Abrasive Belt Polishing and Grinding. George Saxby. Electroplating and Metal Finishing, v. 14, Oct. 1961, p. 361-366, 382.

Continuous polishing of steel and stainless steel strip, copy belt grinding of turbine blades, dressing of welds, centerless polishing of steel tube and rod, rubbing down of cellulose and polyester finishes and superfinishing of camshaft journals. (L10b, G18, 1-52)

962-L. Electrodeposition of Tin-Nickel Alloys From the Pyrophosphate Bath. T. L. Rama Char and J. Vaid. Electroplating and Metal Finishing, v. 14, Oct. 1961, p. 367-373.

Study of alloy composition, cathode efficiency and potential with reference to operating conditions to obtain satisfactory plates with 10-99% Sn. Investigation of anode behavior. 15 ref. (L17, 1-53; Ni, Sn)

963-L. Coil or Sheet From Continuous Galvanising Line. Engineer, v. 212, Sept. 22, 1961, p. 476-477.

Fabrication techniques including roll forming, coating, oxide removal, welding, galvanizing and coiling of 28 SWG and 14 SWG steel. Workhardening is performed where necessary by roller-type leveling machines. (L16, 1-52; ST, Zn)

964-L. Societe Anonyme Phenix Works. Metal Industry, v. 99, Oct. 6, 1961, p. 281-284.

Rolling mills, tinplate lines, continuous galvanizing lines and a plastics coating line for the production of galvanized sheet, strip and household utensils, tinplate and plastics-coated sheet. Pickling, degreasing, annealing, cold and temper rolling and roll coating. (L-general, F23, J23, 1-52, 17-57, 18-67)

965-L. A.D.A. Nottingham Conference on Anodising. Product Finishing, v. 14, Oct. 1961, p. 85-87.

Abstracts of papers presented Sept. 12-14, 1961, covering theory and practice of Al anodizing. Topics include decorative applications, wear resistance, quality control and dyeing of finishes; pre-anodizing techniques; bright anodizing; and electrolytic and chemical polishing. (L19, L-general, 1-52, 11-63, 17-57; Al)

966-L. Paint or Plastic? Raymond Davids. Product Finishing, v. 14, Oct. 1961, p. 98-102, 108.

Development of a cold dip, paste plastisol coating for cast steel and Al tool parts, transformer coils, wire baskets and instrument cases. Coating qualities considered include abrasion and impact resistance, smoothness, embrittlement and color permanency. Operating principles and equipment layout including hand dipping tanks, infrared tunnel and box oven. (L26p, Q-general, T7, 1-52; Al, ST, 17-57)

967-L. Striking Advance in Epoxy Coatings. Industrial Finishing (London), v. 13, Oct. 1961, p. 35.

Spray or brush application of solventless epoxy paint to provide acid and abrasion resistance to tanks and pipelines as in food processing equipment. (L26n, Q9n, R7n, T29p; NM-d)

968-L. Wash Primers for Light Metals. R. H. Chandler. Industrial Finishing (London), v. 13, Oct. 1961, p. 40-41.

Development, application and operating principles of one and two-pack wash primers for Al, Mg and other light metals and alloys. Adherence and corrosion resistance properties for WP-1 primer with zinc tetroxychromate and phosphoric acid components. (L14, Q10c, R-general; EG-a39)

969-L. Large Vessels Rotated for Nickel Alloy Plating. Western Metalworking, v. 19, Oct. 1961, p. 23-24.

Kanigen plating of a steel tank with Ni alloy coating solutions injected at the center line as the tank rotates. Adherence, Rockwell hardness and corrosion and abrasion resistance of Ni plating. (L28, Q-general, T26q; ST, Ni, 17-57)

970-L. New Enamel Process for Metal Panels, Signs. Western Metalworking, v. 19, Oct. 1961, p. 32, 35.

Porcelain enamel process for coating steel architectural panels and highway signs including stamping, punching, pickling, spraying and drying operations. (L27, L12g, G2, G3; ST, 17-57)

971-L. Use of Aluminum in Lubrication Systems--Design and Specifications. Ewell E. McDole. Lubrication Engineering, v. 17, Oct. 1961, p. 488-493.

Descaling, degreasing, pickling, Tig welding, passivation and leak testing of 5052, 5454, 5456 and 5083 Al alloy tanks, coolers and pipes. (L12, K1d, T26, 11-62; Al, 17-57)

972-L. The Production and Uses of Aluminized Steel. J. D. Sprowl. Iron and Steel Engineer, v. 38, Oct. 1961, p. 97-103.

Production of materials with coatings of Al with additions of Fe, Si, Na, Be, B, Ti, Cr, Mo, Zr, V, W and Mg applied by hot dipping, electroplating, cementation, spraying and cladding. Physical properties and corrosion resistance. 19 ref. (L-general, P-general, R-general, 1-52; ST, Al)

973-L. Very Thin Fused Coatings Deposited by Weld Surfacing. Iron and Steel Engineer, v. 38, Oct. 1961, p. 186.

Fused coatings of Stellite or other metals or alloys which can be powdered are deposited with a plasma arc gun with as little as 0.005 in. penetration in layers from 0.010 to 3/16 in. thick. Surface quality is evaluated. (L24, 1-52; Co-b, 17-57)

974-L. The Plasmadyne Arc Plasma Jet. S. C. Poulsen. Machinery (London), v. 99, Oct. 18, 1961, p. 906-911.

Use of plasma arc welding equipment, which can produce temperatures up to 30,000° F., in cutting, welding, spray deposition, vapor phase alloying and purifying of refractory materials, cermets, metals and nonmetals such as W, Ta, Cb, Mo, ZrO_2, Al_2O_3, Cu, brass, Al, stainless steel, precious metal, epoxy resin, carbide and hafnium carbide. Consideration of thermal shock, heat resistance and hardness properties required for tungsten-lined Ni rocket nozzles and chemical vessels. (L29, K6, 10-54)

975-L. Zinc Chromate Primers: A Snarl in Terminology. Harold A. Page. Products Finishing, v. 26, Nov. 1961, p. 43.

Use of tetroxy zinc chromate polyvinylbutyral wash primer and oil-base zinc chromate primer for preventing corrosion on Al parts exposed to salt water. Specification of film thickness which provides maximum corrosion resistance. (L14c, L26c, R-general; Al)

976-L. Vapor Degreasing: A Study of "Tri" and "Per". R. C. Fullerton. Products Finishing, v. 26, Nov. 1961, p. 44-47, 50.

Vapor degreasing technique using trichlorethylene and perchlorethylene as solvents for metal cleaning. Properties and applicability of solvents in cleaning Al, steel and other metals. (L12h; Al, ST)

977-L. Finishing Process Helps Computer "Remember". Products Finishing, v. 26, Nov. 1961, p. 59-60, 62.

Electroplating and zincating processes for adherent deposition of Cu over Al in the finishing of a 6061 T-6 Al computer memory drum. Data are given for film thickness and surface smoothness. (L17, L14d, X14p; Al-b, 17-37)

978-L. Galvanized Steel to Improve Corrosion Resistance. John C. Widman. Products Finishing, v. 26, Nov. 1961, p. 64-76.

Panels made from galvanized steel are organic coated, painted and tested for corrosion resistance, weldability, paint adhesivity and durability to obtain a material suitable for manufacturing chassis frames for cars and trucks. (L26, R-general, T21a; ST, 8-65, 17-57)

979-L. Panel-Coil Heating and Cooling of Process Solutions. Products Finishing, v. 26, Nov. 1961, p. 91-92.

Panel-type heating and cooling coils of heat exchanger used in plating tanks are coated with rubber, plastics and other specified coatings for protection against corrosive attack by process solution. (L26, W3j)

980-L. Refractory Coating by Fluidized Bed. Missiles and Rockets, v. 9, Oct. 23, 1961, p. 28.

Production of protective coatings of SiI_4 on Mo and other refractory metals capable of a disilicide reaction in a

fluidized bed of Si and I_2 gas at 2200° F. which is considered faster and cheaper than the pack cementation method. Coated parts are tested at 3000° F. for hours without damage. (L29; Mo, EG-d37, RM-h36)

981-L. (French.) Chemical Conversion Coating. Pt. 1. Galvano, v. 30, Sept. 1961, p. 567-573.

Survey of phosphatizing, chromating and other conversion methods for Fe, steel, Zn, Al, Cu alloys, Cd, Sn, Ag, Mg and ferrous alloys for protection against corrosion and wear, color effects and as bases for painting and for lubrication during deformation. Review of bath compositions, process variables and properties of coatings. (L14, 10-54)

982-L. Flame Spraying in the Space Age. C. J. Vlahos. Mill & Factory, v. 69, Nov. 1961, p. 87-90.

Flame spraying of Fe, brass, bronze, Mo, graphite, Al and steel equipment or components with carbides, ceramics, borides and other high melting point materials using wire-fed, powder-fed, ceramic rod or plasma-arc guns improves wear resistance, abrasion resistance and corrosion resistance and reduces weight losses. (L29)

983-L. Coatings for Nuclear Fuels Explored. Chemical & Engineering News, v. 39, Oct. 30, 1961, p. 80.

Corrosion resistant coatings of Cb, Cr, V, Si, Mo, Be, W, Cr-Ni and Cb-Zr are applied to UO_2 particles using hydrogen reduction of metallic chlorides in a vibrating reactor apparatus. Use of a fluidized bed technique for vapor deposition of ceramic coatings,including aluminum oxide, beryllium oxide, magnesium oxide and pyrolytic carbon, at 500-900° C. (L28, L25; U, 14-68, Cb, Cr, V, Si, Mo, Be, W, Zr)

984-L. International Anodizing Conference. Light Metals, v. 24, Oct. 1961, p. 276-278.

Summaries of papers presented at a conference organized by The Aluminum Development Assoc. Topics include quality control, wear resistance, decorative applications, dyeing, electrolytic and chemical polishing, electrical insulation, water impurity effects and coating formation for anodized Al. (L19; Al, 10-54)

985-L. Applying Clear, Mill Type Pipe Coatings--Methods and Problems. Donald A. Golbey. Iron and Steel Engineer, v. 38, Sept. 1961, p. 116-120.

Prevention of pipe corrosion by the application of quick-drying coatings of synthetic resin varnishes using a spray head unit with synchronously adjustable nozzles producing a fan-shaped spray pattern, the angle of which is changed with changes in pipe size. Explosion-proof electric heaters are used to maintain viscosity control of the coating material. (L29n, T26r)

986-L. Epoxy Resins Aid Steel Plant Maintenance. Elmer E. Barthel. Iron and Steel Engineer, v. 38, Sept. 1961, p. 129-130.

Application of epoxy resins for patching, bonding, corrosion protection and electrical insulation of steel piping and plates. (L26p, T26r; ST, 4-53, 18-71)

987-L. Recent Improvements in Roll Etching. C. P. Croft. Iron and Steel Engineer, v. 38, Sept. 1961, p. 231-232, 234.

Review of techniques used in providing quality finishes on mill rolls of steel. Descriptions are given for blast etching, centrifugal blasting, roll rotation and etching using various sizes of steel and chilled iron grit. (L10c, W23k; ST, 17-57)

988-L. How to Get the Most From Phosphating Systems. Pt. 3. George H. Pimbley. Metal Progress, v. 80, Nov. 1961, p. 108-111.

The "iron" phosphate systems, either dip or spray, are simple in operation and maintenance and usually require less equipment than the Zn and Mn phosphating systems. (L14b, 1-52)

989-L. Cladding Steel to Improve Corrosion, Wear and High-Temperature Properties. Digest of "New Techniques for Cladding With the Gas-Shielded Process". Paper presented at 41st Annual Meeting, A. W. S., Los Angeles, Apr. 1960. Metal Progress, v. 80, Nov. 1961, p. 182-183.

Through the use of specially designed equipment, welders can make overlays of

uniform depths and penetrations up to 3 in. in width. (L24, 1-52; ST)

990-L. (German.) Mechanism of Anodic Formation of Thick, Hard Oxide Layers on Aluminum. P. Csokan. Dechema Monographien, v. 39, no. 600-615, 1961, p. 229-238.

Method for formation of a hard oxide film on Al and Al alloys such as AlSi, AlMgSi, AlMgZn and AlMgZnTi alloys using an electrolyte of dilute H_2SO_4 at 0^o C. and a high current of 50-60 v. Evaluation of formation mechanisms, microstructure, surface quality and hardness of oxide film. (L19; Al-b)

991-L. Barrel-Finishing Guide. Pt. 1. William P. Nunn. American Machinist/Metalworking Manufacturing, v. 105, Oct. 30, 1961, p. 123-125.

A procedure is given for test runs on metal parts for barrel-finishing operations, with a reference sheet for selection of equipment and media for polishing using rotating and vibrating-rotating barrels or vibrating tub type machines. (L10d)

992-L. International Conference on Anodizing. Corrosion Technology, v. 8, Oct. 1961, p. 301-306.

Survey of papers on properties and performances of anodic films and finishes for wear resistance on Al and Al alloys. Topics include theory of formation of anodic oxide coatings; theoretical aspects of electrolytic and chemical polishing; study of the growth of primary films on Al surfaces; influence of sealing water impurities on the quality of oxide film; and effect of purity, film thickness and Cu and Zn content on the corrosion resistance. (L19, 10-54)

993-L. Flow-Coat Technique Uses Epoxy Resins and Zinc Chromate. Corrosion Technology, v. 8, Oct. 1961, p. 312.

Coating of aircraft parts using epoxy resin or zinc chromate. Description of the flow-coat system installation, with related cleaning and anodizing processes. Determination of depth, thickness and concentration of coating. (L26p, L14c)

994-L. The Effect of Electroplating Processes on the Fatigue Strength and Embrittlement of the Substrate. C. Williams. Sheet Metal Industries, v. 38, Oct. 1961, p. 749-756.

Electrodeposition of Cr, Ni, Cd and Zn on high-strength steel. Effects of shot peening of the steel before plating and of heat treatment after plating on the fatigue strength and of Cd and Zn plating procedures on hydrogen embrittlement of the steel. (L17, G23n, Q7, Q26s; ST, Cr, Ni, Cd, Zn)

995-L. New Developments in Wetting Agents. Carl Alex Fischer. Wire Industry, v. 28, Oct. 1961, p. 987-988.

Metal wire pickling using a combined wetting agent and inhibitor. Tests results obtained with the addition of Rodine 57, HW 592 and the nonionic Marlophene types 89 and 810. Effect of H_2SO_4 concentration and bath temperature on the pickling bath lifetime and the pickled metal surface cleanness. (L12g; 4-61)

996-L. (German.) Standardizing of Thickness of Metallic Coatings With Particular Reference to Corrosion Protection. R. Bilfinger. Elektrie, v. 14, Aug. 1961, p. 243-244.

Review of domestic and foreign standards for thicknesses of metallic coatings such as Zn, Cd and Cu-Ni-Cr compound coatings on steel for corrosion protection in various surroundings including enclosed rooms, open air for various climates and special conditions such as sea water and corrosive dust. (L17c, R-general, S22; ST, Zn, Cd, Cu, Ni, Cr, 8-62, 17-52)

997-L. (German.) Purification of Metal Surfaces in Alkaline Salt Melts--A New Method for Surface Treatment. G. Hansel. Elektrie, v. 14, Aug. 1961, p. 249-253.

Descaling and cleaning (removal of lacquer or dirt) from metal surfaces with emphasis on steel and cast iron in alkaline salt melts, particularly NaOH, by reducing reactions and by electrochemical techniques in which the workpiece is used as the anode. (L12n, L13n; ST, CI)

998-L. (German.) Protective Metallic Coatings and Material Behavior. H. Wiegand. Dechema Monographien, v. 39, no. 600-615, 1961, p. 151-169.

Properties of metallic coatings and base material including dip and cast, welded, sprayed and rolled on coatings and electrocoatings on steel or light metals are discussed in terms of bonding strength of coatings and material mechanical properties such as fatigue strength and corrosion resistance. 5 ref. (L-general, Q-general, 10-54; ST, EG-a39)

999-L. For Best Results When You Specify a Coating on Iron Castings. S. S. Greene. Product Engineering, v. 32, Nov. 13, 1961, p. 96-98.

Design consideration for eliminating coating troubles on gray iron castings. Comparison of numerous organic coatings in terms of resistance to chemicals and environment and application methods. (L26, R-general; CI-n, NM-b)

SECTION M

METALLOGRAPHY, CONSTITUTION and PRIMARY STRUCTURES

1-M. Electron Microscope Observations on the Annealing Processes Occurring in Cold-Worked Silver. J. E. Bailey. Philosophical Magazine, v. 5, Aug. 1960, p. 833-842.

Dislocation structure of cold worked polycrystalline Ag and processes occurring during annealing. 8 ref. (M26b, M21e, 2-64, 3-68; Ag)

2-M. Observation of Interstitial Atoms in F. C. C. Metals. A. Seeger, P. Schiller and H. Kronmuller. Philosophical Magazine, v. 5, Aug. 1960, p. 853-857.

Disaccomodation of the initial susceptibility and relaxation time of Ni wire. Study of the relaxation process due to the dumb-bell rotation. 14 ref. (M26s, Q3; Ni, 4-61)

3-M. (French.) Stacking Faults in Face-Centered Cubic Metals and Alloys. Pierre Coulomb. Metaux, Corrosion, Industries, v. 35, Sept. 1960, p. 336-343.

Stacking faults in Ni, Cu and Al alloys and their effect on physical and mechanical properties studied by X-ray diffraction and electron microscopy. 41 ref. (M26s, Q-general, M22g; Ni-b, Cu-b, Al-b)

4-M. (German.) Hafnium Containing Phases: $HfAl_2$, $HfSn_3$. H. Boller, H. Nowotny and A. Wittmann. Monatshefte fur Chemie, v. 91, no. 4, 1960, p. 736.

Melting of pressed specimens prepared from pure Hf, Al, Sn and Pb on a corundum support in a quartz crucible under argon atmosphere in a high-frequency furnace. Phase identification by X-ray structure analysis. 3 ref. (M24b; Hf-b, Al, Sn, Pb)

5-M. Phase Relations in the Magnesium-Rich Region of the Mg-Al-Zn Phase Diagram. J. B. Clark. American Society for Metals, Transactions, Preprint no. 199, 1961, p. 295-306.

The constitution of the Mg-rich region of the Mg-Al-Zn phase diagram reinvestigated by means of microscopic, thermal and powder X-ray diffraction analysis. The 635 and 400° F. isotherms show the presence of a second ternary intermetallic phase at 40 wt.% Mg, 40 wt.% Zn, 20 wt.% Al. This ternary compound forms by a ternary peritectic reaction (Class III four-phase invariant reaction) between $Mg_{12}Al_{12}$, $Mg_{32}(Al, Zn)_{49}$ and liquid at 740° F. 11 ref. (M24c; Mg-b, Al, Zn)

6-M. Laves-Type Phases of Hafnium. Rodney P. Elliott. American Society for Metals, Transactions, Preprint no. 201, v. 53, 1961, p. 321-329.

The Laves-type intermetallic compounds HfV_2, $HfCr_2$, $HfMn_2$, $HfFe_2$, $HfCo_2$, $HfMo_2$ and HfW_2, prepared from high-purity iodide-grade Hf investigated by powder diffraction techniques. HfV_2, $HfCo_2$, $HfMo_2$ and HfW_2 are isomorphous with the $MgCu_2$ type of structure; $HfMn_2$, the $MgZn_2$ type of structure; and $HfFe_2$, the $MgNi_2$ type of structure. 13 ref. (M26q; Hf)

7-M. Constitution of the Partial System: Uranium Monocarbide-Uranium Dicarbide. W. Chubb and W. M. Phillips. American Society for Metals, Transactions, v. 53, 1961, p. 465-476.

A miscibility gap exists between UC, having the NaCl-type crystal structure and the high-temperature allotrope of UC_2, having the CaF_2-type structure. Evidence for immiscibility of these structures at 2200° C. is presented.

The additional reactions demanded by such a miscibility gap are described. 13 ref. (M24b; U-b, C)

8-M. Factors Controlling the Occurrence of Laves Phases and AB_5 Compounds Among Transition Elements. A. E. Dwight. American Society for Metals, Transactions, Preprint no. 211, v. 53, 1961, p. 477-499.

Study of the $MgCu_2$, $MgZn_2$, $MgNi_2$, $CaCu_5$ and UNi_5 types. The interrelation of crystal structures is shown for the five families. Laves phases may form in the range of Goldschmidt radius ratios from 1.05-1.68 while the radius ratio has little influence on the structure type. 23 ref. (M26q; Mg-b, Zn, Cu, Ni)

9-M. The Solid-State Constitution of High-Uranium Alloys of the Uranium-Zirconium-Silicon System. M. S. Farkas, A. A. Bauer and R. F. Dickerson. American Society for Metals, Transactions, Preprint no. 213, v. 53, 1961, p. 511-521.

Thermal analysis, metallography and X-ray diffraction were used to construct isothermal ternary sections at temperatures from 550-950° C. No new ternary phase was encountered; however, extensive solution of Zr in U_3Si_2 gives $(U, Zr)_3Si_2$. Otherwise the solubility of Zr in uranium-silicon alloys is less than 2 at.%. 5 ref. (M24c; U-b, Zr, Si)

10-M. The Microstructure of Low-Carbon 3.25% Silicon Steel. W. C. Leslie, R. L. Rickett, C. P. Stroble and G. Konoval. American Society for Metals, Transactions, Preprint no. 226, v. 53, 1961, p. 715-734.

Results indicate that the microstructures are profoundly influenced by carbon content, even within the very limited range encountered in such steels and by the temperature to which the steel is heated. Massive grain boundary carbides and the carbide in pearlite in these steels are cementite, Fe_3C. At least one unidentified metastable carbide and perhaps two have been observed to precipitate from supersaturated Si ferrite at temperatures of 1100° F. and below. 8 ref. (M27; CN-g, Si)

11-M. Cylindrical Textures in Tungsten and Other Body Centered Cubic Metals. S. Leber. American Society for Metals, Transactions, Preprint no. 225, v. 53, 1961, p. 697-713.

X-ray diffraction patterns show evidence that cylindrical textures are normally formed during the fabrication of wires from body centered cubic metals. Studies show that the cylindrical texture is an intermediate structure which is converted into a normal fiber texture by extensive deformation. 13 ref. (M26c, 3-68; W, 4-61)

12-M. A Study of the Liquidus in Aluminum-Uranium Alloys. Victor W. Storhok, Arthur A. Bauer and Ronald F. Dickerson. American Society for Metals, Transactions, Preprint no. 235, v. 53, 1960, p. 837-842.

Liquidus temperatures in the Al-U system have been redetermined for alloys containing 13-50 wt.% uranium. Thermal analysis, electrical-resistance measurements and metallography were employed. Effects of ternary additions of up to 1 wt.% Si and up to 0.5 wt.% Mg. (M24b; Al-b, U)

13-M. (German.) Contribution to the Phase Relations in the System Fe-Ti-O at 1000° C. N. G. Schmahl, B. Frisch and E. Hargarter. Zeitschrift fur Anorganische und Allgemeine Chemie, v. 305, Aug. 1960, p. 40-54.

Measurement of concentration of gas mixtures in equilibrium with Fe_2O_3-TiO_2 mixtures at 1000° C. Isothermal decomposition curves are used for investigation of phase relations in the ternary system Fe-Ti-O. (M24c, N8g, 2-61; Fe-b, Ti, O)

14-M. (German.) Crystal Dislocations and Growth of Etching Pits. Walter Riessler. Zeitschrift fur Angewandte Physik, v. 12, Oct. 1960, p. 433-442.

Microscopic and electron microscopic investigation of Ge after etching with five different etching solutions. Geometry of etching figures. 24 ref. (M26b, M20q; Ge)

15-M. (French.) Diffraction and Electron Microscope Study of Nickel Electrolytically Charged With Hydrogen. A. Janko and P. Michel. Comptes Rendus, v. 251, Aug. 22, 1960, p. 1001-1003.

Existence of f-c-c. Ni-H phases with lattice parameters of 3.70 and 3.83 Å is confirmed by electron diffraction of thin polycrystalline sheets and isolated monocrystals. 4 ref. (M22g, M21e, M26; Ni, H, 4-53, 14-61)

16-M. Quantitative Phase Analysis in Titanium by X-Ray Diffraction. Ralph H. Hiltz, Jr., and Stanley L. Lopata. Paper from "Advances in X-Ray Analysis", v. 1. Plenum Press, Inc., New York, N. Y., 1960, p. 39-57.

Integrated X-ray intensities, with calculated Power Formula variables, determining alpha and beta peaks as constants, are used for phase analysis of a number of Ti alloys. Compensations made for errors in the method arising from Ti crystal structure, texture and peak overlapping. Comparison with results of metallographic analysis. (M22g, 3-71; Ti-b)

17-M. Amorphous Solids, Small Particles and Thin Surface Films. F. Schossberger. Paper from "Advances in X-Ray Analysis", v. 1. Plenum Press, Inc., New York, N. Y., 1960, p. 73-99.

X-ray and electron diffraction effects of metals, alloys and organic and inorganic compounds as influenced by chemical composition, crystal and microstructure and method of preparation. Determination of surface reactions in cold rolled and annealed steel. 20 ref. (M22)

18-M. Electrolytic Isolation and the X-Ray Study of Micro-Constituents in Steel. Kenneth W. Andrews and Hugh Hughes. Paper from "Advances in X-Ray Analysis", v. 1. Plenum Press, Inc., New York, N. Y., 1960, p. 101-127.

Separation and identification of carbides, nitrides and intermetallic compounds in alloy, carbon and stainless steels. Examination of particle size, shape and crystal structure: relation, with solid solution hardening, to mechanical and physical properties. 22 ref. (M22g, M26q, N8r, Q-general, S11f; ST)

19-M. Early Aging Effects in Copper-1.76% Beryllium Single Crystals. Doris Evans. Paper from "Advances in X-Ray Analysis", v. 1. Plenum Press, Inc., New York, N. Y., 1960, p. 143-162.

X-ray and optical micrographic and X-ray diffraction examination of age-hardening mechanisms in specimens aged 6-27 hr. at 200° C. Earliest stages of aging show distortion and fragmentation of the matrix lattice and evidence of order-disorder transformation. Data given for reflection curves and mechanical properties. 7 ref. (M21, M22g, N7a, N10, Q-general; Cu-b, Be)

20-M. A Counting Method for Measuring Single Crystal Diffraction Intensities Using a Weissenberg Camera. David T. Peterson and C. L. Vold. Paper from "Advances in X-Ray Analysis", v. 1. Plenum Press, Inc., New York, N. Y., 1960, p. 181-192.

The oscillating crystal method is used with a modified G-M counting attachment to measure integrated diffraction intensities of single crystal structures at greater speed and accuracy than by photographic means. Comparisons are made using reflections from an ideally shaped crystal of Ni dimethylglyoxime and parameterless structures such as Na-Cl. Application to Al, Zn, Zr and Hf single crystals. 12 ref. (M22g; 14-61)

21-M. Recent Applications With the X-Ray Microscope. Selby E. Summers. Paper from "Advances in X-ray Analysis", v. 1. Plenum Press, Inc. New York, N. Y., 1960, p. 483-494.

X-ray microscopy and X-ray micrography examination of various alloys, elements and organic compounds showing the advantages of the X-ray microscope for revealing structure, composition and physical properties. (M21f)

22-M. (German.) Phase Diagram of the Zirconium-Rhenium System. E. M. Savickij, M. A. Tylkina and I. A. Cyganova. Kernenergie, v. 3, July 1960, p. 641-644.

Investigation of phase equilibria over the entire concentration range by measurements of melting and transition temperatures up to 2500° C. and by microscopic, X-ray (unfiltered Cr radiation)and microhardness techniques. 8 ref. (M24b, N-general, M22, M23; Zr-b, Re)

23-M. (German.) Phase Diagram of the Columbium-Rhenium System. E. M. Savickij, M. A. Tylkina and K. B. Pavarova. Kernenergie, v. 3, July 1960, p. 667-670.

Hydrogen reduced Re (99.8%) powder and forged sintered Cb are alloyed by melting. Identification of solid phases by microscopic, X-ray and microhardness investigations. 6 ref. (M24b; Cb-b, Re)

24-M. (German.) Contribution to the Ternary System Titanium-Molybdenum-Boron. A. Wittmann, H. Nowotny and H. Boller. Monatshefte fur Chemie, v. 91, no. 4, 1960, p. 608-615.

Pressed specimens are heated on a corundum support in a quartz crucible under purified argon in a high-frequency furnace and are subsequently recrystallized in vacuum at 1200° C. Phase identification by X-ray powder method. (M24c; Ti-b, Mo, B)

25-M. (German.) Small Angle Grain Boundaries Inhibit Movement of "Bloch" Walls in Silicon Iron. Wolfgang Stephan. Zeitschrift fur Angewandte Physik, v. 12, Sept. 1960, p. 398-400.

Electrolytic etching with chromic-phosphoric acid and microscopic investigation of microstructure of 4% silicon iron. Shifting of "Bloch" walls by magnetic fields. (M27f, M27g, L13q; Fe-b, Si)

26-M. (English.) The Structure of Electrodeposited Chromium. Masahisa Matsunaga. Institute of Physical and Chemical Research (Japan), Scientific Papers, v. 54, June 1960, p. 177-183.

Cr is deposited on a surface by chromic acid baths at temperatures from 20-70° C. at varying current densities. Tests are conducted to determine crystal orientation, surface roughness, hardness and degree of specular gloss. (M26c, Q29; Cr, 8-62)

27-M. Impurity Trapped Interstitials and the Low Temperature Annealing Stages of Irradiated Copper. Ryukiti R. Hasiguti. Physical Society of Japan, Journal, v. 15, Oct. 1960, p. 1807-1814.

Interaction energies of close impurity-atom-interstitial pairs are evaluated by semi-empirical method. Results are used to interpret the annealing temperature stages of irradiated Cu. 17 ref. (M26s, J23, 3-71; Cu)

28-M. Structure Analysis of $AuCu_3$ by Means of a Fourier Transformation of X-Ray Diffuse Scatterings. Kenji Doi. Physical Society of Japan, Journal, v. 15, Oct. 1960, p. 1815-1822.

Method of analyzing two-dimensional disordered structure. Statistical parameters describing the atomic composition of each atomic site and unit cell compositions. 10 ref. (M25, M22g, N10; Cu-b, Au)

29-M. (German.) The Ternary Phase in the Copper-Aluminum-Zinc System. Pt. 1. Decomposition of the T-Phase Between 200-300° C. H. H. Arndt and K. Moeller. Zeitschrift fur Metallkunde, v. 51, Oct. 1960, p. 596-600.

X-ray investigation of ternary Cu-Al-Zn and Cu-Al-Ni alloys at 200-700° C. by a Berthold counting tube goniometer with vacuum heating device. Effect of pressure and radiation on phase transitions. (M24c, N-general, 2-61, 2-67, 3-74, M22g; Al-b, Cu-b, Ni-b, Zn-b)

30-M. (German.) Change of Orientation of Single Crystallites in Polycrystalline Samples of Aluminum and Copper in Uniaxial Tensile Deformation. Randolf J. Hartmann and Eckard Macherauch. Zeitschrift fur Metallkunde, v. 51, Oct. 1960, p. 560-566.

Crystal orientation and slip deformation mechanism of tensile deformed Al and Cu specimens investigated by X-ray back reflection. Influence of uniaxial stress on orientation change. (M26c, Q24a, 3-66; Al, Cu, 14-61)

31-M. The Metallic State. A. H. Cottrell. Contemporary Physics, v. 1, Aug. 1960, p. 417-432.

Theoretical and practical implications of the existence of free electrons in metals. Importance of the free electron bond for the crystal structures, cohesive properties and alloy behavior of metals. Principles underlying the engineering strength properties of matter and the design of creep resistant alloys are discussed in terms of free electrons and dislocations in solids. 15 ref. (M25h, M26)

32-M. Etch Figures on Cleavage Plane of Bismuth. N. S. Pandya and V. P. Bhatt. Journal of Scientific and Industrial Research, v. 19B, Sept. 1960, p. 363-364.

Bi single crystals, grown from the melt by Bridgmann's method and chemically polished, exhibit at some places characteristic triangular patterns consisting of edges made up of broken triangles. Specimen on subsequent etching in 5% aqueous solution of silver nitrate shows triangular etch pits with random distribution. (M26b, M20q; Bi, 14-61)

33-M. (Russian.) Effect of Heat Treatment on Anodic Dissolution of Ballbearing Steel. A. M. Samarin, V. A. Mehedlishvili and G. A. Lyubimova. Zavodskaya Laboratoriya, v. 26, Sept. 1960, p. 1052-1055.

Anodic dissolution and electrolytic isolation of oxide inclusions in heat treated steel. Annealing at 600-800° C. prior to electrolysis produces an anodic precipitate of higher purity. 12 ref. (M20, S11f, 2-64, 9-69; ST, SGA-c)

34-M. (Russian.) Separation of Carbide Phases From Carbon Steel. A. I. Gardin. Zavodskaya Laboratoriya, v. 26, Sept. 1960, p. 1088-1090.

Carbide phases in steel are electrolytically isolated at 20 and -8° C. using 5% solution of chlorous iron in methyl alcohol and 2% citric acid. Structure of phases formed during isothermic heat treatment of steel at 350° C. is determined by electron diffraction. (M20, M22g, M27, S11f, 9-69; CN)

35-M. (Russian.) Metallographic Investigation of Molybdenum Structure. S. B. Maslenkov and Yu. I. Demkin. Zavodskaya Laboratoriya, v. 26, Sept. 1960, p. 1093.

Mo castings, forgings and sintered powders are examined after mechanical polishing, electropolishing in H_2SO_4 and CH_3OH solution and etching in KOH and $K_3Fe(CN)_2$. (M-general, L10, L13p, M20q; Mo)

36-M. The Metallurgy of Chromium Nickel Austenitic Steel Welding. J. J. Ferris. Welding Fabrication and Design, v. 4, Oct. 1960, p. 9-17.

Mechanical properties, microstructure and Shaeffler phase diagram of 18-8 stainless steel weldments. Causes and mechanisms of joint, weld or base metal cracking, sigma and ferrite phase formation, intergranular corrosion, stress corrosion cracking, weld decay and low temperature brittleness. Use of various welding processes and choice of filler metals. 28 ref. (M24, M27, K-general, Q-general, R-general; SS-e, 7-51)

37-M. A Simplified Procedure for Calculating Peak Position in X-Ray Residual Stress Measurements on Hardened Steel. D. P. Koistienen, R. E. Marburger and R. P. Mitchell. Paper from "Advances in X-Ray Analysis", v. 1. Plenum Press, Inc., New York, 1960, p. 37.

A correction procedure using a multiplicative correction to peak intensity which includes all significant geometrical and absorption factors, the line position being determined as the axis of a parabola fitted to the data. Application to fast determination of residual stresses in hardened carbon steel. (M22g, Q25; CN)

38-M. Sigma Phase in Austenitic Stainless Steels. R. F. Hills and D. R. Harries. Chemical and Process Engineering, v. 41, Sept. 1960, p. 391-396.

Formation of sigma phase and its effect on mechanical properties. 41 ref. (M24, Q-general; SS-e)

39-M. Dislocations in Alpha-Iron. D. G. Brandon and J. Nutting. Iron and Steel Institute, Journal, v. 196, pt. 2, Oct. 1960, p. 160-166.

Electron microscope transmission examination of dislocation distribution in pure alpha iron after different degrees of plastic deformation. Formation of irregular sub-boundary networks. 19 ref. (M26b, M27f, 3-68; Fe-a)

40-M. (French.) Nondestructive Metallography of Light and Ultra-Light Materials (Aluminum, Magnesium, Beryllium and Their Alloys). Pierre A. Jacquet. Revue de l'Aluminium, v. 37, July-Aug. 1960, p. 835-842.

Ellopol technique (electrolytic buffer method) of surface preparation. Use of a group of patented electrolytes and their suitability for specific materials. Use of replicas. 3 ref. (M20; EG-a39, Al-b, Be-b, Mg-b)

41-M. Structure of Carburized and Carbonitrided Cases. S. R. Rouze and W. L. Grube. Metal Progress, v. 78, Dec. 1960, p. 86-90.

Extensive studies of case hardened steels with the electron microscope have revealed three types of surface conditions--normal, overcarburized and decarburized. (M27, J28g, J28m; AY)

42-M. Substructure Characteristics of Fine-Grained Metals and Alloys Disclosed by X-Ray Microscopy and Diffraction Analysis. Pt. 2. Description of X-Ray Double-Crystal Diffractometer Combining X-Ray Microscopy and Diffraction Analysis. Sigmund Weissman and Kenneth A. Turner, Jr. Paper from "Advances in X-Ray Analysis", v. 2. Plenum Press, Inc., New York, 1960, p. 37-44.

10 ref. (M21, M22g, M26, 1-52)

43-M. Substructure Characteristics of Fine-Grained Metals and Alloys Disclosed by X-Ray Microscopy and Diffraction Analysis. Pt. 1. Description and Application of Diffraction Method. Sigmund Weissmann. Paper from "Advances in X-Ray Analysis", v. 2. Plenum Press, Inc., New York, 1960, p. 23-37.

An X-ray analysis method which combines optical microscopy with X-ray microscopy and diffraction to correlate the topographical relationship of the grains of a fine-grained material and the fine-structural details of their surface texture. The individual grains can then be analyzed for modifications of subgrain and lattice structures resulting from chemical or physical changes. (M21, M22g, M26c, 2-64, 3-68)

44-M. X-Ray Projection Microradiography and Divergent Beam Techniques. F. W. Von Batchelder. Paper from "Advances in X-Ray Analysis", v. 2. Plenum Press, Inc., New York, 1960, p. 283-291.

Structural examination of thin polycrystalline sections of ferrous and nonferrous alloys, including toolsteel, malleable cast iron, bronze, brass and Monel by microradiography using an X-ray microfocus unit. Divergent beam analysis of Ge and Li-F single crystals after quenching. 11 ref. (M23n, M27; CI-s, Cu-n, Cu-s, Ni-b, TS)

45-M. X-Ray Methods for Detection of Lattice Imperfections in Crystals. Volkmar Gerold. Paper from "Advances in X-Ray Analysis", v. 3. Plenum Press, Inc., New York, 1960, p. 289-313.

X-ray diffraction analysis of single crystals of supersaturated solid solutions precipitated in Al-Cu, Al-Ag and Al-Mg-Zn alloys, showing the effects of atomic distribution and lattice distortion on clustering. X-ray microradiographic analysis of Ge crystals making use of absorption coefficient to determine dislocations. 22 ref. (M22g, M26s; Al-b, Ag, Cu, Mg, Zn, 14-61)

46-M. An Investigation of the Manufacture of Germanium Single-Crystal Ingots by the Levelling Process. N. G. Anderson and D. Gray. Institution of Electrical Engineers, Proceedings, Pt. B, Supplement, v. 106, May 1960, p. 871-878.

Theoretical examination of factors influencing crystal perfection and resistivity spread of ingots made by zone levelling, with attention to design of levelling equipment and selection of process variables. Results indicate that a low thermal gradient at the growing solid-liquid interface and high growth velocity are desirable for high crystal quality. However, a low thermal gradient adversely affects the cross sectional resistivity variations. 21 ref. (M26, 2-61; Ge, 5-59)

47-M. The State of Etched Semiconductor Surfaces as Revealed by Electron Diffraction. P. J. Holmes and R. C. Newman. Institution of Electrical Engineers, Proceedings, Pt. B, Supplement, v. 106, May 1960, p. 287-292.

Oxide layer on Ge and Si surfaces etched with mixtures containing hydrofluoric and nitric acid. Effect of metal ion concentration on deposit formation. 24 ref. (M20q, M22h; Ge, Si)

48-M. Whisker Research. Irwin Stambler. Space/Aeronautics, v. 34, Nov. 1960, p. 48-52.

Relationship between crystal dislocation and mechanical strength in NaCl and SiC whiskers. 3 ref. (M26b, Q27a; 14-61)

49-M. On the Mechanism of Chemically Etching Germanium and Silicon. D. R. Turner. Electrochemical Society, Journal, v. 107, Oct. 1960, p. 810-816.

Electrode potentials of Ge and Si in chemical etching solutions as functions of solution pH, etching rate, physical surface condition, conductivity type and resistivity. The process is electrochemical, with holes being injected at cathode sites and partially consumed at anode sites. 24 ref. (M20q; Ge, Si)

50-M. (English.) Energy Bands in Partially Disordered Binary Alloys. A. Corciovei and D. Grecu. Revue de Physique (Academie de la Republique Populaire Roumaine), v. 5, Feb. 1960, p. 157-167.

Variation of the forbidden energy bands with the far-range order parameter of binary alloys. Electron energy in the vicinity of forbidden bands as a function of the propagation vector. 11 ref. (M26)

51-M. The Effects of Alloying Elements in Titanium. v. A. Constitution. D. J. Maykuth, H. R. Ogden and R. I. Jaffee.

Defense Metals Information Center, Battelle Memorial Institute, DMIC Rept. 136A, Sept. 15, 1960, 232 p. (Available as PB 151094 from U. S. Office of Technical Services, Washington 25, D. C.)

Constitution and structure of binary and ternary Ti alloys are determined from solid-solubility and alloy-constitution data and phase diagrams. 223 ref. (M24b, M24c, M26; Ti-b)

52-M. (Polish.) The Use of Chromium Replicas in Electron Microscopy. J. Bryniarska. Prace Instytutow Hutniczych, v. 12, Apr. 1960, p. 359-214.

Replicas prepared by evaporation deposition of Cr layer over zapon varnish negatives, with subsequent dissolving of the varnish print. Simplicity of preparation and applications, possibility of using larger surfaces and better quality are attributed to the process. (M20r; Cr, 17-57)

53-M. (Russian.) Study of Bi-Se Constitutional Diagram. N. Kh. Abrikosov, V. F. Bankina and K. F. Kharitonovich. Zhurnal Neorganicheskoi Khimii, v. 5, Sept. 1960, p. 2011-2016.

Microstructure and thermal and electric properties of Bi-Se systems containing 0-37% Se. Composition of a new Bi_2Se compound formed by peritectic reaction at 468° C. 9 ref. (M24b, M27, P11, Q21; Bi-b, Se-b)

54-M. (Russian.) Boron-Silicon-Carbon Alloy Systems. K. I. Portnoi, G. V. Samsonov and L. A. Solonnikova. Zhurnal Neorganicheskoi Khimii, v. 5, Sept. 1960, p. 2033-2041.

X-ray and chemical analysis of B_4C-Si and SiC-B semiconductor-type alloys. Samples after hot pressing and sintering at 1700-2300° C. Data for melting points, electrical resistivity and heat and acid corrosion resistance. 25 ref. (M24c, S11p, P15g, R-general; B-b, Si-b, C-b, EG-j)

55-M. (Russian.) Investigation of Titanium-Chromium-Boron System. Zhurnal Neorganicheskoi Khimii, v. 5, Sept. 1960, p. 2025-2031.

Metallographic and thermal analysis of Cr-Ti_2B and Cr-TiB_2 samples with varying Cr content, produced by melting in a BeO_2 crucible in He atmosphere. Microhardness, heat resistance (at 1200° C.) and solubility of TiB_2 and Ti_2B in Cr. Constitutional diagrams. 11 ref. (M23r, Q29q, P12e, M24c; Ti-b, Cr-b, B)

56-M. (Japanese.) Shapes of Aluminum Nitrides in Steel. Shigeo Hasebe and Mutsuo Yonajzawa. Sumitomo Metals, v. 12, Apr. 1960, p. 387-399.

Electron micrographs and diffraction studies of Al-N precipitates in low carbon Al-killed steel containing 0.20% C, 0.30% Si, 1.35% Mn, 0.12% Al and 0.006-0.41% N after normalizing and solution treatment. Crystal structures and dispersion are shown by C and Cr replica technique. 12 ref. (M20, M26, 2-64; ST-c, 14-68, Al, N)

57-M. X-Ray Measurement of Intragranular Misorientation in Metals. Technical News, U. S. Department of Commerce, National Bureau of Standards, STR-2526, Nov. 1960, 6 p.

Polycrystalline brass is plastically strained to achieve a deformation (bending and tilting) of the atomic lattice known as intragranular misorientation. Deformation is measured by an X-ray diffraction process to determine metal fatigue and mechanical properties. (M26c, M22g, Q-general, 3-68; Cu-n)

58-M. (Italian.) Texture of Rolled Zn. P. Gondi. Metallurgia Italiana, v. 52, Sept. 1960, p. 601-606.

Electrolytic Zn of 99.99% purity is cast into samples of 2 cm. thickness, held at 250° C. for 24 hr., hot rolled to 1.5 mm. thickness and cold rolled in several passes to 0.6 mm. Effect of the number of roll passes on crystal orientation, microstructure and mechanical properties. Effect of transverse rolling. 20 ref. (M26c, M27, Q-general, 3-68; Zn)

59-M. (French.) Pearlitic String in Black-Heart Malleable Iron. Fonderie, Aug. 1960, p. 343-345.

Presence of a string of pearlite in the as-cast structure is attributed to surface oxidation during pouring and undercooling at periphery of casting. Use of annealing as a corrective measure for this condition. (M27, N8h, 2-64; CI-s)

60-M. (Russian.) Characteristics of the Mosaic Structure of Germanium and Silicon Monocrystals. O. V. Bogorodsky, Ya. S. Umanskii and S. Sh. Shilsmtein. Doklady

Akademii Nauk SSSR, v. 134, Jan. 1960, p. 114-116.

X-ray analysis of Ge and Si with 10^2-$10^6 cm^{-2}$ and 10^2-$10^3 cm^{-2}$ dislocation density. Study method based on curves showing dependence of the X-ray diffraction upon the deflection angle of the sample during rotation. Relationship between the atomic blocks boundary and dislocations are studied. 5 ref. (M26, M22g; Ge, Si, 14-61)

61-M. (Japanese.) Behavior of Residual Beta Phase and Recrystallized Grain Size in 65/25 Brass Billets. Shigeo Muromachi and Shigenoni Hori. Japan Institute of Metals, Journal, v. 24, Aug. 1960, p. 506-510.

Relation between elimination of beta phase by soaking or annealing and obtaining optimum recrystallized grain size in billets of cast brass prior to rolling. Data are given for hardness and microstructure of chill, continuous and bran cast specimens after heat treatment at 450-680° C. 7 ref. (M26q, M27, N5, Q29n, 2-64; Cu-n)

62-M. (Japanese.) Electron-Microscopic Observations of Chemically Etched Surfaces of Polycrystalline Zirconium. Tetsuhiko Tomiki and Shiro Ogawa. Japan Institute of Metals, Journal, v. 24, Aug. 1960, p. 522-526.

Etch pit formation and coalescence as a function of etching time and reagent concentration studied on Zr specimens treated with Hf, H_2SO_4 and Gulbransen's reagent. 7 ref. (M20q; Zr)

63-M. (Japanese.) Constant Permeability Alloys. Pt. 2. Equilibrium Diagram of the Fe-Ni-Si System and the Ternary Sigma Phase Compound Appearing in the System. Shuzo Takedo, Yoshiroh Iwama and Akira Sakakura. Japan Institute of Metals, Journal, v. 24, Aug. 1960, p. 534-538.

Microscopic and dilatometric examination and magnetic measurements of solid phase reactions in Fe-rich alloys of the Fe-Ni-Si system at temperatures to 1000° C. The sigma phase is found to be ferromagnetic and formed by the peritectoid reaction alpha plus gamma to sigma after solidifying through the eutectic reaction melt to gamma plus alpha. 7 ref. (M24c, M26q)

64-M. (Japanese.) Constant Permeability Alloys. Pt. 3. Crystal Structure of a Ternary Sigma Phase Compound Appearing in "Senperm" Alloys. Yoshiroh Iwama and Shuzo Takeda. Japan Institute of Metals, Journal, v. 24, Aug. 1960, p. 538-540.

X-ray diffraction and pycnometer examination of the ferromagnetic compound $Fe_{11}NiSi_4$ precipitating after 600-800° annealing. Data are given for crystal structure, lattice parameter, density and unit volume. 4 ref. (M26q, M22q, P10a, 2-64; Fe-b, Ni, Si, SGA-n)

65-M. (Book.) Advances in X-Ray Analysis. William M. Mueller, Editor. 494 p. 1960. Plenum Press, Inc., New York, N. Y.

Proceedings of the 6th annual conference on industrial applications of X-ray analysis held at Denver, Aug. 7-9, 1957. Topics include X-ray diffraction, fluorescence, microscopy and absorption analysis of metals and alloys. Papers are abstracted separately. (M22, M26, S11p)

66-M. (Translation-ConBur.) Properties of Alloys of the Nickel-Chromium-Tungsten Ternary System. P. B. Budberg and K. I. Shakhova. Russian Journal of Inorganic Chemistry, v. 5, Feb. 1960, p. 198-201.

Measurement of electrical resistivity, hardness and hot hardness of 32 alloys with constant tungsten contents of 5, 10, 20 and 30% along sections parallel to the Ni-Cr side of the diagram. Electrical resistivity increases with increasing Cr content; hardness and hot hardness increase more with tungsten than with Cr. (M24c, Q29, P15g, 2-60; Ni-b, Cr-b, W-b)

67-M. (Translation-CHP.) The Antimony-Iron-Sulphur Ternary System. A Contribution to the Theory of Precipitation Smelting of Antimony. G. G. Urazov, K. A. Bol'shakov, P. I. Fedorov and I. I. Vasilevskaya. Russian Journal of Inorganic Chemistry, v. 5, Feb. 1960, p. 214-218.

Thermal analysis and microstructure of eight sections in the trapezoidal portion of the Sb-Fe-S system (bounded by the stable section Sb_2S_3-FeS), in which the basic reaction of the precipitation smelting of Sb takes place. Boundaries of the region of layer formation are used for a projection of the liquidus surface. (M24c, C27; Sb-b, Fe, S)

68-M. (Translation-ConBur.) The Phase Composition of Alloys of the System Cobalt-Boron. P. Kolomytsev and N. Zhukovskii. Academy of Sciences of the USSR, Proceedings, v. 124, Jan-Feb. 1959, p. 151-154.

Crystals of CoB, Co_2B and Co_3B are prepared and studied by X-ray and microphotographic methods to determine phase composition, microhardness and lattice structure. (M24b; Co-b, B)

69-M. (Translation-ChemSoc.) Stability of the Beta Phase in Titanium-Vanadium-Molybdenum Alloys. N. V. Ageev and Z. M. Rugachevskaya. Russian Journal of Inorganic Chemistry, v. 5, Mar. 1960, p. 298-300.

Ti-V-Mo alloys prepared by arc fusion are quenched from 900° C. and studied by metallographic and X-ray structure analysis to determine effect of compostion on the stability of the metastable beta phase. (M24c, M26, M22g, 2-60, 2-61; Ti-b, V-b, Mo-b)

70-M. (Translation-ChemSoc.) Stability of the Beta Phase in Titanium-Vanadium Alloys. N. V. Ageev and L. A. Petrova. Russian Journal of Inorganic Chemistry, v. 5, March 1960, p. 295-298.

A study of the stability of the metastable beta phase in Ti-V alloys between -196 to 500° C. The stability of the beta solid solution of the alloys increases with increased V content and this increase is greatest at 200-400° C. with V content of 34.27 and 38.79 wt.%. 7 ref. (M24b, M26, M22g, 2-61; Ti-b, V-b)

71-M. (Translation-ChemSoc.) Physicochemical Behavior of Manganese With Niobium. E. M. Savitskii and Ch. V. Kopetskii, Russian Journal of Inorganic Chemistry, v. 5, Mar. 1960, p. 363-364.

Phase diagram for the Mn-Cb system up to 30 weight % Cb. The intermetallic compound Mn_2Cb is prepared in beryllia crucibles under He in an induction furnace and studied by microstructural, X-ray and thermal analyses. Data for hardness and microhardness. 4 ref. (M24b, S11p, M23r, Q29; Mn-b, Cb)

72-M. (Translation-ChemSoc.) Phase Diagram for Alloys in the Chromium-Lanthanum System. E. M. Savitskii, V. F. Terekhove and A. V. Kholopov. Russian Journal of Inorganic Chemistry, v. 5, Mar. 1960, p. 362-363.

Phase diagram for Cr alloys containing up to 30 weight % La prepared from 99.5% Cr and 99% La metal in an arc furnace under He. Effect of annealing for 100 hr. at 1200° C. on grain growth in the Cr. Microstructure examination to show evidence of immiscibility in both liquid and solid states. 4 ref. (M24b, N3, M27, 2-64; Cr-b, La)

73-M. (Translation-ChemSoc.) Phase Diagram and Properties of Alloys of the Titanium-Neodymium System. E. M. Savitakii and G. S. Burkhanov. Russian Journal of Inorganic Chemistry, v. 5, Mar. 1960, p. 361-362.

Peritectoid phase diagrams are constructed for Ti-Nd alloys. Effect of temperature on the solubility of Nd in alpha-Ti and of Nd concentrations on the hardness and strength of Ti. 9 ref. (M24b, P12e, Q27a, Q29n, 2-60, 2-61; Ti-b, Nd)

74-M. (Translation-ChemSoc.) The Ternary Bismuth-Iron-Sulphur System (a Contribution to the Theory of Precipitation Smelting of Bismuth). G. G. Urazov, K. A. Bolshakov, P. I. Fedorov and I. I. Vasilevskaya. Russian Journal of Inorganic Chemistry, v. 5, Mar. 1960, p. 303-307.

Thermal and microstructural analysis are used to investigate the Bi-S system and five sections of the ternary Bi-Fe-S system and to determine the boundaries of the region of layer formation. Fusion diagram are constructed for that part of the ternary system in which the precipitation smelting of Bi occurs. 7 ref. (M24c, M23r, D-general, Bi-b, Fe-b, S)

75-M. (Translation-ChemSoc.) Phase Diagram of the Titanium-Tin System. I. I. Kornicon and T. T. Nartova. Russian Journal of Inorganic Chemistry, v. 5, Mar. 1960, p. 300-303.

Alloys in the binary Ti-Sn system up to Ti_3Sn are studied by microstructure, hardness and electrical resistivity measurements. Differential thermal analysis performed at 20-1100° C. A minimum in the phase diagram is observed at 860° C. and a peritectoid reaction at 890° C. 11 ref. (M24b; Sn-b, Ti-b)

76-M. (French.) Nondestructive Metallography of Al, Mg, Be and Their Alloys. Conclusion. Pierre A. Jacquet. Revue de l'Aluminum, v. 37, Sept. 1960, p. 977-987.

Local electrolytic polishing and etching of semiproducts using a plug of cotton or fabric containing the electrolyte, a current being passed through the semiproduct and the electrolyte during application. 11 ref. (M20p; Al-b, Be-b, Mg-b)

77-M. Fusion-Zone Structures and Properties in Aluminum Alloys. Paul E. Brown and C. M. Adams, Jr. Welding Journal, v. 39, Dec. 1960, p. 520-s to 524-s.

Microstructural details of 2014 Al alloy arc deposits are quantitatively related to solidification rate as determined by arc energy input. Data for mechanical properties before and after heat treatment and influence of energy input on dendrite spacings. 11 ref. (M27, Q-general; Al-b, 7-51)

78-M. Microstructures and Notes on Carbon Steels to B. S. 3100: 1957: 592 Grade C. J. Turton and B. H. C. Waters. British Foundryman, v. 53, pt. 2, Nov. 1960, p. 480-482.

All microstructures are satisfactorily clean and exhibit type III inclusions, consisting mainly of manganese sulphides, duplex sulphides and silicates. Typical microstructures are shown for a 0.33% carbon, etched in 2% nital in various states of heat treatment. (M27; CN, 9-68)

79-M. Zirconium-Dysprosium Equilibrium Diagram. J. Croeni, C. E. Armantrout and H. Cato. U. S. Bureau of Mines, Report of Investigations 5688, 1960, 12 p.

Melting point, thermal analysis, resistivity, X-ray and metallographic investigation. Results indicate a single eutectic system with a peritectoid reaction occurring at 890° C. The eutectic isotherm extends from 30-95% dysprosium at 1280° C. (M24b; Zr-b, Dy)

80-M. (Japanese.) Properties of Cons-el Arc Melted Bearing Steel. Pt. 1. Zenichiro Takao, Mamoru Nishihara and Yoshiro Yagi. Tetsu-to-Hagane (Iron and Steel Institute of Japan, Journal), v. 46, Nov. 1960, p. 1543-1549.

Macrostructure, microstructure, hardness, compressive breaking strength, surface defects and impurity content of Cons-el Arc melted (vacuum arc melted) steels are compared to properties of air-melted steels after various heat treatments. 8 ref. (M-general, Q-general, 2-64, D8m; AY, SGA-c)

81-M. (German.) Ternary Phase in the Cu-Al-Zn System. Heinz Herbert Arndt and Kurt Moeller. Zeitschrift fur Metallkunde, v. 51, Nov. 1960, p. 656-662.

Constitution diagrams showing the distribution of ternary, gamma, delta, epsilon, zeta, theta and eta phases at 550-740° C. are constructed from results found by X-ray diffraction. 13 ref. (M24c, M22g; Al-b, Cu-b, Zn-b)

82-M. C-Au-C and C-Pt Pd-C Extraction Replicas for Electron Microscope Analysis. Ivan Hrivnak. Metal Treatment and Drop Forging, v. 27, Nov. 1960, p. 445-448.

Method of preparing extraction replicas for electron microscopy and electron diffraction analysis. Possibility of obtaining unlimited contrast with these replicas enables full power of resolution of the microscope to be utilized. (M20r)

83-M. On the Structure of Deformed F. C. C. Metal Single Crystals. Alfred Seeger and Siegfried Mader. Indian Institute of Metals, Transactions, v. 13, Sept. 1960, p. 249-264.

Structural changes during tensile deformation in terms of the arrangement of and the interaction between dislocations. A close correlation exists between the mechanism of work hardening and the nature of the dislocated structure of the crystal. 27 ref. (M26s, Q24; 14-61)

84-M. (Russian.) Structure of Pulverized Lead. A. I. Smolyaninov. Tsvetnye Metally, Sept. 1960, p. 46-48.

Determination of crystal structure and oxidation resistance of Pb coatings obtained by electrometallizing of Pb powder. Use of pulverized Pb coatings for friction resistant machine parts. (M26, R1h, L29; Pb, 6)

85-M. The Lattice Spacing Relationships in Close-Packed Alpha and Zeta Phases Based on Gold. T. B. Massalski and H. W. King. Acta Metallurgica, v. 8, Oct. 1960, p. 677-683.

Lattice spacings in HCP phases of Au-Sn and Au-Hg alloys as a function of composition and electron: atom ratio. X-ray and metallographic analysis of quenched and homogenized annealed specimens at 30° C. 16 ref. (M26, M-general, 2-60; Au-b, Hg, Sn)

86-M. Lattice Spacing Relationships and the Electronic Band Structure of Close-Packed Alpha and Zeta Phases of Gold-Based Alloys. T. B. Massalski and H. W. King. Acta Metallurgica, v. 8, Oct. 1960, p. 684-690.

Correlation of experimental data with known distortion mechanisms associated with the interactions of the Fermi surface with the faces of the Brillouin zone for determination of lattice spacing relationships in Au alloys containing In, Hg,

Sn and Cd. Deviations considered in the light of the band structure theory are compared to those in alloys of Cu and Ag. 15 ref. (M26, M25; Au-b, Cd, Hg, In, Sn)

87-M. Irradiation Hardening in Copper and Nickel. M. J. Makin and F. J. Minter. Acta Metallurgica, v. 8, Oct. 1960, p. 691-699.

Lattice and dislocation component of irradiation hardening measured in polycrystalline Cu and Ni as a function of testing temperature and neutron dose. Results are compared with Seeger's theory of lattice hardening, which is based on dislocations cutting through a forest of obstacles under the action of stress and thermal activation. 13 ref. (M26b, N7e, Q-general, 2-61, 2-67; Cu, Ni)

88-M. The Copper/Arsenic System and the Copper Arsenide Minerals. R. D. Heyding and G. J. G. Despault. Canadian Journal of Chemistry, v. 38, Dec. 1960, p. 2477-2481.

Alloys containing less than 20% As are melted, quenched, annealed at 680° C. and cooled, then heat treated under vacuum. Alloys containing more than 20% As are crushed to powders and heat treated. Structures and compositions of the phases formed are studied by X-ray diffraction. (M24b, 2-64, M22g; Cu-b, As)

89-M. Direct Observation of Lattice Defects in Cold-Worked High Manganese Steels by Electron Microscopy. Zenji Nishiyama and Ken-ichi Simizu. Physical Society of Japan, Journal, v. 15, Nov. 1960, p. 1963-1969.

Thin foils prepared by electrolytic polishing from bulk specimens are studied by electron microscopy to determine phase formation at strain sites and density of ordinary stacking faults. 8 ref. (M26, M24e, M21e; ST, Mn)

90-M. Some Properties of Titanium Sesquioxides Containing Vanadium Ions. Tatsuyuki Kawakubo, Taketoshi Yanagi and Shoichiro Nomura. Physical Society of Japan, Journal, v. 15, Nov. 1960, p. 2102.

Measurement of lattice parameters and electrical conductivity as a function of reciprocal temperature to show the effect of vanadium concentration on antiferromagnetic ordering of sintered powders containing Ti_2O_3-V_2O_3. 5 ref. (M26, P15g, 2-60, 2-61; Ti, V, 6)

91-M. (Japanese.) Microfractography of Fatigue-Fracture Surfaces of Metals. Pt. 2. Electron-Microscopic Observations of the Fatigue-Fracture Surfaces of Low-Alloy Steels and High-Carbon Steels. Akira Tokuda. Japan Institute of Metals, Journal, v. 24, Oct. 1960, p. 665-668.

Fracture patterns and tensile properties and S-N curves for specimens after annealing, quenching, tempering and spheroidizing heat treatments for various times at 710-900° C. 8 ref. (M23p, M21e, Q26, Q-general, 2-64; AY, CN-r)

92-M. (Japanese.) Phase Diagrams of the Zn-Rich Side of the Quaternary System. Zn-Al-Mg-Cu. Hisafuji Watanabe. Japan Institute of Metals, Journal, v. 24, Oct. 1960, p. 672-676.

Phase diagrams of the systems Zn-Cu-Mg and Zn-Al-Mg-Cu studied by microscopy and inverse rate thermal analysis at 380-630° C. 3 ref. (M24d; Al-b, Cu-b, Mg-b, Zn-b)

93-M. New Data on the System Fe_2O_3-$FeTiO_3$-TiO_2 (Ferriilmenites and Titanomghemites). E. Z. Basta. Egyptian Academy of Sciences, Proceedings, v. 14, 1959, p. 1-4.

Microscopic, chemical and X-ray investigations on carefully separated natural minerals and on synthetic preparations belonging to the system Fe_2O_3-$FeTiO_3$-TiO_2. Data are given for the miscibility of TiO_2 in Fe_2O_3 and $FeTiO_3$. (M24c, M21f; Fe, Ti, 14-59)

94-M. Liquidus and Solidus Relations in Iron-Rich Iron-Carbon Alloys. R. A. Buckley and W. Hume-Rothery. Iron and Steel Institute, Journal, v. 196, Dec. 1960, p. 403-406.

Determination of the equilibrium diagram for Fe-C alloys, from 0-20% C., by thermal analysis, followed by microscopic examination of quenched specimens. 12 ref. (M24b, M-general; Fe-b, C)

95-M. Thermal and Magnetic Analysis of an Fe-Ni Alloy by an Electron Beam Technique. S. Yamaguchi. Iron and Steel Institute, Journal, v. 196, Dec. 1960, p. 462.

Determination of the Curie point and crystalline structure of Invar by observing

the diffraction patterns and Lorentz effect at different temperatures of induction magnetized particles heated by electron bombardment. 3 ref. (M23, M22g, M26, P16d; SGA-r, Fe-b, Ni)

96-M. (German.) Electron Microscope Observation of Dislocations in Electrolytically Deposited Nickel Layers. Ludwig Reimer. Naturwissenschaften, v. 47, Nov. 1960, p. 394-395.

Electron micrographs are obtained by through-radiation of 200 Å thin Ni layers of measured orientation on Zn or Cu supports. Dislocations move to small-angle grain boundaries on recrystallization by electron bombardment. (M21e, M26b, N5f; Ni, 14-62)

97-M. Steel Foundry Sand Clay Bonding.. a Microscopic Study. J. B. Caine, E. H. King and J. S. Schumacher. Modern Castings, v. 39, Jan. 1961, p. 111-116.

Microscopic examination of steel foundry sands casts doubts on accepted theories on "clay film thickness" and "clay distribution" by mulling. Methods for microscopic examination. (M21; NM-f45)

98-M. (Japanese.) Influence of Nitrogen on the Structure of Graphite in Titanium Cast Iron. Yoshisada Ueda. Imono (Japan Foundrymen's Society, Journal), v. 32, Oct. 1960, p. 696-702.

Effect of nitrogen content on the composition of phases, graphite structure, tensile strength and hardness of cast iron containing Ti. 11 ref. (M24b, M27, Q27a, Q29n; CI, Ti)

99-M. Precision Lattice Parameter Determination of Zirconium-Oxygen Solid Solution. Barry D. Lichter. Metallurgical Society of AIME, Transactions, v. 218, Dec. 1960, p. 1015-1018.

The lattice parameters of Zr and Zr-O solid solutions (hcP) are determined from measurements of back reflection X-ray photograms obtained at 29° C. using a symmetrical focusing camera. Linear equations between parameters (c, a) in angstrom unit (10^{-8}cm.) and atom ratio (m) of oxygen to Zr are obtained at 0-5% oxygen. 13 ref. (M26, M22g; Zr-b, O)

100-M. A Further Study of Ti_2Ni-Type Phases Containing Titanium, Zirconium or Hafnium. M. V. Nevitt, J. W. Downey and R. A. Morris. Metallurgical Society of AIME, Transactions, v. 218, Dec. 1960, p. 1019-1023.

An experimental survey has determined the occurrence of Ti_2Ni-type phases in binary and ternary alloys of Ti, Zr or Hf with first, second or third long-period transition metals and also in ternary systems in which O is the third component. The existence of 11 previously unreported isomorphs is cited and some approximate phase boundaries are given with lattice parameters and periodic table relationships involved in the occurrence of the phase. 7 ref. (M24, M25, M26; Hf-b, Ti-b, Zr-b, O)

101-M. Annealing Twins and Coincidence Site Boundaries in High Purity Lead. K. J. Aust and J. W. Rutter. Metallurgical Society of AIME, Transactions, v. 218, Dec. 1960, p. 1023-1028.

Formation of annealing twins during the growth of a recrystallized grain into a striated, melt-grown crystal of high purity Pb, resulting in replacement of the original migrating boundary by a large-angle grain boundary of the coincidence site type or by a near-twin boundary. The results support the Fullman-Fisher theory of annealing twins and demonstrate the usefulness of the coincidence site model. 7 ref. (M27e, M27f, N3; Pb)

102-M. Effect of Strain Rate and Temperature on the Compression Texture of Aluminum. L. J. Dwiggins, William J. Rogers and R. O. Williams. Metallurgical Society of AIME, Transactions, v. 218, Dec. 1960, p. 1133-1134.

X-ray diffraction examination of texture and orientation of specimens deformed in compression at -76 to 150° C. 6 ref. (M26c, M22g, Q28, 3-68; Al)

103-M. X-Ray Line Broadening From Explosively Loaded Copper. J. B. Cohen. Metallurgical Society of AIME, Transactions, v. 218, Dec. 1960, p. 1135-1136.

X-ray diffraction analysis of deformation microstructure of electrolytic tough pitch Cu specimens shock loaded at 10 kilobars pressure using composition B explosives. 3 ref. (M22g, M27, Q6p, 3-68; Cu-a, NM-k34)

104-M. (Russian.) Deformation Texture of Cold Rolled Low Alloy Steel. K. V. Grigorov and M. Ya. Zakutner. Fizika

Metallov i Metallovedenie, v. 10, Mar. 1960, p. 404-411.

Magnetometric study of texture development in the cold rolling of 0.9% Si steel within wide ranges of deformation. Derivation of relative crystal volume and the basic orientation type for the cold rolled texture. The mechanism of texture development in this steel is found to be identical to that of the low carbon steel. 10 ref. (M26c, M23a, 3-68; AY)

105-M. A Comprehensive Examination of Samples of Iron Containing Aluminous Inclusions. G. R. Booker and A. R. Westrope. Iron and Steel Institute, Journal, v. 196, Nov. 1960, p. 294-300.

Metallographic studies, including replica, optical and electron microscopy and electron and X-ray diffraction, revealing additional information concerning morphology and composition of the inclusions, with attention to anomaly concerning the occurrence of magnetite in the inclusions of the oxygen-rich ingots and the manner of formation of hercynite and magnetite. 7 ref. (M-general, 9-69; Fe-b, Al)

106-M. X-Ray Investigations on Fe-Si-B and Mn-Si-B Systems. Bertil Aronsson and Ingvar Engstrom. Acta Chemica Scandinavica, v. 14, June 1960, p. 1403-1413.

X-ray diffraction is used to identify four ternary phases in the metal-rich part of the Fe-Si-B system at 1000° C. and Mn_5SiB_2 phase in the metal-rich part of the Mn-Si-B system, also at 1000° C. (M24c, M22g; Fe-b, Mn-b, B, Si)

107-M. Compositions and Crystal Structures of MnB_2, Mn_3Si, Mn_5Si_3 and $FeSi_2$. Bertil Aronsson. Acta Chemica Scandinavica, v. 14, June 1960, p. 1414-1418.

Powder photography and X-ray diffraction are used to determine crystal structure and atomic scattering parameters. Composition is determined by chemical analysis. (M26, M25, M22g, S11; Fe-b, Mn-b, B, Si)

108-M. The Metallography of Reactive Materials. W. Evans. Canadian Mining and Metallurgical Bulletin, v. 53, Nov. 1960, p. 893-900.

Methods for cutting, grinding and polishing U, UO_2, Zr, Zr alloys and Be for metallographic study. Techniques for determining grain structures and identifying phases. (M-general, G17, G18; Be, U, Zr-b)

109-M. (French.) Color Micrography of Magnesium and Magnesium Alloys by Anodic Fluoridation. P. Lelong and J. Dosdat. Memoires Scientifiques de la Revue de Metallurgie, v. 57, Oct. 1960, p. 755-758.

Metallization of surface of polished specimens to produce sharp color contrasts which facilitate metallographic study of variations of composition and orientation and of phenomena associated with segregation, diffusion, workhardening, restoration and recrystallization. Applications in interference micrography. 12 ref. (M20, M21; Mg-b)

110-M. (French.) Crystallographic Relationships Between the Gamma Phase and the Alpha Phase Resulting From Workhardening of an Unstable Austenite. P. Bastien and R. Margerand. Memoires Scientifiques de la Revue de Metallurgie, v. 57, Oct. 1960, P. 778-786.

Orientation relations observed between austenite and alpha phase produced by wire-drawing operation on a high-Cr steel. Relationship between percentage of alpha phase formed and values of modulus of elasticity and internal friction. Proposal of a theory of gamma-alpha transformation by workhardening using Bain's model and concept of dislocation-transformation. Slip mechanism in cases of deformation by compression and by drawing. 12 ref. (M26, N8, Q23a, Q24a; AY, Cr)

111-M. (German.) Dependence of Magnetic Structure of a Cobalt Crystal Upon Crystal Size. G. S. Kandaurowa, Ja. S. Schur and F. W. Maslennikowa. Physikalische Abhandlungen aus der Sowjetunion, v. 3, Feb. 1960, p. 91-95.

Change of thickness of a monocrystalline 4 mm. diameter Co disk from 0.52-0.015 mm. mechanically by grinding and by electrolytic excavation in Cr containing H_3PO_4. Examination of magnetic structure by powder figures for varying crystal thicknesses. (M27g, M-general; Co)

112-M. The Fermi Surface in White Tin. A. V. Gold and M. G. Priestley. Philosophical Magazine, v. 5, Nov. 1960, p. 1089-1104.

The orientation dependence of the De Haas-Van Alphen periods in Sn single crystals is studied in high pulsed magnetic fields, as many as seven periods being found at some orientations, indicating that the Fermi surface is much more complicated than the 3-ellipsoid model suggested by Fawcett. Effective mass values are determined at the principal orientations from the temperature dependence of the amplitudes. (M26, 3-72; Sn, 14-61)

113-M. X-Ray Evidence for Segregation of Solute to Stacking Faults in a Copper-Aluminum Alloy. R. W. Cahn and R. G. Davies. Philosophical Magazine, v. 5, Nov. 1960, p. 1119-1126.

Study of the intensity of scattering of monochromatic X-rays at small angles from a Cu base solid solution containing 15 atomic % Al. The intensity of scattering from a rolled foil increases after heating at 150-250° C., a temperature range in which the alloy hardens and there is little or no recrystallization. This increase is attributed to segregation of Al to the ribbons of stacking faults between partial dislocations. (M22g, 9-69; Cu-b, Al)

114-M. The Etching of Sub-Structures in Beryllium. J. Sawkill and J. E. Meredith. Philosophical Magazine, v. 5, Nov. 1960, p. 1195-1196.

Aqueous solutions of $CuSo_4$, $AgNo_3$, or gold chloride are used to etch Be, the Cu, Ag or Au being deposited at the grain boundaries. (M20q; Be)

115-M. (English.) Effect of Quenching and Tempering on the Structure of a Hypo-Eutectoid Cu-Al Alloy. Gunji Shinoda and Yoshitsugu Amano. Osaka University, Technology Reports, v. 10, Mar. 1960, p. 357-365.

X-ray study of lattice structures, eutectoid and martensitic transformations and Al solid-solubility in alloys containing 9.96 less than 10.5% Al undergoing beta-beta prime-alpha phase transformations, with resultant bcc-kcp-fct structure transitions as a consequence of quenching from 1000° C., cold working and subsequent tempering at 305° C. 6 ref. (M26, N-general, 2-64, 3-68; Cu-b, Al)

116-M. (French.) Insitu Identification of Cementite by X-Ray Diffraction. P. Gendrel and L. Jacque. Comptes Rendus, v. 251, Nov. 14, 1960, p. 2166-2168.

Some 30 lines of the diffraction spectrum of cementite in 1.03% carbon steels, one pearlitic and one troostitic, are identified without chemical separation of the carbide. Technique may be a means of following evolution of phases during reactions of crystal system of ferrous materials. 5 ref. (M22g, N8k; CN)

117-M. (Japanese.) Directional Properties of One-Way Rolled Aluminum Sheet and Detection of Directionality Using the Knoop Indentor. Takashi Ikeno, Shigeo Zaima and Kizo Shibata. Light Metals, v. 10, Sept. 1960, p. 317-321.

Comparison of earings grown by deep drawing in longitudinal and transverse rolled specimens after annealing at 265-500° C. Directional properties are determined in terms of earing ratio and Knoop ratio as a function of rolling direction, reduction and annealing temperature. (M26c, F23, G4b, 2-64, 3-72; Al-b)

118-M. (Japanese.) The Rapid Determination of Orientation of Aluminum Single Crystals. Pt. 1. Kohara Shiro. Light Metals, v. 10, Sept. 1960, p. 330-336.

The etch-glitter method (Barrett's method) and the light figure method, both using Barrett's reagent as the etchant, are studied for accuracy in determining orientation of single crystals as affected by etching time and temperature and surface condition, purity and orientation of the crystal. 3 ref. (M20, M26c; Al, 14-61)

119-M. (Japanese.) Alloying Elements for Mg-Zr System Alloys. Pt. 2. Riei Ichikawa. Light Metals, v. 10, Sept. 1960, p. 360-368.

The possibility that Zr and alloying element which are over the solubility limit in molten Mg alloys form intermetallic compounds is investigated by X-ray analysis using 17 alloying metals. 12 ref. (M26q, M22g, P12e, 2-60; Mg-b, Zr)

120-M. Improved Metallographic Techniques in Nova Scotia. Pt. 1. Metallic

Films Aid Study of Oxide Coatings. C. A. Godden. Metal Progress, v. 79, Jan. 1961, p. 121-122.

Described are a vacuum deposition technique that aids the study of thin oxide films and a versatile mounting material, diallyl phthalate, which does not shrink from edges of the specimen. (M20; Al, 14-62)

121-M. Improved Metallographic Techniques in Nova Scotia. Pt. 2. Diallyl Phthalate as a Mounting Material. C. A. Godden. Metal Progress, v. 79, Jan. 1961, p. 122-123.

(M20; Al, 14-62)

122-M. (Russian.) Effect of Initial Grain Size of EI43B Type Alloy on the Final Grain Size After Deformation. M. Ya. Dzugutov and B. F. Vakhtanov. Kuznechno-Shtampovochnoe Proizvodstvo, Feb. 1960, p. 1-4.

Samples are heated to 1160° C., press forged within 10-80% deformation and heat treated to determine effect of the degree of deformation on the final grain size. (M27c, 3-68, F22, J-general; ST)

123-M. (Japanese.) Sampling in the Investigation of Earing in Deep Drawing Using One Way Cold Rolled Aluminum Sheet. Takashi Ikeno, Shigeo Zaima and Kizo Shibata. Light Metals, v. 10, p. 373-377.

Effect of temperature and degree of deformation during various stages of rolling on earing phenomena in deep drawing specimens. Application to 2S Al alloy during hot and cold rolling and after annealing to establish reliability in specimen-taking for directional property studies. 5 ref. (M26c, 3-72, F23, G4, 2-61, 3-68; Al-b)

124-M. (Japanese.) The Rapid Determination of Orientation of Aluminum Single Crystals. Pt. 2. Shiro Kohara. Light Metals, v. 10, Nov. 1960, p. 378-385.

Analysis of Laue X-ray transmission photographs of Al single crystals at various incident angles. Crystal orientations are calculated from Laue spot indices prepared from charts of the standard patterns. 7 ref. (M26c, M22g; Al, 14-61)

125-M. (Japanese.) Alloying Elements For Mg-Zr System Alloys. Pt. 3. Riei Ichikawa. Light Metals, v. 10, Nov. 1960, p. 405-412.

Processes of solidification of Mg-Zn-Zr, Mg-Ag-Zr, Mg-Al-Zr and Mg-Ca-Zr alloys on the Mg side of the phase diagram are examined by microstructural, differential thermoanalysis and X-ray diffraction analysis. 3 ref. (M24d, M-general, N12; Mg-b, Zr-b, Zn, Al, Ca)

126-M. (German.) Visualizing Dislocations on Iron-Nickel Alloy (50/50) Surfaces by Chemical Etching. W. D. Hannibal. Zeitschrift fur Naturforschung, v. 152, Sept. 1960, p. 835-837.

Metallographic examination for dislocation density, the method comprising etching at room temperature with electrolyte of varying Fe and Ni ion concentration and electrolytic polishing with and without subsequent annealing in pure hydrogen at 220-1000° C. Influence of orientation and plastic deformation (slight bending before polishing and annealing) on etching rate. (M20q, M26b, 3-68, 3-72; Fe-b, Ni-b)

127-M. (Japanese.) Study of Aging by a Film-Replica Technique. Light Metals, July 1960, p. 25-32.

Structural changes in Al-Cu alloys during aging are studied by electron microscopy. (M27, 2-65, M21e; Al-b, Cu-b)

128-M. Soft X-Ray Spectra of Lithium, Magnesium and Aluminum and Their Alloys. R. S. Crisp and S. E. Williams. Philosophical Magazine, v. 5, Dec. 1960, p. 1205-1216.

The effect of alloying and coating on the valence band energy levels of Mg-Si alloys and of Mg and Al either uncoated or coated with Li is determined from measurements of the X-ray spectra. (M22g, 2-60; Mg-b, Al, Li, 8)

129-M. The Growth of Prismatic Dislocation Loops During Annealing. C. A. Johnson. Philosophical Magazine, v. 5, Dec. 1960, p. 1255-1265.

Proposal of a mechanism for coalescence of loops in annealed Al foil by short circuit diffusion around the periphery of the prismatic dislocation loops, a mechanism contrasted with the theory of loop coalescence by vacancy diffusion through the matrix. (M26b, 2-64; Al, 4-56)

130-M. Grain Boundary Migration in Steel Is Seen With Thermionic Emission Electron Microscope. Norelco Reporter, v. 7, Nov-Dec. 1960, p. 152.

Twin boundary movement occurring in austenite 1095 steel at 1065-1150° C. investigated at 1000-3000 X magnifications. (M21e, M27e, N3, 2-62; SS-e)

131-M. (French.) Structural Study of Thin Beryllium Films by Micrography and Electron Microdiffraction. A Saulnier. Journal of Nuclear Materials, v. 2, Dec. 1960, p. 299-309.

Simple and direct technique for making thin sections of Be which can be directly observed in an electron microscope. Comparison of the structure, both in the cold worked and the annealed conditions, of thin Be sheets made by drawing and rolling either cast billets or billets produced by powder metallurgy. Significant differences are observed in the distribution of dislocations in the two cases. (M22h, M26; Be, 14-62)

132-M. Perovskite-Type Compounds Based on Plutonium. L. E. Russell, J. D. L. Harrison and N. H. Brett. Journal of Nuclear Materials, v. 2, Dec. 1960, p. 310-320.

Preparation of perovskite-type compounds containing trivalent or quadrivalent Pu. Crystallographic data are reported for the compounds $PuAlO_3$, $PuVO_3$, $PuCrO_3$ and $BaPuO_3$. 14 ref. (M26; Pu)

133-M. On the Location and Motion of Rare Gas Atoms in Metals. C. W. Tucker and E. J. Norton. Journal of Nuclear Materials, v. 2, Dec. 1960, p. 329-334.

Energetic rare gas atoms coming to rest in a metal lattice apparently capture vacancies and so do not distort the lattice to an appreciable extent. Wide variations occur in the evolution rates of rare gases from metal to metal. 11 ref. (M26, N15d)

134-M. (Spanish.) Imperfections, Lattice Constants and Densities of Cold-Drawn and of Recrystallized Aluminum Wires. M. E. Straumanis and T. Ejima. Nuovo Cimento, v. 18, Jan. 1960, p. 48-64.

Lattice parameters, lattice perfection and density of cold drawn as compared to recrystallized Al wire are interpreted in terms of the deformation during drawing. (M26, P10a, 3-68; Al, 4-61)

135-M. The Crystal Structure of $Mo_{17}O_{47}$. Lars Kihlborg. Acta Chemica Scandinavica, v. 14, July 1960, p. 1612-1622.

Photographic investigation of single, needle-like crystals of $Mo_{17}O_{47}$ with the Weissenberg camera and the Buerger precession camera to confirm the molecular formula and determine crystal structure and interatomic distances. Structural elements are identified as MoO_6 octahedra and MoO_7 pentagonal bipyramids. 24 ref. (M26q, M22g; Mo, 14-61)

136-M. (German.) Electron Microscopic Structure Investigation of S. A. P. (Sinter Aluminum Product). H. Hug and H. Bichsel. Metall, v. 15, Jan. 1961, p. 19-22.

Electron microscopic investigation of electrolytically etched S. A. P. specimens, bromine-methanol isolated oxide contained in S. A. P. powder and sintered and extruded S. A. P., using the oxide replica method to study formation of gamma Al_2O_3. (M27, M21e; Al, 6-72)

137-M. (Japanese.) Effect of Heat Treatment on Steel Sheets for Galvanizing. Seita Sakui and Tsutamu Mori. Tetsu-to-Hagane (Journal of the Iron & Steel Institute of Japan), v. 46, Dec. 1960, p. 10-14.

Effect of heating rate on the grain size, softening temperature and grain orientation in cold rolled low carbon steel heated at a rate of 2000° C. per second and 10° C. per min. (M27c, 2-64; CN-g, 4-53)

138-M. (Japanese.) Macroscopic Nonmetallic Inclusions in Tubes of High-Carbon Chromium Ball-Bearing Steel. Eiji Miyoshi. Tetsu-to-Hagane (Journal of the Iron & Steel Institute of Japan), v. 46, Dec. 1960, p. 14-21.

Comparison of values obtained during microscope and naked eye inspections of the surface of the cut tubes. (M27, M28, 9-71; TS-g, SGA-c)

139-M. (Japanese.) Sand Markings on Roller-Bearing Steel SUJ 3. Kiyoji Deguchi and Yoshimichi Matsumoto. Tetsu-to-Hagane (Journal of the Iron & Steel Institute of Japan), v. 46, Dec. 1960, p. 21-27.

Description of sand markings which appear in acid and basic furnace products during cutting and are probably

caused by inclusions. 3 ref. (M28, 9-71; ST, SGA-c)

140-M. Formation of Etch Pits and of Silicon Carbide on Silicon Surfaces at High Temperatures. R. C. Newman and J. Wakefield. Solid State Physics in Electronics and Telecommunications, Proceedings of the International Conference, Brussels, Belgium, June 2-7, 1958, v. 3. Magnetic and Optical Properties, Pt. 1, 1960, p. 318-328.

Single-crystal Si samples possessing (100), (111), (221) and (511) orientations are heated to 1000-1300° C. in sealed quartz tubes. Surfaces are subsequently examined in the optical and electron microscopes and by electron diffraction to study the nature of any physical or chemical changes which occur as a result of heat treatment. 13 ref. (M26, 2-64, M21, M22g; Si)

141-M. Microstructural Causes of Heat Affected Zone Cracking in Heavy Section 18-12-Nb Austenitic Stainless Steel Welded Joints. N. E. Moore and J. A. Griffiths. Iron and Steel Institute, Journal, v. 197, Jan. 1961, p. 29-39.

Electron microscope study of hot tensile test specimens to determine ductility, microstructure and grain size after heat treatment at 850-1350° C. Comparative tests with a 17-11-Mo type steel. 27 ref. (M27, Q23p, 2-64, Q27, 9-72, M21e; SS-e, Cb, Mo, 7-51)

142-M. Fabrication and Annealing Factors Affecting Grain Size of 18Cr8Ni-Ti Superheater Materials in Steam Boilers. F. Eberle and J. S. Makris. Journal of Basic Engineering (ASME Transactions, Series D), v. 82, Dec. 1960, p. 855-866.

Effect of cold deformation, annealing time and temperature upon grain size of 18Cr8Ni-Ti and TP321H steel alloys. Recrystallization and grain growth studied at 1450-2200° F. for exposure periods of 5-30 min. (M27c, 2-61, 3-68, J23c, T26q; SS)

143-M. An X-Ray Investigation of Systems Between Niobium Pentoxide and Certain Additional Oxides. H. J. Goldschmidt. Metallurgia, v. 62, Nov. 1960, p. 211-218.

Binary constitutions of Cb pentoxide with oxides of Ni, Co, Fe, Cr, V, Ti, Zr and Mo are studied on mixtures melted to varying compositions and in high and low temperature condition. Some of the intermediate columbates formed for higher secondary oxide content have rutile, columbite, hematite, perovskite and other structural types. Data are given for their stability field, transformation, lattice-dimensional and other changes. Primary solid solubility in beta-Cb_2O_5 is frequently extensive and accompanied by a degree of structural distortion. (M24d; Cb-b)

144-M. The Influence of an Electric Potential Gradient on the Thermal Etching of Silver. E. D. Hondros and A. J. W. Moore. Acta Metallurgica, v. 8, Nov. 1960, p. 751-757.

The size of the etched facets produced on an Ag single crystal, heated to 720° C. for 150 hr. in air while a direct current is passing through it is shown to vary depending on the polarity of the field relative to the crystal orientation. 5 ref. (M28p, 1-68, 3-72; Ag)

145-M. The Influence of Impurities on the Annealing of Nickel After Cold Work. L. M. Clarebrough, M. E. Hargreaves, M. H. Loretto and G. W. West. Acta Metallurgica, v. 8, Nov. 1960, p. 797-803.

Measurements of stored energy and of changes in electrical resistivity and density accompanying annealing are made on Ni of 99.85 and 99.46% purity deformed in torsion and compression revealing two stages of annealing prior to recrystallization and ascribed to annealing of vacancies and interstitials. 11 ref. (M26s, P-general, 2-64, 3-68, 3-69; Ni)

146-M. (German.) Effect of Zinc, Magnesium, Silicon, Copper, Iron, Manganese and Titanium on Primary Crystallization of Al_7Cr. H. Zoller. Schweizer Archiv, v. 26, Dec. 1960, p. 478-491.

Data from microhardness measurements, microscopic, X-ray and chemical examination, two-phase equilibria studies and thermal analysis are presented for Al-rich alloys in the ternary systems Al-Cr-Mg, Al-Cr-Si, Al-Cr-Cu, Al-Cr-Fe, Al-Cr-Mn and Al-Cr-Ti to evaluate solubility of Cr in Al-based alloys and size and amount of primarily precipitated Al_7Cr crystals. (M24c, Q29q, S11p, M23r, P12e, N7, 2-60; al-b, Cr)

147-M. (German.) Electron Microscropic Investigation of Cathode Films in Cr Electroplating. W. Reiner and C. Schiele. Metalloberflache, v. 14, Dec. 1960, p. 357-359.

Electron microscopic investigation (10,000-fold electron enlargement, 5-fold optical enlargement) of invisible films formed on Cr, Fe, Ni, Cu and Ag during cathodic polarization in sulphate containing chromic acid. Preparation of specimen. Structure of film. (M27, M21e; Ag, Cr, Cu, Fe, Ni, Cr)

148-M. Carbides in Waspaloy. J. F. Radavich and W. J. Pennington. Metal Progress, v. 79, Feb. 1961, p. 94-96.

The predominant carbides in this superalloy is MC, which contains Ti, Ni, Mo and Zr. Aging breaks down this phase and $M_{23}C_6$ forms at grain boundaries and within the grains. (M26r; Ni-b, SGA-h)

149-M. Investigational Technique. D. A. Ryder. Metal Industry, v. 98, Jan. 13, 1961, p. 23-26.

Application of metallographic and visual examination, X-ray diffraction and microscopy to the analysis and diagnosis of metallurgical failures in aircraft, including those involving fracture and stress corrosion. (M21, M22g, Q26, R11s, T24)

150-M. Crystallization. Jack Van Den Bogaerde and Herbert M. Schoen. I/EC (Industrial and Engineering Chemistry), v. 53, Feb. 1961, p. 155-158.

Review of 1959-1960 literature on nucleation, crystal growth, vapor phase growth, zone melting and single crystal and whisker formation. 132 ref. (M26, N12)

151-M. (Russian.) Structural Changes of Cast Metal During Plastic Deformation. D. I. Berezhkovskiy. Kuznechno-Shtampovochnoe Proizvodstvo, Apr. 1960, p. 12-16.

Determination of the temperature, reduction rate and degree of reduction necessary to cause transformation from large to small grains in the structure of the cast EI765 nickel alloy. Difference in recrystallization uniformity in the sample as influenced by forging with hydraulic press and by drop forge hammer. (M27c, 2-61, 3-68; Ni-b, 5)

152-M. The Crystallography of Martensitic Transformations. B. A. Bilby and J. W. Christian. Iron & Steel, v. 33, Dec. 19, 1960, p. 648-651.

Theoretical analysis of the crystallographic features of a given martensitic transformation in terms of the lattice pure strain, habit planes and orientation relationships, and shape, lattice and dislocation deformations. (M26, N6q, N8p)

153-M. (German.) Oxide Inclusions in Ferrochromium Alloys. G. Siebert and E. Plockinger. Technische Mitteilungen Krupp, v. 18, Nov. 1960, p. 44-53.

Review of technological parameters for production of Cr alloy steels with few inclusions. Metallographic examination of inclusions in Fe-Cr alloys containing 0.06-0.93% Si using polarized light. (M-general, 9-69, D-general; AY, Cr, 14-68)

154-M. (German.) Potentiostatic Isolation and Analytical Investigation of Inclusions in Ferrochromium Alloys. Christa Ilschner-Gensch. Technische Mitteilungen Krupp, v. 18, Nov. 1960, p. 54-63.

Electrolytic isolation of oxides and oxides plus carbides from low-carbon (0.02) and from commercial 1.27-4.33% carbon Fe-Cr alloys. Radiographic, analytical and microscopic investigation of the isolated residues. 12 ref. (M-general, 9-69; Fe-b, Cr, 14-68)

155-M. (Translation-ConBur.) Equilibrium Diagram of the System Co-Co_2B. P. T. Kolomytsev. Academy of Sciences of the USSR., Proceedings, Chemistry Section, v. 130, Jan-Feb. 1960, p. 121-124.

A new equilibrium diagram for the system Co-B (up to 8.5% B) which includes the compound Co_3B. Data for the maximum solubility of B in Co. (M24b; Co-b)

156-M. (Translation-ConBur.) An Investigation of the Metallic Compounds Formed by the Interaction of a Five-Component Nickel Solid Solution With Titanium Carbide. R. B. Golubtsova and L. A. Mashkovich. Academy of Sciences of the USSR, Proceedings, Chemistry Section, v. 130, Jan-Feb. 1960, p. 5-7.

Composition and crystal structure of carbide phases formed in alloys containing a five-component Ni solid solution and 1, 4 and 8% Ti-C. (M24d, Ni-b)

157-M. (Translation-ConBur.) Investigation of the Metallic Compounds in Multicomponent Nickel Alloys Containing Niobium. R. B. Golubtsova and L. A. Nude. Academy of Sciences of the USSR., Proceedings, Chemistry Section, v. 130, Jan-Feb. 1960, p. 318-321.

Electrolysis products of Ni-Cb-Cr-Ti-Mo-W alloy analyzed to establish distribution of elements between gamma solid solution and Ni_3Cb phases. (M24d; Ni-b, Cb)

158-M. (Translation-ConBur.) Equilibrium Diagram of the Ternary System Ti-Al-Sn. I. I. Kornilov and T. T. Nartova. Academy of Sciences of the USSR., Proceedings, Chemistry Section, v. 131, Mar-Apr. 1960, p. 313-315.

Study of the equilibrium of alloys of Ti-Al-Sn in the region bounded by the partial ternary system Ti-Ti_3Sn-TiAl. Limited solid solutions based on alpha Ti are formed by a perieutectoid reaction between the beta phase of Ti and the gamma phase in the Ti-Al system and between the beta phase of Ti and the sigma phase in the system Ti-Sn. (M24c; Ti-b, Al-b, Sn-b)

159-M. (Translation-ConBur.) The Sigma Phase in the System Rhenium-Vanadium. M. A. Rylkina, K. B. Povarova and E. M. Savitskii. Academy of Sciences of the USSR., Proceedings, Chemistry Section, v. 131, Mar-Apr. 1960, p. 247-249.

A series of high temperature annealings is carried out at 1750-1000° C. to determine the temperature interval over which the sigma phase exists. Data are obtained from X-ray and microstructural observations. 10 ref. (M24b, J23; Re-b, V-b)

160-M. (Translation-ConBur.) Uranium and Its Alloys. G. Ya. Sergeev and V. V. Titova. Soviet Journal of Atomic Energy, v. 6, Nov. 1960, p. 143-149.

Structure and mechanical and physical properties of uranium. Effect of irradiation and elevated temperature on dimensional stability of various alpha-phase and gamma-phase uranium alloys. Metallographic examination of uranium. (M27, Q-general, P-general, P10d, 2-61, 2-67; U-b)

161-M. (Translation.) Structural Transformations of Thin Layers of Tungsten. A. I. Andrievskii and I. D. Nabutovich. Soviet Physics--Solid State, v. 2, Nov. 1960, p. 892-895.

Changes in microstructure of thin tungsten layers heated by electron beam of an electron microscope. Reduction of tungsten trioxide to the dioxide and tungsten dioxide to alpha-tungsten. (M27, M21e; W, 14-62)

162-M. (Translation.) Alloys in the Palladium-Copper-Chromium System. A. T. Grigor'ev, E. M. Sokolovskaya, L. N. Altunina and M. V. Maksimova. Russian Journal of Inorganic Chemistry, v. 5, May 1960, p. 534-538.

Phase relationships in the ternary Pd-Cu-Cr system are studied by thermal analysis, determination of microstructure after annealing and quenching, hardness measurements and electrical resistivity measurements. 14 ref. (M24c, M23r, M27, Q29; Pd-b, Cu-b, Cr-b)

163-M. (Translation.) A Study of the Phase Content, Composition Structure and Boundaries of Homogeneity of the System Vanadium-Carbon-Oxygen. M. A. Gurevich and B. F. Ormont. Journal of Inorganic Chemistry, USSR., v. 2, July 1957, p. 183-212.

Compositions of the V-C system from V to VC are studied by X-ray and chemical methods at 980-2300° C. to determine velocity of carbon diffusion into vanadium and study formation of alpha, gamma, sigma and epsilon phases with homogeneity limits. Determination of microhardness, density and abrasive capacity of vanadium carbides to show similarity to SiC. 78 ref. (M24c, M22g, Q29n, N1e; V-b, C, O)

164-M. (Translation.) Investigation of Alloys of the System Ag-Mn-Al. D. A. Petrov and A. Ya. Potemkin. Journal of Inorganic Chemistry, USSR, v. 2, July 1957, p. 161-182.

Study of the phase diagram of the Ag corner of the Ag-Mn-Al system up to 10% Al and 45% Mn by thermal analysis, microstructure determination, hardness and specific electrical resistance measurements. Data are given for primary crystallization field areas, equilibrium constants, saturation limits, temperature of formation, structural components and magnetic properties. 18 ref. (M24c, M23r, M27, Q29n, P15g, P16; Ag-b, Mn-b, Al)

165-M. (Translation.) The Phase Diagram of the TiFe-V System. Bi Tsin-Khua and I. I. Kornilov. Russian Journal of Inorganic Chemistry, v. 5, Apr. 1960, p. 434-436.

TiFe-V system is studied by thermal, microstructural and X-ray diffraction analysis and by hardness measurements to determine phase compositions and solubilities and regions of homogeneous solid solutions. (M24c, M23r, M27, Q29; Ti-b, Fe-b, V-b)

166-M. (Translation.) Alloys in the Palladium-Silver-Chromium System. A. T. Grigor'ev, E. M. Sokolovskaya, M. I. Zargarova and M. V. Maksimova. Russian Journal of Inorganic Chemistry, v. 5, Apr. 1960, p. 430-434.

Ternary Pd-Ag-Cr system is investigated by thermal analysis and by studies of hardness, microstructure and temperature coefficient of resistivity to determine range of immiscibility and range of mechanical mixtures. 9 ref. (M24c, M23r, M27, Q29, P15g, Pd-b, Ag-b, Cr-b)

167-M. Some Aspects of Research on Thin Solid Films. K. M. Greenland. Journal of Scientific Instruments, v. 38, Jan. 1961, p. 1-11.

Structure of Cu, Ni-Cr alloy, Au, Ag, Pd, selenide, telluride, PbS, Ge, Si, indium antimonide, bismuth oxide, Al and Sb thin films deposited in vacuum is determined by electron and field emission microscopy. Measurement of film-substrate binding energy. 42 ref. (M27, M21; 14-62)

168-M. (German.) Cause and Formation of Abnormal Microstructure in Steels. Hans-Joachim Wiester, Richard Pusch and Manfred Hoffmann. Archiv fur das Eisenhuttenwesen, v. 31, Dec. 1960, p. 731-747.

Hyper-eutectoidal stress (1.2% C) and 0.04-0.18% C steels with additions of Si, Mn, P, S, Al, As, Cu, N and O are 1050° C. annealed, cooled at controlled rate and quenched at different temperatures to investigate effect of alloying elements on formation of abnormal microstructure. Carburization tests on pure Fe, an Fe-oxygen alloy and steels with and without Al additions are made in charcoal, $BaCO_3$ and benzol-hydrogen mixture to determine effect of carbon content of the surface on microstructure. (M27, 2-60, J28g, N12q; Fe, ST, Al)

169-M. (Russian.) Vacancy Concentration in Iron-Chrome Alloys. M. A. Krishtal. Fizika Metallov i Metallovedenie, v. 10, May 1960, p. 720-726.

Methods for determination of vacancy concentration in gamma iron and its alloys containing 0.85-5.75% Cr based on measurements of electric resistivity and internal friction. Results are expressed as a function of Cr content and temperature. 7 ref. (M27, P15g, Q22, 2-60, 2-61; Fe-b, Cr)

170-M. (German.) Uranium-Silicon Alloys and Compounds. H. Steinkopff and F. Thummler. Kernenergie, v. 2, Dec. 1960, p. 1105-1114.

Review of the binary U-Si phase diagram and discussion of mechanical and physical properties of U-Si compounds with emphasis on corrosion behavior in water and gases at elevated temperatures. Influence of radioactive radiation. Production of fuel elements by extrusion of U_3Si with $ZrSi_2$ coating. (M24b, P-general, Q-general, R4, 2-67; U-b, Si-b)

171-M. Sulphides, Selenides and Tellurides of Platinum. Fredrik Gronvold, Haakon Haraldsen and Arne Kjekshus. Acta Chemica Scandinavica, v. 14, Sept. 1960, p. 1879-1893.

X-ray study of phase relationships in the systems Pt-S and Pt-Se and Pt-Te to determine densities and lattice constants. Magnetic susceptibilities are measured at -183 to 450° C. 28 ref. (M24b, M22g, M26; Pt, 14-68)

172-M. Alloys of Uranium With Platinum Series Metals. Soviet Journal of Atomic Energy, v. 6, Dec. 1960, p. 443-445.

Phase diagrams of the systems U-Ru, U-Rh, U-Pd, U-Os, U-Ir and U-Pt with data for solubility of metals in U and structure of alloys. 5 ref. (M24b; U-b, EG-c30)

173-M. Theoretical Analysis of Duplex-Grain Structure. Genziro Mima, Toshihiko Kawai and Yashikiyo Ogino. Tetsu-to Hagane (Iron and Steel Institute of Japan, Journal), v. 47, Jan. 1961, p. 27-33.

Method of determining size and distribution of grains of mixed sizes is tested on carbon steel samples. 3 ref. (M27; CN)

174-M. (Italian.) Metallographic Phenomena on Light Alloy Specimens Submitted to Fatigue Stress. M. Paganelli. Alluminio, v. 29, Nov. 1960, p. 511-519.

Micrographic and radiographic comparisons of Raffinal and an Al-5% Cu alloy after fatigue stress. Observations of "slip-band extrusions". 20 ref. (M21, M23m, 3-66; Al-a, Al-b, Cu)

175-M. Cube Texture in Ultra-Thin Molybdenum Permalloy Tape. P. K. Koh. Metallurgical Society of AIME, Transactions, v. 221, Feb. 1961, p. 50-55.

Quantitative pole density stereograms of (111) and (200) poles of Mo Permalloy tapes in their cold rolled, 760 and 927° C. annealed conditions with some supporting magnetic data are used to study the development of cube annealed texture and the correlation of cube texture with magnetic performance. Influence of cold rolling on texture and relation of pole concentration to the switching coefficient, squareness ratio of the hysteresis loop and coercive force. 3 ref. (M26c, P16a, 2-64, 3-68; Mo, 4-56)

176-M. Microstructure of Unidirectionally Solidified Al-$CuAl_2$ Eutectic. R. W. Kraft and D. L. Albright. Metallurgical Society of AIME, Transactions, v. 221, Feb. 1961, p. 95-102.

The theory of eutectic colony formation is tested on a series of high-purity Al-Cu specimens composed of Al solid solution and theta phase $Cu-Al_2$. Three types of eutectic microstructures, a unique structure consisting of lamellae essentially parallel to one another, a banded structure and the colony structure are observed after solidification in an apparatus with control of the temperature of the liquid and the temperature gradient at the solid-liquid interface. 5 ref. (M27, N12q; Al-b, Cu-b)

177-M. Effect of Quenching on the Grain Boundary Relaxation in Solid Solutions. A. S. Nowick and C. Y. Li. Metallurgical Society of AIME, Transactions, v. 221, Feb. 1961, p. 108-109.

Torsion creep test at 69-160° C. demonstrating that quenching from an elevated temperature (400° C.) accelerates the grain boundary relaxation in two solid solutions (alpha Ag-Zn and alpha Cu-Al). Correlation with the proposal that, in solid solutions, grain boundary relaxation occurs by a mechanism of self-diffusion. An alternative possibility, that quenching introduces vacancies into the boundary itself, is also considered. 12 ref. (M27f, M26s, N1d, Q3, 2-64; Ag-b, Zn, Cu-b, Al)

178-M. Texture Formation in Rolled and Annealed Crystals of Silicon-Iron. Hsun Hu. Metallurgical Society of AIME, Transactions, v. 221, Feb. 1961, p. 130-140.

Three single crystal strips of a 3% Si-Fe alloy with approximately (110) (001), (210) and (100)(001) orientation are rolled at room temperature to 30, 50 and 70% reduction in thickness. Deformation and annealing textures upon recrystallization and subsequent growth and orientation relationships are observed, with temperature dependence of recrystallization textures. 15 ref. (M26c, N3, N5, 2-61, 2-64, 3-68; Fe-b, Si, 14-61)

179-M. Phase Relations in the Titanium-Aluminum System. Elmors Ence and Harold Margolin. Metallurgical Society of AIME, Transactions, v. 221, Feb. 1961, p. 151-157.

The Ti-Al system is investigated in the composition region 0-34% Al at 800-1450° C. The phases encountered in this region are alpha, beta, gamma, sigma and epsilon. Data are given for microhardness, lattice parameters and eutectoid and peritectoid reactions. 16 ref. (M24b, M-general, N-general, 2-61; Ti-b, Al-b)

180-M. The Iron-Carbon-Sulphur System From 1149-1427° C. Albert M. Barloga, Keith R. Bock and Norman Parlee. Metallurgical Society of AIME, Transactions, v. 221, Feb. 1961, p. 173-179.

Coils of pure Fe and Fe-C alloy wire (0.05-0.80% C) and sufficient S to saturate the solid phase are equilibrated in evacuated or argon filled tubes. After rapid cooling and removal of the outside nonmetallic layer, the wires are analyzed for C and S and the data used to construct an Fe-S binary diagram and isotherms of the Fe-C-S ternary diagram at 1149-1427° C. 12 ref. (M24c; Fe-b, C, S)

181-M. Metal Crystal Orientation Using the Polarizing Microscope. H. D. Mallon. Metallurgical Society of AIME, Transactions, v. 221, Feb. 1961, p. 199-200.

The direction of the optic of "C" axis of a uniaxial metal crystal is

found with the metallurgical polarizing microscope by examining two planes of section on the crystal. Complete orientation of the crystal is then determined if a twin crystal is common to both surfaces of section. Application to Bi single crystal with substantiation by X-ray diffraction. 5 ref. (M26c, M21c; Bi, 14-61)

182-M. Rare-Earth Gallium Compounds Having the Aluminum-Boride Structure. S. E. Haszko. Metallurgical Society of AIME, Transactions, v. 221, Feb. 1961, p. 201-203.

X-ray diffraction crystallographic data are presented for several new XGa_2 intermetallic compounds, where X is a rare earth, having the AlB_2 structure, as part of a study of the magnetic and structural properties of rare earth alloys. 5 ref. (M26c, M22g; Ga, EG-g)

183-M. Crystallographic Angles in Tetragonal Crystals: Beta Tin and Indium. B. S. Chandrasekhar and B. W. Veal. Metallurgical Society of AIME, Transactions, v. 221, Feb. 1961, p. 202-203.

Calculation of tables of angles for beta-Sn and In both between planes in principal zones and between zones passing through principal planes for application to Laue method of orienting single crystal, the standard formula being used, with $c/a \simeq 0.54554$ for beta-Sn and 1.07586 for In. (M26c; In, Sn)

184-M. On Coincidence Sites. H. P. Stuwe. Metallurgical Society of AIME, Transactions, v. 221, Feb. 1961, p. 203-204.

A model using sieves with holes corresponding to lattice sites is proposed for checking the density of coincident sites deviating from mathematical accuracy in orientation relationships and boundary structure studies of f-c-c. crystals. 4 ref. (M26, 17-56)

185-M. Observations on the Ti-Zr System. E. Ence and H. Margolin. Metallurgical Society of AIME, Transactions, v. 221, Feb. 1961, p. 205-206.

Ti-Zr alloys, containing 24.1-49.0 Zr are examined for the presence of ordering or compound formation by X-ray diffraction and microstructural examination after various heat treatment at 500-700° C. for times of seven days to two months. (M24b, M-general, N10, 2-64; Ti-b, Zr)

186-M. The Magnesium-Rich Region of the Magnesium-Yttrium Phase Diagram. D. Mizer and J. B. Clark. Metallurgical Society of AIME, Transactions, v. 221, Feb. 1961, p. 207-208.

The liquidus, solidus and solvus of the Mg solid solution in the system is investigated by metallography and thermal analysis of 4-20% Y-Mg specimens at 200-1200° F. Determination of eutectoid composition and Widmanstatten structure precipitation as a function of aging time and temperature. (M24b, M-general, N-general; Mg-b, Y)

187-M. Optical Methods of Studying Surface Finish. O. S. Heavens. Institute of Metal Finishing, Transactions, v. 36, 1958-1959, p. 159-166.

Review of microscopy methods including conventional, light-profile and interference microscopy, multiple-beam interferometry and, with special attention, surface reflectivity measurements. Evaluation of applicability for various electropolished, electroplated and oxidized metal surfaces in studying finish, roughness, structure, contours, deformation characteristics and other properties. Application to Ag, Au, Al, Cu, Cd, Ni, Pb, Ti, Ge, Ta, Zn, Sn and some alloys. 18 ref. (M21; 8)

188-M. (French.) Radiocrystallography. Machine Moderne, v. 54, Dec. 1960, p. 59-64.

Survey of processes utilizing the diffraction properties of X-rays for the analysis and the determination of the crystallographic relations, structures and composition of metals and alloys. Review of Bragg's Law and the Bragg rotating crystal method and the Laue, Debye, Scherrer and Hull and Seeman-Bohlin methods. Application with fluorescent analysis and optical microscopy. (To be continued.) (M22g, M26)

189-M. (Translation.) The Change in the Microstructure of Uranium on Cyclic Heat Treatment. R. I. Garber, S. Ya. Zalinadnyi and V. M. Mikhailovskii. Soviet Physics, Solid State, v. 2, Dec. 1960, p. 950-957. (Translation of Fizika Tverdogo Tela, v. 2, June 1960, p. 1033-1360.)

Grain orientation, recrystallization, crystal displacement, plastic deformation, growth and thermal ratcheting of coarse grained, columnar crystallites after cyclic heat treatment at 100-600° C. as determined by microscopic and X-ray diffraction studies. 11 ref. (M27, Q24, M21, M22g, 2-64; U)

190-M. Properties of Iron Alloys (Fractography of High-Strength Steels With the Electron Microscope). C. D. Beachem and J. E. Srawley. Report of NRL (Naval Research Laboratory) Progress, Jan. 1961, p. 26-29.

Fracture surfaces occurring during stressing in tension of 12MoV steel sheet specimens after various heat treatments and cathodic charging are studied by electron microscopy and replica techniques. Examination of the hydrogen embrittlement crack surface shows brittle fracture "river line" cleavage and narrow "shear lips" as characteristic fracture mechanisms. 3 ref. (M23p, M21e, Q26, 3-66; AY)

191-M. The Fermi Surface of Metals. W. A. Harrison and R. W. Schmitt. Physics Today, v. 14, Feb. 1961, p. 20-25.

The electronic structure and properties of pure metals as affected by the behavior and function of Fermi surface shapes and momentum space and orbiting characteristics. Experimental studies of the de Haas-van Alphen, magnetoacoustic, magnetoresistance, anomalous skin and cyclotron resonance effects. (M25)

192-M. (Italian.) Application of Color Metallography to the Study of Phenomena Connected With the Manufacture of Mild Steel Plate for Deep Drawing. G. Odone and V. Berruti. Metallurgia Italiana, v. 52, Nov. 1960, p. 716-720.

Relation between microhardness of single crystals belonging to the same aggregate and their crystal orientation established by color metallography and applied to the study of the development of microhardness during thermal treatment and annealing of rimming steel specimen. (M21g, J-general, Q29q; ST, 4-53)

193-M. (Italian.) Influence of Crystal Orientation on Etching Figures of Metallic Monocrystals. Pt. 2. Bismuth. A. La Vecchia and B. Rivolta. Metallurgia Italiana, v. 52, Nov. 1960, p. 727-732.

Etching of monocrystals oriented in the (111), (110) and (100) plane by HNO_3, concentrated HCl, methyl alcohol with I_2, H_2O_2 + HF + H_2O (1:1:4), CP_4, CH_3OH, Superoxol and Dash. Shape and orientation of etching figures. 11 ref. (M20q, M26c; Bi, 14-61)

194-M. (French.) Methods for Identifying Gamma Grains. Determination of Gamma Grains by Condensation of Syncrystallizable Alloy. G. Vigneron. Metaux-Corrosion-Industries, v. 35, Dec. 1960, p. 439-454.

Review of methods for determining the gamma grain in steel by microscopic examination of the austenite structure after cooling or by observing the development of the gamma structure during heat treatment. Application of a condensation method of structure analysis by vapor deposition of a syncrystallizable alloy on the specimen surface. 28 ref. (M26q, N15g, 1-54; ST)

195-M. (Japanese.) The Effect of Preheating Conditions on the Recrystallization Texture and Anisotropic Properties of Annealed Aluminum Sheets. Toshio Amitari. Japan Institute of Metals, Journal, v. 24, Dec. 1960, p. 765-769.

Earing phenomena and rolling and recrystallization textures of hot and cold rolled Al sheet preheated at 400-650° C. are examined by microscopy and electrical resistance measurements. Changes in anisotropy and texture orientations are attributed to impurity precipitation caused by preheating. 17 ref. (M26c, N5, 2-64, 3-69, 3-72; Al, 4-53)

196-M. (Japanese.) The Texture and Change in the Anisotropy of Aluminum Sheet in Relation to Various Annealing Conditions. Toshio Amitani. Japan Institute of Metals, Journal, v. 24, Dec. 1960, p. 769-773.

Recrystallization grain growth, textures and orientation relationships, earing phenomena and tensile properties are examined for rolled and deep drawn Al sheet after annealing at 250-370° C. for various times. Changes in anisotropy and texture are attributed to impurity or addition element control of grain growth during annealing. 5 ref. (M26c, N5, Q27, 2-64, 3-72; Al, 4-53)

197-M. (Russian.) Structural Changes in Technical Iron During the Aging Process.

Yu. A. Skakov. Metallovedenie i Termicheskaya Obrabotka Metallov, Jan. 1961, p. 15-19.

X-ray study and hardness measurements of aged samples at 100° C. after hardening and tensile deformation. Microstructure and hardness as dependent on the duration of the aging process and concentration of alloy additions. 5 ref. (M27, Q29n, 2-60, 2-65; Fe)

198-M. (French.) Electronic Microscopy. Replica Techniques. Methods for Surface Preparation. C. Lebrun, A. Huber and P. LeLong. Revue de l'Aluminium, v. 37, Nov. 1960, p. 1257-1267.

Methods for obtaining simple replicas of metal surfaces by direct carbon or Al application and of obtaining double replicas of triafol, carbon and Si, or Al and alumina for electron microscopy studies. Methods of surface preparation by electrolytic or chemical polishing. Quality of electron micrographs with bold relief. 22 ref. (M21e, M20r, 10-54)

199-M. Hardening Due to the Recombination of Dislocations. G. Saada. Acta Metallurgica, v. 8, Dec. 1960, p. 841-847.

Two simplified models for dislocation interaction are studied to determine dislocation recombination mechanism effects during hardening. It is established that, in a dislocation "forest", the piercing of attracting "trees" results in stresses which are decidedly greater than those accompanying penetration of repulsing "trees". The recombination mechanism is responsible for the formation of vacancies and interstitials, the role played by thermal activation being negligible. 7 ref. (M26b, N7e)

200-M. Electron-Microscopic Study of Recrystallization Twins in Copper. E. Votava and H. Hatwell. Acta Metallurgica, v. 8, Dec. 1960, p. 874-877.

Recrystallization twins in thin Cu foil, recrystallized in high vacuum at 600-1000° C. after cold rolling, are associated with twinning dislocations in transmission electron microscopy examinations. Relation of growth and disappearance and other phenomena of recrystallization twins to interactions and properties of these dislocations. 11 ref. (M21e, M26b, M27e, N5, Q24b; Cu, 4-56)

201-M. Influence of Plastic Deformation on the Annealing of Quenched Gold. S. Yoshida and J. S. Koehler. Acta Metallurgica, v. 8, Dec. 1960, p. 878-881.

Annealing behavior of lattice vacancies and activation energy of defect motion in specimens quenched from 700° C., annealed at 40-60° C. and pulled in tension. Enhancement of the annealing rate and other phenomena is attributed to vacancies near a dislocation lattice preferring to exist as divacancies, since as divacancies there is a larger attractive interaction. (M26s, M26b, 2-64, 3-68; Au)

202-M. The Orientation of Martensite in Austenite. H. M. Otte. Acta Metallurgica, v. 8, Dec. 1960, p. 892-896.

Laue back reflection and X-ray microbeam measurements of single martensite plates in an austenite matrix in specimens of a 32% Ni-Fe alloy and 28% Cr 150 Fe-based alloy. Data are given for orientation relationships and habit planes in terms of axis and rotation which would bring the austenite axis into coincidence with the martensite axis. Slip systems of the inhomogenous deformation in the formation of martensite are theoretically calculated for the orientation relationships and habit planes. 14 ref. (M26e, M22g, N8p, Q24a; Fe-b, Ni)

203-M. The Use of Lattice Spacings Data to Evaluate the Effective Valency of Transition Metals in Ag-Based H. C. P. Phases T. B. Massalski and K. W. King. Acta Metallurgica, v. 8, Dec. 1960, p. 900-901.

Variation of axial ratio as a function of electron concentration is determined for binary h. c. p. phases based on Ag, containing Cd, Hg, Ga, In, Sn, As and Sb, to study the electronic contribution of the second solute element, the valency of which is not certain, to binary Ag or Cu-based h.c. p. phases for determining whether a master curve could be plotted for effective valencies and possible changes of valencies of transition metals when dissolved in alloys based on noble metals. 4 ref. (M25q, M26; Ag-b, Cd, As, Ga, In, Sb, Sn)

204-M. Welding Stainless by Electron Beam. C. R. Lehmann and E. G. Littell. Metal Progress, v. 79, Mar. 1961, p. 125-126.

Prizewinner in the 14th Annual A. S. M. Metallographic Exhibit. (M26; SS)

205-M. X-Ray Small Angle Scattering From Guinier-Preston Zones in Deformed Aluminium-Silver Single Crystals. S. Sato and A. Kelly. Acta Metallurgica, v. 9, Jan. 1961, p. 59-61.

Clusters forming in Al-20 Ag single crystals, quenched from the sigma phase and aged at room temperature, are observed to deform under rolling but with less deformation than the specimen as a whole. Orientation and symmetry relations of the clusters after tensile deformation are examined by small angle scattering technique to obtain shear and glide strain values and determine homogeneous slip deformation mechanisms. 10 ref. (M21f, M26, Q24a, 3-68; Al-b, Ag, 14-68)

206-M. The Influence of Phosphorus Upon the Mobility of Half-Dislocations in Copper. F. E. van Wely. Acta Metallurgica, v. 9, Jan. 1961, p. 72-73.

The retarding effect of impurities on stacking fault annealing is investigated for pure Cu and a Cu-0.2% P alloy after isothermal annealing at 180° C. Intrinsic fault peak shifts are determined after cold work as a function of annealing time and specimen composition. 3 ref. (M26b, 2-64, 3-69; Cu-b)

207-M. Some Results Obtained From the Microscopic Examination of Fracture Surfaces of a Cast Aluminium Silicon Copper Alloy. D. A. Ryder. Acta Metallurgica, v. 9, Jan. 1961, p. 73-76.

Optical and electron microscopy and carbon replica study of aged Al-2 1/2% Si-1% Cu specimens broken in tension, impact and slow beading. Intercrystalline cleavage fracture is observed, with characteristic river line, fir tree pattern and deformation loops, as a function of elastic stress wave velocity and interaction and crack propagation and coalescence. (M21, M23p, Q26n, 3-66; Al-b, Si, Cu)

208-M. (French.) Nondestructive Structure Testing of Steel Castings. Fonderie, Nov. 1960, p. 475-477.

Castings are polished mechanically and electrolytically by a pad soaked with electrolyte that is brought to the steel surface while a current is passed. Replicas for microscopic testing are produced by application of a nitrocellulose varnish. (M21, M27, L13p, 1-54; ST, 5)

209-M. (German.) New Methods for Microscopic Investigation of Nodular Graphite. J. Blaha, F. Grasenick, H. Horn and E. Jakopic. Radex Rundschau, Dec. 1960, p. 429-446.

Investigation of graphite precipitation, including nodular graphite in Fe, by isolation, sheathing, coating and replica techniques. Method and apparatus for total or partial oxidation of graphite by electrodeless high-frequency activation of oxygen for subsequent electron microscopic structural investigation. (M21, N8s, S11f; Fe-b)

210-M. (German.) Ternary System Nickel-Zinc-Carbon. H. H. Stadelmaier and F. H. Hammad. Metall, v. 15, Feb. 1961, p. 124-125.

Melting of a mixture of Ni, Zn and C in evacuated quartz tubes and subsequent annealing at 800° C. Measurement of the phase equilibria in Ni corner of the isothermal 800° C. section of the ternary phase diagram by microscopic and X-ray investigation. Composition of ternary carbide $Ni_{60}Zn_{30}C_{10}$. (M24c, M21, M22g; Ni-b, Zn-b, C)

211-M. (German.) Ternary System Iron-Tin-Carbon. H. H. Stadelmaier and J. M. Waller. Metall, v. 15, Feb. 1961, p. 125-126.

Melting of a mixture of Fe, Sn and C in evacuated quartz tubes, subsequent annealing at 800° C. and quenching in water. Investigation of phase boundaries in the Fe-rich corner of the isothermal 800° C. section of the ternary phase diagram by microscopic and X-ray investigation. Composition and lattice parameters of ternary compound $Fe_{70}Sn_{15}C_{15}$. (M24c, M21, M22g; Fe-b, Sn-b, C)

212-M. (French.) Structural Modifications in High Purity and Zone Refined Aluminum During Annealing After Cold Working. Pt. 4. Omourtague Dimitrov. Memoires Scientifiques de la Revue de Metallurgie, v. 57, Nov. 1960, p. 852-862.

Point defects and recrystallization occurring with or without the addition

of impurities observed during annealing of high purity Al and in Al refined by zone melting, after severe cold working at lower than room temperatures. 60 ref. (M26s, N5, 2-64, 3-68, 3-69; Al)

213-M. (Translation-ChemSoc.) Investigation of Solubility of Titanium and Phase Composition of Alloys in the Quinary System: Nickel-Chromium-Tungsten-Aluminum-Titanium. I. I. Kornilov, A. Ya. Snetkov and F. M. Turner. Russian Journal of Inorganic Chemistry, v. 2, Jan. 1957, p. 249-259.

Phase diagrams, microstructural changes, lattice dimensions and Ti solubility are determined for the Ni-rich side of the systems in alloys containing 0-11.7% Ti and 5-20.6% Cr, W and Al. Relations between composition and physico-chemical properties are determined through metallographic and X-ray study and thermal analysis after various heat treatments at 850-1180° C. (M24d, M-general, P12e, 2-60; Ni-b, Cr, W, Al, Ti)

214-M. (German.) Hafnium Based Binary Systems. H. Nowotny, H. Braun and F. Benesovsky. Radex Rundschau, Dec. 1960, p. 367-372.

Production of high-melting Hf alloys under argon protective atmosphere in an electrical arc furnace. Results of X-ray, thermo-analytic and micrographic investigation are presented in terms of binary phase diagrams of Hf with B, Al, C, Si, Ge, Sn, W and O. (M24b, C21d; Hf-b)

215-M. (German.) Observation and Registration of Processes in the Electron Emission Microscope. H. Duker. Radex Rundschau, Dec. 1960, p. 406-420.

Alpha-gamma transformations in 0.45% C steel, oxidation of gamma Fe and Ni specimens at high temperatures and electron etching of UO_2 and Al alloyed with Mo and U are investigated to demonstrate the usefulness of the electron emission microscope and a vacuum film camera which permits photography of observed processes, with control of chemical reactions by proper selection of discharge gases. (M21e, N-general, R1h; Fe-b, Ni, U-b, Al)

216-M. (Russian.) Effect of Neutron Exposure on Crystalline Structure and Properties of Metals and Alloys. I. V. Batenin, V. A. Iliena, V. K. Kritskaya, G. V. Kurdyumov and B. V. Sharov. Doklady Akademii Nauk, SSSR, v. 134, Apr. 1960, p. 802-805.

Neutron irradiation of Fe, Cu, 4% Ni in Fe and 0.6% W in Fe specimens followed by annealing at 400-650° C. Effect of irradiation on interference line width and microhardness. (M26, Q29q, 2-67; Cu, Fe-b, Ni, W)

217-M. (Russian.) Investigation of Iron-Palladium-Silver System. E. V. Akatova. Zhurnal Neorganicheskoi, v. 5, Nov. 1960, p. 2395-2402.

Thermal analysis and measurements of hardness, microstructure and electric resistance are used to determine phase relationships in Fe-Pd-Ag system within a wide concentration range. 15 ref. (M24c; Ag-b, Fe-b, Pd-b)

218-M. (Russian.) Investigation of Cr-Cb-Mo Ternary System in the Region of Cr and Mo Corners. N. N. Kurnakov and M. Ya. Troneva. Zhurnal Neorganicheskoi, v. 5, Nov. 1960, p. 2403-2409.

X-ray study, measurements of macro-microhardness and determination of melting points of the system in relation to various concentrations of Cr, Cb and Mo. Lattice parameter and hardness of Cr_2Cb. 14 ref. (M24c; Cb-b, Cr-b, Mo-b)

219-M. (Russian.) Constitution Diagram for Systems of Manganese With Titanium and Zirconium. E. M. Savitskii and Ch. V. Kopetskii. Zhurnal Neorganicheskoi, v. 5, Nov. 1960, p. 2422-2434.

Establishment of Mn-Zr and Mn-Ti constitution diagrams by radiographic study, microstructure phase analysis and measurements of hardness and microhardness. Lattice parameters and hardness of $ZrMn_2$ and $TiMn_2$ intermetallic compounds are found within investigated concentration range. Alpha-beta phase transformation as a function of Ti and Zr concentration. 10 ref. (M24c; Mn-b, Ti-b, Zr-b)

220-M. (English.) Light Figure Phenomena Revealed and Crystal Faces Developed by Chemical Etching of Silicon Crystal. Katashi Masumoto, Mikio Yamamoto, Jiro Watanabee and Toshiyuki Kawada. National Research Institute for Metals, Transactions (Japan), v. 2, Feb. 1960, p. 96-101.

Chemical etching of specimens at 70-100° C. using alkaline reagents to determine orientation relationships and nature of crystal faces in Si single crystals with diamond lattices. 7 ref. (M20q, M26c; Si, 14-61)

221-M. (German.) Investigation of Texture and Magnetostrictive Anisotropy of Fe-Al and Fe-Cr Alloys. M. M. Borodkina, S. N. Bulytschewa and Ja. P. Selisski. Physikalische Abhandlungen aus der Sowjetunion, v. 3, Apr. 1960, p. 256-268.

X-ray investigation (Mo-K-alpha, beta radiation) of deformation and recrystallization texture and magnetostriction of rolling-deformed and heat treated (850-1200° C.) specimens of Fe-Al (10% Al) and Fe-Cr (14% Cr) alloy. (M26c, P16b; Fe-b, Al, Cr)

222-M. (German.) Distribution of Iron in the Microstructure of Zirconium Alloys. P. L. Gruzin, G. G. Rjabova and G. B. Fedorov. Kernenergie, v. 2, Oct-Nov. 1960, p. 1089-1091.

Investigation of Fe distribution in Zr containing 0.15% Fe and in Zircalloy (1.1% Sn, 0.1% Fe, 0.1% Cr, 0.05% Ni) by radiograms using the radioactive isotope Fe-59. Influence of various heat treatments and working operations on Fe distribution. (M27, 2-64; Zr-b, Fe)

223-M. (German.) Investigation of Alloys in the Uranium-Germanium System. V. S. Ljasenko and V. N. Bykov. Kernenergie, v. 2, Oct-Nov. 1960, p. 1094-1096.

Thermal analysis, dilatometric, microstructure and X-ray (Debye-Scherrer) investigation to establish the U-Ge phase diagram over the entire concentration range up to liquidus temperature. Identification of compounds U_3Ge_4, U_5Ge_2 and UGe_3. (M24b; U-b, Ge-b)

224-M. (German.) Carbides and Intermediary Crystals in Heat Resistant Nickel Alloys and Their Isolation. G. Haussler and M. Zophel. Neue Hutte, v. 6, Jan. 1961, p. 52-55.

Current density and potential measurements on heat treated Ni-Cr alloys containing small amounts of Ti, Al, C, Si, Mn, Fe, Cu, Ce, Mo, W and V and of Cr_7C_3 isolated in aqueous electrolytes based on HCl and H_3PO_4. X-ray identification of following phases: TiC, Cr_3C_2, Cr_7C_3, $Ni_3(Al, Ti)$. Dissolution mechanism. (M26r, M22g, P15; Ni-b)

225-M. Structure of Vacuum-Deposited Germanium Films on Amorphous Quartz. J. E. Davey. Report of NRL (Naval Research Laboratory) Progress, Feb. 1961, p. 14-22. (Available as PB171315 from U. S. Office of Technical Services, Washington 25, D. C.)

Structure and orientation relations of specimens hot deposited on a heated substrate are investigated at 20-650° C. by combined reflection and electron diffraction, X-ray diffraction and interferometry methods and are compared to cold deposited annealed films. Influence of deposition temperature on orientation textures, particle size and deposit thickness. 18 ref. (M26, M-general, L25g, 2-61; Ge, 14-62)

226-M. Basic Studies of the Metallic State (The Structure of $CbZn_2$). C. L. Vold. Report of NRL (Naval Research Laboratory) Progress, Feb. 1961, p. 33-34. (Available as PB 171315 from U. S. Office of Technical Services, Washington 25, D. C.)

Single crystals of $CbZn_2$ are prepared by heating $CbZn_2$ in vacuum at 1045° C. for 3 1/2 hr., with the free Zn being removed by etching in an NH_4OH solution. Data are determined for lattice constants symmetry, space group, unit cell and atomic size, composition and Laues phase structure. 3 ref. (M25, M26; Cb-b, Zn, 14-68)

227-M. (Polish.) Technique for Microscopic Study of Bainitic Steels. J. Eysymontt. Prace Instytutow Hutniczych, v. 12, May 1960, p. 248-253.

18HNWA, 65S2WA and Cr-Mo steel samples are heat treated at 400-900° C. and studied to determine microstructure. Several etching reagents are used at constant concentration and varying etching times. Best results are obtained with an alcohol solution of trichloroacetic and nitric acids. 11 ref. (M22e; ST)

228-M. (Polish.) Optical Method for Determination of Crystallographic Orientation of Single-Crystal Ferromagnetics. B. Wyslocki. Prace Instytutow Hutniczych, v. 12, May 1960, p. 264-262.

Electron microscope observation of electrolytically or chemically etched figures on 3% Si cold rolled steel. Selection of suitable etching solution and method of determining orientation for regular and complicated etch figures. 14 ref. (M21e, M26c; ST, Si)

229-M. The Determination of Accurate Lattice Spacings in Hexagonal Close-Packed Alloy Phases. T. B. Massalski and H. W. King. Institute of Metals, Journal, v. 89, Jan. 1961, p. 169-171.

A graphical extrapolation method which makes use of computed tables of the quadratic functions of the axial ratio is derived for determining lattice spacings and correlated with X-ray diffraction patterns. The method is applied to a zeta phase Ag-44.5% Hg h-c-p. 11 ref. (M26, M22g; Ag-b, Hg)

230-M. Growth Structures in Electrodeposited Copper. G. G. Storey and S. C. Barnes. Institute of Metals, Journal, v. 89, Jan. 1961, p. 174-175.

Surface topography of Cu electrodeposits on Cu electrodes as influenced by substrate and cathode orientation. Networks of probable dislocation arrays are observed and attributed to incorporation of impurities at step edges or by lattice misfit between adjacent platelets. 5 ref. (M26, N3, 3-69, 3-72; Cu, 8-62)

231-M. The Structural Aging Characteristics of Al-Cu-Mg Alloys With Copper: Magnesium Weight Ratio of 7:1 and 2·2:1. J. M. Silcock. Institute of Metals, Journal, v. 89, Feb. 1961, p. 203-210.

X-ray diffraction analysis and hardness measurements on single crystal specimens containing 1.29-3.53% Cu and 0.33-1.52% Cu after isothermal age-hardening treatments and deformation by elongation. The zones found in the alloys with a Cu:Mg ratio of 2·2:1 are distinct from G. P. zones found in binary Al:Cu alloys and are termed G. P. B. zones. In the specimens with 7:1-Cu:Mg ratio, G. P. and G. P. B. zones occur at the same time. Data are presented for nucleation and precipitation mechanisms and structures, orientation relationships and hardness values. 17 ref. (M26, M-general, N-general, 2-65, 3-68; Al-b, Cu, Mg)

232-M. Thermally-Activated Glide in Magnesium Crystals From 4.2-420° K. H. Conrad, R. Armstrong, H. Wiedersich and G. Schoeck. Philosophical Magazine, v. 6, Feb. 1961, p. 177-188.

Effect of changes in strain rate and temperature on the flow stress in Mg single crystals. Data indicate that the intersection of dislocations is the controlling mechanism. 15 ref. (M26b; Mg, 14-61)

233-M. (Translation.) Observation of Dislocations in Tellurium. A. I. Blum. Soviet Physics--Solid State, v. 2, Jan. 1961, p. 1509-1511. (Translation of Fizika Tverdogo Tela, v. 2, July 1960, p. 1361-1680).

Te crystals are etched in nitric and tartaric acid, electroetched at 90-160° C. in an electrolyte containing H_3PO_4, H_2SO_4 and CrO_3, then examined with an optical microscope to observe dislocations during plastic deformation. (M26b, M20q, M21c; Te)

234-M. (French.) Heterogeneity of Large Forging Ingots. C. Roques, P. Martin, Ch. Dubois and P. Bastien. Revue de Metallurgie, v. 57, Dec. 1960, p. 1091-1103.

Form, extent and rate of major, local V and reversed V segregation and microsegregation and O and H distribution of 200 steel forging ingots weighing 7-170 tons are studied by Baumann imprints on longitudinal and cross sections by reducing fusion in vacuum and chemical analysis of impurities. A theory is proposed for segregation mechanisms. 12 ref. (M27, 9-69; ST, 5-59)

235-M. (Russian.) Martensitic Transformation in Titanium-Zirconium System. V. N. Gridnev. Doklady Akademii Nauk SSSR, v. 134, June 1960, p. 1334-1336.

Phase transformation, electric resistivity and linear expansion in relationship to the Zr concentration, cooling rate and quenching temperature. Characteristics and origin of intermediate omega phase in Ti-Zr systems. 8 ref. (M24b, P15g; Ti-b, Zr-b)

236-M. (Russian.) Effect of Aging Time on the Gamma Phase in Ni-Cr-W-Al-Ti Systems. P. B. Golubtsova and L. A. Mashkovich. Doklady Akademii Nauk SSSR, v. 134, June 1960, p. 1353-1355.

X-ray study of structure and composition of the gamma prime phase electrolytically isolated from samples after aging for 0-10,000 hr. 6 ref. (M26, 2-65; Al-b, Cr-b, Ni-b, Ti-b, W-b)

237-M. Optical Methods. A. B. Winterbottom and D. McLean. Paper from "The Physical Examination of Metals". Edward Arnold, Ltd., London, England, 1960, p. 1-80.

Survey of optical microscopy and macroscopy principles, systems and techniques, including geometric and physical optics and application to study

of metal surfaces and structures. Topics include incident light microscopy using coated optical and reflecting systems and interference and polarized light methods. 123 ref. (M21c, 10-54)

238-M. Electrical Measurements. R. King and A. P. Grunaugh. Paper from "The Physical Examination of Metals". Edward Arnold, Ltd., London, England, 1960, p. 81-167.

Survey of electrical resistivity measurement principles and techniques including a-c. and d-c. methods and relation of electrical resistivity changes to structural and compositional changes in metals. Application in metallographic research determining constitutional diagrams, order-disorder transitions, phase transformations and the effect of lattice defects on resistivity of pure metals, alloys and metal surfaces. 100 ref. (M-general, N-general, P15g, 1-54, 10-54)

239-M. X-Ray Diffraction. A. Taylor. Paper from "The Physical Examination of Metals". Edward Arnold, Ltd., London, England, 1960, p. 253-346.

Principles of X-ray generation and correlation of diffraction patterns with lattice geometry in metals and alloys. Survey of diffraction methods and application to determination of grain orientations, transformation mechanisms and microstructural elements, composition and stress-strain relationships. (M22g, M26, N-general, 1-54)

240-M. The Diffraction of Electrons. K. J. Marsh and A. G. Quarrell. Paper from "The Physical Examination of Metals". Edward Arnold, Ltd., London, England, 1960, p. 347-383.

Investigation of surfaces and thin films by electron diffraction. The properties of thin oxide coatings, electropolished surfaces and electrodeposited and evaporated films may be readily studied. 70 ref. (M22h, M26, R1h, 1-54)

241-M. Neutron Diffraction. G. E. Bacon. Paper from "The Physical Examination of Metals". Edward Arnold, Ltd., London, England, 1960, p. 385-406.

Principles of neutron scattering by atoms and experimental methods of neutron diffraction. Application to study of superlattice formation, magnetic structures of metals and alloys, ferromagnetic disorder and inelastic scattering, lattice defects and orientation relationships. 20 ref. (M22j, M26, M27, 1-54)

242-M. Electron Metallography. G. L. J. Bailey. Paper from "The Physical Examination of Metals". Edward Arnold, Ltd., London, England, 1960, p. 407-443.

Principles of electron microscopy, design of equipment and methods of application in conjunction with replica and shadow techniques. Investigation of the surface microstructure of carbon and alloy steels, Al and Fe alloys and pure Al single crystals. 13 ref. (M21e, M27f, 1-54; Fe-b, Al-b, ST)

243-M. Microradiography and Autoradiography. R. G. Ward. Paper from "The Physical Examination of Metals". Edward Arnold Ltd., London, England, 1960, p. 825-852.

Autoradiographic and microradiographic investigation of the microstructure of gray cast iron, Mn, MnS, Mn steel and pure Fe. Design of equipment and principles of application. 52 ref. (M23n, M23q; Fe-b, Mn-b)

244-M. (Ukrainian.) X-Ray Determination of the Lattice Size Caused by Aging of Crystalline EI-437 Alloy. Yu. O. Huslienko and V. H. Chorniy. Ukrainskii Fizichnii Zhurnal, v. 5, Apr. 1960, p. 577-578.

Study of change in lattice size of Ni-alloy at various temperature and time ranges of heating, annealing and aging. Effect of increased hardness caused by higher heating temperatures on lattice size. 4 ref. (M26, 2-61, 2-65; Ni-b)

245-M. (German.) Crystal Structure of Several Hafnium Containing Phases. H. Boller, H. Nowotny and A. Wittmann. Monatshefte fur Chemie, v. 91, June 1960, p. 1174-1184.

X-ray (Cr-K-alpha radiation) investigation in the binary Hf-Al and Hf-Sn systems to investigate structure of following phases: $HfAl_2$, $HfAl_3$, $Hf_{0.75}Al$, Hf_4Al_3, Hf_5Sn_3 and $HfSn_2$. (M26, M24b; Hf-b)

246-M. (German.) Ternary System Zirconium-Silicon-Boron. E. Parthe and J. T. Norton. Monatshefte fur Chemie, v. 91, June 1960, p. 1127-1133.

X-ray diffraction investigation of hot pressed and 1400° C. sintered binary

and ternary specimens to investigate phase equilibria. Presentation of results in terms of a ternary isothermal section at 1400° C. (M24c, M22g; Zr-b, Si, B)

247-M. An X-Ray Study of Silver-Cadmium Alloys. Abdul Quader. Indian Journal of Physics, v. 34, Nov. 1960, p. 506-515.

Investigation to determine the phase boundaries at temperatures below 300° C. with particular attention to the beta field. Complete diagram for the Ag-Cd system is obtained from the X-ray study of the alloys in the solid state. 10 ref. (M24b, M22g; Ag-b, Cd-b)

248-M. (German.) Iron-Molybdenum-Silicon System. Rudolf Vogel and Rolfdieter Gerhardt. Archiv fur das Eisenhuttenwesen, v. 32, Jan. 1961, p. 47-56.

Thermal analysis, microstructure and microhardness investigation in the ternary system Fe-Mo-Si for Si concentrations up to those at FeSi-$MoSi_2$ equilibrium conditions to establish phase equilibria and investigate phase reactions. Results are presented in terms of phase diagram sections. (M24c; Fe-b, Mo-b, Si)

249-M. (German.) Structure and Scaling of Niobium-Boron-Silicon Alloys. H. Nowotny, F. Benesovsky, E. Rudy and A. Wittmann. Monatshefte fur Chemie, v. 91, Nov. 1960, p. 975-990.

X-ray investigation of sintered or protective atmosphere arc-melted specimens to identify phase equilibria, which are presented in terms of an isothermal section of the ternary phase diagram at 1600° C. Oxidation of alloy powder or pressed specimens in normal atmosphere at temperatures from 400-1200° C. Selective oxidation according to structure of alloy. (M24c, R1h; Cb-b, B, Si)

250-M. (German.) Zirconium-Rich Phases in the Mg-Zr System. Hans-Joachim Taschow and Franz Sauerwald. Zeitschrift fur Anorganische und Allgemeine Chemie, v. 307, Jan. 1961, p. 123-136.

Diffusion annealing of solid Mg and Zr at 614° C. and of liquid Mg and solid Zr at 800° C. and sintering of Mg-Zr (54-85% Zr) specimens with subsequent hardness testing, X-ray and microstructure examination to investigate the obtained phases. Preliminary annealing experiments in the Mg-Zn-Zr system. (M24b, N13; Mg-b, Zr-b)

251-M. X-Ray Measurement of Intragranular Misorientation in Metals. Technical News Bulletin (National Bureau of Standards), v. 45, Feb. 1961, p. 19-20.

Specimens of brass are sectioned from the reduced area of extended and compresssed rectangular bars and studied by X-ray diffraction to determine relationship between intergranular misorientation and cumulative strain. (M26c, 3-68, M22g; Cu-n)

252-M. The Effect of the Alpha→Beta→Alpha Phase Transformation on the Preferred Orientation of Alpha Uranium. B. R. Butcher and D. Baverstock. Journal of Nuclear Materials, v. 3, Jan. 1961, p. 30-40.

Dilatometric, metallographic and X-ray observations on specimens of rolled uranium rod subjected to varying amounts of transformation into the beta phase in a temperature gradient. The phase change is accomplished by a transformation band of mixed alpha and beta phases passing through each specimen and the amount of the loss of preferred orientation is a function of the degree of transformation. 19 ref. (M26c, M-general, N6q; U)

253-M. (Translation-ConBur.) The Form of the Equilibrium Diagram of Ni-NiAl-Mo Alloys. Yu. A. Bagaryatskii and L. E. Ivanovskaya. Academy of Sciences of the USSR, Proceedings, Chemistry Section, v. 132, May-June 1960, p. 491-495.

Construction of the equilibrium diagram of Ni-NiAl-Mo alloys after homogenization and quenching treatments at 1200° C. using parallel microstructure and X-ray methods. Phase positions and isothermal sections are determined as related to temperatures of 800, 1000 and 1200° C. 14 ref. (M24d; Ni-b, Al-b, Mo-b)

254-M. (Italian.) Alloys of Noble Metals With More Electropositive Elements. Pt. 4, Gamma Phases of the Systems Magnesium-Rhodium and Magnesium-Palladium. Riccardo Ferro. Atti Della Accademia Nazionale dei Lincei, v. 29, 1960, p. 70-73.

Homogeneity interval, behavior of the constants of the elementary cell and contractions of molecular volume in the gamma phases of the systems. 8 ref. (M26q; Mg-b, Ro, Pd)

255-M. Compounds Present in Aluminum-Rich Alloys of the Aluminum-Molybdenum

System. J. W. H. Clare. Institute of Metals, Journal, v. 89, Mar. 1961, p. 232-234.

X-ray examination of the Al-Mo system showing $MoAl_{12}$ to be b-c-c. and $MoAl_7$ to be monoclinic. A peritectic reaction occurs at 706 ± 3° C., $MoAl_7$ reacting with liquid to form $MoAl_{12}$. 7 ref. (M24b, M26, N12r; Al-b, Mo-b)

256-M. The Influence of Dislocations on the Microstructure of Some Titanium Alloys. T. H. Schofield. Institute of Metals, Journal, v. 89, Mar. 1961, p. 235-237.

The microstructure of some Ti alloys as influenced by the number and arrangement of dislocations present, owing to nucleation and growth of a second phase on the dislocation sites. (M27, M26b, N2; Ti-b)

257-M. The System Thorium-Silicon. A. Brown and J. J. Morreys. Institute of Metals, Journal, v. 89, Mar. 1961, p. 238-240.

X-ray diffraction and metallographic examination of the Th-Si system, three new phases, beta $ThSi_2$, alpha Th_6Si_{11} and beta Th_6Si_{11}, being isolated. Structural relationships are investigated as a function of temperature. 5 ref. (M22g, M24b, M26, 2-61; Th-b, Si-b)

258-M. The Stability of a Tetragonal Phase Gamma Prime in Uranium-Niobium Alloys. J. D. Brown and G. K. Williamson. Institute of Metals, Journal, v. 89, Mar. 1961, p. 246-247.

High temperature X-ray diffraction of a 17% Nb-U alloy showing the cubic gamma phase of the alloy to be present with no evidence pointing to a stable gamma prime tetragonal phase. 4 ref. (M22g, M26q; U-b, Nb)

259-M. The Aluminum Rich End of the Aluminum-Hafnium Equilibrium Diagram. Bhakta B. Rath, Ganesh P. Mohanty and L. F. Mondolfo. Institute of Metals, Journal, v. 89, Mar. 1961, p. 248-249.

X-ray analysis of crystals containing 10% Hf, with the compound $HfAl_3$ having a body-centered tetragonal structure being observed to react peritectically with Al to form an Al-rich solid solution. Data are given for the peritectic temperature and liquid and solid solubilities at this temperature. (M24b, M26p, N12p; Al-b, Hf)

260-M. Split Image Measures Small Objects. J. Dyson. Metalworking Production, v. 105, Mar. 8, 1961, p. 54-57.

Application of the image splitting principle to a microscope for measuring small objects such as fine wire, wire helixes, glass fibers and electron microscope grids, the image splitting eyepiece consisting of two prism blocks fitted to a monocular microscope. (M21c)

261-M. (English.) The Predominant Orientation of Crystals of Electrodeposited Hexagonal Cobalt. N. Pangarov and S. Rashkov. Comptes Rendus de l'Academie Bulgare des Sciences, v. 13, Oct. 1960, p. 555-558.

Co deposition from an electrolyte containing $CoSO_4$, H_3BO_3 and NaCl at current densities of 0.008-0.5 amp. per sq. cm. and at 25-45° C., the acidity being adjusted by NH_3 additions to pH=5.40-5.41. Effect of current density, temperature and glycerol additions on crystal orientation. 5 ref. (M26c, L17c; Co)

262-M. Lattice Spacings in the System Copper + Germanium + Silicon. J. H. Foley and G. V. Raynor. Faraday Society, Transactions, v. 57, Jan. 1961, p. 51-60.

Lattice spacings are measured for the close-packed hexagonal sigma phase in the system Cu + Si and for the continuous solid solution formed between this phase and the corresponding sigma phase in the Cu + Ge system. The variation of lattice spacing with composition is correlated with the electronic configuration of the alloys. 17 ref. (M24c, M25, M26; Cu-b, Ge, Si)

263-M. Electron Microscopy in Metallurgical Research. T. K. Bierlein and B. Mastel. Philips Science and Industry, v. 7, May 1960, p. 157-161.

Application with cellulose acetate replica techniques to study of surface and substructure deformation, transformations and morphology. Examples are given for the deformation surface of irradiated uranium, microstructure of nonirradiated Zircaloy 2 and the fracture surface of a beta-heat treated impact specimen. (M21e, M20r, M23p; U, Zr-b)

264-M. (Russian.) Connection Between Structure and Thermal Expansion Anisotropy in Uranium, Plutonium and Neptunium. N. T. Chebotarev. Atomnaya Energiya, Jan. 1961, p. 43-49.

Structure modifications, lattice parameters, atomic spacing, covalent bonds

and thermal expansion coefficient investigated at -200 to 600° C. 7 ref. (M25, M26, P11g; U, Pu, Np)

265-M. (Russian.) Nickel-Tellurium System. S. A. Shchukarev and M. S. Apurina. Zhurnal Neorganicheskoi Khimii, v. 5, Nov. 1960, p. 2410-2413.

Phase constitution of Ni-rich portion of the system at compositions of 1-2% Te is studied in samples heated to 900° C. Data are given for lattice parameters and homogeneity regions in relation to the composition. 11 ref. (M24b, M26, 2-60, 2-61; Ni-b, Te)

266-M. (Japanese.) Observation of Electron-Microscopic Structures of Stress-Aged Mild Steel. Tadashi Kawasaki, Takehiko Shibai and Hisashi Izumi. Japan Institute of Metals, Journal, v. 25, Jan. 1961, p. 68-72.

Microstructural changes for specimens stretched in tension and strain-aged under mechanical stress for various times at 100-200° C. Effect of ferrite solute atom concentration on precipitation phenomena. 8 ref. (M21e, M27, N7e; CN)

267-M. (Japanese.) The Platinum-Niobium System. Hirozo Kimura and Akira Ito. Japan Institute of Metals, Journal, v. 25, Jan. 1961, p. 88-91.

The binary system Pt-Cb is investigated by X-ray diffraction analysis, microscopic examination and liquidus temperature determination. Data are given for solubility limit, crystal structures and lattice parameters, order-disorder, solid solution and intermetallic compound formation, substructures and eutectics with a phase equilibrium diagram constructed for 1000-2500° C. (M24b, M-general, N-general, 2-60, 2-61; Cb-b, Pt-b)

268-M. (French.) Method for the Analysis of Iron Constituents of High-Strength Brass and of Some Complex Copper-Aluminum Alloys. Francoise Gaillard and Adrienne R. Weill. Memoires Scientifiques, v. 57, Dec. 1960, p. 889-900.

Investigation of the iron precipitates in T brass and in Cu-Al alloys with 75.40-80.30% Cu, 2.68-4.79% Fe, 1.90-5.26% Ni, 0.20-11.75% Mn and 8.02-9.60% Al by micrography, electron-microscope and with X-rays after complete dissolution of the matrix and by etching and nitrocellulose replica techniques. 16 ref. (M-general, N7; Cu-b)

269-M. (Slovak.) Selective C-Au-C and C-PtPd-C Replicas for Electron Microscopic Investigation. Ivan Hrivnak. Hutnicke Listy, v. 16, Jan. 1961, p. 49-52.

Preparation of replicas from a mild carbon steel and three alloy steels by polishing and etching the surface, washing in alcohol, acetone or bezine and evaporation of a thin carbon film, an Au or PtPd film and finally a carbon film, on the surface. The replica is separated from the surface by treatment in a HCl + alcohol solution, or electrolysis in HCl. (M20r; AY, CN)

270-M. X-Ray Diffraction Measurement of Intragranular Misorientation in Alpha Brass Subjected to Reversed Plastic Strain. C. J. Newton and H. C. Vacher. Journal of Research, National Bureau of Standards, Engineering and Instrumentation, v. 65C, Jan-Mar. 1961, p. 57-63.

Construction and use of a monochromatic misorientation goniometer to examine X-ray diffraction spots from brass specimens (70% Cu, 30% Zn alpha) subjected to unidirectional and reversed plastic deformation. Measurements of average subgranular misorientation are obtained with 60% of misorientation being recovered by reversing plastic strain. 17 ref. (M22g, M26c, 1-52, 3-68; Cu-n)

271-M. The Position of Gray Tin in the Tin-Mercury System. P. H. Van Lent. Acta Metallurgica, v. 9, Feb. 1961, p. 125-128.

Determination of the solubility of gray alpha Sn and white beta Sn in Hg at -32 to 0° C. by gravimetry and use of these measurements to determine the phase-fields of gray Sn in the system. Derivation of equilibrium constants as a function of temperature, with a proposed mechanism for the transformation of white Sn amalgams. 12 ref. (M24b, N-general, P12d, P12e, 2-61; Hg-b, Sn)

272-M. Rate-Sensitivity and Dislocation Velocity in Silicon Iron. R. W. Guard. Acta Metallurgica, v. 9, Feb. 1960, p. 163-165.

The variation of dislocation velocity with applied stress for 3 1/4% Si-Fe is determined from measurements of strain rate sensitivity at 20° C. 5 ref. (M26b, 3-68; Fe-b, Si)

273-M. Electron Microscope Investigation of S. A. P. Structure. H. Hug and H. Bichsel. Metal Treatment and Drop Forging, v. 28, Mar. 1961, p. 99-104.

The oxide replica method is used to study the structure of dispersion-strengthened Al alloys before and after sintering and extrusion. (M21e, M27; Al-b)

274-M. (Translation-ConBur.) Dilatometric Studies of Rolled Uranium Rods. I. V. Batenin, A. N. Rudenko and B. V. Sharon. Soviet Journal of Atomic Energy, v. 6, Dec. 1960, p. 414-415.

Anomalous behavior of the dilatometric curve during the first heating of a strained uranium rod associated with the diffusion of impurities present in technically pure uranium. At relatively low temperatures, secondary segregation of impurity atoms may occur as the result of "upward" diffusion. (M23b, N1, 2-61, 3-69; U-a)

275-M. (Japanese.) X-Ray Diffraction Methods for Studying the Strength of Materials. Shuuji Taira. Japan Society of Mechanical Engineers, Journal, v. 64, Jan. 1961, p. 7-16.

Theoretical discussion of X-ray diffraction principles including spectra and half width as related to lattice deformation due to strain. Application to determination of local stress in carbon steel and fatigue characteristics of carbon steel and duralumin. (M22g, Q7, Q25; Al-b, CN)

276-M. (Ukrainian.) Formation and Decay of Marginal Intercolations in Chromium Ferrite. V. N. Gridnev and O. I. Efimov. Dopovidi Akademii Nauk Ukrainskoi RSR, Jan. 1961, p. 22-24.

Interferrometric investigation of the effect of heat treatment on the behavior of grain boundary intercolations in a Fe alloy with small additions of carbon and Cr. The formation and decay processes are reproducible and depend on the heating temperature. Results obtained are applied to study of nature of temper brittleness. 3 ref. (M27f, M-general, N8a, 2-64; Fe-b, Cr, C)

277-M. (Russian.) Structure and Properties of Columbium-Aluminum Alloys. V. V. Baron and E. M. Savitskii. Zhurnal Neorganicheskoi Khimii, v. 6, Jan. 1961, p. 182-185.

Microstructural, thermal and X-ray analysis and measurement of hardness and electrical resistivity of cast and heat treated samples. Establishment of constitutional diagram and nature and formation of Cl_3Al, Cb_2Al and $CbAl_3$ compounds in the system. 7 ref. (M24b, M-general, P15g, Q29n; Cb-b, Al-b)

278-M. (German.) Application of High-Temperature Microscopy in Heat Treatment. R. Mitsche and F. Jeglitsch. Harterei-Technische Mitteilungen, v. 15, Apr. 1961, p. 201-218.

Design and mode of operation of a microscope which allows observation of specimens under 10^{-5} Torr vacuum or protective atmosphere at temperatures up to 1600° C. Examples of application include investigation of ferrite-austenite transformation in soft iron, austenite formation in 16MnCr5 and 20MnCr5 steel, intermediate structure formation of a Cr-W alloyed steel, surface graphitization of a hypereutectoid steel in cooling, cementite dissolution and melting temperatures of alloyed steel at temperatures up to 1270° C. (M21, J-general; ST)

279-M. (German.) Significance of Grain Size in Determining Degree of Homogeneity of Microstructure and Transformation Behavior of Steels. A. Legat. Harterei-Technische Mitteilungen, v. 15, Apr. 1961, p. 218-222.

Review of significance of testing methods (fracture test, McQuaid-Ehn test). Control of grain size by alloying elements with emphasis on Al. Correlation between grain size and hardenability of steel. (M27c, J5; ST)

280-M. (German.) Ternary Phase in the Ag-Sb-Te System. Arnold Stegherr, Fritz Wald and Peter Eckerlin. Zeitschrift fur Naturforschung, v. 162, Jan. 1961, p. 130-131.

Lattice parameters, composition in the temperature range 400-530° C. and microstructure of a peritectic ternary phase in the Ag-Sb-Te system having a composition close to $2Ag_2Te.3Sb_2Te_3$. (M24c; Ag-b, Sb-b, Te-b)

281-M. (German.) Various Metal-Carbon Evaporation Replica Techniques in Electron Microscopic Preparation. G. Hunger. Optik, v. 17, Nov. 1960, p. 595-601.

Various techniques and apparatus for simultaneous or separate evaporation of metal dust (Zn, Cr, Pt), metal oxides

(TiO_2) and metal salts ($BiCO_3$, $SnCl_2$, AgCl, uranium acetate) on carbon pins, V-shaped tungsten wire or a tungsten probe. (M21e, N16n; Cr, Pt, Zn)

282-M. (Pamphlet.) X-Ray Diffraction Study of Crystal Perfection in Silicon. Robert H. Bragg and Leonid V. Azaroff. Illinois Institute of Technology Research Report no. AFOSR TN60-632. June 24, 1960, 8 p. (Available from ASTIA, Document Service Center, Arlington Hall Station, Arlington 12, Va.)

Examination of Si crystals to determine crystal perfection, variations in line widths and total diffracted intensity using a modified Laue focusing arrangement. Small perfection differences are disclosed by short-wave X-ray and results are compared with etch-pit determination. 6 ref. (M22g; Si)

283-M. (Books-French.) Constitution Diagrams of French Steels. v. 3-4, 1960. G. Delbart, A. Constant and A. Clerc. Institut de Recherches de la Siderurgie (IRSID), 185, rue President-Roosevelt, St. Germain-en-Laye, France, 90 p.

Constitution diagrams of various carbon steels, Mn-Mo, Ni-Cr, Ni-Mo, Cr-Mo-Al, Cr-V and Ni-Cr-Mo steels, heat resistant stainless steels, toolsteels and high-speed toolsteels, based on thermodynamic measurements. 9 ref. (M24; ST)

284-M. (German.) Electrolytic Polishing of Aluminum and Aluminum Alloys for Microstructure Investigation. F. Rammele and K. Veit. Feingerate-Technik, v. 9, Dec. 1960, p. 551-552.

Electrolytic polishing and subsequent etching of pure Al (99.5 and 99.99), AlMg7 alloy, AlMg3 alloy, AlCuMg alloy and GAlSi 12 (Cu) cast alloy by electrolytes containing perchloric acid, methanol, glycerin, methylglycol and butylcellosolve. (M20p, M20q, M27; Al-b)

285-M. (German.) Properties of Stainless Austenitic Chromium-Nickel Nuclear Reactor Steels Containing Boron. Karl Bungardt and Rudolf Oppenheim. Archiv fur das Eisenhuttenwesen, v. 32, Feb. 1961, p. 95-101.

Description of microstructure investigations, mechanical tests at temperatures from -75 to 750° C., welding tests in Ar-W arc and corrosion tests in boiling $CuSO_4$-H_2SO_4 solution for austenitic CrNi steels with 17-22% Cr, 10-11% Ni and 0.15-1.3% B. (M27, R6, K9r; SS-e)

286-M. (German.) Thermodynamics of the Ternary Systems Iron-Carbon-Copper, Iron-Carbon-Tin and Iron-Carbon-Antimony. Pt. 1. Solubility of Graphite in the Temperature Range 1200-1600° C. Hermann Schenck and Gottfried Perbix. Archiv fur das Eisenhuttenwesen, v. 32, Feb. 1961, p. 123-127.

Measurement of graphite saturation in binary Fe-C and ternary Fe-C-Cu, Fe-C-Sn and Fe-C-Sb melts at temperatures from 1200-1600° C. for the homogeneous region of the Fe-C-Cu system and for Sn and Sb concentrations up to 9%. (M24c, P11; Fe-b, C, Cu, Sb, Sn)

287-M. Rhodium-Platinum Alloys. A. S. Darling. Platinum Metals Review, v. 5, Apr. 1961, p. 58-65.

Constitutional diagrams and lattice parameter curves as functions of composition. Tests at -20 to 1600° C. to determine effect of temperature and composition on electrical, thermoelectric and mechanical properties. Use of alloys in thermocouples. 41 ref. (M24b, P15, Q-general; Pt-b, Rh-b)

288-M. (English.) Quenching Vacancies in Aluminum. Takao Kino and Satoru Kabemoto. Hiroshima University, Journal of Science, Series A, v. 24, Oct. 1960, p. 287-296.

Effect of quenching in water from 290-550° C. on electrical resistivity of high-purity Al wire. Determination of activation energy for the decrease in resistivity from isothermal annealing curves. (M26s, P15g, 2-64; Al-a)

289-M. (English.) Rolling Deformation and Recrystallization in Aluminum Single Crystal Plates. Yasumasa Takano. Hiroshima University, Journal of Science, Series A, v. 24, Oct. 1960, p. 297-310.

Preparation of single crystal plates by heating to 450° C. under a vacuum in an electric furnace, followed by rolling. X-ray photographic examination to determine effect of annealing at 400-600° C. on microstructure. (M26, M27f, N5, Q24, 2-64; Al, 14-61)

290-M. Dislocation and Impurity Boundaries in Zinc Crystals Grown From the

Melt. V. V. Damiato and G. S. Tint. Acta Metallurgica, v. 9, Mar. 1961, p. 177-183.

The distribution of etch pits at microsegregation produced by constitutional supercooling is investigated using progressive polishing and etching techniques. The density of etch pits, their rearrangement into walls and their formation into networks behind the interface suggests that the etch pits reveal the ends of decorated dislocations introduced at the segregation boundaries to accommodate the lattice strain. 13 ref. (M26b, M27f, N12, 3-69, 9-69; Zn, 14-61)

291-M. An X-Ray Investigation of the Effects of Hydrogen in Iron. A. S. Tetelman, C. N. J. Wagner and W. D. Robertson. Acta Metallurgica, v. 9, Mar. 1961, p. 205-215.

X-ray line broadening resulting from cathodic charging of hydrogen into annealed and cold worked pure Fe is investigated by electrolytic charging or tensile straining at 20 and 400-500° C. with X-ray diffraction examination and Fourier analysis. The Fourier coefficients, half widths, particle sizes, strain and recovery kinetics are identical for Fe charged with hydrogen and for Fe strained 5% in tension indicating that the results can be interpreted in terms of plastic deformation. 20 ref. (M22g, Q24, Q26s, 3-68; Fe-a, H)

292-M. X-Ray Measurements of Dislocation Density in Deformed Copper and Aluminum Single Crystals. M. J. Hordan and B. L. Averbach. Acta Metallurgica, v. 9, Mar. 1961, p. 237-246.

Measurements of double crystal rocking curve broadening are used to estimate the dislocation density in annealed and plastically strained single crystals of Cu and Al at 20° C. The total diffraction broadening is resolved into components which depend separately on average lattice tilting, localized bending, dislocation strain and subgrain size. 18 ref. (M22g, M26b, 3-68; Al, 14-61)

293-M. Guinier-Preston Zones in an Aluminum-Silver Alloy. E. J. Freise, A. Kelly and R. B. Nicholson. Acta Metallurgica, v. 9, Mar. 1961, p. 250-255.

X-ray small angle scattering measurements and electron microscope transmission studies on the same specimen of an Al-4.4% Ag alloy, quenched and aged at 125° C. to compare the two methods of examination for validity in delineating substructures. Data are presented for composition, cluster size and concentration of G-P zones. 9 ref. (M21e, M22g, N7, 2-64; Al-b, Ag)

294-M. Estimation of Equilibrium Vacancy Concentration in Solid Metals. R. F. Mehl, M. Swanson and G. M. Pound. Acta Metallurgica, v. 9, Mar. 1961, p. 256-257.

Proposal of a semi-empirical correlation, a rule relating enthalpy of formation of vacancies to the enthalpy of fusion and the solidification shrinkage, to calculate equilibrium vacancy concentration. Comparison of calculated and experimental data for Al, Cu, Au, Na, K, Fe, Ni, Ag and Pb. 24 ref. (M26s, P10c, P12)

295-M. Microstructures and Notes on Chromium-Molybdenum Steel to B. S. 3100: 1957:1458 and 1459. J. Turton and B. H. C. Waters. British Foundryman, v. 54, Mar. 1961, p. 99-102.

Review of the range of properties and microstructures that may be obtained from Cr-Mo steel made to BS 3100; 1957:1458: and 1459. All test bars are heat treated at 950° C. for 6 hr. Some bars are given subsequent normalizing and tempering and others are treated by water quenching and tempering. Specific heat treatment and physical properties are presented in table form. (M27, 2-64, P-general, Q-general; ST, Cr, Mo, 5)

296-M. (English.) The Characterization of Lattice Distortion Spectra With Deformation Indices. I. S. Szanto. Acta Technica Academiae Scientiarum Hungaricae, v. 32, Jan-Feb. 1961, p. 65-92.

Determination of deformation indices by measuring the interference maxima and the change of line profiles observed in the X-ray back reflection diagram of samples after tensile deformation. Use of standard samples for comparison. 13 ref. (M26c)

297-M. Techniques for the Metallography of Porcelain Enameled Steel. H. L. Conaway. Paper from "Porcelain Enamel Institute Forum, Proceedings". v. 20. Porcelain Enamel Institute, Inc., Washington, D. C., 1958, p. 55-69.

Discussion of metallographic procedures for the study of enameled steel. Specimen selecting; mounting, polishing, etching and photographing methods. (M-general; ST, 8-71)

298-M. (Japanese.) Lattice Structure of High-Purity Aluminum. Igarashi Isamu and Igarashi Tamotu. Light Metals, v. 11, Jan. 1961, p. 4-10.

The lattice structure of super purity Al is studied by measuring the Bragg angle of X-ray diffraction on 27% annealed and cold forged specimens. The lattice is distorted in both the annealed and cold forged states. 4 ref. (M26, M22g; Al-a)

299-M. (English.) An Electron Diffraction Study on Cu-Sn Alloys. Tomokuni Mitsuishi. Physical Society of Japan, Journal, v. 16, Mar. 1961, p. 453-455.

Intermetallic compounds produced by the interdiffusion of Cu and Sn are examined by electron diffraction. A new phase of structure type A4 is found. 4 ref. (M22h, N1e; Cu-b, Sn)

300-M. (English.) Study on the Ordered Alloys of the Gold-Manganese System by Electron Diffraction. Pt. 3. Lattice Modulation in Ordered Au_3Mn. Denjiro Watanabe. Physical Society of Japan, Journal, v. 16, Mar. 1961, p. 469-478.

Discussion of the nature of the lattice modulation which is believed to cause the satellites to flank main reflections in electron diffraction patterns of ordered Au_3Mn alloy. Two types of modulation, a periodic change of lattice spacing and of scattering factor, are considered. 13 ref. (M22h; Au-b, Mn)

301-M. (English.) New Magnetic Phase in Manganese-Aluminum-Copper System. Ichiro Tsuboya and Makoto Sugihara. Physical Society of Japan, Journal, v. 16, Mar. 1961, p. 571.

Study of vacuum annealed, cast specimens by X-ray powder analysis to determine the structure, composition range and magnetic properties of a newly discovered cubic phase. 3 ref. (M27, P16, S11p; Al-b, Cu-b, Mn-b)

302-M. (English.) X-Ray Small Angle Scattering From Precipitated Platelets in Al-Ag Alloy. Yashuhara Yoneda and Kouzou Nishioka. Physical Society of Japan, Journal, v. 16, Mar. 1961, p. 578-579.

Scattering is recorded with radiation monochromatized with a LiF crystal monochrometer. Distribution of thickness of the platelet is evaluated by extending the Fankuchen method to a one dimensional case. 6 ref. (M22g; Al-b, Ag)

303-M. (German.) Change of Orientation in Aluminum Crystals Drawn From Melt. F. Wiesmuller. Physikalische Verhandlungen, v. 11, Oct-Nov. 1960, p. 203.

Investigation of orientation in single crystal wire specimens of pure Al and after 0.4% Si addition by a rotating crystal camera which allows scanning of a 55 mm. long specimen by one exposure. (M26c; Al, 14-61)

304-M. (German.) Measurement of Electron Diffraction Intensities of Polycrystalline Aluminum Layers and Comparison With Cinematic and Dynamic Scatter Formula. M. Horstmann and G. Meyer. Naturwissenschaften, v. 48, Jan. 1961, p. 41-42.

Size of crystallites in a 300 Å. thick polycrystalline Al foil is stepwise enlarged from 25-240 Å. by annealing and diffraction intensities are measured in the primary electron energy range of 20-50 Kev. Ring intensity as influenced by electron energy and size of crystallites. (M22h; Al)

305-M. (German.) New Method for Evaluation of the Intensity Curves of Monatomic Metal Melts. H. Richter and G. Breitling. Naturwissenschaften, v. 48, Jan. 1961, p. 44.

Evaluation of preferred atomic distances of Bi, Hg, Sn and Au melts direct from a single intensity curve by a graphical method. (M25h; Au, Bi, Hg, Sn)

306-M. (German.) Importance of Eutectic Research for Quaternary Eutectic Aluminum Alloys. H. Spengler. Metall, v. 15, Mar. 1961, p. 225-227.

Classification of quaternary eutectic alloys according to their eutectic coordinates, crystallization mechanism, macro and microstructure and properties. Analysis of crystallization and structure of eutectic Al-Cu-Fe-Si, Al-Cu-Mg-Si and Al-Fe-Mg-Si alloys. (M24d, M-general, N12; Al-b, Cu, Fe, Mg, Si)

307-M. (German.) Interpretation of Aluminum Textures. W. Bunk and W. Norman. Metall, v. 15, Mar. 1961, p. 230-234.

Pole figures are investigated by an X-ray goniometer for specimens of 99.3-99.99% Al and ALRMg1 (0.95% Mg) sheet obtained by hot (500° C.) rolling and cold finish-rolling in the as-rolled (hard) state and after 400° C. annealing. Reordering of crystals as influenced by annealing and by residual and alloying elements. (M26c, M-general, F23, N-general, 2-60, 2-64; Al-b, 4-53)

308-M. (German.) Tantalum-Gold Alloys. Ernst Raub, Hans Beeskow and Dorothea Menzel. Zeitschrift fur Metallkunde, v. 52, Mar. 1961, p. 189-193.

Microstructure, microhardness and X-ray examination after various heat treating operations at 600-1750° C. of the structure and composition of Ta-Au alloys containing 4-90% Ta. (M24b, M-general, Q29q, 2-60, 2-64; Au-b, Ta-b)

309-M. (German.) Electron Optical Investigation of Electrolytically and Chemically Produced Oxide Crystals on Polycrystalline Copper. Johanna Vahl. Zeitschrift fur Metallkunde, v. 52, Mar. 1961, p. 193-195.

Production of CuO single crystals by anodic oxidation at 60° C. of polycrystalline electrolytic 99.98% Cu sheet using an NaOH electrolyte and by oxidation in an alkaline $K_2S_2O_8$ solution at 65° C. Subsequent X-ray diffraction identification of CuO crystals and electron microscopic examination of crystal geometry. (M21e, M22g, L19, R1h; Cu)

310-M. The Dependence of Wire Texture in F-C-C Metals on Stacking Fault Energy. Norman Brown. Metallurgical Society of AIME, Transactions, v. 221, Apr. 1961, p. 236-238.

Theoretical examination, correlated with existing data for Al, Cu, Ni, Au, Ag and alpha brass cold drawn specimens suggesting that the relative amounts of (111) and (100) wire texture which occur in f-c-c. metals are determined by the difference in the ease of cross slip which is controlled by the stacking fault energy. 17 ref. (M26c, Q24a, 3-68; Ag, Al, Au, Cu-b, Ni, 4-61)

311-M. Liquid-Solid Phase Distribution Studies in the Systems Iron-Lead, Cobalt-Lead, Chromium-Tin and Nickel-Silver. David A. Stevenson and John Wulff. Metallurgical Society of AIME, Transactions, v. 221, Apr. 1961, p. 271-275.

The solubility of Fe and Co in liquid Pb, of Cr in liquid Sn and Ni in liquid Ag are determined at 450-1300° C. to show the relationship between lag mole fraction of solute and the inverse of the absolute temperature. Values are given for the differential heat of solution and the excess partial molar entropy. 9 ref. (M24b, P12, 2-61; Pb-b, Co, Fe, Sn-b, Cr, Ag-b, Ni)

312-M. A Study of the Ti-Cu-Zr System and the Structure of Ti_2Cu. Elmars Ence and Harold Margolin. Metallurgical Society of AIME, Transactions, v. 221, Apr. 1961, p. 320-322.

The partial isothermal section of the Ti-Cu-Zr system is studied at 750° C. with X-ray diffraction determination of the crystal structure of Ti_2Cu. 9 ref. (M24c, M26; Ti-b, Cu, Zr)

313-M. Phase Equilibria and Elevated Temperature Properties of Some Alloys in the System Ni_3Cr-Ni_3Al. C. M. Hammond, R. A. Flinn and Lars Thomassen. Metallurgical Society of AIME, Transactions, v. 221, Apr. 1961, p. 400-405.

A portion of the Ni_3Cr-Ni_3Al phase diagram is investigated including the precipitation of gamma prime (Ni_3Al) and the existence of ordered gamma (Ni matrix) with metallographic studies by electron microscopy and X-ray diffraction and creep and tensile testing at 20 and 600-1300° C. 22 ref. (M24d, M-general, N-general, Q-general, 2-60, 2-62; Ni-b, Al, Cr)

314-M. A Technique for the Preparation of Thin Films of Two-Phase Alloys Suitable for Use in Transmission Electron Microscopy. G. S. Ansell, L. R. Sefton and E. Eichen. Metallurgical Society of AIME, Transactions, v. 221, Apr. 1961, p. 406-407.

An air-abrasion technique using minute Al_2O_3 particles in a CO_2 stream impinging on the specimen surface is used for thinning SAP dispersion alloy foil for metallographic examination. (M20p; Al-b, 6-70, 14-62)

315-M. Shock Loading to Produce Fine Grain Structure. E. G. Zukas and R. G. McQueen. Metallurgical Society of AIME,

Transactions, v. 221, Apr. 1961, p. 412-413.

Production of isotropic fine grain microstructure in ingot Fe plate by shock loading, using a plane-wave initiated high-explosive charge through a 1 5/8 air space, followed by recrystallization annealing at 650° C. for 2 hr. (M27c, G-general, 2-64; Fe-a, NM-k34, 17-57)

316-M. (Russian.) Composition Diagram of Fe-Al Alloys in the Region of Self-Regulating Solid Solutions on the Basis of Fe. Ya. P. Selinskii. Zhurnal Neorganicheskoi Khimii, v. 5, Nov. 1960, p. 2435-2439.

Dilatometric and thermomagnetic determination of critical temperatures and ferromagnetic transition ranges in Fe-Al alloys. Relation of magnetic saturation to temperature and Curie point. Effect of composition on transitions, Curie point and magnetic properties. 10 ref. (M24b, M-general, N8, P16; Fe-b, Al)

317-M. (German.) Trends of Development in Electro Steel Sheet. H. Reinboth. Umschau, v. 14, Oct. 1960, p. 372-378.

Development of dynamo and transformer sheet of low-carbon steel with up to 4.5% Si and Ni alloyed steel with classification in terms of dynamo steel sheet; textureless transformer sheet, "simple texture sheet" (large texture, one cube edge in rolling direction) and "cube texture sheet". (M26c, P16, S22; ST-f, 4-53)

318-M. (Russian.) Nature of the Sigma Phase. N. V. Ageev and V. Sh. Shekhtman. Doklady Akademii Nauk SSSR, v. 135, Feb. 1960, p. 309-311.

A Cr-Re alloy with 37 at.% Cr, a Mn-Re alloy with 47.7 at.% Mn and a Fe-Re alloy with 55 at.% Fe are heat treated at 1000-1500° C. for 6-500 hr. From the results of X-ray tests, conclusions are drawn on the atomic structure and the amount of Re present in the sigma phase. 15 ref. (M25; Cr-b, Fe-b, Mn-b, Re-b)

319-M. X-Ray Measurement of Intragranular Misorientation in Metals. Wire and Wire Products, v. 36, Apr. 1961, p. 482, 522-523.

Quantitative measurement by X-ray diffraction techniques of the misorientation in plastically strained polycrystalline specimens of cartridge brass. (M26c, M22g; Cu-n)

320-M. (German.) Influence of Several Elements on Grain Size of Silicon Crystals in Al-Si Cast Alloys. Chiu Shiu-Tang. Naturwissenschaften, v. 48, Mar. 1961, p. 71-72.

Influence of alloying elements on grain size in hypo-eutectic (5.46% Si, 0.3% Fe), eutectic (12% Si, 0.44% Fe) and hypereutectic (22.52% Si, 0.64% Fe) Al-Si alloys. Classification of influencing elements in terms of phase reactions such as monotectic (Na, K, Pb, Cd and Bi), peritectic (Cr and Mn) and eutectic (Sb, Ca and Li) reactions favored by respective elements and elements which diminish oxidation impurities (Ni, Zn and S). (M27c, 2-60; Al-b, Si, Fe)

321-M. (German.) Selenium and Its Crystallographic Properties. Lieselotte Moenke-Blankenburg. Jenaer Jahrbuch 1959, 1959, p. 211-225.

Review of crystal properties in terms of polymorphy, crystal geometry and lattice structure. Investigation of crystallization mechanism by microstructure examination at 20-210° C. (M26, M27, 2-61; Se)

322-M. Crystal Structure of $PdGa_5$. Suraj Bhan and Konrad Schubert. Indian Institute of Metals, Transactions, v. 13, Dec. 1960, p. 332-336.

X-ray diffraction and metallographic examination of powder and single crystal specimens relating structure to $CoGa_3$ and $CuAl_2$. Data are given for mean atomic volume, lattic constants and space group. 4 ref. (M25, M26; Ga-b, Pd)

323-M. The Ternary System Aluminum-Silver-Manganese. Werner Kosten and Mohendar Sekhii. Indian Institute of Metals, Transactions, v. 13, Dec. 1960, p. 337-350.

The constitution of the system is investigated by thermal, microscopic and X-ray analysis in the melt area and an isothermal section at 500° C. with data given for eutectic and peritectic transformations, solubility relations and boundary systems. (M24c; Al-b, Ag-b, Mn-b)

324-M. Structural Irregularities in Mechanically Deformed Cobalt. T. R.

Anantharaman. Indian Institute of Metals, Transactions, v. 13, Dec. 1960, p. 374-382.

Effect of microstresses and stacking faults occurring during mechanical deformation (rolling) on X-ray line broadening in rod and thin film Co specimens annealed in vacuum at 800° C. 12 ref. (M26b, M22g, 3-66, 3-68; Co-a)

325-M. (French.) Notch Effect Due to Graphite. Gabrielle Aubrion. Fonderie, v. 181, Feb. 1961, p. 70-84.

Determination of the K coefficient, representing the notch effect in relation to the form of the graphite and the nature of the matrix for gray, malleable and spheroidal graphite castings. 9 ref. (M27; CI)

326-M. Dislocation Loops Formed in Zinc Crystals During Low Temperature Pyramidal Glide. P. B. Price. Philosophical Magazine, v. 6, Mar. 1961, p. 449-451.

Electron microscopy examination of elongated dislocation loops formed during tensile straining of single crystals at -60 to -120° C. (M21e, M26b, Q24, 2-63, 3-68; Zn, 14-61)

327-M. The Cooperative Movement of Dislocation in Very Pure Aluminum Foil. R. N. Wilson and P. J. E. Forsyth. Philosophical Magazine, v. 6, Mar. 1961, p. 453-454.

Thin foils of 99.99% pure Al and 99.9999% pure zone refined Al are strained in tension with transmission electron microscopy examination to determine the effect of the impurity level on deformation movement and mode of fracture. Cooperative movement in arrays is observed in the zone refined specimens. 5 ref. (M26b, M21e, 3-68, 3-69; Al-a, 4-56)

328-M. Dislocation Loops and Hardening in Neutron Irradiated Copper. M. J. Makin, A. D. Whapham and F. J. Minter. Philosophical Magazine, v. 6, Mar. 1961, p. 465-468.

Foil specimens of 99.998% Cu are neutron irradiated at -195° C. and examined in the cold stage of a Siemens microscope. Loop growth is determined as a function of temperature-influenced point defect mobility with irradiation hardening being related to loop density. 6 ref. (M26b, N3, 2-63, 2-67; Cu, 4-56)

329-M. (Ukrainian.) Crystal Structure of $MnNi_{1.55}Si_{0.45}$ Compound. Yu. B. Kuzma and E. E. Cherkashin. Dopovidi Akademii Nauk Ukrainskoi RSR, Oct. 1960, p. 1413-1415.

Microstructure and X-ray analysis of Mn-Ni-Si and Mn-Co-Si alloys with 30-35 at.% of Mn. Homogeneous range and lattice parameters of $MnNi_{1.55}Si_{0.45}$ compound. Existence of ternary compounds such as $Mn_{20}Ni_{55}Si_{25}$ and $Mn_{50}Ni_{35}Si_{15}$. 7 ref. (M26, S11p; Co-b, Ni-b, Mn, Si)

330-M. (Ukrainian.) Fine Crystalline Structure Changes in Aged Nimonic Type Alloys. V. G. Chornii. Ukrainskii Fizichnii Zhurnal, v. 5, May 1960, p. 689-691.

Alloy containing 1.6% Ti, 0.43% Al and 19.67% Cr (rest Ni) is hardened in water from 1080° C. with subsequent aging at 400-950° C. for 4 hr. Study of heterogeneity of lattice parameters and determination of mosaic block size by the width of interference lines in the region of X-ray scattering. 5 ref. (M26, M22g; Ni-b)

331-M. (German.) Influence of Deformation on Cold Rolling and Recrystallization Textures of Iron-Silicon Sheets. Konrad Sagel. Archiv fur das Eisenhuttenwesen, v. 32, Mar. 1961, p. 153-164.

X-ray, microstructure and magnetic (torque measurement) investigation of cold rolling and primary recrystallization textures after four cold rolling operations and various annealing treatments (400-1200° C.) of Fe-Si alloy (0.01% C, 2.6-3.45% Si). (M26c, 3-68; Fe-b, Si)

332-M. Crystal Structures and Phase Transitions of the Gold-Rich Gold-Cadmium Alloy. H. Hirabayashi and S. Ogawa. Acta Metallurgica, v. 9, Apr. 1961, p. 264-274.

Single crystal and polycrystal specimens containing 23.2-28.6% Cd are examined by X-ray diffraction and by electrical resistance and specific heat measurements after annealing and quenching. A one-dimensional antiphase domain is noted in the ordered state exhibiting f-c-t. structure with stacking faults being evident in the hexagonal structure. Data are given for lattice constants, order-disorder transitions, resistivity and thermodynamic properties. 17 ref. (M26, M-general, N10, N-general, P12r, 2-60, 2-64; Au-b, Cd)

333-M. Texture and Earing in Deep Drawing of Aluminium. G. E. G. Tucker. Acta Metallurgica, v. 9, Apr. 1961, p. 275-286.

A theoretical approach using the maximum resolved shear stress criterion for dip on (111) (110) systems is advanced for predicting the important features of the earing of cups pressed from single crystals with substantiation by measurement of cups pressed from Al specimens. The theory is extended to include polycrystalline materials. 15 ref. (M26c, G4b, 3-71, 3-72; Al)

334-M. The Deformation of a Tilt Boundary Under Applied Forces. A. N. Stroh. Acta Metallurgica, v. 9, Apr. 1961, p. 315-319.

The equilibrium positions of the dislocations forming a tilt boundary are found when they are acted on by applied forces varying both periodically and aperiodically along the boundary. Explicit expressions are obtained for the displacements when these are small; large displacements are determined by using a relaxation technique. 4 ref. (M26b, 3-66)

335-M. (Hungarian.) Determination of the Residual Austenite Content in Hardened Steels by X-Ray Diffraction. E. G. Fuchs. Acta Technica Academiae Scientiarum Hungaricae, v. 32, Mar-Apr. 1961, p. 389-414.

Metallographic, dilatometric, magnetic and X-ray diffraction analysis of the residual austenite content in hardened steels. 24 ref. (M22g, N8n; ST)

336-M. (Translation-ConBur.) Phase Diagram of the Zirconium-Rhenium System. E. M. Savitskii, M. A. Tylkina and I. A. Tsyganova. Soviet Journal of Atomic Energy, v. 7, Mar. 1961, p. 724-727.

The phase diagram of the Zr-Re system is constructed from X-ray and microscopic analysis and melting points, hardness and microhardness data. Solubility studies are made from 550-2500° C. Zr_5Re_{24}, ZrRe2 and Zr2Re are formed by peritectic reactions. 8 ref. (M24b, P12e; Zr-b, Re-b)

337-M. (Translation-ConBur.) Phase Diagram for the Niobium-Rhenium System. E. M. Savitskii, M. A. Tylkina and K. B. Povarova. Soviet Journal of Atomic Energy, v. 7, Mar. 1961, p. 937-940.

Phase analysis of the alloys of the system by X-ray structural analysis and microscopic methods and by measuring the hardness and microhardness of the structural components. Alloying and annealing is from 1000-3170° C. Starting materials are Re powder (99.8% purity) and a forged Cb cermet. $Re_{22}Cb_7$ is formed by peritectic reaction. 6 ref. (M24b; Re-b, Cb-b)

338-M. (French-German.) Quantitative Micrography. A. Braun. Pro-Metal, v. 14, Apr. 1961, p. 466-477.

Method for evaluation and interpretation of three-dimensional microstructural grain size in single and multiple phase isotropic and anisotropic Cu and Cu alloys by unidimensional measurement. (M27c; Cu-b)

339-M. (Russian.) Metallographic Investigation of Alfenol Alloy (Fe and 16% Al). N. G. Lahman and B. G. Livshits. Izvestiya Vuz-Chernaya Metallurgiya, Sept. 1960, p. 148-156.

An induction melted alloy of Armco Fe and Al is analyzed following homogenization and hot rolling by chemical and metallographic methods. Data are given for lattice structure, hardnesses, electrical resistance and micro emf. as affected by cooling rate and homogenization. 17 ref. (M26, M-general, P-general, Q29n, 2-64; Fe-b, Al)

340-M. Phase Identification in Nickel-Base Alloys. J. E. Wilson and J. F. Radavich. Metal Progress, v. 79, May 1961, p. 94-96.

As-cast structures contain gamma prime, Ni_3Al, a complex boride and Ti carbonitride. During heat treatment the carbonitride breaks down and another complex carbide forms at its expense. Grain size and distribution of phases determine rupture life. (M27, M21e, M22g; Ni-b, SGA-h)

341-M. The Electron Microscope...a New Tool for Examining Fractures. Austin Phillips and Guy A. Bennett. Metal Progress, v. 79, May 1961, p. 97-102.

Fracture surfaces of metals can now be examined at magnifications up to 50,000 x by the electron microscope. This technique, termed "electron microfractography", may become an important tool in failure analysis; it promises to reveal many of the heretofore undisclosed details associated with the various failure phenomena. (M12e, M23p)

342-M. Cryogenics and Radiation Damage. L. Weil. Cryogenics, v. 1, Mar. 1961, p. 129-134.

Review of radiation defect occurrence and this observation in solids, such as Cu, W, Cb, Al, Bi, Re, other metals and nonmetals. Measurement of related thermal conductivity and electrical resistivity at 1-80° K. Effect of irradiation time, thermal treatment and straining on recovery and out of defects and lattice imperfections. (M26s, P11h, P15g, 2-63, 2-67; Cu, W, Cb, Al, Bi, Re, NM)

343-M. (German.) X-Ray Determination of Frenkel Defects in Copper. M. Schenk. Kernenergie, v. 4, Jan. 1961, p. 9-11.

X-ray measurement of intensity variations in radiation of a f-c-c. lattice (using Cu) with fast neutrons (Mo radiation). Computation of Frenkel defects using an atomistic model. (M26s, M21f; Cu)

344-M. (Japanese.) The Microstructure of Radar Housings Etched With 5% Hydrofluoride. Takuichi Morinaga, Shigeo Zaima, Tsuneo Takahashi and Yukio Aono. Imono (Japan Foundrymen's Society, Journal), v. 33, Feb. 1961, p. 12-18.

Metallographic examination of specimen parts of radar housings cast from AC7A Al-Mg alloy by sand and metal molding methods. Effect of casting's shape, nonuniformity of casting pressure and cooling conditions on variance of properties. 3 ref. (M27, M-general, E25; Al-b)

345-M. Metallurgical Application of X-Ray Projection Microradiography. J. Vettraino and F. Seppi. U. S. Office of Technical Services, PB 171381, Aug. 1960, 55 p. $1.75.

Methods of preparing thin specimens. Several microradiographs were obtained of ferrous and Al alloys so that the usefulness of the X-ray microscope could be compared with the optical metallograph. (M21f; Al-b, Fe-b)

346-M. Refractory Metal Constitution Diagrams. A. R. Kaufman. Nuclear Metals, Inc., Massachusetts Institute of Technology and Westinghouse Research Laboratories (Wright Air Development Division). U. S. Office of Technical Services, PB 171391, Oct. 1960, 197 p. $3.

Nine binary constitution diagrams and one ternary constitution diagram of some of the refractory metals including Ta-Ru, W-Ru and Ta-Os. (M24; Ta-b, Ru-b, W-b, Os-b)

347-M. (Russian.) Structure and Heat Resistance of Alloys and Steels. I. L. Mirkin and V. Z. Tseitlin. Metallovedenie i Termicheskaya Obrabotka Metallov, Feb. 1961, p. 2-11.

Kinetics of structural changes in heat resistant materials exposed to long service at elevated temperatures. The rate of pearlite and carbide grain growth in various materials, long time tensile strength and creep strength are tested at 300-700° C. Heat resistance in relation to composition. 21 ref. (M27, Q27a, Q3m)

348-M. (Russian.) Sigma Phase in 1Kh20N14S2 Steel. V. S. Lyashenko, V. N. Bykov and V. A. Rudenko. Metallovedenie i Termicheskaya Obrabotka Metallov, Feb. 1961, p. 22-24.

Phase composition and microstructure study of steel (containing 0.14% C, 20.2% Cr, 15.5% Ni, 2.44% Si and 1.14% Mn) aged at 650° for 5000 hr. Stabilization of structure to prevent tendency to embrittlement resulting from aging. 5 ref. (M24, M27; ST)

349-M. (Russian.) Effect of Alloying Elements on the Phase Composition of Austenitic Steel. N. Ya. Karasik and N. E. Shepyanova. Metallovedenie i Termicheskaya Obrabotka Metallov, Feb. 1961, p. 28-30.

X-ray analysis of electrolytically isolated carbides from four identical steels containing 0.85-0.99% Cb and additionally alloyed with Mo, W or both in various concentrations. 5 ref. (M24, S11p; SS-e, 5)

350-M. Tin-Antimony Equilibrium Diagram. R. F. Smart. Tin and Its Uses, no. 51, 1961, p. 8-9.

Data given for the solid solubility, order-disorder transformation temperature, alpha and beta phases and crystal structure and parameters of Sb-Sn equilibrium diagram. 12 ref. (M24b; Sb-b, Sn-b)

351-M. Fractographic Analysis of AISI 4340 Steel by Optical and Electron Microscopy. N. A. Tiner. ASTM Preprint no. 82, 1961, 9 p.

Shear and transverse fractures are examined to determine direction of crack propagation. 11 ref. (M21, Q26q; ST)

352-M. (Czech.) Nonaging Deep Drawing Steel for Heavy Duty Stampings. J. Solc, M. Zezulova and Zd. Zdenek. Hutnicke Listy, v. 16, Mar. 1961, p. 159-168.

Sheet of 1.5-3 mm. thickness containing 0.10-0.12% C, 0.30-0.45% Mn, 0.05-0.10% Si, 0.07-0.10 Al, max. 0.030% P and max. 0.030% S is normalization annealed at 910° C., allowed to cool to 650° C., held at this temperature for 16 hr. and subsequently stored for 3 months. Structure and tensile testing at various stages of the above treatment. 9 ref. (M27, Q27a, 2-65; ST)

353-M. (Czech.) Microstructure and Mechanical Properties of Welded Austenitic and Ferritic-Pearlitic Steels Used in the Construction of Heavy Duty Boilers. Karel Pawera, Vaclav Pilous and Frantisek Poboril. Hutnicke Listy, v. 16, Mar. 1961, p. 186-197.

The filler metal VZU60 is used in the Ar arc welding of CSN15225 and 17481 steels containing 0.05-0.15% C, 0.45-19% Mn, 0.15-0.70% Si, 0.40-8% Cr, 0-1% Mo, 0-0.35% V, 0-0.60% Ti, 0-0.045% P and 0-0.045% S. The weldments are subjected to heat treatments at 680-980° C. for 1/2-1 hr. and X-ray tested, bend tested; tension tested at 20 and 575° C.; structure tested, exposed to thermal cycling and corrosion and creep tested. 20 ref. (M27, Q-general; SS, 7-51)

354-M. X-Ray Microscopy. W. C. Nixon. Contemporary Physics, v. 2, Feb. 1961, p. 183-197.

X-ray microscopy is used to examine alloy specimens of Al, Sn, Mn, Cr, Fe and steel. Comparison of the wavelength limitation on resolution in various methods including reflection X-ray microscopy, contact microradiography, projection X-ray microscopy, X-ray microanalysis in air, direct emission, electron microscopy and optical mirror microscopy. 3 ref. (M21f; Al, Cr, Fe, Mn, Sn, ST)

355-M. Producing Small Parts From Sheet Metal by Etching. Machinery (London), v. v. 98, Apr. 19, 1961, p. 876-878.

Production of computer components, missile guidance system parts and other electronic apparatus by photoengraving and etching of Ni-Ag sheet metal with H_3PO_4 and $FeCl_3$. Good results are also obtained when etching ferrous metals such as Cu, Al and their alloys. (M20q, T1; Ag, Ni, 4-53)

356-M. Reticular Density in Cubic Lattices. R. H. Deiter, J. P. Ostriker and J. E. Davey. Report of NRL (Naval Research Laboratory) Progress, Apr. 1961, p. 46-47.

Method for calculation of reticular density or number of atoms per unit area, in a particular plane, for simple body-centered, face-centered and diamond cubic lattice structures. (M26)

357-M. Liquidus-Solidus Relation in Iron-Rich Iron-Niobium and Iron-Molybdenum Alloys. W. S. Gibson, J. R. Lee and W. Hume-Rothery. Iron and Steel Institute, Journal, v. 198, May 1961, p. 64-66.

The liquidus and solidus relations in Fe-rich alloys of the systems Fe-Cb and Fe-Mo are determined for alloys of high purity. Information is given on the constitution of the alloys in the solid state. (M24b; Fe-b, Cb, Mo)

358-M. The Ag-Rich Side of the Binary Phase Diagrams Ag/Au and Ag/Cu as Studied by Zone Refining. J. Markali and P. Thoresen. Acta Chemica Scandinavica, v. 15, Jan. 1961, p. 31-35.

Determination of the segregation coefficients of Ag/Au and Ag/Cu binary alloys as a function of the concentration of the solute. Concentration profiles are determined by neutron activation analysis, radioactive tracers, chemical analysis and direct spectrographic analysis. 8 ref. (M24b, 9-69; Ag-b, Au-b, Cu-b)

359-M. (Russian.) Effect of Arsenic on Structure and Properties of Rolled St. 3 sp. Steel Sections. A. V. Demakova, L. P. Tarasova and Z. I. Baranova. Stal', Dec. 1960, p. 1127-1130.

Ingots are cast from steel containing 0.142-0.260% As. Samples are taken from the upper, middle and lower parts of the ingot, exposed to a tensile deformation of 10%, held at 250° C. for 1 hr. and impact tested at -60 to +20° C. Mechanical testing of samples taken from rolled profiles with and without previous normalization at 880° C. (M27, Q6, 2-60; ST, As)

360-M. (Japanese.) The Origin of Cube Texture in Copper. Taichi Kamijo and Kazuma Yamamoto. Japan Institute of Metals, Journal, v. 25, Feb. 1961, p. 151-155.

The orientation relationship between rolling and annealing texture is examined for tough pitch Cu strip specimens after secondary rolling at right angles to the primary rolling direction and after 150° C. annealing for various times to test the oriented nucleation and growth theories for cube texture. 10 ref. (M26c, 2-64, 3-68; Cu-a)

361-M. A Metastable Compound in the System Copper-Bismuth. A. K. Covington, K. Groenwolt and B. W. Howlett. Institute of Metals, Journal, v. 89, Apr. 1961, p. 291-292.

X-ray metallograph observation of metastable Cu_5Bi_2 compounds forming in alloys of the system containing 25-75% Cu, after annealing from 200-600° C. and subsequent quenching. Precipitation of the compound occurs as a result of quenching from Bi supersaturated with Cu in the absence of Cu nuclei. 9 ref. (M26q, M-general, 2-64; Cu-b, Bi-b)

362-M. The Isobaric Point in Ternary Liquid Systems. Marc Van Lancker and Franz Halla. Institute of Metals, Journal, v. 89, Apr. 1961, p. 293-295.

Occurrence of a common point of intersection, the isobaric point, in the activity curves of several ternary systems as a function of the partial systems, irrespective of the ratio of the atomic fraction of the two components dissolved in the solvent. Investigation of intersection points in Zn-Cd-Sn, Zn-Cd-Sb, Na-Pb-Hg and Cd-Pb-Bi systems at 400-823° K. 13 ref. (M24c, P12b)

363-M. (Book-French.) Metallographic Technique. Preparation of Metallic Surfaces for Micrography and Macrography. A. Roos. 1960. 121 p. Dunod, 92, Rue Bonaparte, Paris (6e), France.

Surface conditions and principles of metallography. Specimen preparation, polishing technique, metallographic attack and final surface preparation. Electrolytic polishing. Macrography. Application to nonferrous metals, steels and cast iron. 41 ref. (M20; CI, ST, EG-a38)

364-M. Grain-Size Control in Automatic Weld Deposits. B. Phelps. Australian Institute of Metals, Journal, v. 6, Feb. 1961, p. 78-82.

Methods of refining the "as cast" grain size of weld deposits by nucleation, vibration and heat treatment. It is concluded that vibration and heterogeneous nuclei can be effective grain refiners if the parent plate itself is reasonably fine-grained. 13 ref. (M27c; AD-p35, 7-51)

365-M. (Russian.) Temperature Dependence of the Growth Velocity of Beta Crystals in Bronze. A. L. Belinkii. Metallovedenie i Termicheskaya Obrabotka Metallov, Mar. 1961, p. 25-27.

The bronzes BrO 24.6 and BrO 24.8 are cooled in a vacuum to -160 or -182° C. respectively. The growth of beta crystals is studied by microcinematography exposing 25-600 pictures per sec. 6 ref. (M26; Cu-s)

366-M. The Isolation of Surface Films From Copper. A. F. Beck and M. I. Pryor. Electrochemical Society, Journal, v. 108, May 1961, p. 417-423.

Oxide and sulphide films are isolated from Cu by selective attack of the film-metal interface by a 3% ammonium acetate, 0.25% bromine in methanol solution When stripping is performed in dry air, no film dissolution or contamination is detectable. 19 ref. (M20q; Cu)

367-M. On the Mechanism of Cathodic Crystal Growth Processes. B. C. Banerjee and P. L. Walker, Jr. Electrochemical Society, Journal, v. 108, May 1961, p. 449-454.

Effects of bath composition and current density on the structure and morphology of thin films of Cu deposited on Cu and Pt foil from acid-Cu and Cu-glycine baths are studied by electron diffraction and electron microscopy. Some results of similar studies of Ni deposited on brass are presented. 22 ref. (M26, M21e, M22g; Cu, Ni)

368-M. (English.) Some Observations on Copper Electrodeposits. T. B. Vaughan. Electrochimica Acta, v. 4, May 1961, p. 72-77.

Investigation into the nature of unusual metallographic markings on etched Cu electrodeposits from acid sulphate baths. Growth mechanism involving twinning on (111) planes is suggested as possible explanation. Mechanism complicates

but does not invalidate bunching mode of growth previously reported. 16 ref. (M27; Cu, 8-62)

369-M. (German.) The Phase Diagram Niobium-Rhenium. J. M. Savitzki, M. A. Tylkina and K. B. Povarova. Planseeberichte fur Pulvermetallurgie, v. 8, Jan. 1961, p. 188-191.

Establishment of the binary system Cb-Re by measurement of melting temperatures by the "bore-hole method" and phase analysis measurement, radiation, hardness measurement and microscopic investigation. 6 ref. (M24b; Cb-b, Re-b)

370-M. (English.) The Phase-Diagram Tantalum-Rhenium. M. A. Tilkina, I. A. Tsiganova and E. M. Savitzkij. Planseeberichte fur Pulvermetallurgie, v. 8, Jan. 1961, p. 192-194.

Establishment of the binary phase diagram Ta-Re by thermal analysis, metallographic investigation, X-ray analysis and microhardness measurement. Occurrence of two intermetallic compounds formed by peritectic reaction. 7 ref. (M24b; Re-b, Ta-b)

371-M. (German.) Study of the Systems Uranium-Zirconium-(Hafnium, Niobium, Tantalum) Carbon. F. Benesovsky and E. Rudy. Planseeberichte fur Pulvermetallurgie, v. 9, Apr. 1961, p. 65-76.

X-ray investigation of sintered specimens to establish structure of following ternary systems in terms of phase equilibria: UC-ZrC-C, UC-CbC-C and UC-TaC-C. Evaluation of free enthalpies of formation for UC_2. Use of UC as fuel in graphite moderated high-temperature reactors. (M24d; Cb, Hf, Ta, U, Zr, 6-69)

372-M. (English.) Alloys of Tantalum Diboride With Iron, Cobalt and Nickel. H. W. Lavendel. Planseeberichte fur Pulvermetallurgie, v. 9, Apr. 1961, p. 80-95.

Chemical analysis, microstructure and X-ray investigation of cold pressed and sintered specimens to establish the binary phase diagram TaB_2-Ni with particular reference to solid-liquid equilibria and intermetallic compounds. Substitution of Ni by Co and Fe. Formation (by peritectic reaction) temperatures and crystal structure of $MeTaB_2$ and Me_5TaB_2-type intermetallic compounds; Me_5TaB_2/Me eutectic. 5 ref. (M24d; Ta-b, Co, Fe, Ni, 6-72)

373-M. Preparing Titanium for Microscopic Examination. W. C. Coons. Metal Progress, v. 79, June 1961, p. 93.

Electrolytic polishing procedures for samples of "alpha-beta" Ti. (M21, L13p; Ti)

374-M. A Century-Old Razor. Samuel J. Rosenberg. Metal Progress, v. 79, June 1961, p. 94-96.

Spectrochemical and chemical analysis and hardness measurements of a pre-Civil War razor of German manufacture. The excellent service rendered by the razor is attributed to its being of an unusually clean steel, hardened to over C-60 and with a microstructure of fine martensite plus tiny particles of excess carbide. (M26; CN)

375-M. Growth of Single Iron Crystals for Corrosion Studies. Willard F. Brickell and Edward C. Greco. Corrosion, v. 17, May 1961, p. 237t-238t.

Method based on hydrogen reduction of $FeCl_2$ for the production of single Fe crystals with characteristic plane surfaces and essentially cubic dimensions. (M26; Fe)

376-M. (English.) On the Crystallography of Martensite--The "(225)" Transformation in Alloys of Iron. C. M. Wayman, J. E. Hanafee and T. A. Read. Acta Metallurgica, v. 9, May 1961, p. 391-402.

Microscopic and X-ray observations of orientation relationships in an Fe-7.90% Cr-1.11% C alloy, with habit plane of (449) on the austenite axis, after austenitizing and transformation to martensite by quenching. Theoretical analysis and correlation of lattice correspondence and parameter, invariant shear, Bain distortion and isotropic interface dilation. 27 ref. (M26c, M-general, N8p, 2-64; Fe-b)

377-M. (English.) Interactions of Interstitials With Dislocations in Iron. K. Kamber, D. Keefer and C. Wert. Acta Metallurgica, v. 9, May 1961, p. 403-414.

The interaction between interstitial N and C with dislocations in body-centered cubic Fe is examined by anelastic measurement, using both the

Snoek damping and the cold work damping peak. 17 ref. (M26b, Q22, 3-69; Fe-a)

378-M. (English.) Transmission Electron Microscopy Studies of Dislocation and Stacking Faults in a Hexagonal Metal: Zinc. A. Berghezan, A. Fourdeux and S. Amelinckx. Acta Metallurgica, v. 9, May 1961, p. 464-490.

Observation of dislocation loops containing stacking fault, dislocation networks and tilt and twist boundaries in 99.999% Zn polycrystal and single crystal specimen deformed by rolling. Analysis of interaction and review of dislocation theory and deformation phenomena, with classification of types of dislocations and stacking faults possible in hexagonal close-packed lattices. 26 ref. (M26b, M21e, 3-68; Zn)

379-M. (French.) Reversible Striations of Metallic Surfaces in Sulfurizing Atmospheres. J. Audar, F. Brouty and J. Benard. Acta Metallurgica, v. 9, May 1961, p. 520-521.

Polycrystal specimens of Au are exposed to H_2-H_2S atmospheres at 900° C. to determine whether surfaces grooving similar to those occurring in absorption of oxygen also occur when other elements are absorbed. The observed surface striations are compared to those for Ni and Fe. 7 ref. (M28, P13d, 2-62; Au, Ni, Fe)

380-M. (Translation-ConBur.) State of Carbon in Liquid Cast Iron. A. A. Vertman and A. M. Samarin. Academy of Sciences of the USSR, Proceedings, Physical Chemistry Section, v. 134, Sept-Oct. 1960, p. 895-897.

Carbon formation and structure in liquid cast iron by a centrifuging process. Results indicate that cast iron is a nonequilibrium, microheterogeneous system consisting of a dispersion medium of carbon and carbon enriched micelles with particle diameter of 10^{-6} cm. 8 ref. (M27; CI, C, 14-60)

381-M. (German.) Structure and Properties of Semimetals. Pt. 13. Formation of Solid Solutions Between the Metals, Arsenic and Antimony and Semiconductive Chalcogenides of the Fourth Group. H. Krebs, K. Grun, D. Kallen and W. Lippert. Zeitschrift fur Anorganische und Allgemeine Chemie, v. 308, Mar. 1961, p. 200-211.

Microstructure and X-ray investigation of vacuum melted, pulverized and 400-470° C. stress-free annealed alloys of As and Sb with Sn, Ge and Te. Evaluation of boundaries of solid miscibility, lattice parameters of solid solutions and chemical bonds. (M26q; As-b, Sb-b, Sn, Ge, Te)

382-M. (German.) Phase Diagram of Zirconium-Beryllium. V. S. Emel'janov, J. G. Godin, A. I. Evstjuchin and A. A. Rusakov. Kernenergie, v. 4, Mar. 1961, p. 228-232.

Construction of binary phase diagrams for all concentrations of the system from thermal analysis, metallographic and X-ray investigation and by hardness measurements. Formation of intermetallic phases $ZrBe_2$, $ZrBe_6$, $ZrBe_9$ by peritectic reactions is observed at 1235, 1475 and 1555° C., respectively. 5 ref. (M24b, M-general; Be-b, Zr-b)

383-M. (Translation-Chemical Society.) A New Boride Phase in the Beryllium-Boron System. G. S. Markevich, Yu. D. Kondrashev and L. Ya. Markovskii. Russian Journal of Inorganic Chemistry, v. 5, Aug. 1960, p. 865-867.

X-ray diffraction analysis of the crystal structure and lattice parameters of Be_5B formed by compacting B and Be powders in atomic ratios from 1:9-1:2 and annealing at 1000-1100° C. Other properties investigated include electrical conductivity and resistivity, hydrolysis in acids forming suboxides and boron hydride formation in HCl. 6 ref. (M24b, M22g; Be-b, B)

384-M. (Italian.) Influence of Preheating Time Before Hardening on Structure and Tensile Strength of Some Chill-Cast Aluminum Alloys. C. Panseri and G. Bracale. Alluminio Nuova Metallurgia, v. 30, Mar. 1961, p. 119-130.

Variations of microstructure, tensile strength, elastic limit and elongation of Inafond C 41, S 52, S 71 and Termafond C 3 and C 46 as a function of composition and preheating time. 4 ref. (M27, Q23p, Q21e, Q27, 2-60, 3-67; Al-b, 5-66)

385-M. Light Alloy Grain Size Control and Supercooling Measurements. V. B.

Kurfman. Modern Castings, v. 39, Apr. 1961, p. 98-102.

Rapid determination of grain size in commercial purity Mg and Al alloys by a simple cooling curve determination based on supercooling measurement. Possible usage of this measurement to estimate the grain diameter of various alloys to determine if the melt will be coarse grained. (M27c; Al-b, Mg-b)

386-M. Binary and Ternary Phase Diagrams of Columbium, Molybdenum, Tantalum and Tungsten. J. J. English. Defense Metals Information Center, Battelle Memorial Institute, DMIC Report 152, Apr. 28, 1961, 225 p. (Available as PB 171421 from U. S. Office of Technical Services, Washington 25, D. C.)

Compilation of 93 binary and 68 ternary phase diagrams of Co, Mo, Ta and W in combination with other elements. Information on solubility and crystal structure of intermediate phases. 233 ref. (M24b, M24c; Co-b, Mo-b, Ta-b, W-b)

387-M. (Russian.) Equilibria of the Cb-C-O System. F. G. Kusenko and P. V. Gel'd. Isvestiya VUZ-Tsvetnaya Metallurgiya, Feb. 1961, p. 43-52.

Temperatures for the gradual reduction of Cb_2O_5 by carbon. Partial reduction to CbO_2 is achieved at a temperature above 1230° K., further reduction to CbO occurs at more than 1650° K. At 2860° K. and 1 atm. pressure (or at 1550° C. in a technical vacuum) the higher carbide forms as an intermediate product. 19 ref. (M24c, C26; Cb-b, C, O)

388-M. (Russian.) Radiographic Testing of Nonferrous Metals While Exposed to Cycling. Yu. S. Terminasov and A. M. Toropov. Isvestiya VUZ-Tsvetnaya Metallurgiya, Feb. 1961, p. 116-122.

Effect of cycling at room temperature on the width of /222/ and /311/ lines, size of mosaic blocks and lattice distortions of Al and Cu. 7 ref. (M23n; Al, Cu)

389-M. (Translation-Columbia) Investigation of the Principal K Absorption Edge of Nickel in Nickel-Aluminum Alloys. S. A. Nemnonov and M. F. Sorokina. Academy of Sciences of the USSR, Bulletin, Physical Series, v. 24, Apr. 1960, p. 462-466.

Investigation of Ni, Ni_3Al, NiAl and $NiAl_3$ by X-ray spectroscopy shows that the K absorption edge undergoes modification in crystallographic structure and electron density with an increase of Al. (M22g, M25, M26, P17, 2-60; Ni-b, Al)

390-M. An X-Ray Study of Deformation Stacking Faults at Low Temperature in Lead, Some Lead Alloys and Aluminum. G. F. Bolling, T. B. Massalski and C. J. McHargue. Philosophical Magazine, v. 6, Apr. 1961, p. 491-502.

The deformation stacking-fault probability, alpha, is determined by the deformation of bulk specimens of zone-refined Pb at 4.2 and 77° K. Al (99.996%), alpha-brass (70:30), 0.1% Pb, Ag and Pb-20% In are also examined at 4.2° K. with relation of stacking-fault probability to twin boundary energy and electron interaction as a function of deformation increase. 19 ref. (M26b, Q24b, 2-63, 3-68; Pb-b, In, Ag, Al, Cu-n)

391-M. Dislocation Decoration by Precipitation in Gold-Cobalt Alloys. R. B. Campbell and L. Muldower. Philosophical Magazine, v. 6, Apr. 1961, p. 531-534.

Precipitation from an alloy of Au-5% Co is observed by electron microscopy using replication and transmission technique after solution, quenching and aging treatments. Dislocation walls are observed as a result of polygonization during aging. 12 ref. (M26b, M21e, N7, N-general, 2-65; Au-b, Co)

392-M. (German.) Improved Microstructure Evaluation by Interference Evaporation Layer. Werner Pepperhoff. Archiv fur das Eisenhuttenwesen, v. 32, Apr. 1961, p. 269-273.

Microstructure evaluation of unetched polished metal and nonmetallic specimens using SiO_2 and TiO_2 evaporated layers which improve identification of phases with almost identical reflection power. Examples for Cu, Zn, Al, Ni, austenitic steel, Fe, Al-Ag alloys, heat treated X20 CrNiSi 25/4 steel and scale layers on Fe. (M27; Al, Cu, Fe, Ni, ST, Zn)

393-M. (German.) Etching and Corrosion of Aluminum Specimens in the As-Cast State. U. Benedict. Metall, v. 15, May 1961, p. 415-420.

Corrosion and etching of Al specimens of various purity (99.968-99.9992% Al)

in HCl (7%) with and without addition of 0.5 ppm. Cu, and in a concentrated mixture of HNO_3, HCl and HF. Usefulness of etching agents in metallographic examination. 10 ref. (M20q, R6g; Al, 5)

394-M. (German.) Microstructure Assessment of Melted and Sintered Materials. H. Schreiner. Metall, v. 15, May 1961, p. 422-425.

Review of theoretically possible and practically occurring types of microstructure in compact and porous, melted and sintered materials. Techniques of microstructure assessment with emphasis on porous metals such as sintered Fe, sintered Cu-Pb-Sn and W-Cu alloy. (M27; Cu-b, Fe, W-b, 6-71, 6-72)

395-M. Studies of Ferrous Materials With Electron Microscopes. Takeshi Akutagawa and Iku Uchiyama. Tetsu-To-Hagane Abstracts (Abstracts from Iron and Steel Institute, Journal), no. 10, 1960, p. 31-52.

Historical and technical review of the use of optical microscope and electron microscopes for the study of the microstructure of ferrous materials. Methods of preparing the metal specimen. 106 ref. (M21e)

396-M. On the Relation Between the Change in Modulus of Rigidity of Brass Wires by Cold Rolling and Rolling Textures. Jun Kuroyanagi. Physical Society of Japan, Journal, v. 16, May 1961, p. 1019-1023.

Pole figures are given for brass specimens after 90% reduction in cross-sectional area by cold rolling. Intensity of the texture is affected by Zn content. 5 ref. (M26c, 3-68; Cu-n)

397-M. Structural Studies of Liquid Metals by X-Ray Diffraction. P. C. Sharrah and R. F. Kruh. Paper from "Physical Chemistry of Process Metallurgy". Pt. 1. v. 7. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 419-420.

Radial distribution numbers and coordination numbers are determined for Ga, In, Hg, Sn-Bi, Au-Sn and In-Hg systems using a diffractometer employing Bragg-Bretano geometry with a stationary level sample and counter-rotating X-ray tube and detector. (M22g; Au-b, Ga, Hg-b, In-b, Sn-b, 14-60)

398-M. (Japanese.) The Effect of Small Amounts of Additional Elements on the Anisotropic Properties of Annealed Aluminium Sheets. Toshio Amitani. Japan Institute of Metals, Journal, v. 25, Mar. 1961, p. 170-173.

Deep drawing tests on 400-450° C. annealed Al sheet specimens containing about 0.3% addition of Pb, Si, Sb, Ni, Fe, Be, Ti, Zr, Cr, Mn, Cu, Li, Mg and Zn. Influence of addition elements on recrystallized grain size and anisotropy (earing). 8 ref. (M27c, 2-60, 2-64, 3-72; Al-b, 4-53)

399-M. (Japanese.) Formation of Cube Texture in Copper. Taichi Kamija and Kazuma Yamamoto. Japan Institute of Metals, Journal, v. 25, Mar. 1961, p. 220-224.

Effect of rolling direction, annealing time and temperature on cubic texture formation in tough pitch Cu is investigated by X-ray diffraction, optical microscopy and sterographic projection examination of orientation relationships in straight and cross-rolled specimens annealed from 130-140° C. for various times. Recrystallization and polygonization phenomena in terms of oriented nucleation and oriented growth theories. 8 ref. (M26c, M-general, N-general, 2-64, 3-68; Cu-a)

400-M. (French.) Preservation of the Gamma Grain by Deposition of Nickel Alloy Vapors. G. Vigneron. Revue du Nickel, no. 2, Mar-Apr. 1961, p. 39-45.

Polished samples of an extra hard chromium steel, ferronickel with 36% Ni, cupronickel of various composition and Armco iron are brought to austenitization temperature in a vacuum while vapors of a Ni alloy, Ni or Cu are precipitated on the surface. The vapor deposit assumes and preserves the austenitic microstructure. (M27c, L25; Cu-b, Ni-b, ST, Cu, Ni)

401-M. Single Crystal Diffraction Pattern of Germanium. R. Bubakova, J. Drahokoupil and A. Fingerland. Czechoslovak Journal of Physics, v. 11, May 1961, p. 199-204.

Diffraction pattern for the (111)-reflection of Ge is measured by the three-crystal arrangement and compared with dynamical theory. Results obtained indicate the possibility of using Ge crystals for precise measurements in X-ray spectroscopy. 10 ref. (M22g; Ge, 14-61)

402-M. (Czech.) Effect of Small Aluminum Contents on Austenitic Grain Size. Zdenek Rusnak, Karel Stransky and Marie Kralova. Slevarenstoi, v. 9, Apr. 1961, p. 138-143.

To a melt of carbon steel containing 0.20-0.28% C, 0.54-0.84% Mn, 0.24-0.46% Si, 0-0.34% P and 0-0.39% S, 0-800 g. Al per ton steel are added. Test pieces are cast, normalized at 890° C. and relief annealed at 620° C. The austenitic structure at 930° C. is recorded by carbide or oxide precipitation along the grain boundaries. 12 ref. (M27c, 2-60; CN, Al)

403-M. Electron Microscopy of Etch Pits. R. E. Pawel. Materials Laboratory (Wright Air Development Center). U. S. Office of Technical Services, PB 161838, Oct. 1959, 23 p. $.75.

Advanced electron microscopic techniques uses etch pits to delineate the crystalline structure and orientation of single grains of polycrystalline Cu, brass and Al. Prior to etching, small block specimens are annealed, ground and polished on metallurgical papers and wheels. (M21e; Al, Cu, Cu-n)

404-M. The Influence of Large Amounts of Undercooling on the Grain Size of Nickel. J. L. Walker. Paper from "Physical Chemistry of Process Metallurgy". Pt. 2. v. 8. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 845-853.

Experimental determination of the dependency of grain structure of Ni on undercooling. An hypothesis is presented to explain grain size transition in terms of mechanical disturbance caused by the rapid change in volumes at very high freezing rates. 5 ref. (M27c, N12, 3-67; Ni)

405-M. Grain Size Control During Ingot Solidification. W. A. Tiller. Paper from "Physical Chemistry of Process Metallurgy". Pt. 2. v. 8. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 855-863.

Thermal and chemical factors controlling the ratio of equiaxed zone width and the grain sizes in these zones in ingots. Interaction between the heterogeneous nuclei and the concentration gradients and effects on the thermal properties of the alloy. 10 ref. (M27c, N12, P11, 2-61)

406-M. (Czech.) Preparation of Samples From Soft Tin and Cadmium Solders for Metallography. Zdenek Kremla, Zdenek Demek and Zdenek Hamza. Sbornik, v. 6, May-June 1960, p. 595-604. (4 p. of Tables.)

Casting of samples. Description of mechanical grinding, electrolytic and chemical polishing. Sampling by distribution of a solder drop on the surface of a glass slide. Etching with a mixture of HNO_3, acetic acid and glycerine. 18 ref. (M20; Cd, Sn, SGA-f)

407-M. (Translation.) The Structure of Copper Microwire. E. M. Nadgornyi and B. I. Smirnov. Soviet Physics--Solid State, v. 2, June 1961, p. 2707-2708. (Translation from Fizika Tverdogo Tela, v. 2, Dec. 1960, p. 2989-3196.)

X-ray analysis of the structure of Cu microwires of 4, 5, 6.6, 8, 9, 10.5, 14, 15 and 17 microns diameter. Variation of structure with diameter. 4 ref. (M26, 3-73, M22g; Cu, 4-61)

408-M. Titanium-Gadolinium Phase Diagram. J. G. Croeni, S. C. Rhoads, C. E. Armantrout and H. Kato. U. S. Bureau of Mines, Report of Investigations 5796, 1961, 14 p.

Physical properties of Ti and Gd. Impurity analysis, hardness tests, solidus-liquidus determinations, X-ray diffraction analysis and alpha-beta transformation temperatures. 6 ref. (M24b, P-general, Q29, M22g; Ti-b, Gd-b)

409-M. Cobalt-Carbon Alloys. Jozef Dilewijns. Cobalt, no. 11, June 1961, p. 28-35.

Metallographic structure of Co-C alloys containing up to 3% C. Effect of noncarbide-forming and Mn additions on the existing phases. Evaluation of hardness, tensile strength, Young's modulus and damping capacity. Effectiveness of Ce-mischmetal and Ni-Mg additions made to obtain spheroidal graphite. 11 ref. (M24b, Q-general; Co-b, C, AD-p37)

410-M. Investigation to Develop Optimum Properties in Forged Ti-7Al-4Mo. J. E. Hamer. Crucible Steel Co. for America. (Wright Air Development Division). U. S. Office of Technical Services, PB 171546, Oct. 1960, 145 p. $2.75.

Influence of six processing sequences on the microstructure, mechanical properties and heat treatment response. Forging entirely above the beta transus produces the usual Widmanstatten type of

structure found in Ti alloys after such processing. Notch tensile and notch stress rupture do not show any direct relationships with processing history. (M27, Q-general, J-general; Ti-b, Al, Mo, 4-51)

411-M. The Zirconium-Platinum Alloy System. E. G. Kendall, C. Harp and R. E. Swift. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 445-452.

Investigations of the Zr-Pt system by metallography, incipient melting and X-ray diffraction to determine the phase relationships from 0-50% Pt. Phase fields in the Pt-rich region, intermetallic compound and solid solution formation. Eutectic, eutectoid and peritectic reactions and phase solubility relations are established after various heat treatments as a function of time, temperature and composition. 7 ref. (M24b, M-general, N-general, Pt-b, Zn-b)

412-M. Interpretation of the Rolling Texture of Copper. M. N. Parthasarathi and Paul A. Beck. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 461-463.

X-ray methods are used to determine the (220) pole figure of OFHC Cu rolled to 96% R. A., the occurrence of four texture components of the type (135) (211) being confirmed. The total volume fraction of material close to the four symmetrical orientations of this type is larger than the volume fraction of the other components together. 12 ref. (M26c, M22g, 3-68; Cu-a)

413-M. Oxygen Potentials and Phase Equilibria in the Fe-Ca-O System. E. T. Turkdogan. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 546-553.

A compilation and review of the data on the system. Using the results on the reduction-equilibria, an oxygen potential diagram is drawn with a number of univariant systems and invariant points, not determined experimentally, being evaluated using the theorem on univariant curves intersecting at an invariant point. The formation of solid solutions and tenary compounds are given with the crystal structures of some of the phases for some temperatures. 39 ref. (M24c, D11r, 2-61; Fe-b, Ca, O)

414-M. Dilatometric Investigations of Vacuum-Melted Zircaloy-2. Josef Intrater. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 567-572.

A dilatometric determination of the alpha + beta region temperature limits in vacuum melted Zircaloy-2 and the temperature of transformation for alpha to alpha + beta and alpha + beta to beta on heating and cooling as a function of rate of heating and heat treating history. Data are given for thermal expansion. 14 ref. (M23b, N-general, P11g, 2-62, 2-64, 3-67; Zr-b)

415-M. Phase Diagram and Thermodynamic Properties of the Thorium-Zinc System. P. Chiotti and K. J. Gill. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 573-580.

Thermal, metallographic and vapor pressure data are obtained to establish the phase diagram for the system. Four compounds corresponding to the stoichiometric formulas Th_2Zn, $ThZn_2$, $ThZn_4$ and Th_2Zn_{17} are observed with melting points determined. The standard free energy, enthalpy and entropy of formation for the compounds are determined from Zn vapor pressure data. 18 ref. (M24b, M-general, P12, 2-60; Th-b, Zn-b)

416-M. The Gadolinium-Iron System. V. F. Novy, R. C. Vickery and E. V. Kleber. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 580-585.

The constitutional diagram is determined in part for the system Gd-Fe, seven intermetallic compounds being found at compositions corresponding to the following Gd-Fe ratios: 2:3, 1:2, 1:3, 2:7, 1:4, 1:5 and 2:17. Differential thermal analysis, densitometry, gravimetry and X-ray diffraction are used to determined melting points, lattice parameters, transformation structure and reactions and thermodynamic properties. (M24b, M-general; Gd-b, Fe)

417-M. The Gadolinium-Nickel System. V. F. Novy, R. C. Vickery and E. V. Kleber. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 585-588.

The constitutional diagram is determined for the system Gd-Ni with nine intermetallic compounds being found

at compositions corresponding to the following Gd-Ni ratio: 3:1, 3:2, 1:1, 1:2, 1:3, 2:7, 1:4, 1:5 and 2:17. Differential thermal analysis, densitometry, gravimetry and X-ray diffraction methods are used to determine melting points, lattice parameters, transformation structure and reactions and thermodynamic properties. 8 ref. (M24b, M-general; Gd-b, Ni)

418-M. The Gadolinium-Cobalt System. V. F. Novy, R. C. Vickery and E. V. Kleber. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 588-590.

The constitutional diagram for the Gd-Co system is determined with seven intermetallic compounds being found at compositions corresponding to the following Gd-Co ratios: 3:1, 1:1, 2:3, 1:2, 1:3, 1:4. 1:5. Differential thermal analysis, densitometry, gravimetry and X-ray diffraction methods are used to determine melting points, lattice parameters, transformation structures and reactions and thermodynamic properties. 9 ref. (M24b, M-general; Gd-b, Co)

419-M. A Study of the Titanium-Nickel System Between Ti_2N1 and TiNi. G. R. Pundy and J. Gordon Parr. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 636-639.

The phase boundaries of "TiNi" is determined by high-temperature X-ray diffraction and metallographic techniques. The phase (centered at 51% Ni) has a restricted range of homogeneity at 500° C. and a much greater range at 800° C. "TiNi" in all alloys containing less than 51% Ni decomposes rapidly and reversibly at 36° C. to form a previously unreported phase. 9 ref. (M24b, M26q, M-general, 2-60, 2-61; Ti-b, Ni-b)

420-M. The Structure of Ti_3Al. A. J. Goldak and J. Gordon Parr. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 639-640.

The hexagonal structure and lattice parameters for powdered Ti-25% Al alloys prepared by levitation melting are determined by X-ray diffraction examination at temperatures to 900° C. No superlattice lines are observed. 7 ref. (M26q, M22g, 2-61; Ti-b, Al)

421-M. The Phase Relationships in the Magnesium-Rich Region of the 335° C. Tetrahedrom of the Mg-Al-Ca-Zn Phase Diagram. J. B. Clark. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 643-644.

X-ray diffraction examination of phase equilibria in the 60-80% Mg regions of the system, with data for ternary phase stability, composition and solid solubility relation. No quaternary intermetallic compounds are found. (M24d, M26q, M22g; Mg-b, Al, Ca, Zn)

422-M. The Solid Constitution in the Magnesium-Rich Region of the Mg-Ca-Zn Phase Diagram. J. B. Clark. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 644-645.

X-ray diffraction metallography is used to determine the existence of two ternary intermetallic compounds, beta and omega, in equilibrium with the Mg solid solution in the Mg-rich isothermal section of the system. (M22g, M24c, M26q; Mg-b, Ca, Zn)

423-M. Stacking Faults in Platinum. J. Taranto and F. R. Brotzen. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 645-646.

The loss of stacking faults and dislocations in Pt specimens during recovery as a result of annealing is investigated by line shift measurements using X-ray methods on Pt filings after isochronal annealing at 1200° C. 10 ref. (M26b, M22g, N4, 2-64; Pt)

424-M. On the Existence of Lower Tantalum Oxides. R. J. Wasilewski. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 647.

X-ray diffraction examination of Ta powder specimens after annealing in oxidizing atmospheres at 1050° C. and nitriding at 850° C. to investigate the existence of the Ta_2O phase. The suboxide is identified as oxynitride, rather than Ta_2O, with data given for lattice parameters and crystal structure. 8 ref. (M22g, M26q; Ta, 14-68)

425-M. (German.) Ternary System of Aluminum-Silicon-Vanadium. Erich Gebhardt and Gunter Joseph. Zeitschrift fur Metallkunde, v. 52, May 1961, p. 310-317.

Microstructure investigation, microhardness and X-ray examination, thermal analysis, tensile testing from 20-350° C. and corrosion testing in NaCl solution (5%), of Al-Si-V specimens with 0-12% V and 0-14% Si. Establishment of the Al-rich portion of the ternary phase diagram. (M24c; Al-b, Si, V)

426-M. (German.) Bonding Types in Intermetallic Phases of the NiAs Type. Hans Wever and Gunter Wintermann. Zeitschrift fur Metallkunde, v. 52, May 1961, p. 329-336.

Electrolytic measurements of transport numbers and diffusion coefficients in binary Ni-Sn (composition $Ni_{1.5}Sn$) and binary Cu-Sn specimens at 1084° C. Interpretation of results in terms of bonding types. (M25h, N1; Cu-b, Ni-b, Sn-b, 14-68)

427-M. Stainless Lox Vessels Must Meet Extreme Cleanliness Tests. Inco Nickel Topics, v. 14, Apr. 1961, p. 10-11.

Sand blasted, vacuum cleaned and pickled 304 stainless steel pressure vessels are subjected to microscopic tests to determine cleanliness. (M21, T26q)

428-M. (French.) Orientation in a 50% Iron-Nickel Alloy Caused by Neutron Irradiation in a Magnetic Field. J. Pauleve and D. Dautreppe. Journal de Physique et Le Radium, v. 22, Apr. 19, 1961, p. 39S.

Sample is irradiated in a magnetic field from 25-250° C. Anisotropy due to orientation as a function of irradiation intensity ranging from 1×10^{17} to 15.10^{17} nvt. (M26c, P16, 2-67; Fe-b, Ni-b)

429-M. (English.) The Crystal Structure of HfAl. Lars-Erik Edshammar. Acta Chemica Scandinavica, v. 15, Feb. 1961, p. 403-406.

X-ray powder measurements of space group, unit cell dimensions and interatomic distance of HfAl specimens. Comparison of structure with that of CrB. 11 ref. (M22g, M25, M26; Hf-b, Al-b)

430-M. High Temperature X-Ray Diffraction Techniques for Active Metals. J. J. Hanak and A. H. Daane. Review of Scientific Instruments, v. 32, June 1961, p. 712-714.

Technique for obtaining X-ray diffraction information on metals such as tungsten and rare earths at high temperatures (1000, 1400 and 2200° C.) One method permits simultaneous measurement of specimen heat resistance with diffraction patterns. 11 ref. (M22g, 2-62, P11h; W, EG-g45)

431-M. X-Ray Diffraction Camera for the Alignment of Large Single Crystals. R. W. Meyerhoff, D. M. Bailey and J. F. Smith. Review of Scientific Instruments, v. 32, June 1961, p. 715-717.

Examination of the degree of single crystallinity of a specimen by a back-reflection Laue camera incorporating three rotation axes and three orthogonal translation axes. Camera allows for alignment of large single crystals with a precision of ± 0.25°. (M22g, 1-52, M26)

432-M. (German.) Nitride Phases of Niobium. G. Brauer and R. Esselborn. Zeitschrift fur Anorganische und Allgemeine Chemie, v. 309, Apr. 1961, p. 152-170.

Nitriding of pure Cb sheet or powder and of CbH from 750-1450° C. in NH_3 and N_2 atmospheres. Investigation of nitride phases by chemical analysis, X-ray examination (using Cu, Ni or Fe-K alpha radiation) and density measurements. Data are given for lattice structure and phase transformations. (M26q, M-general, N-general; Cb, N, 14-68)

433-M. (German.) System Potassium-Arsenic. Friedrich Wilhelm Dorn, Wilhelm Klemm and Sigurd Lohmeyer. Zeitschrift fur Anorganische und Allgemeine Chemie, v. 309, Apr. 1961, p. 205-209.

Establishment of the K-As phase diagram up to 60 at.% As quantitatively by thermal analysis and, for higher As contents, qualitatively by comparative techniques and by X-ray methods. Data are given for melting, sublimation and transition temperatures of the compounds K_3As, K_5As_4, KAs and KAs_2. (M24b, M-general, 2-60; K-b, As-b)

434-M. (German.) On Some A_3B and AB_2-Type Compounds of the Heavy Alkali Metals With Elements of the Fifth Group. Geert Gnutzmann, Friedrich Wilhelm Dorn and Wilhelm Klemm. Zeitschrift fur Anorganische und Allgemeine Chemie, v. 309, Apr. 1961, p. 211-225.

X-ray determination using Ni-filtered Cu-K alpha radiation of crystal structure of K_3P, Rb_3As,

Rb_3Sb, Rb_3Bi and Cs_3Bi. Discussion of lattice types and space chemistry of A_3B-type compounds. Influence of electronegativity on volume contraction of ABi_2 compounds. (M25, M26; EG-e, EG-a)

435-M. (German.) Influence of Residual Copper Clouds Around Dislocations on Recombination in Germanium. S. G. Kalaschnikow and A. K. Mednikow. Physikalische Abhandlungen aus der Sowjetunion, v. 4, Feb. 1961, p. 151-160.

Measurement of specific resistance, type of conductivity and diffusion length of minority charge carriers for Ge single crystal specimens of various dislocation densities, before and after tempering in contact with Pb from 625-700° C. Influence of Cu on recombination rate. 12 ref. (M26b, P15g, 2-64, 3-69; Ge, Cu)

436-M. Moire Pattern and Dislocation Grid in Pure Iron. Hiroshi Fujita and Zenji Nishiyama. Osaka University, Institute of Scientific and Industrial Research, Memoirs, v. 18, 1961, p. 55-64.

Electron microscopic distinction between moire patterns and dislocation grids in Fe foils made by electropolishing after annealing, despite their spacings being as small as 100 A or less. 4 ref. (M26n, M26b, M21e; Fe-a, 4-56)

437-M. Distribution of Dislocations in Pure Iron Deformed at Low Temperatures. Hiroshi Fujita and Zenji Nishiyama. Osaka University, Institute of Scientific and Industrial Research, Memoirs, v. 18, 1961, p. 65-70.

Transmission electron microscope observations on pure Fe deformed at low temperatures reveal formation of the sub-boundary-like structure by heavy cold working, formation of the irregular dislocation networks and moire patterns and dynamic formation of dislocation loops. 4 ref. (M26n, M26b, M21e, 3-68; Fe-a)

438-M. (Russian.) Radiographic Investigation of Austenitic Steels. V. I. Grigorkin and G. V. Korotushenko. Izvestiya VUZ--Chernaya Metallurgiya, Feb. 1961, p. 96-99.

Investigation of crystal lattice periods, alteration in the fine grain structure and grain hardenability as dependent on fast plastic deformation of commercial forged hoop Fe and rich Mn austenitic steels. 13 ref. (M23n, M26, M27, J5, 3-68; Fe, SS-e, Mn)

439-M. (Russian.) Investigation of Iron-Aluminum Alloys. F. L. Edel'man and L. I. Tushinskii. Izvestiya VUZ--Chernaya Metallurgiya, Feb. 1961, p. 128-132.

Inexpensive alloy of low-carbon Fe and 2.49-29.36% Al is investigated to determine structure, machinability, hardness and oxidation at high temperatures (800-1100° C.) 5 ref. (M26, Q29, G17k, R1h, 2-62; Fe-b, Al)

440-M. Open Orbits and the Fermi Surface of Copper From Magnetoresistance and Hall Effect Data. J. R. Klauder and J. E. Kunzler. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 213-216.

A phenomenological determination of the topology of the Fermi surface by correlation of high-field magnetoresistance data for transverse and longitudinal rotation, as indicating the number of open orbits existing as a function symmetry direction and by calculations for the Hall constant as an indicator of closed orbits. Measurements are made at 4.2° K. with longitudinal and transverse magnetic field rotation in the case of magnetoresistance. 5 ref. (M25n, P15p, P16e, 2-63; Cu)

441-M. Fermi Surface Areas and Fermi Velocities of Mg, Zn and Cd. E. Fawcett. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 228-229.

Estimates of the free area in wave-vector space of the Fermi surface are obtained for fine-grain polycrystalline samples using a thermal method of measurement at 35.5 Gc/s and 4.2° K. An equation is derived combining Fermi surface area with d-c conductivity and electronic specific heat to obtain values for the carrier mean free path and the Fermi velocity and, consequently, the relaxation time. 4 ref. (M25, P15g, P12r; Mg, Zn, Cd, 14-61)

442-M. A Direct Comparison of the Mean Free Paths for Electrical and Thermal Conduction in Indium at Low Temperatures. J. L. Olsen and P. Wyder. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 266-267.

The size dependence of the electrical and thermal conductivities are used to determine the electron mean free paths in pure In by experimental methods and calculation using the Wiedemann-Franz law, at 0-293° K. as a function of temperature and as related to relaxation time. (M25, P11h, P15g, 2-63, 3-73; In)

443-M. Scattering of Lattice Waves by Point Defects. P. G. Klemens, R. J. Tainsh and G. K. White. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 273-276.

Thermal and electrical conductivities from 2-90° K. of Cu-rich alloys containing 0.5-2% Pr, 2.3-4% Si and 0.06% Fe and Ag-rich alloys and 2% Al, 2% Pt and 0.2% Sn, are measured to determine lattice wave scattering cross sections by point defects as influenced by impurity concentration and mass differences. 9 ref. (M26s, P11h, P15g, 2-60, 2-63, 3-69; Cu-b, Ag-b)

444-M. A Study of the Band Structure and Superconducting Properties of Several Gamma-Uranium Alloys From Measurements of Their Specific Heats Between 1° K. and 4° K. B. B. Goodman, J. Hillairet, J. J. Veyssie and L. Weil. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 350-356.

Investigation of the shape of the density of states curve in gamma U-Mo (13.7-29.6%) and U-Cb (25.9%) alloys and alpha uranium (99.95%). Correlation of data in studying the BCS relation for the transition temperature of a superconductor. 11 ref. (M25, P13h, P15g, 2-60, 2-63; U-b, Mo, Cb)

445-M. The Use of Superconductivity in Studying Neutron Irradiation Damage in Rhenium and Tin. J. Blanc, B. B. Goodman, G. Kuhn, E. A. Lynton and L. Weil. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 393-395.

Study of magnetization curves of specimens irradiated at 77° K. and 20° C. after 500° C. annealing to determine the critical temperature and frozen-in-moment as indicators of irradiation damage. Relation of superconductivity parameters to point defect and dislocation occurrence and annealing out, probably by the recombination of Frenkel pairs, as a function of temperature. 7 ref. (M26s, M26b, P15g, P16, 2-63, 2-64, 2-67; Rh, Sn)

446-M. The Effect of Free Electron on Lattice Vibration. W. C. Overton, Jr. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 677-679.

The effect of free electron gas on the lattice vibrations of f-c-c. metals is investigated for Cu in terms of a central force model with nearest and next-nearest neighbor interactions and the same model immersed in the gas of the free electron. Experimentally elastic constants near 0° K. are used to determine force constants for determining the vibration spectra. 6 ref. (M25, Q21, 2-63; Cu)

447-M. Quenched-In Vacancies and Quenching Strains in Gold. J. Takamura. Acta Metallurgica, v. 9, June 1961, p. 547-557.

The contraction in length of quenched Au specimens is observed during annealing from 8-30° C. and is interpreted in terms of vacancies. The concentration of quenched-in vacancies is given by an equation in terms of the total fractional-volume change deduced from the length measurement, the fractional volume of a vacancy, the formation energy and the quenching strain and temperature. 29 ref. (M26s, P10d, 2-61, 2-64; Au)

448-M. The Observation of Dislocations in Mica. E. C. H. Silk and R. S. Barnes. Acta Metallurgica, v. 9, June 1961, p. 558-562.

Thin cleaved fragments of mica are examined in the electron microscope and show dislocations lying in the cleavage planes. The dislocations are formed by slip and interact simply. The superposition of loose sheets of the mica produces

moire patterns which reveal those dislocations which are perpendicular to the cleavage plane. 9 ref. (M26b)

449-M. (Japanese.) The Configuration of Titanium Sulphide in Steels. Toshio Saito. Tetsu-to-Hagane (Iron and Steel Institute of Japan, Journal), v. 47, May 1961, p. 707-714.

The effect of Ti-S ratio on the distribution, shape and structure of Ti sulphide inclusions in cast steels is examined by X-ray diffraction and electron microscopy after quenching from 1200-700° C. Data are given for lattice parameters and thermodynamic properties of the sulphides and for formation of oxides, carbides and nitrides. Influence of inclusions on tensile properties and microhardness. 26 ref. (M26q, M-general, Q-general, 2-60, 2-64, 9-69; ST, Ti, S)

450-M. International Union of Crystallography--Fifth International Congress and Symposia. K. Rajagopalan. Scientific and Industrial Research, Journal, v. 20A, Apr. 1961, p. 193-196.

A review of crystallographic theory, research, techniques and apparatus. Topics include crystal structures of various metals, alloys, minerals and compounds, including the study of chemical bonding and lattice structure. (M26, A-general. 10-54)

451-M. (Translation-Brutcher no. 4985.) Nature of the Manganese Phase of Certain Magnesium Alloys. M. E. Drits. Metallovedenie i Termicheskaya Obrabotka Metallov, Oct. 1959, p. 33-37.

Development of an electrolytic method of separating Mn from Mg alloys containing 1 1/2-2% Mn. Nature of the Mn-rich phase in various systems--Mg-Mn-Al, Mg-Mn-Ca, Mg-Mn-Al-Ca and Mg-Mn. Microstructure and X-ray analysis on residues. (M27, S11; Mg-b, Mn, Al, Ca)

452-M. Fractographic Analysis of AISI 4340 Steel by Optical and Electron Microscopy. N. A. Tiner. ASTM Preprint no. 82, 1961, 9 p. $.50.

Study is made of the modes of fracture for AISI 4340 steel. Fracture surfaces are examined by electron microscopy. The discontinuous nature of fracture propagation is analyzed and two methods are developed for determining the direction of propagation. 11 ref. (M23p, M21, Q26q; AY)

453-M. (Book.) Advances in X-Ray Analysis. v. 4. William M. Mueller, Editor. 1961. 568 p. Plenum Press, New York. $15.

Proceedings of the Ninth Annual Conference on the application of X-ray analysis, sponsored by the University of Denver, Aug. 10-12, 1960. Papers are abstracted separately. (M21f, M22g, 10-54)

454-M. Electrocrystallography of Cobalt and Cobalt-Nickel Alloys. H. F. Quinn and I. M. Croll. Paper from "Advances in X-Ray Analysis", v. 4. Plenum Press, New York, 1961, p. 151-174.

X-ray analysis reveals preferred orientation in the polycrystalline deposits generally and extreme preferred orientation (characterized by (00.2) and (11.0) fiber axes) in the case of those samples obtained with additive-free electrolyte. A change in the pH of the bath or the addition of an a-c. component are equally effective in determining the type of fiber axis in the deposit. 6 ref. (M21e, M26c, L17; Co-b, Ni)

455-M. A Study of Phase Reactions in a Complex 4.5 Al-3.5 Ti-Ni Base Alloy. John F. Radavich and W. J. Boesch. Paper from "Advances in X-Ray Analysis", v. 4. Plenum Press, New York, 1961, p. 233-243.

Investigation of the phase changes after solutioning at high temperatures and aging at lower temperatures. The physical distribution and size of the precipitated phases are studied by electron microscopy. X-ray diffraction and fluorescence analysis are carried out on chemically extracted residues. 7 ref. (M21e, M22g, M24c, N7, 2-64, 2-65; Ni-b, Al, Ti)

456-M. (Translation-Brutcher no. 5010.) Structural Changes in Ferritic Magnesium-Treated Cast Iron. A. I. Yatsenko. Metallovedenie i Termicheskaya Obrabotka Metallov, Dec. 1959, p. 47-50.

Previously abstracted from original. See item 71-M, 1960. (M27, Q29q, P16a, 2-64; CI, Mg)

457-M. (Translation-Brutcher no. 5192.) Surface Defects on Rolled Steel. P. Ya. Ryzhkov and R. M. Shereshevskaya. Metallurg, May 1961, p. 25-26.

Metallographic patterns on artificially produced surface defects on tube blanks as a potentially useful guide in identifying the nature of actual surface defects such as occur on rolled stock. (M-general, 3-68; ST, 9)

458-M. Analysis of Germanium-Silicon Alloy Grown by Pulling Technique. Zensho Ishii and Yasuo Matsukura. Electrochemical Laboratory, Bulletin (Japan), v. 25, Apr. 1961, p. 280-282.

Ge-Si alloy crystals are grown from the melt using Si seeds. X-ray analysis shows that parts of about 40 wt. % in the grown crystals are single with the same orientation as the seed. X-ray diffraction and measurement of specific gravity show that the composition of the grown crystals is in the range of 97.5-91.0% Si and is homogeneous in the plane perpendicular to the growing axis. Segregation constant of Ge in Si. (M26, M22g, P10a; Si-b, Ge, 14-61, 9-69)

459-M. Projections on Electrobrightened Aluminium Surfaces. J. P. A. Wortley and T. B. Vaughan. Institute of Metals, Journal, v. 89, June 1961, p. 376.

Occurrence of geometrical shapes (i.e., pyramids with rectangular or hexagonal bases) on the polished surfaces of single and polycrystal specimens of super-pure Al during electrobrightening with a phosphoric acid solution containing chromic acid. Growth of the projections and their orientation and grain boundary relations are attributed to the absence of normal dissolution at certain sites as a function of solution age and electrobrightening time. (M28m, M27f, L13, 3-67; Al-a)

460-M. A Metallurgical Look at 300-Year-Old Iron. Warren C. Jeffery. Foundry, v. 89, Aug. 1961, p. 48-49.

Chemical composition and microstructure of a large diameter cast iron pressure pipe cast in 1664 for use in a water transporting system. (M27, T26r; CI, 17-57)

461-M. Metallographic Investigations of Ancient Iron Objects From the Territory Between the Oder and the Basin of the Vistula River. Jerzy Piaskowski. Iron and Steel Institute, Journal, v. 198, July 1961, p. 263-282.

Structures, inclusions, segregation and carburization in a variety of ancient tools, jewelry and weapons. 51 ref. (M-general, M26, M27; Fe, 9-69)

462-M. (German.) Comparative Investigation and Assessment of Methods of Evaluation of Austenitic Grain Size. Jiri Skarek and Karel Ciha. Neue Hutte, v. 6, May 1961, p. 301-309.

Direct and indirect microscopic and electron microscopic investigation of austenite grain size for unalloyed case hardenable and heat treatable steel; alloyed Mn-Si, Cr-Mn, Cr-V and Cr-Ni steel; and differently deoxidized heat treatable Cr-Ni steel, employing techniques such as direct observation in a high-temperature microscope or electron microscope; thermal etching and etching by acids and fused salts; thermal embrittlement and diffusion methods. 49 ref. (M27c, M-general, N8; ST)

463-M. (German.) Ternary System Iron-Nickel-Gold. Werner Koster and Werner Ulrich. Zeitschrift fur Metallkunde, v. 52, June 1961, p. 383-391.

Investigation of phase equilibria and establishment of the ternary Fe-Ni-Au phase diagram over the concentration range and up to melting temperatures by thermal analysis; microstructure, magnetic, X-ray and dilatometric examination and by hardness and electrical resistance measurement. (M24c, M-general, 2-61, 2-64; Au-b, Ni-b, Fe-b)

464-M. (German.) Ternary C Alloys of Pd and Pt With Mg, Al, Zn, Ga, Ge, Cd, In, Sn, Hg, Tl and Pb. Hans H. Stadelmaier and William K. Hardy. Zeitschrift fur Metallkunde, v. 52, June 1961, p. 391-396.

Preparation of ternary specimens by melting and sintering under vacuum and phase identification and lattice structure investigation by microscopic and X-ray examination. Structure of PdMg, Pd_2Zn, Pd_3Tl, Pt_3Mg, PtMg, Pt_3Al, Pt_3In and Pt_3Hg. (M24c; Pd-b, Pt-b, C, Al, Zn, Ga, Ge, Cd, In, Sn, Hg, Tl, Pb)

465-M. (German.) Combined Electrolytic and Mechanical Polishing of Iron-Carbon Alloys. Jurgen Just and Wilhelm Altgeld. Zeitschrift fur Metallkunde, v. 52, June 1961, p. 410-413.

Method, apparatus and electrolytes for polishing of Fe-C alloys (examples--lamella and nodular cast iron, steel) in microstructure investigations. (M20p; Fe-b, C)

466-M. (German.) New Shapes of Silicon Crystals in Aluminum-Silicon Alloys. Chiu Shiu-Tang. Zeitschrift fur Metallkunde, v. 52, June 1961, p. 414-416.

Microscopic investigation of shapes of Si crystals precipitated from hypereutectic Al-Si alloys (12-23% Si). Influence of alloying elements. (M26, N7, 2-60, 3-73; Al-b, Si)

467-M. (German.) Atom Distribution in Melts. Siegfried Steeb. Zeitschrift fur Metallkunde, v. 52, June 1961, p. 422-425.

Critical analysis of atom distribution curves in liquid elements (He, Ar, Xe, Li, Na, K. Al, Ag, Au, Zn, Cd, Hg, Ga, In, Tl, Ge, Sn, Pb, Bi) and in the amorphous state of Bi and Ga. Interpretation of maxima in atom distribution by a "chain model" and a statistical model derived by Bernal. (M25; 14-60)

468-M. (French.) Application of the "Total Replica" Technique to the Detection of Defects in the Inner Surface of Pipe. L. Alfille, M. Azam and M. Fignon. Revue de Metallurgie, v. 58, May 1961, p. 429-436.

The replica of the entire inner surface is obtained by use of a prevulcanized rubber solution. The quality of the replicas obtained is illustrated by some typical examples--cross wires, Knoop hardness indentations, etch pits and induced scratch marks. (M20r, M-general, 9-69; 4-61)

469-M. Notes on the Microstructure of Centrifugal Castings for the Automobile Industry. F. Cumberland. British Foundryman, v. 54, July 1961, p. 302-304.

Chemical composition and mechanical properties of pearlitic gray irons and free carbide materials used in cylinder liners and piston rings. Effect of heat treatment on microstructure. (M27, 2-64, Q-general, 2-60, T21b; CI-n, 5-65)

470-M. An Effect of Composition on the Macrostructure of Ingots of a Low-Alloy Steel. T. B. Smith, J. S. Thomas, R. Goodall and R. T. Allsop. Iron and Steel Institute, Journal, v. 198, June 1961, p. 161-163.

Effect of reducing the Si and Mn content of 1.57% Ni-Cr-Mo steel ingots on the increase in length of the columnar crystals, ingots are cast at 1600° C. from a melt consisting of Lowmoor Fe, low-Si pig iron, pure Cr, ferro-Mo, and carbonyl Ni. Si and Mn content of the steel has an influence on the ingot macrostructure which outweighs that of casting temperature. (M28, 2-60; AY, Si, Mn)

471-M. (French.) Radiocrystallography. Machine Moderne, v. 55, June 1961, p. 83-88.

X-ray diagrams are obtained for Cu, a Cd-Bi alloy, Au and single crystals, powders, sheets and wires of Al for determination of phases present, chemical composition, texture and thickness. 12 ref. (M21f, M22g, S11p, S14e)

472-M. Electron-Microscope Studies at the N. P. L. Metal Treatment and Drop Forging, v. 28, July 1961, p. 279-280.

Application of the electron microscope to ferrous and nonferrous metallurgy including Fe, Au, Cu and Cu-Sb alloys at the Metallurgy Div. of the National Physical Laboratory at Teddington. Study of precipitation of phases from solid solutions by thin film techniques and analysis of aging, surface energy, creep and composition. (M21e, N7, P13h, Q3; Fe, Au, Cu, Cu-b, Sb)

473-M. Ternary System Th-Ce-Al. J. H. N. van Vucht. Philips Research Reports, v. 16, Feb. 1961, p. 1-40.

Metallographic examination and X-ray analysis of the ternary system Th-Ce-Al, the binary systems Th-Al Ce-Al and Th-Ce and of Ce. Data are given for structure, lattice constants, atomic sites and composition. The structure of Ceto, a nonevaporating getter, is determined. 39 ref. (M26, M25, M24; Th, Ce, Al)

474-M. The Phase Diagram of the Gallium-Tellerium System. P. C. Newman, J. C. Brice and H. C. Wright. Philips Research Reports, v. 16, Feb. 1961, p. 41-50.

Phase diagram is investigated by differential thermal analysis and direct observation of melting points under controlled Te pressures. Results indicate the existence of Ga_3Te_2 and $GaTe_3$ compounds which are not stable at room temperature. Upper decomposition limits. 14 ref. (M24b, P12n, S11g; Ga, Te)

475-M. (German.) Changes on Corpuscular Irradiated Copper and Boron Surfaces. Willi Marth. Zeitschrift fur Angewandte Physik, v. 13, May 1961, p. 224-230.

Electron microscopic and X-ray investigation by replica technique of surface changes before and after bombardment with alpha particles and heavy atoms of the ThB decomposition series under 10^{-4} Torr vacuum. Leveling effect of alpha bombardment on Cu surface and "cold sintering" effect on sintered boron specimens. (M28n, M-general; Cu, B)

476-M. The Constitution of Quaternary Aluminum-Copper-Magnesium-Silicon Alloys at 500° C. D. P. Smith. Metallurgia, v. 63, May 1961, p. 223-230.

Alloys severely worked and annealed at 500° C. exhibit a quaternary phase in addition to the phases of the constituent ternary systems. Phase boundaries derived by calculations are confirmed by experiment indicating the Al solid-solution region at 500° C. 12 ref. (M24d, 2-62, 3-68; Al-b, Cu, Mg, Si)

477-M. (Japanese.) The Surface Faults of Hot-Rolled Stocks. (Supplement) Takashi Ikeno. Light Metals, v. 11, May 1961, p. 165-170.

The constituents of surface faults in hot rolled Al plate specimens after pickling and anodizing are examined by electron microscopy, X-ray, and ultraviolet and infrared absorption spectrum methods. Ca, Mg, Si, C and H are identified in both the macro and microstructure of the faults. (M-general, M28, S11, 9-71; Al-b, 4-53)

478-M. (Japanese.) Earing in the Deep Drawing of Aluminium Alloy Sheet. Pt. 1. (In the Case of 3S Aluminium.) Takuichi Morinaga and Shigeo Zaima. Light Metals, v. 11, May 1961, p. 171-176.

Effect of cold rolling reduction, direction of rolling and annealing temperature on directionality phenomena including earing height and growth and Knoop ratio as determined by deep drawing tests on specimens of 3S Al, a hot rolled, nonheat treatable alloy. 4 ref. (M28k, M28p, 2-61, 3-72, 9-71; Al-b, 4-53)

479-M. (Japanese.) Earing in the Deep Drawing of Aluminium Alloy Sheet. Pt. 2. (In the Case of 52S.) Takuichi Morinaga and Shigeo Zaima. Light Metals, v. 11, May 1961, p. 177-181.

Cold rolling reduction, direction of rolling and annealing temperature effects on directionality phenomena including earing height and growth and Knoop ratio correlation as determined by deep drawing tests on 52S Al specimens. (M28k, M28p, 2-61, 3-72, 9-71; Al-b, 4-53)

480-M. Large Dislocation Loops in Antimony Telluride. P. Delavignette and S. Amelinckx. Philosophical Magazine, v. 6, May 1961, p. 601-608.

Electron microscopy examination of hexagonal, prismatic dislocation loops in Sb_2Te_3 crystals slowly grown from the melt. The loops are attributed to deviations in the stoichiometric composition causing the precipitation of Te vacancies. Equilibrium shapes are calculated with projection of Burgers vectors and analysis of glide interactions. 8 ref. (M26b, 3-67; Sb-b, Te, 14-61)

481-M. Lattice Spacing Relationships and the Electronic Structure of H.C.P. Zeta Phases Based on Silver. H. W. King and T. B. Massalski. Philosophical Magazine, v. 6, May 1961, p. 669-682.

Phases in the systems Ag-Cd, Ag-Hg, Ag-Ga, Ag-In, Ag-Sn, Ag-As and Ag-Sb are studied by X-ray powder methods. Changes in the lattice spacing are determined as functions of electron:atom ratio and interpreted in terms of distortions of the Brillouin zone following interactions between the Fermi surface with various zone faces. 25 ref. (M25, M26, M-general, 2-60; Ag-b, Cd, Hg, Ga, In, Sn, As, Sb)

482-M. The Low Energy Ion Bombardment of Gold. D. G. Brandon and Piers

Bowden. Philosophical Magazine, v. 6, May 1961, p. 707-710.

Thin films of annealed Au (99.998% pure) are bombarded with Ar ions at energies to 75 ev. with electron microscopy examination of subsurface produced in the crystal lattice. Point defect production and vacancy and interstitial impurity effects are compared to irradiation damage. 9 ref. (M26s, 2-67; Au, 14-62)

483-M. (Japanese.) Study on Aluminum Alloy Slab. Pt. 2. Annular Ring-Like Structure in Grains. Tojiro Kobayashi and Hisao Otsuji. Light Metals, v. 11, Mar. 1961, p. 89-95.

The effect of cold rolling reduction and heat at 500° C. for 24 hr. on the disappearance of annular structures occurring in semicontinuous cast slab is studied by inferometric methods. Appearance of the structures is attributed to nonuniformity of the density of the solid solution. 4 ref. (M27c, M28, 2-64, 3-68; Al-b, 5)

484-M. (Japanese.) Effect of Zirconium on Aluminum and Its Alloys. Pt. 5. Hajime Yamada. Light Metals, v. 11, Mar. 1961, p. 101-106.

Formation of intermetallic compounds, with consequent impairment of solubility and increase of precipitation of Zr, in Al-50% Zr alloys by Fe, Mn and Cu impurities. Effects on recrystallization temperature, annealing curve at 20-600° C., lattice constants and solidification structures are examined by X-ray diffraction and metallographic methods. 7 ref. (M26q, M-general, N-general, 2-60, 3-69; Al-b, Zr)

485-M. High Velocity Dislocations. J. Weertman. Paper from "Response of Metals to High Velocity Deformation". v. 9. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 205-248.

Review of theory of uniformly moving dislocations. Extension of Eshelby's analysis of moving in an isotropic medium, showing that edge dislocations of like sign attract each other when the dislocations are traveling at velocities above the Rayleigh wave velocity. 24 ref. (M26b, 3-67, 3-68)

486-M. (Russian.) Lattice Imperfections in Cold Deformed Nickel and Nichrome. Ya. D. Vishnyakov and S. S. Gorelik. Fizika Metallov i Metallovedenie, v. 10, Dec. 1960, p. 841-852.

Cold deformation of Nichrome by filing and of Ni powder by grinding in a ball mill with subsequent vacuum heating and X-ray diffraction examination. Effects of deformation, heat treatment and Cr content on lattice imperfections and lattice parameters. 14 ref. (M26s, 2-60, 2-64, 3-68; Ni-b, Cr)

487-M. (Russian.) Effect of Sulphur on Surface Properties and Structure of Nickel-Carbon Alloys. R. A. Sidorenko and B. V. Tsarevskii. Fizika Metallov i Metallovedenie, v. 10, Dec. 1960, p. 866-872.

Samples of an alloy containing 2.40% C, 0.002% S and 0.0004% O are held with various quantities of a Ni-C-S alloy on a graphite plate at 1360° C. Influence of the Ni-C-S alloy additions on the sulphur content and effect of sulphur on the liquid metal-graphite plate contact angle, graphitization, macrostructure and microstructure. 22 ref. (M27, M28, N-general, 2-60, 2-61; Ni-b, C, S)

488-M. (German.) Structure of Hafnium-Aluminum. H. Boller, H. Nowotny and A. Wittmann. Monatshefte fur Chemie, v. 92, Feb. 1961, p. 330-334.

Investigation of crystal structure of HfAl using polycrystalline specimens and a needle-shaped single crystal. X-ray determination of lattice structure and pycnometric evaluation of stoichiometric composition of HfAl. (M26; Hf-b, Al, 14-61)

489-M. (German.) Investigation in the System Tungsten-Silicon-Germanium. H. Nowotny, F. Benesovsky and C. Brukl. Monatshefte fur Chemie, v. 92, Feb. 1961, p. 365-370.

X-ray measurement of lattice parameter and phase identification in sintered, pressure-sintered, arc-melted and long-time annealed specimens with construction of the ternary phase diagram. (M26, M24c; Ge-b, W-b, Ti-b)

490-M. Crystal Structures and Electrical Properties of Alkali Antimonides. Junichi Chikawa, Shunji Imamura, Kenzo Tanaka and Makoto Shiojiri. Physical Society of Japan, Journal, v. 16, June 1961, p. 1175-1180.

X-ray study and electrical measurements in vacuum on K-Sb, Na-Sb, Cs-Sb and RbSb to determine relationships between crystal structure transitions and number of excess alkali atoms. 5 ref. (M26, P15, S11q, 1-73; EG-e41, Sb)

491-M. Observation of Dislocations in Germanium Single Crystal. Masakazu Shoji, Shoji Tauchi, Tomokuni Mitsuishi and Masami Tomono. Physical Society of Japan, Journal, v. 16, June 1961, p. 1253.

Dislocation lines in Ge are observed using the Borrman method in order to compare density of etch pits with that of X-ray images. 6 ref. (M26b; Ge, 14-61)

492-M. (German.) Crystal Structure of $CaZn_2$. J. Wieting. Naturwissenschaften, v. 48, May 1961, p. 401.

X-ray measurement of lattice parameters on single crystal specimens and powder samples. (M26; Zn-b, Ca)

493-M. Concerning the Distribution Coefficient of Gold in Lead. J. T. Tubb, E. L. Holmes and W. C. Winegard. Canadian Journal of Physics, v. 36, June 1961, p. 945-947.

The value of the distribution coefficient is obtained from the published phase diagram, assuming straight solidus and liquidus lines. 9 ref. (M24b, P12, 2-60; Pb-b, Au)

494-M. (Russian.) Change in Defect Density of the Crystal Lattice During Quenching and Tempering of Low-Alloy Steels. L. M. Mirkin. Izvestiya VUZ--Chernaya Metallurgiya, Dec. 1960, p. 97-98.

Examination of defects in alloy steels containing 0.2-0.35% C, 1% Cr, 1% Mn, 0.1-0.2% Ti by X-ray diffraction. The steels were quenched from 920-1200° C. with reheating at 0-700° C. for 1 1/2 hr. Density of defects is investigated as a function of composition, initial heat treatment and reheat temperature. (M26s, M22g, N8a, 2-60, 2-61, 2-64; AY)

495-M. Temperature Dependence of Rolling Textures in High-Purity Silver. H. Hu and R. S. Cline. Journal of Applied Physics, v. 32, May 1961, p. 760-763.

A rolling texture transition from the (110) (112) is produced in Ag by changing the temperature of deformation. Rolling at 200° C. produces a texture of the (123) type, plus a cube texture component due to partial recrystallization. 12 ref. (M26c, 2-61, 3-68; Ag)

496-M. Stacking Fault Probability of Noble Metal-Zinc Alloys. L. F. Vassamillet. Journal of Applied Physics, v. 32, May 1961, p. 778-783.

X-ray diffraction examination of crystal structures of a number of alloys of Au, Ag and Cu with varying Zn content. The relative magnitudes of the stacking fault energies are deduced by measuring the stacking fault probabilities. 9 ref. (M22g, M26b, 2-60; Ag-b, Au-b, Cu-b, Zn)

497-M. First Magnetocrystalline Anisotropy Constants of Some Iron Silicon Alloys. Sigurds Arajs, Henry Chessin and D. S. Miller. Journal of Applied Physics, v. 32, May 1961, p. 857-859.

Torque magnetometer measurements on disordered alloys containing 3.6-12.4% Si and 297° K. by determining the torque exerted on (100) single-crystal disks in uniform magnetic field. Crystallographic orientation and lattice parameters are determined by Laue back reflection techniques. 29 ref. (M26, P16, 3-72; Fe-b, Si)

498-M. Textural Properties of Germanium Films. John E. Davey. Journal of Applied Physics, v. 32, May 1961, p. 877-880.

Investigations on thin films vacuum evaporated onto hot fused quartz substrates from 20-650° C. The strongest texture is the (110) obtained at substrate temperatures as low as 175° C. Between 350 and 575° C., competition for growth occurs and the texture varies principally between being powder, (110) and (111). 18 ref. (M26c, 2-61; Ge, 14-62)

499-M. (Russian.) Changes in Cohesion Forces of Solid Solutions in the Nickel-Cobalt-Vanadium System. B. G. Livshits and G. A. Rymashevskii. Izvestiya VUZ--Chernaya Metallurgiya, Mar. 1961, p. 154-160.

Investigation of interatomic cohesion in various compositions, melted in an Ar atmosphere. Determination of characteristic temperature by measuring elasticity moduli. 11 ref. (M25h; Ni, Co, V)

500-M. (Italian.) Electron Microscopy for the Study of Metals. M. Paganelli. Alluminio Nuova Metallurgia, v. 30, May 1961, p. 231-240.

Examination of the distribution of handening precipitates using the replica of anodic oxide for Al alloys and the replica of carbon or SiO for other alloys. Distribution of lattice defects is studied by thinning the metallic specimen and examining it by transmission. 9 ref. (M21e, M26)

501-M. Electrolytic Polishing of Refractory Metals. F. R. Cortes. Metal Progress, v. 80, Aug. 1960, p. 97-100.

A versatile solution, composed of small amounts of sulphuric and hydrofluoric acids in methanol, can be used to electropolish four refractory metals--Mb, W, Ta and Cb. Grinding and polishing procedures. (M20p; Mo, W, Ta, Cb, EG-d)

502-M. (Spanish.) Metallography and Spectrography of Industrial Lead-Tin Alloys. Enrique Asensi Alvarez-Arenas. Tecnica Metalurgica, v. 16, Nov-Dec. 1960, p. 215-229.

Preparation of specimens from Pb-Sb alloys containing 0.90-12.30% Sb and Pb-Sb-Sn and alloys with 2.14-23.18% Sb and 2.34-14.17% Sn to determine the effect of heat treatment and of composition by spectrographic analysis. 14 ref. (M20, S11c, 2-60, 2-64; Pb, Sb, Sn)

503-M. The Crystal Structure of Actinium Metal and Actinium Hydride. J. D. Farr, A. L. Giorgi, M. G. Bowman and R. K. Money. Journal of Inorganic and Nuclear Chemistry, v. 18, Mar. 1961, p. 42-47.

Analysis of X-ray diffraction patterns using small Ac samples (0.010 mg.) freshly separated from its radioactive daughters. (M26; Ac, 14-68)

504-M. (German.) On the Ternary System Iron-Sulphur-Tungsten. Rudolf Vogel and Horst-Heinrich Weizenkorn. Archiv fur das Eisenhuttenwesen, v. 32, June 1961, p. 413-420.

Microstructure investigation and thermal analysis of phase equilibria in the partial system Fe-FeS-WS_2-W. Phase diagram and crystallization mechanism. 18 ref. (M24c, M27, M23r, N12; Fe, S, W)

505-M. (Russian.) Temper Brittleness. L. M. Utevskii. Metallovedenie i Termicheskaya Obrabotka Metallov, June 1961, p. 35-41.

Development of temper brittleness in the presence of phosphorus that shows its highest concentration on the grain boundaries. Behavior of phosphorus enriched boundaries in micrographic etching. Transition temperature measurements with KhG2, O4KhG2, O8KhG2, KhG2R and O9KhG2r steels, heat treated after hardening at 500-650° C. for 1-45 hr. 25 ref. (M27f, 2-64, Q23r; ST, P)

506-M. (Russian.) Microstructure of Steel Manufactured From Shavings. I. N. Goncharov and K. M. Stroeva. Metallovedenie i Termicheskaya Obrabotka Metallov, June 1961, p. 48-49.

Shavings are heated in a rotary furnace or in sheet metal boxes and subsequently forged. Effect of oxidation during the storage of shavings on tensile and yield strengths, elongation, impact strength and microstructure of the steel obtained. (M27, Q-general; ST, 3-70)

507-M. Grain Boundary and "Superhigh Plasticity". Michael G. Lozinsky. Acta Metallurgica, v. 9, July 1961, p. 689-694.

Experimental data on the influence of impurities at grain boundaries in Fe, Ti and Zr on the development of "superhigh plasticity" under cyclic fluctuations of temperature including factors which result in formation of two necks in the specimens undergoing tension and heating. A tentative evaluation is given for the carbon concentration in the grain boundary of technical iron. 7 ref. (M27f, Q27h, 2-61, 3-69; Fe, Ti, Zr)

508-M. (Ukranian.) Crystal Structure of Ni_2MnIn Alloy. E. I. Hladyshevsky, and I. V. Smolyaninov. Dopovidi Akademii Nauk Ukrainskoi, Jan. 1961, p. 33-35.

X-ray determination of crystal structure of ternary ferromagnetic alloy, Ni_2MnIn and comparison with Cu_2MnAl alloy. 17 ref. (M26, 2-60; Ni-b, Mn, Al)

509-M. (German.) Influence of Tin and Arsenic on Dry Lead Refining. H. Hadamovsky. Monatsberichte der Deutschen Akademie der Wissenschaften zu Berlin, v. 2, Dec. 1959, p. 778-779.

Chemical analysis, X-ray investigation and microscopic examination of Sn dross obtained at 625° C.; examination of the PbO-SnO_2 phase diagram; investigation of oxidation rate of Pb-As alloys and of phase equilibria in the PbO-As_2O_3 system. (M24b, C-general, P13, 2-60; Pb, Sn, As)

510-M. (English.) The Relationship Between the Dissolution Shape and Solution Anisotropy in Cubic Crystals. Mikio Yamamoto. Tohoku University, Science Reports of the Research Institutes, v. 13, June 1961, p. 151-159.

Relationship between the final dissolution shape of an initially sphere cyrstal and its solution anisotropy with reference to cubic crystals. Comparison with observations on the dissolution shapes of initially sphere Ge crystals. 4 ref. (M26c; Ge, 14-61)

511-M. (English.) Growth and Dissolution Shapes of Spherical Shell Crystals and the Shapes of Etch Pits on Crystals. Mikio Yamamoto. Tohoku University, Science Reports of the Research Institutes, v. 13, June 1961, p. 168-173.

Analysis of crystal shape as affected by slow inward and outward growth and dissolution. Results indicate a polyhedron structure surrounded by planar faces normal to principal directions with outward growth and dissolution and the same structure surrounded by planar forces subtended among neighboring principal crystallographic direction with inward growth and dissolution. Al, Ge and Bi single crystals are considered. 6 ref. (M26c; Al, Ge, Bi, 14-61)

512-M. (German.) Magnetic Domains in Mn_5Ge_3. A. Wrzeciono. Monatsberichte der Deutschen Akademie der Wissenschaften zu Berlin, v. 3, Jan. 1961, p. 10-13.

Investigation of magnetic powder patterns on the surface of polished Mn_5Ge_3 specimens obtained by vacuum melting and subjected to X-ray, magnetic and microscopic analysis. (M27g, 1-54; Mn, Ge)

513-M. Basic Studies of the Metallic State (The Structure of $NbZn_2$). C. L. Vold. Report of NRL (Naval Research Laboratory) Progress, July 1961, p. 19. (Available as PB 171320 from U. S. Office of Technical Services, Washington 25, D. C.)

Progress report on the structure of $CbZn_2$. Tabulation of interatomic distances, refined atomic coordinates and isotropic temperature factors. (M25, 1-54; Cb, Zn)

514-M. Physical Metallurgy of Refractory Metals (The Removal of Interstitial Impurities From Niobium by Zinc-Niobium Compounds). R. J. Goode and R. A. Meussner. Report of NRL (Naval Research Laboratory) Progress, July 1961, p. 22-24. (Available as PB 171320 from U. S. Office of Technical Services, Washington 25, D. C.)

Report of impurity extraction studies conducted on arc-melted Cb alloys containing Ni, O and C. Effects of heat treating are tabulated for Zn-coated Cb-C alloys. (M26p, 2-64, 3-69; EG-d37, Cb, Zn, C)

515-M. (Russian.) Phase-Composition of the System Nickel-Molybdenum-Boron. P. T. Kolomytsev and N. V. Moskaleva. Atomnaya Energiya, v. 10, Mar. 1961, p. 276-277.

Investigation of the influence of long annealing periods (100 hr.) at high temperatures (1000° C.) on the phase composition and microhardness of Ni-Mo-B alloys melted in an argon atmosphere and cooled in air. (M24c, M26, Q29q, 2-64; Ni-b, Mo, B)

516-M. Lattice Imperfections in Metals, Semiconductors and Ionic Crystals. H. G. van Bueren. Philips Technical Review, v. 22, no. 11, 1960-1961, p. 362-373.

Differences in the behavior of lattice imperfections with emphasis on formation and influence on electrical and mechanical properties of the substance concerned. Examples are given for KCl, NaCl and LiF ionic crystals, Si and Ge semiconductors and Al and Au. 13 ref. (M26s, M26b, P15, Q-general; Si, Ge, Al, Au)

517-M. The Fermi Surfaces of the Noble Metals. J. F. Cornwell. Philosophical Magazine, v. 6, June 1961, p. 727-733.

The energy band structure of Au, Ag and Cu are calculated using a plane wave pseudo-potential method and the properties of the Fermi surfaces so obtained are compared with those deduced from experimental observations. 30 ref. (M25, P15, P16; Au, Ag, Cu, 10-54)

518-M. The Face-Centered Cubic Solid Solutions in Transition Metal Alloys of the First Long Period. W. Hume-Rothery. Philosophical Magazine, v. 6, June 1961, p. 769-774.

The limits of composition of the f-c-c. solid solutions in binary alloys of the elements V, Cr, Fe, Co and Ni are discussed in terms of the average group number values of the alloy or position of the transition metal in the First Long Period. Phase equilibrium diagrams and liquidus-solidus curves are drawn for alloys at 900-1508° C. 6 ref. (M24b, M25, 2-60; Co-b, Cr-b, Fe-b, Ni-b, V-b, 14-67)

519-M. The Direct Observation of Antiphase Boundaries in the Fe_3Al Superlattice. M. J. Marcinkowski and N. Brown. Philosophical Magazine, v. 6, June 1961, p. 811-813.

Transmission electron microscopy examination of domain structures in thin foils of Fe_3Al as obtained by annealing for 1 hr. at 600° C. and quenching to room temperature. Establishment of the dependence of the antiphase boundary geometry on temperature and the nature of the ordering mechanism. (M27g, M21e, N10, 2-64; Fe-b, Al)

520-M. Segregation of Solute Atoms in Copper-Aluminum Alloys. Koichi Nakazima and Shigeyasu Koda. Philosophical Magazine, v. 6, June 1961, p. 823-824.

X-ray diffraction examination of the small angle scattering of solute atom segregation and concentration on deformation stacking faults in Cu-18.3% Al specimens as caused by cold working at room temperature. 6 ref. (M26b, 2-61, 3-68, 9-69; Cu-b, Al)

521-M. (Japanese) Identification of Nonmetallic Inclusions Causing Sand Marks in Steel. Pt. 1. Zenichiro Takao, Takaaki Simose, Kiichi Narita and Atushi Miyamoto. Tetsu-to-Hagane (Iron and Steel Institute of Japan, Journal), v. 47, July, 1961, p. 907-918.

Electron diffraction, spectroscopy, optical microscopy and chemical analysis methods are used to examine the nature of nonmetallic inclusions in low and medium carbon and alloy steels prepared by various deoxidation, austenite grain refining, deoxidation and tapping and teeming practices during basic electric furnace melting to determine their relation to defects occurring during forging and rolling. 7 ref. (M-general, D-general, E25, S11, 2-60, 3-68; ST, 9-69)

522-M. (Russian.) Structure of Cast Iron After Rapid Cooling From the Liquid State. I. S. Miroshnichenko and I. V. Salli. Izvestiya Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk, Metallurgiya i Toplivo, Jan. 1961, p. 44-48.

Fe-C alloys with 2.2-5.5% C and up to 0.1% Si, 0.4% Mn, 0.04% S and 0.03% P are heated to 150-200° C. above liquidus temperature. A drop of the melt is compressed rapidly between two Cu plates to produce a cast film of 0.05-0.2 mm. thickness solidified at a cooling rate of up to 105° C. per sec. Structure testing. 7 ref. (M26, M27, N12, 3-67; CI)

523-M. (Russian.) Role of Aluminum in Phosphorus-Containing Steel. O. D. Moldavskii. Izvestiya Akademii Nauk SSSR, Otdelenie Tekhnicheskikl Nauk, Metallurgiya i Toplivo, Jan. 1961, p. 87-95.

Fe, prepared by oxide reduction, is melted with various ferrophosphorus and ferroaluminum additions in a vacuum, held for 2 hr. at 1600° C. and cooled to solidification within 4 hr. The metal obtained is subjected to structure tests and chemical analysis. Inclusions are isolated by electrolysis and analyzed. Effect of Al phosphorus liquation, quantity and composition of inclusions. 11 ref. (M27, 2-60, D8m, S11; AY, Al, P)

524-M. (Russian.) Boundaries of One-Phase and Two-Phase Areas in W-C-Co and W-C-Ni Systems. I. N. Chaporova and E. A. Shchetilina. Izvestiya Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk, Metallurgiya i Toplivo, Jan. 1961, p. 126-132.

Structure testing of alloys containing 0-70% W, 0.04-0.15% C and 0-82% Co or 0-86% Ni after sintering at 650-1450° C. Solubility of tungsten as a function of the carbon content. Please boundaries for various Co and Ni contents. 5 ref. (M26, 2-60, M24c; W-b, Co-b, Ni-b, C)

525-M The Properties of Columbium-Titanium-Tungsten Alloys. Pt. 1. Oxidation. S. T. Wlodek. Paper from "Columbium Metallurgy". v. 10. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 175-203.

The maximum in oxidation resistance in this system, which occurs at 5-15 wt.% Ti and in excess of 15 wt.% W, is associated with the formation of a Cb_2O_5 TiO_2 WO_3 type of columbate. Although alloys such as 65% Cb-7% Ti-28% W can exhibit a 50-100% reduction in the oxidation rate of pure Cb at temperatures up to 1425° C., they are sensitive to oxygen contamination. Oxidation kinetics of alloys such as 67% Cb-10% Ti-20% W-3%V and 70% Cb-7% Ti-20% W-3% Mo, which partially retain the oxidation resistance of the ternary base while exhibiting improved resistance to oxygen contamination. (M24c, R1h, 2-60, 2-61; Cb-b, Ti, W)

526-M. The Properties of Columbium-Titanium-Tungsten Alloys. Pt. 2. Structure and Mechanical Properties. W. F. Sheely and J. L. Wilson. Paper from "Columbium Metallurgy". v. 10. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 205-221.

Tensile properties of a 65% Cb-7% Ti-28% W alloy, which combines good high temperature strength and oxidation resistance. Effects on high temperature strengths of Cb-Ti-W alloys of 3% additions of Mo or V and 1-2% Zr are investigated; Mo and Zr can contribute to high temperature strength but the strengthening by V is impaired by the presence of Ti. (M24c, M27, Q27, 2-60, 2-61; Cb-b, Ti, W, V)

527-M. Columbium-Nitrogen System. Rodney P. Elliot and Steven Komjathy. Paper from "Columbium Metallurgy". v. 10. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 367-381.

Equilibrium diagram investigated in the composition range up to stoichiometric CbN and in temperatures up to the melting point of Cb. When Cb is melted in a nitrogen atmosphere or when nitrided Cb powder is melted, an alloy composition of approximately 3 wt.% nitrogen is established. Metallographic examination of the arc-melted ingots does not reveal the nature of the melt reaction but indicates the precipitation of Cb_2N from the solid solution on cooling. (M24b, N7, N15, 2-60, 2-61; Cb-b, N)

528-M. Alloying Behavior of Columbium. A. E. Dwight. Paper from "Columbium Metallurgy". v. 10. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 383-405.

Cb phase diagrams may be classified into three groups--those which exhibit liquid or solid immiscibility, those which exhibit continuous solid solubility and those which form compounds. The nature of the diagram assumed by a particular element is closely related to its position in the periodic table. Data are presented on binary systems which are representative of all three groups. The Cb-Zr-U and Cb-Ti-Mo ternary systems are used to illustrate alloy behavior trends.
(M24, P12; Cb-b, Mo, Zr, Ti, U)

529-M. Contribution to the Technology of Binary Columbium Alloys Containing Molybdenum and Tungsten. H. Braun and K. Sedlatschek. Paper from "Columbium Metallurgy". v. 10. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 539-549.

The variation of hardness, electrical properties, chemical properties and workability is determined for the complete range of compositions in the isomorphous binary systems Cb-Mo and Cb-W. Maxima in hardness and electrical resistivity are observed. A workability gap existed in both systems, in which region rolling or forging can not be accomplished. (M24b, Q-general, P15, 2-60; Cb-b, Mo, W)

530-M. The Properties of Columbium-Aluminum-Vanadium Alloys. Pt. 1. Oxidation. S. T. Wlodek. Paper from "Columbium Metallurgy". v. 10. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 553-582.

The addition of small amounts of Al and V to Cb appreciably reduces the oxidation rate while retaining the inherent low neutron cross section of Cb and improving the mechanical properties. Further complexing with Ti, Cr, Fe and Ni raises the oxidation resistance of the Cb-Al-V type of alloy to the level of stainless steel. Studies of the kinetics of oxidation in the ternary Cb-Al-V system up to a maximum solute content of 10 wt.% are presented for 800, 1000 and 1200° C. (M24c, Q-general, R1h, 2-60, 2-62; Cb-b, Al, V)

531-M. (Translation.) The Problem of Visualization of Dislocations in Germanium by Etching. V. N. Vasilevskaya and E. G. Miselyuk. Soviet Physics--Solid State, v. 3, Aug. 1961, p. 313-318. (Translation of Fizika Tverdogo Tela, v. 3, Feb. 1961, p. 317-670).

The density of dislocations on various crystallographic planes are studied as a function of etchant composition and etching time for selecting proper etching techniques for revealing crystal imperfections. (M20q, M26b, M26s; Ge)

532-M. X-ray Diffraction Microscopy Study of Imperfections in Silicon Single Crystals. G. H. Schwuttke. GT&E (General Telephone & Electronics Corp.) Research and Development Journal, v. 1, July 1961, p. 68-76.

Detection of dislocations, oxygen segregation and Cu precipitation effects by the extinction contrast method of X-ray diffraction microscopy. 19 ref. (M22g, M26b, N7; Si, 14-61, 9-69)

533-M. (Italian.) Structure and Magnetic Properties of MX Compounds of Terbium With Group V and VI Metalloids. Giorgio L. Olcese. Atti della Accademia Nazionale dei Lincei, v. 30, Feb. 1961, p. 195-200.

Valence and magnetic anomalies from 473-73° K. as functions of structure and magnetic properties of Tb compounds with Se, Te, S, P, As, Sb and Bi. (M26, M25g, P16, 2-61; Tb-b, Se, Te, S, P, As, Sb, Bi, 14-68)

534-M. (Italian.) Magnetic Susceptibility of Some Semimetallic Compounds of Samarium and Gadolinium. Aldo Iandelli. Atti della Accademie Nazionale dei Lincei, v. 30, Feb. 1961, p. 201-207.

Valency of Sm and Gd is determined by measuring magnetic susceptibility of their metallic and semimetallic compounds formed by synthesis with P, As, Sb, S, Se, Te and Bi. Effect of temperature. (M25g, P16n, 2-61; Sm-b, Gd-b, 14-68)

535-M. Optical Investigation of the Band Structure of Ge-Si Alloys. J. Tauc and A. Abraham. Physics and Chemistry of Solids, v. 20, Aug. 1961, p. 190-192.

The reflection spectra of Ge-Si alloys are measured at room temperature in the photon energy range 2-5 ev. The curve giving the dependence of the energy of the first characteristic peak in the reflection spectrum on the composition of the alloy shows a break at about 79% Si with analogous conclusions being drawn for the band structure and transition energies. 14 ref. (M25h, M-general, 2-60; Ge-b, Si)

536-M. Atomic Configurations in Ideally Flat Surfaces. Pt. 1. Construction of Models of Surfaces in Face-Centred and Body-Centred Cubic Crystals. A. J. W. Moore and J. F. Nicholas. Physics and Chemistry of Solids, v. 20, Aug. 1961, p. 222-229.

A method is described for constructing ball models of atomically flat surfaces of any orientation in f-c-c. and b-c-c. cubic crystals by stacking the balls in layers. 5 ref. (M25, M26, 17-56)

537-M. Atomic Configurations in Ideally Flat Surfaces. Pt. 2. Description of Surface for an Arbitrary Crystal Structure. J. F. Nicholas. Physics and Chemistry of Solids, v. 20, Aug. 1961, p. 230-237.

An atomically-flat surface is described in terms of the intersections of the surface with a set of parallel planes which enables a model of such a surface to be constructed. The theory is applied to develop formulas for constructing models of surfaces in crystals with f-c-c. and h-c-p. structures. (M25, M26, 17-56)

538-M. Cyclotron Resonance Measurements of the Energy Band Parameters of Germanium. B. W. Levinger and D. R. Frankl. Physics and Chemistry of Solids, v. 20, Aug. 1961, p. 281-288.

Valence band and conductance band energy parameters are measured at a frequency of 24 kMc using a microwave

bridge circuit at 1.35-1.4° K. Effective mass curves are calculated and compared with previously published data. 7 ref. (M25, P16f, 1-54, 2-63; Ge)

539-M. Stress-Induced Alignment of Anisotropic Defects in Crystals. J. W. Corbett and G. D. Watkins. Physics and Chemistry of Solids, v. 20, Aug. 1961, p. 319-320.

Method for revealing the "hidden" anisotropy of point defects, as caused by defect populations in equivalent orientations, by aligning the defects through applied uniaxial stress. Application to study of properties of defects in Si with particular reference to the absorption band at room temperature as associated with the vibration of impurity oxygen in the Si lattice. 14 ref. (M26s, 3-66, 3-72; Si, 14-61)

540-M. Texture Transition in High-Purity Silver and Its Correlation With Stacking Fault Frequency. Hsun Hu, R. S. Cline and S. R. Goodman. Journal of Applied Physics, v. 32, July 1961, p. 1392-1399.

Rolling texture of high purity Ag changes gradually from the common Ag type to the Cu type as temperature of deformation increases at 150-200° C. There is a general correlation between Ni texture transition and the change in stacking fault frequency as a function of rolling temperature. The texture transition produced by varying the temperature of deformation or by alloy additions is interpreted in terms of a change in the stacking fault energy, a change in the dislocation density, or both. 21 ref. (M26c, M26b, F23, 2-60, 2-61; Ag)

541-M. Deformation-Produced Point Defects. Howard K. Birnbaum and Floyd R. Tuler. Journal of Applied Physics, v. 32, July 1961, p. 1403-1404.

Investigation of the interaction of deformation-produced point defects with dislocations in high purity Cu. Analysis of the kinetics of the interaction and evaluation of the activation energy for diffusion of the defects in terms of the concentration of interstitials produced by plastic deformation. 6 ref. (M26s, M26b, 3-68, 3-69; Cu)

542-M. Development of Randomly Oriented Wrought Beryllium Sheet. F. M. Yans. Nuclear Metals Inc. (Wright Air Development Div.) U. S. Office of Technical Services, AD 258241, Dec. 1960, 104 p. $2.50.

Relation of specimen geometry and rolling sequence on texture development. During rolling, the basal plane population parallel to the plane of Be sheet increases with reduction in area. Rolling and annealing tests on bi-directionally rolled sheet demonstrate that when the sheet is subjected to annealing temperatures of over 950° C. the location of the basal plane peak intensity is shifted and the intensity profile changes markedly, yielding a third dimensional ductility of 1.75%. (M26c, F23, 2-64; Be, 4-53)

543-M. Quantitative Metallography. Ervin E. Underwood. Metals Engineering Quarterly, v. 1, Aug. 1961, p. 70-81.

Quantitative measurement of volume fraction based on measurement of areas, lineal intercepts and counting of points. Measurement of surface area. 16 ref. (M-general, S12)

544-M. (Ukranian.) Determination of Vacancies in Silver. O. M. Ovcharenko. Ukrainskii Fizichnii Zhurnal, v. 6, Jan. 1961, p. 139-140.

Ag samples are hardened at 1000° K. in helim and in air, followed by determination of the porosity resulting from dissolved oxygen by electroresistance, using an ohmmeter. 11 ref. (M26s, M23s, 1-53; Ag)

545-M. Radiation Damage in Steel--Considerations Involving the Effect of Neutron Spectra. A. D. Rossin. Paper from "Steel for Reactor Pressure Circuits". no. 69. Iron and Steel Institute, London SW 1, England, 1961, p. 393-409.

Mechanism of interaction between fast neutrons and atoms of a metal lattice. A cross section for the production of vacancies in Fe by neutrons, as a function of neutron energy, is derived and shown to be roughly proportional to the product of the neutron energy and the isotropic elastic scattering cross section. The vacancy production cross section is applied to several reactor spectra. (M26s, 2-67; ST)

546-M. Microstructures in Aluminized Steel. James C. Wilkins. Metal Progress, v. 80, Sept. 1961, p. 73-74.

Metallographic techniques used on Al-coated steel sheets produced by continuous hot dipping. (M27, M-general; ST, 4-53, 8-65)

547-M. Ternary Systems for Ductile Brazing Alloys. D. C. Herrschaft. Metal Progress, v. 80, Sept. 1961, p. 96-B.

Ni-Cu-Au, Pd-Ni-Cu, Pd-Au-Ni and Pd-Au-Cu diagrams extrapolated from limited data from several sources. These ternary systems have great potential as sources of ductile brazing alloys for elevated temperature service. (M24c, Q23p, 2-60; SGA-f, Ni-b, Pd-b, Cu-b, Au-b)

548-M. For a Unified Grain-Size Standard. L. L. Wyman and R. E. Penrod. Materials Research & Standards, v. 1, Aug. 1961, p. 638-639.

A brief report on the standardization of procedures for estimating the average grain size in metals using ASTM tests to locate grain boundaries and the calculation of master tables showing grain size relationships. 4 ref. (M27c, 1-54)

549-M. The Role of Transmission Electron Microscopy in Fundamental Fatigue Studies. H. G. F. Wilsdorf. Materials Research & Standards, v. 1, Aug. 1961, p. 640.

The electron microscope and micrograph are used to analyze the internal structural changes in fatigued metals. The preparation of specimens and use of diffraction contrast techniques to study single dislocations and their patterns. (M22h, Q7, 1-54)

550-M. (Book.) Chemical Crystallography. C. W. Bunn. 1961. 509 p. Oxford University Press, Amen House, London E.C. 4, England. $8.40.

Morphological, optical and X-ray crystallographic methods used for the identification of crystalline substances and for the determination of the precise atomic arrangement of crystal structures. (M26, M-general, 10-54, 11-64)

551-M. (German.) The Iron-Rich Side of the Iron-Zinc System. H. H. Stadelmaier and R. K. Bridgers. Metall, v. 15, Aug. 1961, p. 761-763.

Diffusion tests at 1200° C., microscopic investigation and high temperature X-ray examination at 770 and 820° C. of binary Fe-Zn specimens containing up to 40% Zn. Establishment of the alpha and gamma phase boundaries. (M24b, 2-60, 2-61; Fe-b, Zn)

552-M. (German.) The Ternary System Cobalt-Zinc-Carbon. H. H. Stadelmaier and J. J. Duplessis. Metall, v. 15, Aug. 1961, p. 763-764.

Microstructure, X-ray and chemical analysis of sintered and melted Co-Zn-C specimens (0-60% Zn, 40-100% Co, 0-40% C) after annealing at 850-975° C. Determination of stoichiometric composition of the ternary carbide $Co_{51}Zn_{32}C_{17}$. Survey of melting-face-projection in the Co-rich corner of the phase diagram. (M24c, 2-60; Zn-b, Co, C)

553-M. Activities of Chromium in Chromium-Molybdenum Solid Solutions. Marc Laffitte and O. Kubaschewski. Faraday Society, Transactions, v. 57, June 1961, p. 932-934.

Knudsen's effusion technique is combined with radioactive tracer analysis to determine the activities of Cr in Cr-Mo alloys containing 5-80 at. % Cr at a temperature of 1471° K. Results obtained provide evidence of a miscibility gap at lower temperatures. The approximate position of the solidus-liquidus gap is calculated. 9 ref. (M24b; Cr, Mo)

554-M. Substructure Formation in Iron During Creep at 600° C. F. Garofalo, L. Zwell, A. S. Keh and S. Weissmann. Acta Metallurgica, v. 9, Aug. 1961, p. 721-729.

Structural changes in Fe during creep under constant stresses of 176 and 550 kg. per $cm.^2$ are investigated by metallographic examination, high resolution X-ray methods and transmission electron microscopy. The subgrain size remains constant with increasing strain but the disorientation between subgrains increases and the lattice misorientation within the subgrains decreases. Gross grain deformation accounts for about 25-30% of the over-all strain indicating that grain-boundary shearing is a prominant deformation mode. 22 ref. (M26, M27, Q3, Q24, 2-61, 3-68; Fe)

555-M. Atomic Arrangements in Titanium-Molybdenum Solid Solutions. J. M. Dupouy and B. L. Averbach. Acta Metallurgica, v. 9, Aug. 1961, p. 755-763.

The short range order and size effect coefficients and the thermal and static atomic cisplacements are measured in f-c-c. solid solutions of Ti-Mo using

X-ray diffraction techniques. The solutions exhibit a strong preference for unlike near neighbors even though superlattice is not found. The size effect coefficient indicates that the Mo atoms are smaller than the Ti atoms in solution. Center to center distances between the different pairs of nearest neighbor atoms are calculated from the size effect coefficients and the lattice parameters. 23 ref. (M25, M26, N10; Mo-b, Ti-b, 14-67)

556-M. Theory and Direct Observation of Dislocations in the Fe_3Al Superlattice. M. J. Marcinkowski and N. Brown. Acta Metallurgica, v. 9, Aug. 1961, p. 764-786.

Specimen foils of Fe_3Al having various ordered structures examined by electron microscopy and diffraction to determine whether dislocations move through the lattice as superlattice dislocations or as ordinary dislocations. Theoretical analysis is made in terms of slip behavior and antiphase boundary binding according to structure and orientation. 30 ref. (M26b, N3, N10, Q24a, 3-71, 3-72; Fe-b, Al, 14-67)

557-M. Effect of Annealing Under High Pressures on Dislocations in Lithium Fluoride, Aluminum, Copper and Iron. J. E. Hilliard, J. M. Lommel, J. B. Hudson, D. F. Stein and J. D. Livingston. Acta Metallurgica, v. 9, Aug. 1961, p. 787-794.

Dislocation structures of single crystals annealed for 1 hr. at 500-600° C. under a pressure of 40 kb. are studied, before and after treatment, by the Berg-Barrett X-ray technique in Al and by etch pitting in the other materials. The high-pressure anneals produce no detectable change in the dislocation densities. The results are consistent with calculations which show that the application of pressure will reduce both the climb and glide rates of a dislocation. 23 ref. (M26b, 2-64, 3-74; Al, Cu, Fe, Li-b, 14-61)

558-M. (Italian.) Department of Metallurgy. Istituto Sperimentale dei Metalli Leggeri--Rapporto Annuale 1960, 1961, p. 67-81.

Metallography of light alloys, Ti alloys, Al and aluminum bronzes. Effect of Li, Fe, Si and Al on corrosion, wear and abrasion resistance of rolled Al, Al-Cu and Zn-Al-Cu alloys. (M-general, Q9n, R-general; EG-a39, Ti-b, Cu-s, Al-b, Cu, Zn)

559-M. Radiation Effects. Alvin E. Fein. Chapter 6 from "Thermoelectricity--Science and Engineering". Interscience Publishers, Inc., New York 1, 1961, p. 120-153.

The effects of radiation on semiconductors are studied including transmutation of atoms, ionization of electrons, fission of atoms, production of thermal or displacement spikes, creation of interstitial atoms and vacancies and ordering or disordering of the atoms. 116 ref. (M26, 2-67; EG-j31)

560-M. (English.) X-Ray Investigation of Disturbance Fields Due to Individual Dislocations in Silicon and Germanium. J. Auleytner. Acta Physica Polonica, v. 20, May-June 1961, p. 371-377.

Disturbance fields from individual dislocations on Si and Ge crystal surfaces are studied by X-ray and spectrometric methods and the mapping made by the two methods are compared. Linear dimensions of disturbance fields in Si single crystals with density of less than 10^4 dislocations for cm.^{2} are found to range from 20-120 microns. 9 ref. (M26b, M22; 14-61, Si, Ge)

561-M. (German.) Structure Changes in the Laves Phases $ZrAl_2$ and UAl_2 by Uranium and Zirconium Additions. Siegfried Steeb and Gunter Petzold. Naturwissenschaften, v. 48, June 1961, p. 450-451.

X-ray investigation by Guinier technique using monochromatic Cu-K-alpha radiation of lattice parameters of cast and 1050° C. vacuum annealed UAl_2 alloy containing 0-22% Zr and $ZrAl_2$ containing 0-11% uranium with density measurements for evaluation of number of atoms in the unit cell. (M26, M25, M22g, 2-60; Al-b, Zr, U)

562-M. Identification of Intermediate Phases in the Manganese-Titanium System. R. M. Waterstrat. Metallurgical Society of AIME, Transactions, v. 221, Aug. 1961, p. 687-690.

X-ray diffraction and metallographic examination of binary Mn-rich alloys with Ti revealing the presence of intermediate phases including a binary R phase and a phase having an alpha-Mn type structure. The X-ray pattern

of the phase $TiMn_3$ is presented and a tentative phase diagram is constructed for the Mn-rich portion of this binary system. 11 ref. (M22g, M24, M26q; Mn-b, Ti)

563-M. Technique for Determining Orientation Relationships and Interfacial Planes in Polyphase Alloys--Application to Controlled Eutectic Specimen. R. W. Kraft. Metallurgical Society of AIME, Transactions, v. 221, Aug. 1961, p. 704-711.

Design and application of a back-reflection precession-type X-ray camera for determining the crystallographic orientation of the crystallites of both phases in small areas of thick specimens of polyphase alloys. The camera technique is used with metallographic observations of interfacial angles (or habit planes or growth direction) on the same specimen to correlate crystallographic and metallographic orientations data for a unidirectionally solidified $CuAl_2$-Al eutectic specimen. 5 ref. (M22g, 1-52, M26c; Al-b, Cu)

564-M. The Evolution of Textures in FCC Metals. Pt. 2. Alloys of Copper With Phosphorus, Arsenic and Antimony. R. H. Richman and Y. C. Liu. Metallurgical Society of AIME, Transactions, v. 221, Aug. 1961, p. 720-732.

Deformation and recrystallization textures of the alpha solid solutions of alloys containing 0.004-1.70% P, 0.048-5.17% As or 0.0089-1.45% Sb are examined after homogenization at 650-900° C. for times to 266 hr., 99.1-99.3% reduction by rolling and final annealing at 400-500° C. for 0.5-1.5 hr. Texture transitions and orientation relations are dependent upon alloy composition and type of solute element. 24 ref. (M26c, N5, 2-60, 2-64, 3-68; Cu-b, P, As, Sb, 14-67)

565-M. Observations of the Structure of Aluminum Specimens Grown From the Melt. P. E. Doherty and R. S. Davis. Metallurgical Society of AIME, Transactions, v. 221, Aug. 1961, p. 737-740.

The formation of pits on the surface during cooling from elevated temperatures, attributed to the condensation of vacancies from supersaturated solution, is used as an etching technique for studying striation, cell and dendrite structures of Al single crystal specimens grown from the melt. Sub-boundaries, micropores and other imperfections are also observed. 8 ref. (M26s, M20, N12, 2-61, 3-67; Al, 14-61)

566-M. The Control of Annealing Texture by Precipitation in Cold-Rolled Iron. W. C. Leslie. Metallurgical Society of AIME, Transactions, v. 221, Aug. 1961, p. 752-758.

The textures of cold rolled and of annealed Fe are compared with those of an Fe-0.8% Cu alloy in which the amount of precipitation after cold rolling is controlled. The effects of precipitation after cold deformation are to retain the cold rolled texture after annealing, to inhibit the formation of the usual annealing texture and to produce elongated recrystallized ferrite grains. 13 ref. (M26c, N5, N7, 2-64, 3-68; Fe-b, Cu)

567-M. Zinc-Rich Corner of the Zn-Fe-Al System. E. H. Rennhack. Metallurgical Society of AIME, Transactions, v. 221, Aug. 1961, p. 775-779.

Phase equilibria of the Zn-rich portion of the system containing up to 20% Fe and Al are investigated at 20-600° C. by metallographic and X-ray diffraction techniques and differential thermal analysis. The phase relationships involve only those phases present in the three binary systems. (M24b, M-general, 2-60, 2-61; Zn-b, Al, Fe)

568-M. The Cadmium-Uranium Phase Diagram. Allan E. Martin, Irving Johnson and Harold M. Feder. Metallurgical Society of AIME, Transactions, v. 221, Aug. 1961, p. 789-791.

The Cd-U system is studied by thermal, metallographic, X-ray and sampling techniques, special emphasis being placed on the establishment of the liquidus lines. The single intermetallic phase, UCd_{11}, melts peritectically at 473° C. to form alpha uranium and melt containing 2.5% U. The Cd-rich eutectic (0.07% U) freezes at 320.6° C. Solid solubilities appear to be negligible. Between 473 and 600° C., the liquidus line is retrograde. (M24b, 2-60, 2-61; Cd-b, U-b)

569-M. The Effect of Initial Orientation on the Fiber Texture of Aluminum Rods. Carl J. McHargue. Metallurgical Society

of AIME, Transaction, v. 221, Aug. 1961, p. 812-819.

Rods of 99.99% Al with initial orientation of (001), (118), (115), (111) and random are swaged at room temperature with reductions to 96%. Changes in orientation as a function of deformation are studied on axis distribution charts which show the distribution of fiber axes with respect to the crystallographic axes in a basic triangle of a standard stereographic projection in units which are "times random". 14 ref. (M26c, 3-68, 3-72; Al-a, 4-55)

570-M. The Oriented Growth Mechanism of the Formation of Recrystallization Textures in Aluminum. M. N. Parthasarathi and Paul A. Beck. Metallurgical Society of AIME, Transactions, v. 221, Aug. 1961, p. 831-838.

The components of the recrystallization texture formed by selective growth of random nuclei in an 80% rolled, 99.997% Al crystal are related to the single component rolling texture with the relative-volume fraction being accounted for by the low mobility of twist boundaries. Results with an Al alloy crystal of the (110)(112) orientation, containing Fe, Si and Zn, show that solute contents do not impair the effectiveness of the oriented growth mechanism. 21 ref. (M26c, M27f, N3, N5, 2-64, 3-68; Al-b)

571-M. Orientation of Cast Beryllium. F. A. Crossley, A. G. Metcalfe and R. P. Elliot. Metallurgical Society of AIME, Transactions, v. 221, Aug. 1961, p. 890.

The texture method (using monochromatic Cu radiation) is used to determine the orientation of the columnar grains of vacuum induction melted and vacuum cast Be ingots. X-ray De Bye patterns show no preferred orientation due to the occurrence of a phase transformation above 1250° C. which masks the original solidification orientation. (M26c, M22g, N12, 2-61; Be-a)

572-M. Transmission Electron Microscopy of Metals--Dislocations and Precipitation. George L. Clark. Encyclopedia of Microscopy, 1961, p. 291-307.

Specimen preparation and application to the study of deformation, dislocations, forces between dislocations, stacking faults and partial dislocations, contrast due to stacking faults, condensed vacancies, workhardening, quench hardening, fatigue, precipitation, eutectic structures, radiation damage, antiphase domains, martensitic transformations and properties of thin metal films. 72 ref. (M21e, M20, M26b, N7)

573-M. (Translation-ConBur.) Investigation of the Physicochemical Properties of Alloys in the System $CiSi_2$-$MoSi_2$. V. S. Aleksashin and V. S. Mikheev. Journal of Applied Chemistry of the USSR, v. 33, Oct. 1960, p. 2185-2190.

Melting points, microhardness, hardness, electrical resistivity, microstructure and heat resistance are given for heat treated Cr-Mo alloys. 4 ref. (M24b, M27, P-general, Q-general, 2-60, 2-62, 2-64; Mo-b, Cr-b, Si)

574-M. (English.) An Electron Microscope Study of the Structure of Zinc Single Crystals. P. Kratochvil and M. Molcik. Czechslovak Journal of Physics, v. 11, 1961, p. 540-541.

Surface and lamellar structures, dislocation and etch pit densities and critical shear stress are studied by electron microscopy and interpreted in terms of impurity microsegregation. Crystals are etched in a solution of distilled water and nitric acid and chemically polished. 9 ref. (M21e, M26, 9-69, 14-61; Zn)

575-M. (Italian.) The Ternary Equilibrium Diagram of Cu-Al-Ag Alloy With High Copper Content. Panseri C. Leoni. Alluminio Nuova Metallurgie, v. 30, June 1961, p. 289-298.

Metallographic determination of the equilibrium diagram of Cu-Al-Ag alloys with Cu content over 90%. Tensile strength, ohm resistance, specific weight, point of fusion and Brinell hardness of 2496 Cu alloy which is particularly suitable for the production of deep drawn ornamental objects. (M24c, P-general, Q27a, Q29n, T9q; Cu-b, Al, Ag)

576-M. (Translation-AIP.) The Form of Martensitic Crystals and the Orientation of the Interphase Boundaries in Cu-Al-Ni Alloy. G. V. Kurdyumov, V. A. Lobodyuk and L. G. Khandros. Soviet Physics--Crystallography, v. 6, Sept-Oct. 1961, p. 165-170.

Large elastic crystals of the martensitic phase in Cu-14.4% Al-4.75% Ni alloy are produced by quenching from 900° C. The orientation of the habit plane and midrib plane of the crystals are determined by X-ray methods and related to transformation stresses. 11 ref. (M26c, N6q, 2-64, 3-66; Cu-b, Al, Ni)

577-M. (Translation-AIP.) Crystal Structures of Some Intermetallic Compounds. E. I. Gladyshevskii, P. I. Kripyakevich, M. Yu Teslyuk, O. S. Zarechnyuk and Yu. B. Kuz'ma. Soviet Physics--Crystallography, v. 6, Sept-Oct. 1961, p. 207-208.

Powder X-ray diffraction data (using Debye and Preston patterns) for lattice constants and superstructures of intermetallic compounds found in binary and ternary alloys containing Cb, Al, V, Fe, Si, Co, Ni, Ge, Mn, Ga, Ce, Cu, Mg, In, Zn, Nd, Ba, Ca, Ti, Sr, Be and Er. 11 ref. (M26q, M22g)

578-M. (Translation-AIP.) Revision of the Phase Diagram for the Bismuth-Rhodium System. R. N. Kuz'min and N. N. Zhuravlev. Soviet Physics--Crystallography, v. 6, Sept-Oct. 1961, p. 209-210.

Lattice parameters determined for alpha and beta phases in the Bi-rich section of the system using X-ray goniometry. Effect of composition and heat treatment on transformation structures. 9 ref. (M24, M26, 2-60, 2-64; Bi-b, Rh-b)

579-M. (Translation-AIP.) Detection of Edge Dislocations in Germanium by Ionic Bombardment. I. G. Sirotenko and G. V. Spivak. Soviet Physics--Crystallography, v. 6, Sept-Oct. 1961, p. 213-215.

Cathodic sputtering (ionic etching) is compared to chemical etching for revealing dislocation arrays in Ge single crystals. Specimens are deformed by indentation at 550-600° C. in nitrogen atmosphere. 4 ref. (M20q, M26b, L25h; Ge, 14-61)

580-M. Determination of the Orientation of Diffusion Submicropores in Alpha-Brass by the Method of Small Angle X-Ray Scattering. V. L. Kalikhman and Ya. S. Umanskii. Soviet Physics--Solid State, v. 3, Aug. 1961, p. 238-240. (Translation from Fizika Tverdogo Tela, v. 3, Feb. 1961, p. 317-670).

The oxide inclusions on which pores are nucleated during the evaporation of Zn from alpha brass are examined by Laue back reflection and identified as plates, surfaces of which are parallel to the (110) planes of the base metal. 8 ref. (M26c, M22g, N1, N16, 9-68, 9-69; Cu-n)

581-M. What Causes Hard Spots in Steel? James H. Adams and Donald D. Goehler. American Machinist/Metalworking Manufacturing, v. 105, Sept. 4, 1961, p. 97-99.

Specimens of high-strength steels (AISI 4330, 4340 and 300M) that have failed during machining are drilled to study source of hard spots. Fracture analysis of the microstructure around the hole shows a layer of transformed material and a series of cracks indicating that machining operations induce temperatures of 1350-1500° F. which cause a transformation of austenite to martensite. (M-general, N8, 2-62, 3-68, 9-72; ST, SGB-a)

582-M. (German.) Reactions of the Alkali Metals With Copper, Silver and Gold. Gerhard Kienast and Jitendra Verma and Wilhelm Klemm. Zeitschrift fur Angewandte und Allgemeine Chemie, v. 310, June 1961, p. 144-169.

Investigation of binary compound formation, solid solutions and alloys of Cu, Ag and Au with alkali metals Li, Na, K, Rb and Cs by thermal analysis and X-ray structure examination. Binary phase diagrams; structure of solid phases; volume changes in formation of compounds and alloys. (M-general, N-general; Cu, Au, Ag, EG-e41)

583-M. (German.) "Inverse" Nickel-Iron Films. E. Feldtkeller. Naturwissenschaften, v. 48, July 1961, p. 474-475.

Electron microscopic investigation of domain structure during magnetizing. Interpretation of interaction which hinders rotary movement of domains. (M27q, M21e; Ni-b, Fe, 14-62)

584-M. (Russian.) X-Ray Photographic Investigation of the Substructure of Thin Condensates of Aluminum by Using a "Microbeam". L. S. Palatnik, M. Ya. Fuks, B. T. Boiko and V. B. Pariiskii. Fizika Metallov i Metallovedenie, v. 11, June 1961, p. 864-869.

Characteristics of the substructure of thin polycrystalline films (60-200 Å), size of blocks of crystallites and degree of their disorientation. 10 ref. (M26n, S11p; Al, 14-62)

585-M. (Russian.) Change of Uranium Microstructure During Cyclic Heat Treatment. Pt. 2. R. I. Garber, S. Ya. Zalivadnyi and V. M. Mikhailovskii. Fizika Metallov i Metallovedenie, v. 11, June 1961, p. 889-892.

Change of grain size and shape from 100-600° C. and 2000 cycles. Recrystallization, mutual displacement of crystallites and grains and elongation. 4 ref. (M27a, M27c, N12, Q23p, 2-64; U)

586-M. (Russian.) Influence of Manganese on the Phase Composition of Siliceous Electrotechnical Steels. N. F. Dubrov, M. I. Gol'dshtein and S. G. Guterman. Fizika Metallov i Metallovedenie, v. 11, June 1961, p. 919-922.

Effect of 0.04-0.77% Mn on plasticity and behavior during rolling at high temperatures is determined by photomicrographic techniques. (M26, Q23p, 2-60, 2-68; ST, Mn)

587-M. Investigation of the System Beryllium-Boron. Clarence L. Hoenig, Carl F. Cline and Donald E. Sands. American Ceramic Society, Journal, v. 44, Aug. 1961, p. 385-389.

X-ray single crystal and powder diffraction examination, chemical analyses and Knoop microhardness measurements are made of mixtures reacted under argon at 1100-1600° C. to determine unit cell shape, hardness and melting point. An anistropic unknown phase is found which forms eutectic with Be at 972° C. and whose hardness depends on orientation. 8 ref. (M24b, M-general, 2-60, 2-61; Be-b, B-b)

588-M. (German.) Crystal Transition of Cobalt. G. M. Schwab and W. Ludwig. Pure and Applied Chemistry, v. 2, no. 1-2, 1961, p. 297-301.

Investigation of the alpha-beta transition of Co from hexagonal to cubic close packed structure using X-ray investigation (Debye-Scherrer technique) of powder specimens and of compact Co films obtained by electrodecomposition of Pt wire at temperatures from 20-800° C. (M22, M24, 1-54, 2-61; Co, 6-68, 14-62)

589-M. (German.) Crystal Structure of $HfBe_2$, $HfBe_{13}$ and HfBeSi: Partial Systems $MeBe_2$-MeB_2-$MeSi_2$ (Me = Zr, Hf). E. Rudy, F. Benesovsky, H. Nowotny and L. E. Toth. Monatshefte fur Chemie, v. 92, Mar. 1961, p. 692-700.

X-ray powder investigation (Cu-K alpha radiation) of pressure-sintered (1200-1550° C.) Hf-Be specimens and of specimens of the quasibinary systems $HfBe_2$-$HfSi_2$, $ZrBe_2$-$ZrSi_2$, $ZrBe_2$-ZrB_2, $HfBe_2$-HfB_2, $ZrSi_2$-ZrB_2 and $HfSi_2$-HfB_2. Measurement of lattice parameter as influenced by composition. (M26, M22g, 1-53, 2-60; Hf, Zr, B, Be, Si)

590-M. (German.) Crystal Structures of TiSi, Ti $(Al, Si)_2$ and Mo $(Al, Si)_2$. C. Brukl, H. Nowotny, O. Schob and F. Benesovsky. Monatshefte fur Chemie, v. 92, Mar. 1961, p. 783-788.

X-ray investigation of TiSi, $TiAl_{0.3-0.6}Si_{1.7-1.4}$ and $MoAl_{1.3}Si_{0.7}$ by the Debye-Scherrer technique using Cu-K alpha radiation. Effect of composition on lattice parameters. 13 ref. (M26, 1-54, 2-60; Ti-b, Mo-b, Al, Si)

591-M. (German.) Electron Microscopic Identification of Aluminum-Nitride in Production-Melted Structural Steels. Winfried Dahl, Paul Schwaab and Helmut Hengstenberg. Archiv fur das Eisenhuttenwesen, v. 32, July 1961, p. 475-478.

Electron microscopic recognition of Al and V nitrides and subsequent identification of structure by X-ray diffraction analysis in conventionally manufactured Al-killed steel sheets with up to 9.04% Al, 0.02% N and 0.2% V. (M21, M22g, M26q, 9-69; ST-c, 14-68)

592-M. (German.) X-Ray Investigation of Structure of Iron-Rich Alloys in the Iron-Aluminum System. Franz Lihl and Horst Ebel. Archiv fur das Eisenhuttenwesen, v. 32, July 1961, p. 483-487.

X-ray measurement of lattice parameters at 20-800° C. of Fe-Al alloy powders containing 0-50% Al using counting-tube registration in a vacuum chamber rather than conventional film registration. (M22g, M26; Fe-b, Al)

593-M. (German.) X-Ray Investigation of Structure of Iron-Rich Iron-Silicon Alloys. Franz Lihl and Horst Ebel. Archiv fur des Eisenhuttenwesen, v. 32, July 1961, p. 489-491.

X-ray measurement of lattice and thermal expansion parameter of homogenized Fe-Si filings (3.7-23.4 at.% Si) at temperatures from 20-1100° C. using

a high-temperature vacuum chamber. Construction of the Fe-rich portion of the Fe-Si phase diagram. (M22g, M24b, M26; Fe-b, Si)

594-M. (German.) Crystallographic Properties of Iron Nitride Precipitations in Ferrite. Wolfgang Pitsch. Archiv fur das Eisenhuttenwesen, v. 32, July 1961, p. 493-500.

Electron microscopic investigation (replica method) and X-ray identification of Fe-nitride needles in cold rolled Fe sheets, normalized at 950° C. and decarburized by hydrogen at 800° C. after nitriding at 580° C. by H_2/NH_3 mixtures and aging at temperatures from 20-350° C. (M26q, M21e, N7, 2-64; Fe, 14-68)

595-M. (German.) Measurement of Grain Size and Deformation Degree in Cold Worked Metals and Alloys. August Braun. Zeitschrift fur Metallkunde, v. 52, July 1961, p. 461-463.

Theoretic derivation and practical application of a microscopic method for determination of grain size and deformation in single-phase anisotropic structures. (M21, M27c)

596-M. (German.) Investigation of Equilibria in the System Tantalum-Nitrogen. Erich Gebhard, Hans-Dieter Seghezzi and Eckehard Fromm. Zeitschrift fur Metallkunde, v. 52, July 1961, p. 464-476.

Investigation of phase equilibria in the Ta-rich side (up to 30% N) of the Ta-N phase diagram in a modified Sieverts-apparatus, by resistance measurements and microscopic and X-ray investigation, at temperatures up to 2380° C. and at pressures from 5×10^{-4} Torr to 1 atm. (M-general, N15d; Ta-b, N)

597-M. (Translation-Brutcher no. 5173.) Effect of Delta Ferrite on Properties of Chrome-Nickel Stainless Steels. R. Nakagawa and Y. Otoguro. Tetsu-To-Hagane (Iron and Steel Institute of Japan), v. 47, Mar. 1961, p. 554-556.

Influence of Ni and Mo on microstructure of Cr-Ni stainless steels and of effect of delta ferrite on mechanical properties. Relationship between quantity of delta ferrite and the Ni and Mo contents; tensile strength at various temperatures as function of Ni content and of solution-treating temperature. (M27, Q-general; SS, Ni, Mo)

598-M. (English.) Etch Pits on X-Ray Damaged Rochelle Salt. Kenkichi Okada. Physical Society of Japan, Journal, v. 16, Aug. 1961, p. 1647-1648.

Effects of X-rays on the dislocation etch pit pattern and on the distribution of open-cored dislocations parallel to the c-axis are studied in order to obtain a more reliable image of the polar anisotropy centers introduced by radiation. 9 ref. (M26, 1-54, 2-67)

599-M. X-Ray Diffraction Study of the Recrystallization and Grain Growth Processes Taking Place During Sintering of the Metal Powder Compacts. R. Sharan and D. Swarup. Banaras Hindu University, Journal of Scientific Research, v. 11, Dec. 1961, p. 73-79.

Influence of compacting pressure, section thickness, sintering time and sintering temperature on recrystallization and grain growth of Al, Ni and Cu powder compacts. 8 ref. (M22g, N3, N5, 2-61, 3-67, 3-74; Al, Ni, Cu, 6-71)

600-M. (Japanese.) Some Anisotropic Properties of Rolled Uranium Plates. Ko Soeno. Atomic Energy Society of Japan, Journal, v. 3, Aug. 1961, p. 614-622.

Effects of cold and hot rolling, beta phase quenching and thermal cycling at 720° C. on anistropic properties of 99.5% uranium specimen are examined by metallography and thermal expansion coefficient measurements. Texture and preferred orientation, recrystallization grain growth and thermal expansion are related to thickness reduction, deformation and heating temperatures and rolling direction. 20 ref. (M26, M-general, N5, P11g, 2-61, 3-68, 3-72; U-a, 4-53)

601-M. (Italian.) Influence of Crystal Orientation on the Etching Process of Metallic Single Crystals. L. Peraldo Bicelli and B. Rivolta. Metallurgia Italiana, v. 53, July 1961, p. 363-369.

Investigation of attack by various acids and other solutions on (0001) and (1120) oriented Zn single crystal surfaces. Geometrical figures are usually obtained on the (0001) surface but they seldom occur on the (1120). (M20p, M20q, 3-72; Zn, 14-61)

602-M. Crystallography of the Rare-Earth Metals. Karl A. Gschneidner, Jr. Chapter 14 from "The Rare Earths". John Wiley & Sons, Inc., New York 16, 1961, p. 190-214.

Determining the effects of temperature (4.2-1773° K.), pressure and alloying on crystal structure. X-ray and neutron diffraction studies are made to determine magnetic structures and lattice constants. 60 ref. (M22, M26, M27, 2-60, 7-61, 3-74; EG-g45)

603-M. Metallography of the Rare-Earth Metals. B. Love. Chapter 15 from "The Rare Earths". John Wiley & Sons, Inc., New York 16, 1961, p. 215-224.

Various techniques used in observing crystal structures are described including sectioning, mounting, grinding, polishing and etching. Prepared specimens are examined by microscopy and photography. (M20, M21, M23; EG-g45)

604-M. Rare-Earth Phase Diagrams. C. E. Lundin. Chapter 16 from "The Rare Earths". John Wiley & Sons, Inc., New York 16, 1961, p. 224-385.

Alloying behavior is recorded by binary equilibrium phase diagrams for the 14 metals. Solubility relationships and crystallographic data are presented with a review of techniques including metallographic examination of polished and etched specimens, thermal analysis and X-ray diffraction analysis. 130 ref. (M-general, P12e; EG-g45)

605-M. Principles of the Alloying Behavior of Rare-Earth Metals. Karl A. Gschneidner, Jr., and James T. Waber. Chapter 17 from "The Rare Earths". John Wiley & Sons, Inc., New York 16, 1961, p. 386-427.

Alloying is discussed in terms of size effects, electronegativities, valences, electron numbers and thermodynamics. The classical rules proposed by Hume-Rothery and quasi-thermodynamic approaches are applied. 22 ref. (M-general, P12; EG-g45)

606-M. Materials. Power Reactor Technology, v. 4, June 1961, p. 42-46.

Topics reviewed include preferred orientation in extruded Zircaloy-2 tubing, tensile testing of unirradiated and irradiated Zircaloy-2 hot water loop tubing, corrosion of nuclear reactor materials by He impurities, decontamination of pressurized-water systems and corrosion of 1100 and 6061 Al alloy by water cooling. 5 ref. (M26c, Q27, R1, T11; Zr-b, 4-58)

607-M. Precipitation of Laves Phases in Modified 12% Cr Steels. Jaroslav Koutsky and Jaroslav Jezek. Metal Treatment and Drop Forging, v. 28, Aug. 1961, p. 302-305, 307.

Electron microscopic and X-ray study of the precipitation of the delta phase ferrite and sorbite structures in quenched and tempered high-alloy steels. Cr-C-W composition ratios are examined at 650-800° C. to determine the concentration of the alloying elements in the precipitates. 9 ref. (M26q, M-general, N7, N8, 2-60, 2-64; AY, Cr, W)

608-M. (Russian.) Phase Equilibrium in a Quasi-Triple System Ti-Ti_3Sn-Zr. V. V. Glazova and N. N. Kurnakov. Doklady Akademii Nauk SSSR, v. 138, Apr. 1961, p. 835-838.

Diagrams of isothermic sections for phase equilibriums at 850-1560° C. Microscopy. 6 ref. (M24d; Ti, Sn, Zr)

609-M. (Russian.) Movement of Dislocations in Antimony Crystals. L. M. Soifer and V. I. Startsev. Doklady Akademii Nauk SSSR, v. 138, May 1961, p. 1084-1087.

X-ray crystallography and microscopy are used to determine plastic characteristics of low density dislocations for high-purity monocrystals under stress and heat treatment. 12 ref. (M26p, M21f, 2-64, 3-66; Sb, 14-61)

610-M. (Russian.) Origination of Fatigue Fractures in Metals. V. S. Ivanova. Izvestiya Akademii Nauk SSSR--Metallurgiya i Toplivo, Mar. 1961, p. 77-81.

Microscopic study of the effect of vacancies, dislocation and coagulation in lattices of steel samples. 19 ref. (M21, M26; ST)

611-M. (Russian.) Connection Between Solidus and Liquidus Properties of Certain Semiconducting Alloys. V. M. Hlazunov and S. N. Chizhevskaya. Izvestiya Akademii Nauk SSSR--Metallurgiya i Toplivo, Mar. 1961, p. 154-156.

Viscosity and electroconductivity of GaSb, InSb, Ga_2Te_3 and In_2Te_3 are studied in both solid and liquid states. 12 ref. (M24b, P10f, P15g; EG-j31, Ga, In, Sb, Te)

612-M. The Shape of Melt-Crystal Interfaces During Float Zoning of Silicon. Remo A. Pellin and Juergen H. Braun. Electrochemical Society, Journal, v. 108, Oct. 1961, p. 969-974.

Study of the thermal environment of the interface of growth of a Si crystal during floating zone melting. The shape of the interface is observed by slot doping of n-type silicon with an excess of boron dope to give a p-n junction between n-type crystal and p-type melt outlining and interface which is decorated with a staining etchant. Effect of zone travel and power input, latent heat of fusion and high frequency induction skin heating characteristics on interface shape. 13 ref. (M27f, C28k; Si, 14-61)

613-M. Characteristics of the (111) Surfaces of the 111-V Intermetallic Compounds. Pt. 3. The Effects of Surface Active Agents on InSb and the Identification of Antimony Edge Dislocations. M. C. Lavine, H. C. Gatos and M. C. Finn. Electrochemical Society, Journal, v. 108, Oct. 1961, p. 974-980.

Influence of specific adsorption of inorganic and organic surface active agents on the dissolution rate and microstructure of InSb in oxidizing etchants and to development of etch pits identified with edge dislocation on the (111) surfaces. This result is verified by plastic deformation experiments. Electrical measurements at 78° K. suggest that Sb dislocations serve as electron donors whereas In dislocations serve as electron acceptors. 9 ref. (M20q, M26b, M26q; In-b, Sb)

614-M. (English.) Metastable Phases in the Uranium-Molybdenum System and Their Origin. K. Tangri and G. I. Williams. Journal of Nuclear Materials, v. 4, July 1961, p. 226-233.

Study of composition limits of metastable phases alpha prime and alpha double prime; changes in parameters a, b, c and angle gamma of the alpha uranium lattice with increasing Mo additions 0.67-11.39%; and effect of cooling rates in producing alternative structures. Increasing additions of Mo stiffen the uranium lattice making it more resistant to shear whereas the increasing cooling rate favors shear and carries the transformation towards completion. 14 ref. (M24, M26, N-general, 2-60, 2-64; U-b, Mo)

615-M. (English.) Thermal Etching of Beryllium. J. Williams and J. W. S. Jones. Journal of Nuclear Materials, v. 4, July 1961, p. 234-235.

Changes of surface topography as a function of vacuum annealing time (30-120 min.) at 900-975° C. is investigated for polished specimens of cast electrolytic Be. Correlation of etch pit formation and distribution within the grains and at grain boundaries with dislocation sites on the surface. (M20, M26b, M27, 2-64; Be)

616-M. Mosaic Size in Lead From X-Ray Measurements. Yosio Hiki and Ryukiti Hasiguti. Journal of Applied Physics, v. 32, Sept. 1961, p. 1647-1650.

X-ray measurements of Pb powders of 100-200 mesh sizes determine spectral intensities. These are used to calculate the mosaic size and dislocation density which are found to decrease with annealing in vacuum at 150° C. 17 ref. (M26s, M21f, 1-54, 1-73, 2-64; Pb, 6-68)

617-M. Phase Diagram for the Pseudobinary System Ag_2Te-Sb_2Te_3. J. P. McHugh, W. A. Tiller and S. E. Haszko. Journal of Applied Physics, v. 32, Sept. 1961, p. 1785.

Thermal investigation substantiated by metallographic and X-ray powder techniques to establish equilibrium phase diagram for quenched samples annealed at 300-400° C. for 48 and 200 hr. 4 ref. (M26, 1-54; Ag, Sb, Te)

618-M. (French.) Investigation of the Structure of Metallic Films by Means of X-Ray or Electron Diffraction and Electron Microscopy. Madeleine Gandais. Revue d'Optique Theorique et Instrumentale, v. 40, Mar. 1961, p. 101-115.

Evaporation of Ag, Au, Cu, Al, Sn, Bi-Sb and Zn-Cd alloys on polished quartz in a vacuum of 10^{-6}-8.10^{-6} mm., the quartz surface being held

at -90 to -40° C. Comparison of metallographic techniques for observing microstructures. 7 ref. (M22, M-general; 14-62)

619-M. (German.) Structure of Liquid Mercury. G. Voigtlaender-Tetzner. Naturwissenschaften, v. 48, Aug. 1961, p. 520-521.

X-ray investigation of the Hendus distribution curve of Hg at room temperature and evaluation of structure by statistical methods. Similarity of structure of monatomic liquids to structure of close-packed crystals. (M22g, M26, 1-53; Hg)

620-M. Phase-Equilibrium Studies in Metallurgical Systems. U. S. National Bureau of Standards, Technical News, Sept. 1961, 17 p.

Study of effects of temperature, pressure and component concentration on phase stability and chemical composition of alloy systems. Thermal analysis, nuclear magnetic resonance measurements and microscopy are employed to obtain data on reaction systems containing Ni, Pb, In, Ta, Cb, Co, U, Be, Au, Ag, Pt, Cu, Rh, Pd, Ru, Re, Zn, Hg, Sn, Sb, Fe, Cr and W. 8 ref. (M24, 2-60, 2-61, 3-74)

621-M. Vacancy Trapping in Quenched Aluminum Alloys. K. H. Westmacott, R. S. Barnes, D. Hull and R. E. Smallman. Philosophical Magazine, v. 7, July 1961, p. 929-935.

Foils of Al-based alloys containing Zn, Cu, Ag, Mg and Si are given various quenching treatments with the size and distribution of the vacancy clusters and dislocation loops being observed by electron microscopy. The solute atoms trap the vacancies and their bending energies determine both the scale of the clusters and the number of vacancies. 13 ref. (M26s, 2-60, 2-64; Al-b)

622-M. Phase Equilibria in the Binary Systems $PuCl_3$-RbCl and $PuCl_3$-CsCl. R. Benz and R. M. Douglass. Journal of Physical Chemistry, v. 65, Aug. 1961, p. 1461-1463.

Melting point, peritectic composition, polymorphic transformation temperatures, birefringence, extinction, elongation, optic axial angle and mean refractive index are revealed using metallographic examinations. 5 ref. (M24b, 1-54; Cs, Pu, Rb, 14-68)

623-M. The Systems Tantalum Pentachloride-Ferric Chloride and Niobium Pentachloride-Ferric Chloride. Charles M. Cook, Jr., and Robert B. Hand. Journal of Physical Chemistry, v. 65, Aug. 1961, p. 1467-1468.

Solid-liquid equilibria are investigated and freezing points, eutectic points and liquidus temperature are determined. (M24b, N12, 1-54; Fe, Ta, 14-68)

624-M. (German.) Microstructure of Zinc-Copper-Titanium Alloys. E. Pelzel. Metall, v. 15, Sept. 1961, p. 881-883.

Microstructure of slowly cooled or quenched, nonworked or cold and hot-worked binary Zn-Cu (0.6% Cu) and Zn-Ti (0-0.3% Ti) and ternary Zn-Cu-Ti (0.55-0.6% Cu, 0.06-0.14% Ti) alloys. Microstructure as influenced by cooling rate and degree of deformation. (M24, 2-64, 3-68; Zn-b, Cu, Ti)

625-M. (German.) Progress and Results in Investigation of Phase Diagrams. H. Spengler. Metall, v. 15, Sept. 1961, p. 883-891.

Bibliography of recent investigations on binary, ternary and multicomponent phase diagrams. Research results for the individual systems are given in abstract form. (M24, 10-54, 11-65)

626-M. (German.) Phase Equilibria in the Gallium-Lead-Cadmium System. Bruno Predel. Zeitschrift fur Metallkunde, v. 52, Aug. 1961, p. 507-511.

Investigation of phase equilibria by differential thermal analysis of quasi-binary sections of constant Ga (4-90%) content at temperatures up to 650° C. Ternary Ga-Pb-Cb phase diagram in terms of projections of isothermal transformations for all concentrations. (M23, M24c, N7c, N12; Ga-b, Pb-b, Cd-b)

627-M. (Translation.) An X-Ray Study of Packing Faults in Deformed Tantalum. L. P. Muravtsov and B. I. Smirnov. Soviet Physics--Solid State, v. 3, Oct. 1961, p. 923-925. (Translation from Fizika Tverdogo Tela, v. 3, Apr. 1961.)

Dependence of "effective" dimensions of blocks on crystallographic direction determined through study of 110, 200, 211, 220, 400 and 426 reflections in filings containing 0.63% Cb. 13 ref. (M26c, 3-68; Ta-b, Cb)

628-M. The Constitution of Bismuth-Cadmium-Tin Alloys. H. J. Bray, F. D. Bell and S. J. Harris. Institute of Metals, Journal, v. 90, Sept. 1961, p. 24-27.

A study of the binary and ternary alloys in the system at 80-300° C. by microscopic, thermal and X-ray analysis. Determination of the phase boundaries in the solid alloys including the limits of solid solubility and extent of the beta phase of the Ca-Sn system penetration into the ternary system and the effect of Bi on its decomposition temperature. 9 ref. (M-general, M24, P12e, 2-60; Bi, Cd, Sn)

629-M. Lattice Parameters of the Metastable Close-Packed Structures in Silver-Germanium Alloys. W. Klement, Jr. Institute of Metals, Journal, v. 90, Sept. 1961, p. 27-30.

The lattice spacings of the nonequilibrium f-c-c. and hcp. phases in the system are determined by X-ray diffraction techniques for 9.0-25.9% Ge alloys quenched rapidly from the melt. Transformation results are presented for some cold working and annealing experiments. 8 ref. (M26, M22g, 2-64, 3-68; Ag, Ge)

630-M. Metal Finishing Technology: A Student's Guide. Pt. 9. Crystal Structure and Related Properties. A. Alexander. Metal Finishing Journal, v. 7, Sept. 1961, p. 329-334.

Effects of crystal structure on hardness and elasticity in steel, cast iron, brass, Cu, Ni and Zn-base alloys. Techniques for controlling the crystal size and eliminating flaws during casting and electrodeposition of metals. (M26, E-general, L17a, Q-general, 2-60, 3-69; ST, CI, Cu-n, Cu, Ni, Zn-b)

631-M. (German.) Microstructure Investigation of Rails With Bearing Surfaces Grooved by Wear. Friedrich Karl Naumann. Archiv fur das Eisenhuttenwesen, v. 32, Sept. 1961, p. 617-626.

Chemical analysis of nitrogen in bearing surface, microstructure, hardness, microhardness and X-ray investigation of worn rails of basic Bessemer and openhearth steel. Groove formation as influenced by hardenability and strain-hardenability of steel. (M27, N7e, Q29, T23q; ST)

632-M. (German.) Microstructure Investigation of Ferroalloys by Evaporated Interference Films. Werner Pepperhoff. Archiv fur das Eisenhuttenwesen, v. 32, Sept. 1961, p. 651-653.

Comparative investigation of microstructure by conventional polishing and etching and after evaporation of thin layers of TiO_2 which amplify the optical anisotropy in polarized light. FeCr, FeV, FeTi, FeB, FeSi, SiCr and FeMoSi are examined. (M-general, 1-54; Fe, Si, B, Cr, Si, V)

633-M. (German.) Phase Equilibria of the Iron-Rich Side of the Iron-Zinc Phase Diagram. Rudolf Vogel and Rolfdieter Gerhard. Archiv fur das Eisenhuttenwesen, v. 32, Sept. 1961, p. 655-659.

Investigation of phase equilibria in the Fe-Zn system in the concentration range 0-30% Zn for temperatures up to liquidus temperature by thermal analysis of Fe-Zn alloys under a Zn-partial pressure of 1 atm. Phase equilibria as influenced by pressure. (M24, 2-60, 2-62, 3-74; Fe, Zn)

634-M. (German.) Properties of Spherical Metal Crystals With Untouched Surfaces. E. Menzel. Metalloberflache, v. 15, Sept. 1961, p. 265-268.

Electron and X-ray diffraction investigation of bright and oxidized metal spheres (Cu, Ag, Au, Pb) obtained by assymetric cooling on resistance-heated conductor strip (W, Mo or graphite) in high vacuum or in oxidizing atmosphere. Crystal structure and orientation and surface structure are investigated. (M22, M26, M28, 1-54; Ag, Au, Cu, Pb)

635-M. (German.) Rolling and Recrystallization Textures of Thin Tungsten Sheet With and Without Alloying Additions. Erwin Roeder and Gerard Daniel Rieck. Zeitschrift fur Metallkunde, v. 52, Sept. 1961, p. 572-576.

Rolling and recrystallization textures of cold rolled tungsten sheets annealed at 1220-2520° C. under hydrogen with and

without small additions of $AlCl_3$ and potassium silicate. Investigation by X-ray diffraction techniques and examination of microstructure with data given in terms of pole figures. (M26c, N5, 2-60, 2-64, 3-68; W, 4-53)

636-M. (Czech.) Effect of Molybdenum and Copper on the Properties of Stainless Chromium Steels. Miloslav Vyklicky, Karel Lobl, Adolf Kabrhel, Hanus Tuma, Vladimir Cihal and Milan Prazak. Hutnicke Listy, v. 16, Aug. 1961, p. 553-560.

Samples containing 0.06-0.11% C, 0-6.11% Cu, 14.58-26.60% Cr and 0-3.91% Mo are tested in the cast and heat treated state for microstructure, mechanical properties, corrosion resistance in HCl, $NaHSO_3$ solution, H_2SO_3, oxalic acid, tartaric acid, lactic acid, citric acid, acetic acid and H_3PO_4 and weldability. 12 ref. (M27, Q-general, R-general, K9s, 1-54, 2-60; SS, Cr, Cu, Mo)

637-M. (Czech.) Effect of Oxygen on Surface Tension. Karel Mazanec and Emilie Kamenska. Hutnicke Listy, v. 16, Aug. 1961, p. 561-565.

Samples of 30KhN2MA alloy steel containing 0.016% oxygen are homogenization treated at 1000° C. for one week, polished and micrographically etched in a vacuum of 3×10^{-3} to 1×10^{-3} mm. pressure at 1050° C. for 2-48 hr. to study the correlation between surface profile and crystallographic planes. The formation of slip lines on fractured surfaces is studied on samples austenitized at 1100° C. for 1 hr. and water quenched. 14 ref. (P13h, M-general, 2-60, 3-71; AY, EG-q)

638-M. (Japanese.) Texture and Anisotropy of Annealed Aluminum Sheet. Pt. 2. Toshio Amitani. Sumitomo Light Metals Technical Reports, v. 2, July 1961, p. 47-52.

Investigation of cube texture, recrystallized grain size and anisotropy and directionality changes in rolled Al sheet, containing various metallic impurities, as a function of annealing time and temperature (280-360° C. for 1/2-48 hr.), by deep drawing tests and metallographic examination. 8 ref. (M26c, M27c, G4b, 2-61, 2-64; Al, 4-53)

639-M. Substructures and Dislocations Produced During Solidification of Aluminum. Heraldo Biloni. Canadian Journal of Physics, v. 39, Oct. 1961, p. 1501-1507.

Study of substructure changes produced during polycrystalline solidification of 99.99% Al using the decanting method for interruption of solidification. Metallographic examination of chemical etching, electrolytic polishing and application of thin epitaxial layers of aluminum oxide. Results indicate grain growth, macrosegregation and distribution of dislocation impurities and their relation with segregated cases. (M-general, L13p, N3, 9-69; Al)

640-M. A Note on Nickel Hydride. T. Boniszewski and G. C. Smith. Physics and Chemistry of Solids, v. 21, Oct. 1961, p. 115-118.

X-ray back reflection and front reflection examination of Ni strip specimens showing existence of a f-c-c. nickel hydride obtained at room temperature by saturating with hydrogen using cathodic charging in an aqueous solution H_2SO_4. (M26q; Ni-b, 14-68)

641-M. (English.) Incorporation of Slip Dislocation in Mechanical Twins. Pt. 1. A. W. Sleeswyk and C. A. Verbraak. Acta Metallurgica, v. 9, Oct. 1961, p. 917-927.

The transformation matrices pertaining to dislocation incorporation in a twin either by gliding across the twin boundary or by being engulfed by a growing twin are derived for (112) (111) twinning in the b-c-c. lattice with a discussion of the products of the transformations in terms of a dislocation model. 17 ref. (M26b, Q24b)

642-M. (English.) High Pressure Equilibria in the Iron-Nickel System and the Structure of Metallic Meteorites. Larry Kaufman and A. E. Ringwood. Acta Metallurgica, v. 9, Oct. 1961, p. 941-944.

Calculation of phase equilibria in the system indicating miscibility gap formation and eutectoid decomposition in Fe-Ni alloys at pressures exceeding 60 kb. This behavior is related to the origin of the plessite microstructure, which is an intimate lamellar mixture of low Ni kamacite b-c-c. and high Ni taenite f-c-c.,

found in metallic meteorites. 12 ref. (M24b, 3-74; Fe, Ni)

643-M. (French.) The Nature of Point Defects Created by Dislocation Intersections. G. Saada. Acta Metallurgica, v. 9, Oct. 1961, p. 965-966.

A model in which mobile dislocation on a glide plane under exterior constraint cross fixed dislocations in a dislocation forest is used to derive a formula for creation of point defects in terms of orientation relative to Burgers vectors and dislocation repulsion and attraction interaction. (M26b, M26s)

644-M. (English.) Dislocation Densities in Cold-Worked Copper-Silicon Alloys. R. J. Tainsh, G. K. White and P. G. Klemens. Acta Metallurgica, v. 9, Oct. 1961, p. 966-968.

Lattice, thermal and electrical conductivities are measured at 2-90° K. on deformed and 700° C. annealed polycrystalline rod specimens containing 2.25-4.5% Si with dislocation density, as a function of deformation, being derived from resistivity curves. 7 ref. (M26b, P15g, 2-60, 3-68; Cu-b, Si)

645-M. (English.) Atom Movements and Dislocation Structures in Some Common Crystals. M. L. Kronberg. Acta Metallurgica, v. 9, Oct. 1961, p. 970-972.

Review of theory and analyses for the structural nature of dislocations responsible for slip and twinning deformation systems in crystals including Hg, Sn, In, As, Sb, Bi, U, PbS, Mg, Al_2O_3, Zn, Fe_2O_3, Fe_3O_4, Cd and Zr. Relation of atom position in the volume interface and atom movement on deformation modes occurring during the shear process. 10 ref. (M25, M26b, Q24, 3-68; 14-61)

646-M. (English.) Annealing Twins and Stacking Faults in Niobium. R. L. Segall. Acta Metallurgica, v. 9, Oct. 1961, p. 975-976.

Transmission electron microscopy and selected area diffraction are used to examine twin boundaries and stacking faults in zone refined, rolled and recrystallized specimens after annealing at 900-1325° C. for various times. Interfacial energy for twin formation and stacking fault energy are affected by impurity segregation to dislocations as a function of purity. Use of vacuum during annealing and annealing temperatures. (M27e, 2-61, 2-64, 3-69; Cb)

647-M. (Russian.) Investigation of Attractive Forces in Solid Solutions of Nickel-Molybdenum on the Basis of the Fine Structure of X-Ray Absorption Spectra. V. A. Trapeznikov. Izvestiya Akademii Nauk SSSR--Seriya Fizicheskaya, v. 25, Aug. 1961, p. 994-996.

Measurement of the K absorption edge of Ni in alloys containing 0-16% Mo and relation to bonding forces with a general consideration of these forces in Ni-Mo alloys. 14 ref. (M25, M26, P17c; Ni-b, Mo)

648-M. (Russian.) X-Ray Spectral Investigation of Intermetallic Bonding in the System Copper-Zinc. V. A. Batyrev. Izvestiya Akademii Nauk SSSR--Seriya Fizicheskaya, v. 25, Aug. 1961, p. 997-998.

Determination of K absorption edges for Cu and Zn in the pure states, beta phase (CuZn), gamma phase (Cu_5Zn_8) and epsilon phase ($CuZn_3$). 7 ref. (M25h, M-general; Cu-b, Zn-b)

649-M. Derivation of Phase Diagram for the Silicon-Oxygen-Carbon System. W. A. Krivsky and R. Schuhmann, Jr. Metallurgical Society of AIME, Transactions, v. 221, Oct. 1961, p. 898-904.

A general method is presented for the derivation of ternary phase diagrams under various conditions of temperature and pressure from existing thermodynamic data. This method has been found useful for analysis of complex commercial reduction reactions giving an understanding of the process not readily available by other means. For purposes of illustration, the system Si-O-C is chosen over the temperature range of interest to the process metallurgist and at pressures ranging from 0.01 to 5 atm. 9 ref. (M24c, 2-61, 3-74; Si-b, O, C)

650-M. A Reinvestigation of the Systems Ti-Cr and Ti-V. Felix Ermanis, Paul A. Farrar and Harold Margolin. Metallurgical Society of AIME, Transactions, v. 221, Oct. 1961, p. 904-908.

The systems Ti-Cr and Ti-V are reinvestigated at up to 40% alloying addition using both conventional and rapid quenching techniques with metallographic examination of recrystallization microstructures. The eutectoid temperature, solubility of Cr and V in alpha titanium and the beta transus are determined with the phase diagram as a

function of temperature and composition. 19 ref. (M24b, M-general, N-general, 2-60, 2-61; Ti-b, Cr, V)

651-M. Lattice Strains and X-Ray Stress Measurement. Matthew J. Donachie, Jr., and John T. Norton. Metallurgical Society of AIME, Transactions, v. 221, Oct. 1961, p. 962-967.

Residual lattice strains produced in 2024 Al and ingot Fe by uni-axial tensile deformation are measured on the original surface and with depth below the surface. The strains conform approximately to those from a macroscopic stress distribution but are not truly macroscopic in nature, the grain behavior being dependent on internal stress. 19 ref. (M26, Q24, Q25, Q27, 3-68; Al-b, Fe-a)

652-M. Determination of Number of Particles Per Unit Volume From Measurements Made on Random Plane Sections: The General Cylinder and the Ellipsoid. R. T. DeHoff and F. N. Rhines. Metallurgical Society of AIME, Transactions, v. 221, Oct. 1961, p. 975-982.

The problem of determining the number of particles of a phase distributed randomly in unit volume of an opaque matrix from measurements made on random plane sections is investigated with a formalized derivation for the general case being applied to specific types of dispersed aggregates including circles, particles with flat circular ends, cylinders and constant shape aggregates of ellipsoids of revolution. 6 ref. (M-general)

653-M. The Constitution Diagram Niobium (Columbium)-Rhenium. Bill C. Giessen, Rolf Nordheim and Nicholas J. Grant. Metallurgical Society of AIME, Transactions, v. 221, Oct. 1961, p. 1009-1013.

The binary system Cb-Re is examined at 19.1-99.6% Re utilizing pure metals, arc melting techniques and heat treatments at 600-2600° C. Metallographic and X-ray methods are used for phase identification. The composition limits and mode of formation of the intermetallic compounds sigma and chi are determined with solidus points. 12 ref. (M24b, M26q, 2-60, 2-61, 2-64; Cb-b, Re-b)

654-M. The Zirconium-Rich Corners of the Ternary Systems Zr-Co-O and Zr-Ni-O. M. V. Nevitt and J. W. Downey. Metallurgical Society of AIME, Transactions, v. 221, Oct. 1961, p. 1014-1017.

The phase boundaries for the 950° C: isothermal sections in the systems are determined for compositions of 50-100% Zr. The two systems show very similar phase relations, having no extensive solid solution phase fields. Each contains a ternary phase which is apparently isostructural. Some aspects of the phase relations are discussed in terms of the alloying behavior of transition metals. 14 ref. (M24c, 2-60, 2-61; Zr-b, Co, Ni, O)

655-M. Sigma Phases With Aluminum. K. P. Gupta. Metallurgical Society of AIME, Transactions, v. 221, Oct. 1961, p. 1047-1049.

X-ray diffraction and metallographic examination of binary specimens, 40% Al-Ta, 35% Al-Mo and 30-50% Al-Cb alloys after quenching and annealing treatments at 1175-1250° C. to determine the existence of Al-rich sigma phases and the presence of ordering. Phase field boundaries, lattice parameters and order schemes are presented with microstructural aspects and composition ranges. 5 ref. (M26q, M-general, N10, 2-60, 2-61, 2-64; Al-b, Ta-b, Mo-b, Cb-b)

656-M. Orientations of Large Grains in Tungsten Wire. A. J. Opinsky, J. L. Orehotsky and L. L. Seigle. Metallurgical Society of AIME, Transactions, v. 225, Oct. 1961, p. 1083-1084.

Preferred orientation direction and recrystallization texture and nature of grain elongation as a function of heating temperature are examined by Laue back reflection technique for Si-Al doped W specimens annealed in H and N atmospheres and in vacuum at 1000-3300° C. and for undoped specimens strain annealed at 1400-1600° C. 7 ref. (M26c, N3, N5, 2-62, 2-64; W-b, 4-61)

657-M. Ternary Laves Phases With Transition Elements and Silicon. D. I. Bardos, K. P. Gupta and Paul A. Beck. Metallurgical Society of AIME, Transactions, v. 221, Oct. 1961, p. 1087-1088.

Review of laves phase formation in binary alloys of transition metals such as Ni, Fe, Co, Ti, V, Sc, Y or Cr group

elements as a function of electron concentration and size. X-ray diffraction study of Si stabilization of laves and sigma phase formation in 1000-1200° C. annealed specimens of Ti_2Ni_3Si, $V_4Ni_5Si_3$, Cb_2Ni_3Si, Ta_2Ni_3Si, Mo_2Ni_3Si, W_2Ni_3Si, $V_4Co_5Si_3$, Mo_2Co_3Si, W_2Co_3Si, $W_{40}Fe_{50}Si_{10}$, $Ti_{30}Mn_{50}Si_{14}$, $Mo_{25}Mn_{47.5}Si_{27.5}$ and W_2Mn_3Si alloys. 10 ref. (M26q, M24c)

658-M. Phase-Equilibrium Studies in Metallurgical Systems. Technical News Bulletin (National Bureau of Standards), v. 45, Oct. 1961, p. 170-176.

The conventional two-component diagram (temperature versus composition) is studied and revised to develop a theory of alloying that can predict behavior for various compositions under various experimental conditions. Systems studied include binary combinations of Fe, Cr, Mo, U and semiconductor materials. (M24b, M24e; Fe, Cr, Mo, U, EG-j31)

659-M. (Ukranian.) Ternary Laves-Phase in the System Manganese-Cobalt-Beryllium. P. I. Krip'yakevich. Dopovidi Akademii Nauk Ukrains'koi RSR, Aug. 1961, p. 1042-1044.

X-ray determination of a cubic $MgCu_2$ type phase in the system after 400° C. heat treatment for various times. Data are given for lattice parameters and microstructure. 7 ref. (M26; Mn-b, Co-b, Be-b)

660-M. (Ukranian.) Crystal Structure of the Alloy $MgInCu_4$. M. Yu. Teslyuk and P. I. Krip'yakevich. Dopovidi Akademii Nauk Ukrains'koi RSR, Aug. 1961, p. 1039-1040.

X-ray determination of lattice parameters and space group of a ternary intermetallic compound. 7 ref. (M26q; Cu-b, In-b, Mg-b)

661-M. Metal Surfaces...How They Look and How They Behave. Digest from "Sixth Regional Seminar on Properties of Metallic Surfaces, held Apr. 20, 1961, at Illinois Institute of Technology in Chicago by the Chicago-Western Chapter of ASM. M. V. Nevitt. Metal Progress, v. 80, Nov. 1961, p. 126-138.

A variety of experimental techniques, ranging from field ion microscopy to magnetic measurements, are being employed to learn how surface structure affects properties. Review of instruments currently used to probe the structure of metal surfaces. (M-general, 1-53)

662-M. (Russian.) The Iron-Hafnium Composition Diagram. V. N. Svechnikov and A. K. Shurin. Doklady Akademii Nauk SSSR, v. 139, Apr. 1961, p. 895-898.

Determination of the Fe-Hf composition diagram through differential thermal analysis and dilatometric measurements. X-ray measurement of epsilon phase lattice parameter as a function of composition. 13 ref. (M24b, M-general, 2-60; Fe-b, Hf-b)

663-M. (Russian.) Distribution of Electrons on the Basis of States in Metals of the Iron Transition Group. N. D. Borisov and V. V. Nemoshkalenko. Izvestiya Akademii Nauk SSSR--Seriya Fizicheskaya, v. 25, Aug. 1961, p. 1002-1006.

Measurement of the CrK-beta 5, K-beta 5 and CoK-beta 5 lines in pure Cr, Fe and Co. Relation of K-beta 5 intensity to atomic number and relative number of outer electrons. 8 ref. (M25, P17c; Cr, Co, Fe)

SECTION N

TRANSFORMATIONS and RESULTING STRUCTURES

1-N. The Atomic Diffusion of Platinum in Gold. A. J. Mortlock, A. H. Rowe and A. D. LeClaire. Philosophical Magazine, v. 5, Aug. 1960, p. 803-814.

Measurement of the diffusion of Pt at tracer concentrations in Au at 800-1000° C. Calculation of activation energy and diffusion coefficient. 18 ref. (N1; Au, Pt)

2-N. (French.) Determination of Gamma Grain by Syncrystallizable Alloy Condensation. The Effect of Aluminum Nitride on Grain Coarsening. G. Vigneron. Memoires Scientifiques de la Revue de Metallurgie, v. 57, Sept. 1960, p. 705-720.

Polished samples of Armco iron, Cr steel and carbon steel are heated to 850-1100° C. An Fe-Ni alloy, pure Ni or Cu is evaporated and deposited on the surface. The deposit assumes and preserves the shape of gamma grain and is used for micrography. Study of coarse grain formation in a carbon steel with traces of aluminum nitride by the above method. 19 ref. (N3, M27c; CN)

3-N. (French.) Effect of Low Chromium, Iron or Molybdenum Additions on Transformations in Uranium During Hardening and Tempering. Jean Delaplace. Memoires Scientifiques de la Revue de Metallurgie, v. 57, Sept. 1960, p. 721-727.

Pure uranium and uranium containing 0.05-0.50 at.% Cr, 0.34 at.% Fe or 2.8 at.% Mo are cooled at various rates from 775-735° C. to 600-400° C. to study the effects of additions and cooling rate on the gamma-beta and beta-alpha transformations. 8 ref. (N-general, 2-60, J-general; U, Cr, Fe, Mo)

4-N. The Structure and Mechanical Properties of Uranium-Titanium Martensites. D. L. Douglass. American Society for Metals, Transactions, Preprint no. 200, v. 53, 1961, p. 307-319.

Small amounts of Ti were very effective in increasing the strength of martensitic uranium. The strengthening effect saturated at about 2 at.% Ti and was not due to the presence of a second phase. Lattice parameter changes with composition were continuous, both a_o and c_o increased with increasing solute, whereas b_o decreased. The measured changes were greater than those calculated on the basis of size differences alone. 19 ref. (N6q, 2-60; U-b, Ti, 14-67)

5-N. Effect of Rolling Procedure on the Kinetics of Recrystallization of Cold-Rolled Iron. J. T. Michalak and W. R. Hibbard, Jr. American Society for Metals, Transactions, Preprint no. 202, v. 53, 1961, p. 331-348.

Effect of straight-rolling, cross-rolling, time of recrystallization, temperature of recrystallization, apparent nucleation frequency, growth rate and preferred orientation. 16 ref. (N5f, F23; Fe)

6-N. Isothermal Transformation of Ti-13V-11Cr-3Al. L. E. Tanner. American Society for Metals, Transactions, Preprint no. 206, v. 53, 1961, p. 407-414.

Transformation kinetics investigated for a heat treatment that consisted of water quenching from a beta solution anneal at 788° C. (1450° F.) and reheating to aging temperatures between 350-700° C. (662 and 1292° F.) A TTT diagram was constructed from

metallographic, hardness and X-ray diffraction data. 6 ref. (N7c, 2-64; Ti-b, V, Cr, Al)

7-N. The Morphology of Proeutectoid Cementite. R. W. Heckel and H. W. Paxton. American Society for Metals, Transactions, Preprint no. 215, v. 53, 1961, p. 539-554.

Three hypereutectoid, plain carbon steels containing 1.20, 1.48 and 1.72 wt.% carbon were solution treated to give a large austenite grain size and subsequently isothermally transformed for various lengths of time between 550° C. and the A_{cm} temperature. The specimens were examined metallographically in order to observe the effect of experimental variables (carbon concentration, transformation temperature and transformation time) on the morphology of the precipitated proeutectoid cementite. 16 ref. (N8k; CN)

8-N. The Occlusion of Hydrogen by Annealed Hypoeutectoid Iron-Carbon Alloys. Michael Kotyk and H. M. Davis. American Society for Metals, Transactions, Preprint no. 222, v. 53, 1961, p. 653-661.

Unworked iron-carbon alloys of five carbon contents involving three carbide forms were equilibrated with hydrogen gas at temperatures from 40-550° C. Minima in certain occlusion curves are resultants of decaying exothermic occlusion and increasing endothermic occlusion. The mechanism of the exothermic process is thought to be sorption at carbide-ferrite or pearlite-ferrite interfaces. 15 ref. (N15d; Fe-b, C, H)

9-N. The Effect of Aluminum on Strain Aging and Internal Friction in Low Carbon Steel. F. H. Laxar, J. W. Frame and D. J. Blickwede. American Society for Metals, Transactions, Preprint no. 224, v. 53, 1961, p. 683-696.

Internal friction results indicate that carbon and Al atoms interact. This is evidenced by three abnormal peaks in the internal friction curves of these steels which increase in size at the expense of the normal peak as Al content increases. The equilibrium solid solubility of carbon in ferrite at 700° C., as measured by the sum of the peak maxima, decreases with increasing Al content. 13 ref. (N7e, Q22, 2-60; CN-g, Al)

10-N. Diffusion of Carbon in Thorium. David T. Peterson. American Society for Metals, Transactions, Preprint no. 230, v. 53, 1961, p. 765-773.

The rate of diffusion of carbon in Th was determined by measuring the fractional saturation of Th cylinders at various times. The activation energy for diffusion is 38 kcal. per mole. Evidence of a change in the diffusivity with concentration is observed. 4 ref. (N1; Th, C)

11-N. The Mechanism of Occlusion of Hydrogen by Cold-Worked Hypoeutectoid Iron-Carbon Alloys. J. E. Werner and H. M. Davis. American Society for Metals, Preprint no. 237, v. 53, 1961, p. 853-869.

Equilibration of gaseous hydrogen with cold worked iron-carbon alloys between 250-400° C. reveals the existence of both an exothermic and an endothermic mechanism of occlusion, to which processes the total occluded volume of hydrogen could be apportioned. Both mechanisms are shown to be fully reversible. 20 ref. (N15d; Fe-b, C)

12-N. Analysis of Diffusion Couples by X-Ray Absorption. Robert E. Ogilvie. Paper from "Advances in X-Ray Analysis", v. 1. Plenum Press, Inc., New York, N. Y., 1960, p. 439-453.

Diffusion zones in thin sections of Ni-NiAu, Fe-Cr and Ni-Cr diffusion couples are scarred with a monochromatic X-ray beam. Zone composition and phase diagrams are determined from the measured intensity of the transmitted X-rays and the absorption coefficients of the component elements. (N1, S11p)

13-N. Ordered Phases With Long Period in the Gold-Zinc Alloy System. Pt. 1. Survey of Crystal Structures and Calorimetric Measurement. Hiroshi Iwasaki, Makoto Hirabayashi, Kunio Fujiwara, Denjiro Watanabe and Shiro Ogawa. Physical Society of Japan, Journal, v. 15, Oct. 1960, p. 1771-1783.

Study of Au-Zn single crystals by X-ray and electron diffraction. Phase diagrams, orientation distribution of the ordered crystals and transition behavior of the alloys with changing temperature. 18 ref. (N10a, 2-61, M24b, M22, M26; Au-b, Zn, Zn-b, Au)

14-N. (German.) Spherulite Formation in Metal Melts. Hans H. Stadelmaier.

Zeitschrift fur Metallkunde, v. 51, Oct. 1960, p. 601-604.

Growth of spherulites in melts composed of Fe-Sn-C, Ni-C, Co-C and Fe-Ni_2Mg is traced by microscopic examination in polarized and nonpolarized light. (N8q, M21; Co-b, Fe-b, Ni-b, C, Mg, 14-60)

15-N. (German.) Investigation of Transition Behavior of Titanium-Molybdenum and Titanium-Vanadium Alloys. Willy Knorr and Herbert Scholl. Zeitschrift fur Metallkunde, v. 51, Oct. 1960, p. 605-612.

Isothermal and nonisothermal damping measurements on heat treated binary TiV and TiMo bars of varying composition at 0-700° C. Evaluation of phase relations from modulus of elasticity and damping capacity measurements. (N-general, M24b, Q8g, Q21a, 2-60, 2-61; Ti-b, Mo, V, 4-55)

16-N. (German.) Anisotropy of Grain Growth in Recrystallization of Aluminum Single Crystals. G. Czjzek and F. Haessner. Zeitschrift fur Metallkunde, v. 51, Oct. 1960, p. 567-572.

Al single crystals, obtained by a recrystallization method from cold rolled Al (99.99%) foil, are hand stretched annealed at 390-510° C. and electrolytically etched. Effect of deformation structure and grain-matrix orientation on anisotropy of grain growth is measured microscopically. (N3, 3-68, 3-72; Al, 14-61)

17-N. Polygonization Capacity of Zone Melted Copper. Jacques LeHericy, Francoise Bourelier, Jean Montuelle and Georges Chaudron. Comptes Rendus, v. 251, Oct 24, 1960, p. 1779-1781.

Microscopic inspection of zone melted Cu after tensile deformation and subsequent holding at 1050° C. to determine extent of polygonization. 6 ref. (N4, N5, 3-68, M21' Cu-a)

18-N. (French.) New Carbide Formed During Transformation of Carbon-Silicon Steels. J. Pomey, J. Deliry, M. Wintenberger, R. Lafont, P. Lesage and A. Diament. Comptes Rendus, v. 251, Oct. 10, 1960, p. 1507-1508.

Formation of a carbide with hexagonal structure and Curie point near 370° during bainitic transformation of carbon silicon steel at 350-450° C. Isothermal decomposition of austenite around 400° occurs in two successive stages with ferrite developing during carbon enrichment of austenite and the remaining austenite decomposing to form ferrite and the new carbide. (N8r; CN, Si)

19-N. (Japanese.) Application of Atomalloy Treatment to Die Steel and Its Effects. S. Ohwaku, K. Hachiya, H. Nakagami and H. K. Ashikari. Metals, v. 30, Aug. 15, 1960, p. 57-61.

Activated fine grained WC or Mo_2C is adsorbed on an activated die and diffuses over the steel surface during heating to form a hardened tough skin. Hardness testing. Applications. (N1h, J28, Q29n; TS)

20-N. High-Pressure Research in Metallurgy. John E. Hilliard. American Society of Mechanical Engineers, Paper no. 60-WA-271, 1960. 9 p. $1.

Effect of ultra-high pressure and temperature on phase transitions, grain growth, diffusion, crystal structure and defect concentration, thermodynamics and mechanical properties of alloys. 33 ref. (N-general, M26, P-general, Q-general, 3-74)

21-N. (French.) Simultaneous Cementites Substitution for Chromium, Molybdenum and Manganese in Low Carbon, Low Alloy Steels. L. Backer, R. Bigot and E. Herzog. Comptes Rendus, v. 251, Oct. 3, 1960, p. 1388-1390.

Evolution of substitutional cementites are studied after different heat treatments to determine limits of solubility of Cr, Mo and Mn. Carbides are isolated by electrolytic separation and analyzed chemically and by X-ray diffraction. 3 ref. (N8k, N8r, M26p; AY, C, Cr, Mo, Mn)

22-N. Kinetics of the Martensite Transformation in Iron Alloys. W. S. Owen and A. Gilbert. Iron and Steel Institute, Journal, v. 196, pt. 2, Oct. 1960, p. 142-149.

Types of martensite in Fe alloys and driving force required for martensitic transformations. Nucleation theories. 64 ref. (N8p, N2; Fe-b)

23-N. Cooling Transformation Diagrams for A. I. S. I. 8620 and 8640. Metal Progress, v. 78, Dec. 1960, p. 100B.

Data presented in two diagrams. (N-general; CN)

24-N. (Russian.) Some Self Diffusion Variables and Distribution of Elements in

Alloys. P. L. Gruzin. Metallovedenie i Termicheskaya Obrabotka Metallov, Oct. 1960, p. 5-13.

Study of atomic migration in solid bodies. Dependence of diffusion coefficient upon temperature, structural factors and grain size. Diffusion of carbon in ferrite as influenced by Si, Ni and Mo concentrations. (N1e, N8, 2-59, 2-60, 2-61)

25-N. (Russian.) Pearlite in Iron-Carbon-Silicon Systems. Ya. N. Malinochka, N. G. Osada and G. Z. Koval'chuk. Metallovedenie i Termicheskaya Obrabotka Metallov, Oct. 1960, p. 19-21.

Microscopic study of honeycomb pearlite formed with laminar pearlite in rapidly cooled castings composed of posteutectoid Si steel and low carbon and high Si cast iron. (N8h, M24c; CI, ST, Si, 5)

26-N. Annealing Texture in a Rolled and Artificially Nucleated Aluminum Single Crystal. S. Kohara, M. N. Parthasarathi and Paul A. Beck. Paper from "Advances in X-Ray Analysis", v. 2. Plenum Press, Inc., New York, 1960, p. 7-21.

The effect of random nuclei on recrystallization texture and relative grain boundary mobilities in various orientations between a deformed (99.98% pure) Al single crystal and recrystallized grains growing in it in well deformed lattice orientation relationships are studied by X-ray back reflection of specimens with nucleation caused by abrasion and annealing. 21 ref. (N2, N3, N5, M26C, M22g, 2-64; Al, 14-61)

27-N. On the Mechanism of Recrystallization of Aluminum. Sigmund Weissmann. Paper from "Advances of X-Ray Analysis", v. 2. Plenum Press, Inc., New York, 1960, p. 47-70.

Recrystallization and grain growth of 99.998% Al by methods combining metallographic techniques with X-ray microscopy and diffraction and analysis. The recrystallized grains are the product of preferential subgrain growth whereby subgrains subtending large disorientation angles with respect to their neighbors exhibited the highest velocity of growth. 28 ref. (N5, N3, M21, M22g; Al)

28-N. Recrystallization Studies of High Purity Aluminum Single Crystals. Robert A. McCune and H. P. Leighly, Jr. Paper from "Advances in X-Ray Analysis", v. 2. Plenum Press, Inc., New York, 1960, p. 341-359.

Laue back reflection and transmission and X-ray diffraction study of recrystallization growth rates in strain-annealed Al single crystals deformed in tension. Correlation of growth rates with relative orientations of the matrix and the recrystallized grain suggesting a compromise between the theories of oriented growth and oriented nucleation in the recrystallization mechanism. Effect of residual stress on rupture of the coherent bond between the embryo and the matrix allowing nuclei formation; and partial stress relief occurring through polygonization permitting recrystallization. 7 ref. (N5, N2, M22g, 2-64, 3-66, 3-68; Al-a, 14-61)

29-N. Analysis of Aluminum-Nickel Diffusion Couples by X-Ray Absorption. Paul Lublin. Paper from "Advances in X-Ray Analysis", v. 3. Plenum Press, Inc., New York, 1960, p. 1-10.

X-ray determination of diffusion zone concentration gradients, phase compositions, porosity and layer growth. The technique employs a monochromatic X-ray beam which impinges on a very fine slit aligned with the diffusion zone. 4 ref. (N1, S11p; Al-b, Ni-b)

30-N. A High-Temperature Study of Phase Precipitation in Superalloys. John F. Radavich. Paper from "Advances in X-Ray Analysis", v. 3. Plenum Press, Inc., New York, 1960, p. 365-375.

Electron microscopy, electron diffraction and X-ray diffraction and fluorescence analysis of grain boundary precipitation in V-57 and A-286 Fe-base alloys at 1950-2150° F. Effect of process temperature on grain boundary thin film (TiC) formation and subsequent embrittlement. 5 ref. (N7, 2-62, M21, M22; SGA-h)

31-N. (German.) Changes of Microstructure and of Properties of Cast Iron in the Solid State. Werner Jellinghaus. Stahl und Eisen, v. 80, Nov. 10, 1960, p. 1695-1700.

Dilatometric and microstructural investigations on die and sand cast specimens of cast iron with varying

carbon (1.1-3.0% C) and silicon (0.4-2.7% Si) content after isothermal austenite transformation, hardening and annealing. Role of Si in microstructural changes. (N8, M27, Q29n, 2-60, 2-64; CI, Si, 5)

32-N. (Spanish.) Influence of Boron on the Hydrogen Content of Steel. R. Suarez Acosta. Instituto del Hierro y del Acero, v. 13, July-Sept. 1960, p. 778-790.

Presence of boron retards diffusion of hydrogen in steels and facilitates formation of martensite during hardening treatments. Addition of boron to Al-killed carbon steel is advised. In alloy steels containing Ni, boron addition is not necessary as Ni has same retarding effect on diffusion of hydrogen as does boron. 9 ref. (N1, N8p, 2-60; AY, CN, B, H)

33-N. (French.) Curie Point of Hexagonal Iron Carbides. Comptes Rendus, v. 251, Sept. 19, 1960, p. 1220-1222.

Effect of Si and Fe concentration on the stability and Curie point of iron carbides formed in steel. (N8r, P16d, 2-60; ST)

34-N. (German.) Influence of Chromium, Molybdenum, Tungsten and Manganese on the Transformation of 1% C Steels. Karl Bungardt and Otto Mulders. Stahl und Eisen, v. 80, Oct. 27, 1960, p. 1603-1618.

Construction of TTT diagrams for steels with 1-3% Cr, 0.2-2% Mo, 0.4-2.3% W, or 0.3-1.9% Mn. Magnetic measurement and microscopic and X-ray examination of effect of alloying additions, based on activation energies of the phase transformations. 50 ref. (N-general, 2-60; ST, W, Cr, Mo, Mn)

35-N. (Japanese.) Carbides in High-C High-V High-Speed Steel. Sadae Koshiba, Shin Kimura and Hideki Harada. Japan Institute of Metals, Journal, v. 24, July 1960, p. 437-440.

Composition, crystal structure and shape of carbides electrolytically isolated from several high-speed steels after heat treatment as determined by chemical and X-ray analysis and electron microscopy. Effect of heat treatment on carbide content and relation of carbide content to cutting durability of the steels. 10 ref. (N8r, 2-64, M-general; TS-m)

36-N. (Japanese.) Carbides in Molybdenum Steels (Continued). Tomo-o Sato, Taiji Nishizawa and Koreaki Tamaki. Japan Institute of Metals, Journal, v. 24, July 1960, p. 469-473.

Carbides existing at equilibrium with austenite in Mo steel studied by electrolytic isolation and by subsequent chemical and X-ray analysis; after austenitizing and tempering. Data are given for crystal structure and composition. 10 ref. (N8r, M-general, 2-64; AY, Mo)

37-N. (Japanese.) Carbide Reactions, Secondary Hardening and Volume Change Occurring in the Fourth Stage of Tempering of Alloy Steels. Tomo-o Sato and Taiji Nishizawa. Japan Institute of Metals, Journal, v. 24, July 1960, p. 473-477.

X-ray, dilatometric and chemical analysis of carbides isolated electrolytically from Cr, Mo, W and V steels tempered at 400-730° C. 16 ref. (N8r, J29, M-general, P10d, 2-60; AY, Cr, Mo, V, W)

38-N. Gas Solubility in Iron-Base and Nickel-Base Alloys. M. J. Trzeciak and F. W. Boulger. Paper from "Electric Furnace Proceedings, 1959", v. 17. American Institute of Mining, Metallurgical and Petroleum Engineers, Inc., New York, 1960, p. 203-223.

H, O and N contents in liquid melts of Fe and Ni alloys. Effect of alloying elements, melt temperature and gas pressure on the gas solubility. 9 ref. (N16m, 2-60, 2-61, 3-74; Fe-b, Ni-b, H, N, O)

39-N. Aging Characteristics of Aluminum Alloys. Industrial Heating, v. 27, Nov. 1960, p. 2366.

Electron microscope study of the aging in high-purity Al alloys containing Mg, Zn and Cu and in commercial D.T.D. 687 alloys. Factors influencing distribution of precipitates. (N7a, M2le; Al-b, Cu, Mg, Zn)

40-N. (Polish.) The Rate of Martensitic Transformation. W. Cias. Prace Instytutow Hutniczych, v. 12, Apr. 1960, p. 181-191.

Literature review of crystallographic and kinetic aspects of martensitic transformation and various methods of rate determination. 40 ref. (N8p, 11-65)

41-N. Continuous Cooling Transformations in a 0.6% C-Cr-Mo-V Steel. Tatsuro Kunitake. Sumitomo Metals, v. 12, Apr. 1960, p. 400-414.

Transformation behavior and resultant microstructure, hardness, tensile and impact properties of a 0.6% C, 1% Cr, 0.5% Mo, 0.2% V steel as influenced by continuous cooling from 850-450° C. are investigated by dilatometric and metallographic methods. 17 ref. (N-general, M-general, Q-general, 2-61, 2-64; AY)

42-N. (Japanese.) Mechanism of Age-Hardening of Au-Cu-Ag Alloys. Tomotsune Abo, Hideo Miyashita and Masayuki Uda. Japan Institute of Metals, Journal, v. 24, Aug. 1960, p. 511-514.

X-ray diffraction analysis and hardness measurements of ternary Au-Cu-Ag alloys and of specimens electroplated with Au-Cu-Ag alloys after aging at 200-500° C. in vacuum, solution treatment and electrodeposition. Effect of ordering and phase precipitation on age hardenability. 8 ref. (N7a, 2-4; Au-b, Cu-b, Ag-b)

43-N. (Japanese.) Strain Age-Hardening of Carbon Steel. Pt. 1. Kazuyoshi Nishino and Kiyoharu Takahashi. Japan Institute of Metals, Journal, v. 24, Aug. 1960, p. 514-518.

Two stage hardening mechanism observed in 0.1-0.9% carbon steel during annealing after cold working, the first stage taking place within the ferrite phase at 100° C., with the second occurring at 150-340° C. as a function of carbon content, removal of the Bauschinger effect and the arrangement, shape and size of cementite particles. Torsion and tensile test data given for stress-strain relations and mechanical properties. 13 ref. (N7a, Q-genera; CN)

44-N. (Japanese.) Some Phenomena Related to Strain Age-Hardening of Carbon Steel. Pt. 2. Kazuyoshi Nishino. Japan Institute of Metals, Journal, v. 24, Aug. 1960, p. 518-522.

Relation of strain age-hardening, as a result of annealing and mechanical deformation, to secondary work-hardening and to destruction of deformation structures which exhibit a marked anisotropy in anelastic effect. Influence of internal stress, thermal diffusion, cold work and heat treatment on properties. 10 ref. (N7a, 2-64, 3-68; CN)

45-N. (Translation-ConBur.) Investigation of Structural Changes of Some Magnetic Alloys by the Method of True Specific Heat. Yu. D. Tret'yakov and K. G. Khomyakov. Russian Journal of Inorganic Chemistry, v. 5, Feb. 1960, p. 196-198.

Measurement of true specific heat and coercivity of magnetic ANKO-1 and ANKO-2 alloys after hardening and tempering. Effects of temperature. Tempering of the hardened magnetic alloys is associated with a number of exothermic and endothermic effects. 12 ref. (N11h, P12r; SGA-n)

46-N. (Translation-Brutcher no. 4905.) Effect of Vibrations of Ultrasonic Frequency on Crystallization Pattern of Weld Puddles. A. A. Erokhin. Izvestiya Akademii Nauk SSSR, OTN, Jan. 1958, p. 140-142.

Effect of ultrasonic vibrations in weld puddles of creep-resisting austenitic steel or 0.3% C steel upon crystallization. Macrostructure of argon-arc weld metal with and without vibration treatment during its solidification. (N12, 1-74; ST, 7-51)

47-N. (Translation-Columbia.) Investigation of the Causes of Selective Disintegration of Alloys by a Spark Discharge. I. Grikit. Academy of Sciences of the USSR, Bulletin, Physical Series, v. 23, Sept. 1959, p. 1083-1084.

Samples of pure Ni and Armco iron, metal-ceramic alloys composed of tungsten and TiC and artificial heterogeneous alloys of Armco iron, Ni, Cu, Al, Mg, Sn and Zn containing pressed-in carbides are disintegrated by a spark discharge to determine the cause of selectivity in spark contacts. 6 ref. (N16n; Fe-a, Al-b, Cu-b, Mg-b, Ni-b, Sn-b, Zn-b, NM-a35)

48-N. A Method of Growing Dislocation Free Germanium Crystals. B. Okkerse. Philips Technical Review, v. 21, no. 11, 1959-1960, p. 340-345.

Ge crystals without discloations are produced by a modified pulling method in which the diameter of the crystal grown from the seed is reduced to 1 or 2 mm. initially, for a length of about 20 mm. and then raised to the desired value. No dislocations appear because of the absence of sources. (N3r; Ge)

49-N. (French.) Austenite Transformation and Formation of Cold Cracks in Fusion Welded Steels. N. N. Rykaline and M. K. Chorchorov. Soudage et Techniques Connexes, v. 14, Sept-Oct. 1960, p. 335-347.

Weldability and changes in structure of base and weld metal studied by reproduction of thermal cycles in heat affected

zone on tubular and notched specimens of a carbon steel and four low alloy steels (Soviet grades 23 G, 20 H GS, 35 H GS A, 40 H and St 45). Influence of rate of heating and cooling in A_c1-A_c3 temperature range on homogenization of austenite, grain growth and formation of cold cracks. (N8, N-general, K9s, 9-72; AY, CN, 7-51)

50-N. (German.) Inhibition of Strain Aging of Unalloyed Low-Carbon Structural Steels by Phosphorus. F. Erdmann-Jesnitzer, W. Precht and G. Wunsche. Bergakademie, v. 12, Oct. 1960, p. 559-567.

Aging of openhearth steel and electro steel samples in oil at 75° C. for varying aging times after 10% tensile stressing. Measurement of mechanical properties to evaluate influence of phosphorus on aging. Macrostructure to show phosphorus segregation. (N7e, Q-general, M28p, 2-60; ST)

51-N. (Russian.) Effect of Impurities on Saturation of Solid Solutions in Some Aluminum Alloys. V. M. Vozdvizhenskii. Tsvetnaya Metallurgiya, May 1960, p. 116-120.

Determination of solid solution concentrations by measurements of electrical resistivity in Al-Si and Al-Cu alloys with various amounts of Fe and Si additions. Effect of annealing temperature and composition on resistivity. 19 ref. (N12p, P15g, 3-69; Al-b, Cu, Si)

52-N. (Russian.) Radiographic Study of Recrystallization Processes in Hard Alloys Containing Tungsten, Titanium and Tantalum Carbides. S. S. Gorelik, E. I. Mozzhukhin and V. I. Elyutina. Tsvetnaya Metallurgiya, May 1960, p. 121-125.

Radiographic determination of constitution diagram for WC-Tic-Tac and solubility of WC in Tic-Tac solid solution at 1450-2200° C. Determination of recrystallization temperature and reverse precipitation of carbide phase occurring during heat treatment in some alloys. 4 ref. (N5, N12p, M23m, M24c, 2-61, 2-64; SGB-q, W-b, Ti-b, Ta-b, 14-68)

53-N. (Japanese.) Solidification Phenomena in Hypo and Hyper-Eutectic Iron and the Effect of Manganese and Sulphur on the Process. Goro Ohira and Katsuya Ikawa. Japan Institute of Metals, Journal, v. 24, Sept. 1960, p. 588-592.

Thermal and micrographic analysis of specimens quenched from 1240° C. Data for eutectic solidification reactions; flake, nodular and granular graphite separation, austenitic gamma dendrite, ledburite, cementite formation; and distribution of gray, white and mottled structures. 10 ref. (N12, 2-60; Fe-b, Mn, S)

54-N. (Japanese.) Study of Carbides in Commercial Special Steels by Electrolytic Isolation. Pt. 10. Tomo-o-Sato, Taiji Nishizawa and Koreaki Tamaki. Tetsu-to-Hagane (Iron and Steel Institute of Japan, Journal), v. 46, Nov. 1960, p. 1549-1554.

Chemical and X-ray analysis of carbides electrolytically isolated from as-annealed, as-quenched and as-tempered structure of H_{11}, H_{12}, H_{13} and D_2 hot work steels. Effect of Cr, Mo, V and W concentrations on carbide composition, structure and equilibrium reaction. 15 ref. (N8r, M-general, 2-60, 2-64; TS-k)

55-N. (Japanese.) Study of Carbides in High Speed Steels by Electrolytic Isolation. Pt. 4. Sadao Koshiba, Shin Kimura and Hideki Horado. Tetsu-to Hagane (Iron and Steel Institute of Japan, Journal), v. 46, Nov. 1960, p. 1554-1558.

Composition and crystalline structure of carbides electrolytically isolated from heat treated specimen determined by electron microscopy, X-ray diffraction and chemical analysis. Influence of tempering time and repetition of tempering on carbide precipitation. 9 ref. (N8r, M-general, 2-64; TS-m)

56-N. (Russian.) Investigation of Primary Stages of Aging in Aluminum-Zinc Alloys. M. I. Zakharova and I. I. Eliseeva. Fizika Metallov i Metallovedenie, v. 10, Apr. 1960, p. 560-563.

Pattern etching and X-ray analysis of monocrystals and polycrystals aged at 100-150° C. Aging process in Al alloy with 10% Zn is accompanied by elastic disorientation of atomic blocks in some parts of the matrix. Angular value of disorientation increases with aging time to the individual maxima in different crystals. (N7a; Al-b, Zn)

57-N. (Russian.) Effect of Stresses and Deformation on Self Diffusion. A. V. Savitskii. Fizika Metallov i Metallovedenie, v. 10, Apr. 1960, p. 564-571.

Measurements of self diffusion in Ag and Fe between 460-800° C. under

monoaxial stress by means of radioactive isotope absorption. Considerable increase of self diffusion coefficient for Fe in low carbon steel is observed during exposure to a tensile load. 19 ref. (N1d, 3-66, 3-68; Ag, Fe)

58-N. (Russian.) Carbide Formation During Tempering of Hardened Alloy Steels. V. N. Shcherbakov, V. V. Kubatkina, L. M. Motova, G. N. Tsvetkova and A. N. Yarochkina. Fizika Metallov i Metallovedenie, v. 10, Apr. 1960, p. 622-627.

Data on structural changes of carbide phase in V, Mo, W, Mn and Cr alloy steels (C up to 1%) during tempering at 200-680° C. based on radiographic study of electrolytically separated powders. Mechanism of Fe_3C phase changes in relation to alloying degree. (N8r, 2-60, J29; AY)

59-N. (German.) Evaporation of Liquid Metals at Reduced Pressure. Bernhard Ilschmer and Jean Humbert. Zeitschrift fur Metallkunde, v. 51, Nov. 1960, p. 626-632.

Al and Ag are evaporated at 1050-1250° C. in an argon atmosphere at a pressure of 10^{-5} to 10^{3} Torr. Effect of temperature and pressure on evaporation. 24 ref. (N16n, 2-61, 3-74; Ag, Al)

60-N. (German.) Motion of Impurities During Recrystallization. Tivadar Millner, Laszlo Bartha and Janos Prohaszha. Zeitschrift fur Metallkunde, v. 51, Nov. 1960, p. 639-642.

AgCl is precipitated from agneous $AgNO_3$ solutions containing radioactive Ag^{110} atoms and dried. The AgCl is placed in a crucible and spectrographically pure molten Sn is added and covered with charcoal powder. Autoradiographs and micrographs are made from samples in the cast state and after heat treatments for 0-24 hr. at 200-210° C. with and without previous cold rolling to study the position of Ag in the crystallites and on the grain boundaries. 9 ref. (N5f, 2-64, 3-68; Sn, Ag)

61-N. (German.) Martensitic Nucleation. Cornelis Antonius Verbraak. Zeitschrift fur Metallkunde, v. 51, Nov. 1960, p. 646-649.

Changes of orientation occurring during the recrystallization of rolled Cu sheet. Reorientation according to Rowland's model previous to the formation of the final cube-texture is assumed. 11 ref. (N5, M26c, N2; Cu, 4-53)

62-N. (German.) Secondary Recrystallization in Double and Multiple Metallic Layers. Hans Gunter Baer. Zeitschrift fur Metallkunde, v. 51, Nov. 1960, p. 650-655.

Sheets of Fe containing 2-3% Si, Cu and Ni, Ni with 20% Cr, Ni with 50% Fe and NiSi alloys in the rolled and primary or secondary recrystallized state are brought into close contact forming groups of two and more sheets, heated to above recrystallization temperature and held for 10-20 hr. Radiographic testing of crystal orientation. Effect of contacting structure on secondary recrystallization. 8 ref. (N5, M26c, 1-54; Fe-b, Ni-b, Cr, Si)

63-N. (Rumanian.) Effect of the Mechanical Failure of Iron Carbide Particles on Curie Point and X-Ray Diffraction. Alois Masin and Olga Bakalikova. Studii si Cercetari de Metalurgie, v. 5, Mar. 1960, p. 313-319.

Wires of high-purity Fe-C alloys containing 0.2% C are drawn through a die which reduces the original diameter. Specimens are prepared by mechanical and electrolytic polishing, etched in 1% HNO_3 and studied by radiography and magnetic testing. (N8r, F28, M22g, P16d; Fe-b)

64-N. (Rumanian.) Isothermal Austenite Decomposition in Ball Bearing Steels. Butu Rotenstein and Nicolae Dragan. Studii si Cercetari de Metalurgie, v. 5, Mar. 1960, p. 321-342.

Steels containing 0.93-1.05% C, 0.19-0.55% Si, 0.32-1.1% Mn, 0.54-1.54% Cr, 0.013-0.017% P, 0.008-0.017 S, 0.067-0.17% Cu, 0.017-0.12% Ni, 0.012-0.05% Mo and traces of Ti are austenized and subsequently held at 200-700° C. Samples are then subjected to thermomagnetic, micrographic and hardness testing to determine austenite composition as a function of holding time. 11 ref. (N8g, 2-64; SGA-c, ST)

65-N. Steel Yields More of Its Secrets. Mechanical World and Engineering Record, v. 140, Dec. 1960, p. 503-504.

Effect of heat treatment and removal of metal from the surface on the retained austenite in hardened steel. Effect of alloy segregation on the amount, kind and form of banding in preferred regions. Use of radioactive tracers to determine the distribution of impurities in steel. (N8, 2-64, 1-59; ST)

66-N. (Russian.) Phase Transformation in Kh17N7Yu Stainless Steel. E. G. Feld

Gandler and M. V. Pridantsev. Metallovedenie i Termicheskaya Obrabotka Metallov, Nov. 1960, p. 2-7.

Samples are vacuum heat treated at 1050° C., then tempered at 300-750° C. for 3 hr. Secondary phase segregation during low temperature tempering and alpha-gamma transformations are studied by radiographic analysis. Data are given for effect of Ni and Al concentrations and temperature on hardness and electrical resistivity. 11 ref. (N-general, Q29n, P15g, 2-60, 2-61; SS, Al, Ni)

67-N. (French.) Study of Seeds in Metals and Alloys by Thermal Analysis of Granules. Claude Mascre. Fonderie, June 1960, p. 254-258.

New method for studying seeds in metals and alloys comprising thermal analysis of fragments or granules smaller than the normal grain. Application to Al and Al alloys with addition of 0.01% Ti, effect of undercooling, remelting on growth activity and regeneration. (N2, N3, M23r; Al-b)

68-N. Discontinuous Mode of Dissolution of a Beta Phase Precipitate Into Alpha Cu-Cd Solid Solutions. M. S. Sulonen. Acta Metallurgica, v. 8, Oct. 1960, p. 669-676.

Metallographic and X-ray studies of 1.82-4.21 Cd-Cu alloys after homogenization, solution and precipitation annealing at 250-650° C. and rolling. Relation of grain boundary diffusion to discontinuous mode of solid phase dissolution and precipitation. 7 ref. (N-general, M-general, 2-64; Cu-b, Cd)

69-N. Diffusion in the System Uranium-Titanium. Y. Adda and J. Philibert. Acta Metallurgica, v. 8, Oct. 1960, p. 700-710.

Intermetallic diffusion studied at 650-1050° C. using metallography, microhardness and micro-analyzer techniques on U-Ti diffusion coupler. Data are given for diffusion coefficient, activation energies, frequency factor and relation of evidenced Kirkendall effect. 19 ref. (N1; Ti-b, U-b)

70-N. Precipitation in Gold-Platinum Alloys. Pt. 1. Thermodynamics. L. J. Van Der Toorn and J. J. Tiedema. Acta Metallurgica, v. 8, Oct. 1960, p. 711-714.

An expression is derived for the increase in the Gibbs' free energy which arises from the mixing of a total amount of 1 mole of the components of a binary system. The six constants of these expression are calculated for the Au-Pt system from experimental data and are applied to calculation of the spinodal curve to study its influence on precipitation. 9 ref. (N7, P12; Au-b, Pt)

71-N. Precipitation in Gold-Platinum Alloys. Pt. 2. Influence of the Spinodal Curve on the Rate and Mechanism of the Precipitation Process. L. J. Van Der Toorn. Acta Metallurgica, v. 8, Oct. 1960, p. 715-727.

X-ray studies of homogenized single crystal and polycrystal specimens annealed at 500-700° C. Comparison of theories predicting precipitation phenomena in solid solutions at compositions and temperatures above the spinodal curve, with attention to the influence of lattice imperfections on the result. 19 ref. (N7, M26, 2-60, 2-61; Au-b, Pt)

72-N. Hydrogen and Austenite Stabilization. E. G. Ramachandran and C. Dasarathy. Acta Metallurgica, v. 8, Oct. 1960, p. 729-730.

Effect of hydrogen on deactivation of strain embryos in austenite during heat treatment, resulting in austenite stabilization, is discussed in terms of hydrogen build up and migration as a function of temperature and solubility. 9 ref. (N8, 2-61; ST, H)

73-N. Identification of the Diffusion of Iron Ions in Magnetite Employing Markers. D. Fuller. Acta Metallurgica, v. 8, Oct. 1960, p. 743-744.

Observation of oxide-atmosphere interface lines in Fe_2O_3 layer after oxidation of FeO in pure steam at 600-1200° C. Fe ion diffusion in magnetite is determined as a function of initial Fe saturation, rather than oxygen, in the layer and as a function of time and temperature. 6 ref. (N1; Fe)

74-N. (Japanese.) Nitrogen-Bearing 13% Chromium Stainless Steels. Masazo Okamoto and Takeshi Naito. Japan Institute of Metals, Journal, v. 24, Oct. 1960, p. 633-637.

The effect of nitrogen additions 0.018-0.183% on specimens after various heat treatments is investigated by microscopic and dilatometric analysis and hardness,

tensile and corrosion tests with heating at 0-1300° C. Data are given for transformation temperature and mechanisms, microstructure and mechanical properties. 7 ref. (N-general, M-general, Q-general, R-general, 2-60, 2-64; SS, N)

75-N. (Japanese.) Shift of the Magnetic Transformation Temperature Caused by Annealing at and Over 600° C. in Iron-Chromium Alloys. Kenzaburo Kumada. Japan Institute of Metals, Journal, v. 24, Oct. 1960, p. 658-662.

Thermomagnetic analysis, hardness, thermal expansion and magnetization curve measurements and microscopic observation at 100-600° C. of 35.10-63.94% Cr-Fe alloy specimens after annealing at 600-900° C. 4 ref. (N-general, M-general, P16, 2-64; Fe-b, Cr)

76-N. (Japanese.) Magnetic Study of the Sigma Transformation Rate of Cr-Fe Alloys. Kenzaburo Kumada. Japan Institute of Metals, Journal, v. 24, Oct. 1960, p. 662-665.

The magnetic transformation temperatures of residual Cr-Fe ferrites during sigma transformation of 35-60% Cr-Fe alloy specimens are investigated by thermomagnetic analysis at 20-500° C. Sigma phase composition is determined by measurement of saturated intensity of magnetization of ferrite and as a function of annealing. 4 ref. (N6p, M23a, M26p; Fe-b, Cr)

77-N. (Russian.) Investigation of Iron Recrystallization Using Radioactive Isotopes. S. Z. Bokstein, M. A. Gubareva, S. T. Kishkin and L. M. Moroz. Zavodskaya Laboratoriya, v. 26, Oct. 1960, p. 1110-1114.

Behavior of the grain boundary atoms during plastic deformation and subsequent recrystallization is studied to show that the mechanism of grain boundary dislocation and grain growth resulting from recrystallization is not of the diffusional character. 15 ref. (N5, N3, N1a; Fe)

78-N. (German.) Influence of Phosphorus on Strain Aging of Basic Bessemer Steel. Friedrich Erdmann-Jesnitzer and J. Karl. Neue Hutte, v. 5, Nov. 1960, p. 660-665.

Impact and tensile test specimens of 0.048-0.17% P basic Bessemer steel with the same carbon (0.035-0.045%) and nitrogen (0.013-0.016%) content are stretched at 20° C. and subsequently aged at 75° C. Yield point, hardness and notch impact strength are measured as a function of composition. (N7e, Q24c, Q29n, Q6, 2-60; ST)

79-N. Some Trace Elements Influence Malleable Iron Graphitization. G. Sandoz, B. F. Brown and W. A. Pennington. Modern Castings, v. 39, Jan. 1961, p. 93-103.

Effects of trace amounts of Bi, Sb, Sn, Pb, Cd and Zn on the kinetics of each of the three graphitization reactions critical to the malleabilization of irons. Effects are determined in irons with both low and high Mn-S ratios to detect possible interactions with sulphur. 17 ref. (N8s, 2-60; CI-s, Bi, Sb, Sn, Pb, Cd, Zn)

80-N. (Japanese.) Influence of Carbon, Silicon, Manganese, Phosphorus and Sulphur on the S-Curve in Molybdenum Copper Cast Iron. Youichi Tokunaga. Imono (Japan Foundrymen's Society, Journal), v. 32, Oct. 1960, p. 713-722.

Isothermal austenite decomposition after austenization at 900° C. for 30 min. is investigated by microscopic examination in the pearlite transformation range and by dilatometric measurement in the bainite range. 4 ref. (N8g, 2-60, M21, M23b; CI, Cu, Mo)

81-N. (Czech.) Precipitation of Phases in Modified 12% Cr Steels. Jaroslav Koutsky and Jaroslav Jezek. Hutnicke Listy, v. 15, Nov. 1960, p. 864-867.

Two ingots are forged into bars which are hardened at 1050° C., oil quenched and tempered at 670-770° C. for 1 hr. and subsequently held at 650-800° C. for 100-1500 hr. Effect of heat treatments on the precipitation of $M_{23}C_6$, M_6C type phases, Fe_2Mo, Fe_2W and Cr_2N. 9 ref. (N7, 2-64; SS, Cr)

82-N. (Japanese.) Grain Boundary Reaction in Age Hardenable Alloys. Pt. 1. University of Tokyo, Engineering Research Institute, Annual Report, v. 19, Sept. 1960, p. 186-193.

Phenomenon where a new, strain-free region with coarser precipitate arrangement extends from a boundary into an adjacent grain on either side or into adjacent grains on both sides of the boundary. The driving force of this extension or growth is thought to

be caused by the difference in strain energy between the new region and the old matrix grain. Methods of metallographic observation. 15 ref. (N7a)

83-N. Self-Diffusion in Alpha Iron. Richard J. Borg and C. Ernest Birchenall. Metallurgical Society of AIME, Transactions, v. 218, Dec. 1960, p. 980-984.

The self diffusion coefficients for alpha Fe are determined at 980-1167° K. using Fe^{55} as the tracer. With decreasing temperature, the diffusivity is found to decrease more rapidly than predicted by the Arrhenius equation in the region of the Curie temperature. 21 ref. (N1d, 1-59; Fe-a)

84-N. Diffusion in the Iron-Chromium System. H. W. Paxton and T. Kunitake. Metallurgical Society of AIME, Transactions, v. 218, Dec. 1960, p. 1003-1109.

The self diffusion coefficient of Cr in various alloys in the Fe-Cr system is measured at 1275° C. using autoradiographic and sectioning techniques. A variation in D_0 from 10^{-4} for pure Cr to a maximum of 10^2 near 60% Cr appears with a range of activation energy from about 50-80 K. cal. per mol. 26 ref. (N1d, 2-60; Cr-b, Fe-b)

85-N. Recrystallization of Cold-Drawn Sintered Aluminum Powder. E. J. Westerman and F. V. Fenel. Metallurgical Society of AIME, Transactions, v. 218, Dec. 1960, p. 1010-1014.

The recrystallization behaviors of two extruded and cold drawn experimental sintered Al powder alloys, containing 1.75 and 3% Al_2O_3 by weight, are compared with that of extruded and cold drawn commercially pure Al. The kinetics of recrystallization and nucleation and growth rate are semiquantitatively determined. 6 ref. (N2, N3, N5; Al-b, 6-72)

86-N. Growth of (110) (001) Oriented Grains in High-Purity Silicon Iron-A Unique Form of Secondary Recrystallization. J. L. Walter and C. G. Dunn. Metallurgical Society of AIME, Transactions, v. 218, Dec. 1960, p. 1033-1038.

Secondary recrystallization to the (110) (001) texture in high-purity silicon Fe occurring when low-oxygen material is annealed in a nonoxidizing atmosphere, departure from these conditions resulting in a growth of (100) oriented grains. The nature of the matrix and recrystallization structure and textures and the nature of grain boundary interactions during growth show that the low gas-metal interfacial energy of the (110) surface provides the driving force for growth. 17 ref. (N3, N5, N15, M26c; Fe-b, Si)

87-N. The Growth Rate of Bainite. G. R. Speich and Morris Cohen. Metallurgical Society of AIME, Transactions, v. 218, Dec. 1960, p. 1050-1059.

The growth rate of lower bainite has been determined by hot stage metallography at 180-320° C. in five hypereutectoid high-purity iron-carbon, Fe-C-Cr and Fe-C-Ni alloys. The growth rate is independent of time at constant temperature but both the edgewise and sidewise growth rates increase with increasing temperature. 38 ref. (N8m, 2-61; Fe-b, C, Cr, Ni)

88-N. The Aging Characteristics of Cu-Ti. G. T. Murray. Metallurgical Society of AIME, Transactions, v. 218, Dec. 1960, p. 1059-1064.

The aging behavior of a Cu-Ti (3.2 at.% Ti) alloy determined by electrical resistivity, hardness and metallographic changes at 175-675° C. The resistivity data indicate two principal processes, the first being associated with the formation of heterogeneous submicroscopic nuclei causing a sharp decrease in resistivity and the second, which occurs over a long period of time, being homogeneous precipitation causing a smaller rate of decrease. 15 ref. (N7a, M-general, P15g, Q29n, 2-65; Cu-b, Ti)

89-N. A Metallographic Study of Precipitation of Copper From Alpha Iron. E. Hornbogen and R. C. Glenn. Metallurgical Society of AIME, Transactions, v. 218, Dec. 1960, p. 1064-1070.

Electron microscopy and diffraction examination of Fe-1.23% Cu alloys after homogenization, gamma phase quenching and aging at 500-1000° C. Cu precipitates as F-C-C epsilon phase without formation of intermediate compounds, spherical particles being formed at a high rate in the first stage and at a rate given by Zener's equation in the second stage, with rod shaped particles growing in the third stage. 19 ref. (N7, M-general; Fe-b, Cu)

90-N. The Effect of Dilute Transition Element Additions on the Recrystallization

of Iron. E. P. Abrahamson, II, and B. S. Blakeney, Jr. Metallurgical Society of AIME, Transactions, v. 218, Dec. 1960, p. 1101-1104.

The effect of the transition elements in binary solid solution additions upon the recrystallization temperature of Fe annealed at 300-700° C. is investigated by metallography and hardness measurements. A correlation is noted between the rate of rise of recrystallization temperature with atomic percent solute and the electron configuration of the solute element. 6 ref. (N5, M25, 2-60, 2-61; Fe-b)

91-N. The Diffusivity of Hydrogen in Alpha Iron. E. W. Johnson and M. L. Hill. Metallurgical Society of AIME, Transactions, v. 218, Dec. 1960, p. 1104-1112.

The diffusivity determined at 25-780° C. from hydrogen evolution rates. Anomalous evolution from air-melted Fe is attributed to residual hydrogen, which is interpreted as a hydrogen compound that decomposes at a strongly temperature-dependent rate above 500° C. 26 ref. (N1, 2-61; Fe-a, H)

92-N. Carbide Precipitation and Evolution and Depletion of Matrix in Heat Resisting Steels and Alloys Treated in Carburizing Atmospheres. Metallurgical Society of AIME, Transactions, v. 218, Dec. 1960, p. 1129.

Discussion of paper by G. Pomey (AIME Transactions, vol. 218, p. 310). Existence and structural characteristics of orthorhombic Cr_3C_2 carbide phase in equilibrium with M_7C_3 phase. 8 ref. (N8r, N7, M26q, 2-64; SGA-h, SS)

93-N. (Russian.) Investigation of Aging Process in Duralumin Using Nuclear Magnetic Resonance. V. S. Pavlovskaya, V. N. Poddyakov and B. N. Finkelshtein. Fizika Metallov i Metallovedenie, v. 10, Mar. 1960, p. 346-358.

Measurement of width, shape and intensity of nuclear magnetic resonance absorption lines of quenched specimens after natural and artificial aging at 50-300° C. for 1-8 hr. Evaluation of changes in lattice distortions resulted from atomic rearrangement occurring during decomposition of supersaturated solid solutions. Influence of quadrupole effect on parameters of the resonance lines. 10 ref. (N7a, P16f; Al-b)

94-N. (Russian.) Effect of Third Component Additions on the Aging of Aluminum-Silver Alloy. R. R. Zakharova and N. I. Buinov. Fizika Metallov i Metallovedenie, v. 10, Mar. 1960, p. 375-381.

Effect of Cu, Mg, Si and Zn additions on aging of Al-Ag studied by X-ray diffraction, electronic microscopy and hardness measurements. Distribution of the third component and its influence on the stability of Guiner-Preston zones. 7 ref. (N7a, M-general, 2-60; Al-b, Ag)

95-N. (Russian.) Investigation of Phase Recrystallization in Titanium. V. D. Sadovsky, G. N. Bogacheva, L. V. Smirnov, I. P. Sorokin and N. A. Kompaneitsev. Fizika Metallov i Metallovedenie, v. 10, Mar. 1960, p. 397-403.

Metallographic and dilatometric study of phase transformation and evaluation of resulting internal strains, in Ti samples heat treated at 800-1200° C. Effect of heat treatment on structure and lattice parameters. 11 ref. (N-general, M-general, 2-64; Ti)

96-N. (Slovakian.) Transformations of Brass During Heating. Pavel Slysko. Zvaracsky Sbornik, v. 9, Mar. 1960, p. 304-324.

Brass of various composition is heat treated at 100-850° C. for 0-2 hr. and welded with and without filler metal. Effect of heat treatment and welding on structure and hardness. 4 ref. (N-general, Q29n, 2-64, K-general; Cu-n)

97-N. (French.) Self-Diffusion of Beta-Phase Zirconium With a Cubic Lattice. Dimitri Volokoff, Serge May and Yves Adda. Comptes Rendus, v. 251, Nov. 21, 1960, p. 2341-2343.

Two cylindric Zr samples are butt welded, inserting a Zr foil of approximately 5 micron that was previously neutron irradiated for 8 days at a radiation intensity of 10^{12} n. sq. cm. S^{-1}. The weldments are heat treated at 900-1240° C. for 5-24 hr. in a vacuum of less than 5.10^{-6} mm. Hg pressure. Amount of diffusion occurring is determined by measuring the gamma radiation activity of slices cut normally to the cylinder axis. 5 ref. (N1a, 1-59, 2-64; Zr)

98-N. (French.) Effect of Cu and Mg Additions on the Recrystallization of Zone Melted Aluminum. Colette Frois and Omourtague Dimitrov. Comptes Rendus, v. 251, Nov. 21, 1960, p. 2344-2346.

Samples containing 30 x 10^{-6}% Cu or 1 x 10^{-6}-96 x 10^{-6}% Mg are rolled to a deformation of 97% at liquid nitrogen temperatures and held subsequently at 14° C. to study the effect of additions on recrystallization velocity and grain growth. (N5f, N3m; Al, Cu, Mg, AD-p)

99-N. The Behavior of Inert Gases in Metals. C. E. Ells. Canadian Mining and Metallurgical Bulletin, v. 53, Nov. 1960, p. 885-892.

Review of diffusion experiments on inert gas-metal combinations and fundamental aspects of bubble growth in neutron irradiated Be, stainless steel and Al. Effect of bubble formation on mechanical properties. 32 ref. (N15d; Al, Be, SS, EG-m)

100-N. (French.) Application of a Practical Method for Measuring the Diffusion of Hydrogen Through Thin Mild Steel Sheet. P. E. Lagasse and L. Lilet. Memoires Scientifiques de la Revue de Metallurgie, v. 57, Oct. 1960, p. 729-740.

Cracking and blistering defects and deterioration caused by hydrogen diffusion during working and use of sheet. Technique and apparatus for accurate, reproducible measurement of permeability to hydrogen. Influence of work-hardening and grain size on permeability. 24 ref. (N1, P10m, Q-general; CN, 9-72, H)

101-N. (French.) Structural Evolution During Heat Treatment After Workhardening of High Purity Zone-Refined Aluminum. Pt. 1. Omourtague Dimitrov. Memoires Scientifiques de la Revue de Metallurgie, v. 57, Oct. 1960, p. 787-807.

Electrical resistivity measurements, metallographic techniques and X-ray diffraction used to study recrystallization times, temperatures and structures of specimens cold worked as much as 97% at temperatures ranging from 20° C. down to that of liquid H. (To be continued.) (N-general, M-general, 2-63, 2-64; Al-a)

102-N. (German.) Effect of Zinc, Magnesium, Silicon, Copper, Iron, Manganese and Titanium on Primary Crystallization of Al_2Cr. H. Zoller. Schweizer Archiv, v. 26, Nov. 1960, p. 437-448.

Investigation of the influence of alloying elements on liquidus line in the Al-rich section of the Al-Cr phase diagram at 660-800° C. (equilibrium melt with Al_7Cr) by crystallization of Al_7Cr from the melt and by thermal analysis. Evaluation of peritectic reaction solid solution - Al_7Cr in the presence of alloying elements. Microhardness and lattice parameter of Al_7Cr crystals. (N12r, M24b, M-general, 2-60; Al-b, Cr)

103-N. (German.) Strain Aging of Zinc Containing Traces of Magnesium. Friedrich Erdmann-Jesnitzer. Bergakademie, v. 12, Nov. 1960, p. 598-608.

Aging of Zn (99.9903%) specimens containing 0.0018% Mg at 22-200° C. for varying times after 1-6% cold tensile deformation and annealing at 150° C. Investigation of static and dynamic mechanical properties, electrical conductivity, microstructure and substructure. Comparison with properties of pure Zn. (N7e, M-general, Q-general, P15g, 2-60; Zn-b)

104-N. (German.) Magnetic Structure of Small MnBi Alloy Single Crystals. Ja. S. Schur, Je. W. Stolz and W. I. Margolina. Physikalische Abhandlungen aus der Sowjetunion, v. 3, Feb. 1960, p. 96-103.

Microscopic examination of powder figures on magnetized cylindrical specimens, consisting mainly of monocrystalline grains of sizes from a few to 1000 microns. Influence of temperature cycling from +20 to -196° C. and back to 20° C. and grain size on magnetic structure. (N11h, 2-59, 2-61, M21; Mn-b, Bi, 14-61)

105-N. A Magnetic Study of Precipitation in a Gold-Cobalt Alloy. P. Gaunt. Philosophical Magazine, v. 5, Nov. 1960, p. 1127-1145.

The precipitation kinetics of air and water quenched specimens of an Au-1.5% Co alloy are followed by measuring the saturation magnetization of the precipitated Co, remanent magnetization, coercive force and field to reduce remanence to zero. Results are compared with current theories and discussed in terms of the single magnetic domain model, the magnetic properties being compared to those

of the Au-Ni system. Effect of particle shape on the anisotropy in the Au-Co system. (N7b, P16; Au-b, Co)

106-N. The Influence of Solutes on Self-Diffusion in Metals. A. B. Lidiard. Philosophical Magazine, v. 5, Nov. 1960, p. 1171-1180.

Derivation of a statistical theory showing the effect of solutes on solvent self-diffusion in dilute alloys, based on the vacancy model used previously by Hoffman, Turnbull and Hart and considering two limiting cases, one in which the vacancies attach themselves strongly to solute and the jump frequencies differ greatly. Results are illustrated on Ag alloys. (N1d; Ag-b)

107-N. (English.) Effect of Zirconium on the Austenitic Grain Size in Steel. Akira Adachi, Kujoshi Mizukawa, Hirokazu Omoto and Noboru Hiraoka. Osaka University, Technology Reports, v. 10, Mar. 1960, p. 471-480.

Grain refining and grain coarsening temperatures in electrolytic Fe and low carbon rimmed steel, as a function of Zr additions and O and N concentration, are studied for specimens melted in vacuum and various atmospheres. Grain growth is measured as a function of composition and temperature. 5 ref. (N3, M27c, 2-60, 2-61; Fe-b, ST, Zr)

108-N. (French.) Direct Observation by the Electron Microscope of the Phenomena Accompanying the Return to Equilibrium of a 1.2% Si-Al Solid Solution During Tempering Treatments Subsequent to Quenching. Adrien Saulnier. Comptes Rendus, v. 251, Nov. 14, 1960, p. 2160-2162.

Precipitation of vacancies and formation of dislocation loops after quenching; resorption of loops during treatment at 60-170° C.; nucleation and growth of Si particles between 150-350° C. Effect of vacancies still in supersaturation in lattice following quenching on nucleation. 4 ref. (N-general, M26, M21e, 2-64; Al-b, Si)

109-N. (French.) Two-Stage Recrystallization of Cold Worked 70/30 Brass. J. Herenguel, D. Whitwham and R. Leguet. Comptes Rendus, v. 251, Nov. 14, 1960, p. 2163-2165.

Uneven work hardening of different areas in same specimen and evolution of microstructure of areas during annealing between 250 and 700° C. Early recrystallization characterized by fine, stable grains growing to a size of 2-4 microns occurs in harder areas. Less hard sections then recrystallize with a slow but steady growth which progressively replaces the first. 4 ref. (N3, N5, Q23r, 2-64, 3-68; Cu-n)

110-N. (Japanese.) Effect of Zirconium on Aluminum and Its Alloys. Pt. 4. Precipitation Phenomenon of $ZrAl_3$ and the Effect of Si and Mg on the Recrystallization Temperature of Al-Zr Alloys. Hajime Yamada. Light Metals, v. 10, Sept. 1960, p. 322-329.

X-ray diffraction data for specimens containing 0.15-0.45% Zr, 0.43-1.07% Si and 0.28-0.96% Mg after fast and slow solidification from 500° C., with $ZrAl_3$ and $ZrSi_3$ precipitating from the supersaturated solid solution. 7 ref. (N5, N7, N12, M22g, 2-60; Al-b, Zr)

111-N. Intermetallic Diffusion in Gold-Lead Systems. A. Ascoli and E. Germagnoli. Pure and Applied Chemistry, v. 1, no. 1, 1960, p. 139-141.

Diffusion coefficient for intermetallic diffusion of Au in Pb at 120-372° C. and the diffusion activation energy are determined by a radioactive tracer technique. (N1a, 1-59; Pb-b, Au)

112-N. (German.) Gases in Ferro Alloys. Roger Limpach and Borut Marincek. Archiv fur das Eisenhuttenwesen, v. 31, Nov. 1960, p. 639-643.

Gas content (oxygen, hydrogen and nitrogen) of Fe alloys containing Si, Mn, Ca, V, Ti, P and Zr is measured by vacuum hot extraction (up to 2000° C. extraction temperature) with automatic recording. Influence of particle size (mesh size), composition and storing time on gas content. (N15, 2-60; Fe-b)

113-N. (German.) Gas Content and Type of Compound of Gases in Ferro Alloys. Alfons Fuchs and Johannes Niebuhr. Archiv fur das Eisenhuttenwesen, v. 31, Nov. 1960, p. 645-649.

Measurement of hydrogen and oxygen content in Fe alloys with Cr, Mn, Mo, W, Cb, Ti and V and in pure metals Cr, Co, Mn, W, V and Ni by vacuum hot extraction (1500-2100° C.). Microscopic and X-ray examination to determine the chemical form in which the gas is present in metal. (N15, 2-60, M-general; Fe-b)

114-N. (German.) Influence of Deformation Aging on Reactions in Alternating Stressing of Steel. Hermann Schénck, Eugen Schmidtmann and Hans Kettler. Archiv fur das Eisenhuttenwesen, v. 31, Nov. 1960, p. 659-669.

Alternating stressing under oil cooling at 3100 revolutions per second of 190° C. aged unkilled 0.22% C openhearth steel. Measurement of damping and modulus of elasticity at various numbers of load alternations. Interpretation of results in terms of dislocation theory. (N7e, Q21, Q8g, 3-66; ST-e)

115-N. (German.) Precipitation of Carbon in Iron. Otto Krisement. Archiv fur das Eisenhuttenwesen, v. 31, Nov. 1960, p. 677-686.

Interpretation of microcalorimetric measurements of reaction energies for the precipitation of carbon in gamma Fe, alpha Fe and martensite. Influence of deformation on carbon precipitation and migration of carbon atoms into dislocations. (N7, N-general, 3-68; Fe-b, C)

116-N. (German.) Microstructure and Hardness of Iron Alloys Containing Small Amounts of Carbon and Nickel. Rudolf Vogel and Giancarlo Volpato. Archiv fur das Eisenhuttenwesen, v. 31, Nov. 1960, p. 687-690.

Microscopic investigation and hardness measurements on Fe alloys with 0.1-0.6% C and 0-4% Ni before and after annealing at 550-650° C. Correlation between the test results and the Fe-C-Ni phase diagram. Influence of C and Ni on ferrite and carbide formation in annealing. (N8, M-general, Q29n, 2-64; Fe-b, C, Ni)

117-N. (German.) Electrical Investigation of Ordering Processes in Nickel-Copper-Zinc Alloys. Wolfgang Schule and Hans Peter Kehrer. Zeitschrift fur Metallkunde, v. 51, Dec. 1960, p. 711-715.

Electrical resistance measurements at -183 to 700° C. of recrystallized cold rolled foils (95% deformed) and drawn (42-60% deformed) wires of Ni-Cu-Zn alloys of varying composition in the range of the intermetallic compound Cu_2NiZn. Temperature dependence of resistance and degree of order. (N10, P15g, 2-61; Cu-b, Ni, Zn)

118-N. (Japanese.) Effect of Zirconium on Aluminum and Its Alloys. Hajime Yamada. Light Metals, July 1960, p. 39-46.

Formation of $ZrAl_3$ precipitates in Al alloys is studied during solidification and preheating. Results show that a fine $ZrAl_3$ precipitate delays recrystallization while a coarse precipitate has a minor effect. (N5f, N7, 2-60; Al-b, Zr)

119-N. (Japanese.) Grain Size in Aluminum Sheet. Takashi Ikeno and Shibata Kizo. Light Metals, July 1960, p. 47-53.

Effect of rolling on the recrystallization grain size, softening curve during annealing and elongation of Al. (N5, M27c, Q23p, J23, 3-68; Al, 4-53)

120-N. (Japanese.) Study of Casting Structure. Takashi Ikeno and Kizo Shibata. Light Metals, July 1960, p. 54-59.

Effect of preheating, Mg additions and cooling rate on the recrystallization grain size of cast Al. (N5, M27c; Al, 5)

121-N. Pitting of Aluminum at Grain Boundaries After Aging. G. A. Bassett and C. Edeleanu. Philosophical Magazine, v. 5, Dec. 1960, p. 1217-1220.

Thin electropolished foils of pure Al develop surface pits along grain boundaries during aging at 20° C. It is suggested that pits are formed by a vacancy mechanism and are associated with the initiation of etch attack at grain boundaries. 8 ref. (N7a, 9-71; Al, 4-56)

122-N. Hydrogen in Zircaloy-2. Its Distribution and Heat of Transport. A. Sawatzky. Journal of Nuclear Materials, v. 2, Dec. 1960, p. 321-328.

An equation is developed giving the hydrogen concentration in the two phase (alpha plus hydride) region as a function of time and temperature. On the basis of this equation, a model for the over-all hydrogen distribution under the influence of a temperature gradient is proposed. The model predicts that for hydrogen pickup on the hot surface (as a failure of a fuel rod sheath) maximum hydriding will occur at some position displaced from the cold surface. 9 ref. (N15d; Zr-b, H)

123-N. Growth From the Vapor of Large Single Crystals of Lead Selenide of Controlled Composition. A. C. Prior. Electrochemical Society, Journal, v. 108, Jan. 1961, p. 82-87.

Single crystals of lead selenide are grown by sublimation. A measure of composition control is achieved by control of the partial pressure of Se during growth. 12 ref. (N15g; Pb, 14-61)

124-N. (German.) Effects of Heat Treatment on Structure Stability and Age Hardening of Titanium Alloy Ti_3Al_5Cr. H. Wiegand and K. H. Illgner. Metall, v. 15, Jan. 1961, p. 23-29.

Mechanical testing and microscopic, electron microscopic and X-ray diffraction investigation of end quenched and subsequently aged Jominy specimens at 200-500° C. Influence of cooling rate on aging and of aging on mechanical properties and structure. (N7a, M27, Q-general, 2-64, M22g, M21; Ti-b, Al, Cr)

125-N. Fast Heating Accomplishes Uniform Spheroidizing of Heading Stock. John Tschapp. Industrial Gas, v. 39, Jan. 1961, p. 2-3.

Spheroidization of pearlite in 1038, 1041 and several low alloy steels for use in headed products using a continuous pusher type furnace. (N8q; ST)

126-N. (Czech.) Transformations in Heat Treatment of 13% Cr Steels. Stanislav Drapal. Hutnicke Listy, v. 15, Dec. 1960, p. 961-971.

Various stainless steels are hardened at 800-1250° C. for 0-16 hr. Effects of carbon content on transformation temperatures and carbide precipitation in cooling and of austenization temperatures and times on the grain size. Austenite decomposition and eutectoid formation. 17 ref. (N8, J-general, 2-60, M27c; SS)

127-N. Magnetic Measurement of Low Temperature Recovery After Plastic Deformation. C. A. J. Ammerlaan, H. J. Hofer and G. W. Rathenau. Solid State Physics in Electronics and Telecommunications, Proceedings of the International Conference, Brussels, Belgium, June 2-7, 1958, v. 3. Magnetic and Optical Properties, Pt. 1, 1960, p. 231-234.

Ballistic measurements of the rate of recovery of magnetic properties in annealed and cold drawn Ni strip at -196° C. as affected by the annihilation of point defects such as lattice vacancies. 7 ref. (N4, P16, 1-67, M26s; Ni, 4-53)

128-N. (Japanese.) Effect of Lithium on the Recrystallization Temperature of Aluminium-Magnesium-Zirconium Alloy. Shiro Terai and Yoshio Baba. Sumitomo Light Metals, Technical Reports, v. 1, Oct. 1960, p. 246-253.

Alloys in the Al-Mg-Li and Al-Mg-Zr-Li systems containing 2-3% Mg, 0-0.26% Zr and 0-2.79% Li are subjected to various heat treatments at 20-550° C. before cold rolling. Recrystallization temperature and mechanical properties are determined as a function of Li and Zr content. 4 ref. (N5, Q-general, 2-60; Al-b, Mg, Zr, Li)

129-N. The Carbide Constitution and Tempering Behavior of Chromium-Vanadium-Niobium Steels at 700° C. K. C. Mills, B. B. Argent and A. G. Quarrell. Iron and Steel Institute, Journal, v. 197, Jan. 1961, p. 9-21.

Measurement of carbide content, structure and phase boundries by electrolytic extraction, centrifugal separation, X-ray examination and electron metallographic examination. It is suggested that Cb additions reduce the carbon available for combination with Fe, Cr and V and that these changes in the effective carbon content cause movement of the carbide phase boundaries. (N8a, M27f, M22g, M21e; ST, Cb, Cr, V)

130-N. An Electron Microscopical Investigation of the Tempering of 18-4-1 High Speed Steel. C. H. White and R. W. K. Honeycombe. Iron and Steel Institute, Journal, v. 197, Jan. 1961, p. 21-28.

Electron microscope examination of the structures which occur during tempering at 200-800° C. of high speed steel containing 18% W, 4% Cr and 1% V. Influence of tempering time and temperature, precipitation of an alloy carbide ($M_{23}C_6$) and amount of retained austenite on hardness. (N8a, Q29n, 2-61, M27, M21e; TS-m, W, Cr, V)

131-N. Kinetics of Later Stages of Clustering in Al-Cu Alloy. D. Turnbull and R. L. Cormia. Acta Metallurgica, v. 8, Nov. 1960, p. 747-750.

Resistometric investigation of secondary clustering reactions in Al-1.75% Cu alloys as a function of holding time

and temperature (0-80° C.) after various thermal treatments. Relation of clustering to vacancy trapping by highly curved dislocation loops and solute clusters. 15 ref. (N3, M26b, M26s, P15g, 2-64; Al-b, Cu)

132-N. Dispersion Hardening. W. H. Meiklejohn and R. E. Skoda. Acta Metallurgica, v. 8, Nov. 1960, p. 773-780.

The increase in yield strength of solid Hg due to dispersed Fe particles is experimentally determined to be proportional to particle diameter and spacing between particle centers and therefore a function of volume fraction of precipitate. Temperature dependence of yield strength at 77° K. is related to the melting point of Hg matrix and precipitation hardening phenomena is related to coherency as a function of dislocation movement in stress fields. 12 ref. (N7a, M-general, Q23b, 2-61; Hg-b, Fe)

133-N. A Theory of Diffusion of Impurities in Pure Silver. J. M. Tobin. Acta Metallurgica, v. 8, Nov. 1960, p. 781-787.

A new ionic model for the determination of activation energy and diffusion constants by the method used by Lazarus is used to obtain values for period V elements in Ag. With the same model, the difference in ion core size and effective nuclear charge is used to calculate these values in periods IV and VI. 18 ref. (N1, 9-51; Ag)

134-N. Migration Energies in Quenched and Deformed Gold. M. Meshii and J. W. Kauffman. Acta Metallurgica, v. 8, Nov. 1960, p. 815-816.

Activation energies as determined by slope intersection method are measured for the recovery of residual resistivity in Au quenched from 1000° C. and plastically deformed at -195.8° C. to study the physical nature of the interactions between point defects and dislocations. (N3, M26, P13a, P15g, 2-61, 2-64, 3-68; Au)

135-N. Cooling Transformation Diagrams for AISI 9620 and 4047. R. C. Hess and D. J. Blickwede. Metal Progress, v. 79, Feb. 1961, p. 100-B.

Cooling curves at indicated distances from quenched end. (N-general; AY)

136-N. The Morphology of Martensite. P. M. Kelly and J. Nutting. Iron & Steel, v. 33, Dec. 19, 1960, p. 652-657.

Morphological analysis of martensite formed from Fe-Ni-C steel, plain carbon steel and 18-8 stainless steel. Effects of internally twinned crystals and single-crystal needles on deformation and hardness. (N8p, M-general, Q-general; ST)

137-N. The Kinetics of the Martensite Transformation in Iron Alloys. W. S. Owen and A. Gilbert. Iron & Steel, v. 33, Dec. 19, 1960, p. 657-660.

Nucleation and growth of martensite are examined theoretically in terms of driving force, interface energy, embryo elastic and dilatation strain energy, strain and plastic deformation in the austenite lattice, thermal activation and dislocation generation. T-T-T diagrams and transformation rate equations are derived for alloys containing various amounts of Cr, Ni, C, Mn and Si at -196 to 500° C. (N8p)

138-N. The Effect of Composition on the Structure and Properties of Martensite. K. J. Irvine, F. B. Pickering and J. Garstone. Iron & Steel, v. 33, Dec. 19, 1960, p. 660-665.

Hardness, microstructure, transformation reactions, ductility, hardenability and impact properties of martensite in carbon, alloy and stainless steel as affected by the carbon alloying elements, content, tempering temperature and warm working. (N8p, P-general, Q-general, 2-64, 3-68; ST)

139-N. (Ukrainian.) Substructural Changes of Hardened High-Speed Steel on Tempering. P. M. Yushkevich. Dopovidi Akademii Nauk Ukrains'koi RSR, Aug. 1960, p. 1064-1068.

Multiple tempering of the alloyed, high speed steels to determine crystallic transformation and red hardness at various temperature intervals. Study of decomposition of martensite into Cr carbide at 380-450° C. and into ferrito-carbide at 520-540° C. and of emergence of vanadium-carbide and tungsten-carbides at 540-620° C. Determination of the changing lattice sizes by ionic refractometry. 9 ref. (N8, M26; TS-m)

140-N. (Ukrainian.) Kinetics of Eutectic Crystallization of Iron-Carbon Alloys. K. P. Bunin and L. T. Kalinina. Dopovidi Akademii Nauk Ukrains'koi SSR, Sept. 1960, p. 1231-1235.

Eutectic crystallization of white cast iron during continuous cooling in 1120-1000° C. temperature range. Specific temperatures for transformation to austenite, graphite and cementite. (N8; CI-p)

141-N. The Nature of Strengthening Magnesium Alloys of the System Mg-Mn-Al-Co at Elevated Temperatures. A. A. Bochar, M. E. Drits and Z. A. Sviderskaya. Paper from "Contemporary Problems of Metallurgy". Consultants Bureau, Inc., New York, 1960, p. 445-453.

Effect of alloy composition on hardening and softening processes and resultant creep and heat resistance. Mechanical properties, microstructure and lattice parameters are determined after quenching, aging, tempering and stabilizing at 50-600° C. for various times. 8 ref. (N7a, J-general, M-general, Q-general, 2-60, 2-64; Mg-b, Mn, Al, Ca)

142-N. The Nature of Martensitic Transformations. G. V. Kurdvumov. Paper from "Contemporary Problems of Metallurgy". Consultants Bureau, Inc., New York, 1960, p. 454-461.

Review of theoretical and experimental determinations of the temperature dependence of martensite transformations in steels and nonferrous metals. The rate of formation and growth of martensite nuclei, as the contributing factor in the transformation, is determined to be a value of the thermal fluctuation needed for a given supercooling and the mean kinetic energy of the atoms during displacement. Transformation data are given for 23% Ni and 3.5% Mn steels, Cu-Al, Cu-Sn and Cu-Zn alloys tested at -200 to 200° C. 46 ref. (N6q, N8p, 2-61, 10-54; Cu-b, SS-e)

143-N. (Translation-ConBur.) Intensification of Red Lead Production. A. A. Ravdel and N. V. Agarev. Journal of Applied Chemistry of the USSR., v. 33, Jan. 1960, p. 67-72.

The diffusion coefficient of oxygen in red Pb and the activation energy of the process are calculated from the general theory of diffusion phenomena. 9 ref. (N1a, P13a; Pb, O)

144-N. (Translation.) Distribution Coefficient of Tin in Selenium. D. M. Chizhikov and V. M. Edel'shtein. Soviet Physics--Solid State, v. 2, Nov. 1960, p. 790-792.

Radioactive Sn is used to determine Sn distribution in Se after zone recrystallization. (N1a, N5; Se-b, Sn)

145-N. (Translation.) Transformations of the Solid State in Alloys of the Copper-Zinc System in the Range of Alpha-Solid Solution. A. T. Grigor'ev, E. M. Sokolovskaya and V. N. Pyatnitskii. Journal of Inorganic Chemistry, USSR., v. 2, July 1957, p. 154-160.

Cu-Zn alloys are prepared under slags of $BaCl_2$, $CaCl_2$, LiCl and KCl, annealed and tested by differential thermic analysis, electrical resistance and hardness measurements and X-ray analysis to study transformations in the range of alpha-solid solution. 8 ref. (N-general, 2-64, M23r, Q29, P15g, M22g; Cu-b, Zn-b)

146-N. (German.) Study of Deformation Aging in Mild Unalloyed Steels by Tensile Strength and Damping Measurements. Wilhelm Heller and Mathias Nacken. Archiv fur das Eisenhuttenwesen, v. 31, Dec. 1960, p. 723-730.

Annealed and tensile deformed wire specimens of electro steel, basic Bessemer steel and air-refined special steel containing 0.009-0.0185% C are tensile deformed and aged at 20-250° C. Aging is studied by stress-strain curves, damping measurements to determine carbon precipitation and coercive force measurements. (N7e, Q27, Q8; CN, 4-61)

147-N. (German.) Evaluation of Diffusion Coefficients in Iron-Chromium Alloys. Theo Heumann and Heinz Bohmer. Archiv fur das Eisenhuttenwesen, v. 31, Dec. 1960, p. 749-754.

Diffusion annealing at 823-1440° C. of Fe-Cr (0-22 at.% Cr) alloy plates welded against pure Fe and of Fe-Al (17.6% Al) plates to measure diffusion coefficients of Fe and Cr and to evaluate influence of Al on diffusion. (N1, J23, 2-60; Fe-b, Cr, Al)

148-N. (Russian.) Electrical Resistivity Anomaly in Brass and Aluminum Bronze.

A. A. Presnyakov, L. I. Dautova and Yu. F. Klyuchnikov. Fizika Metallov i Metallovedenie, v. 10, May 1960, p. 676-679.

Kinetics of ordering process occurring in Cu-Zn and Cu-Al alpha solid solutions. Changes of specific electric resistivity are studied in quenched samples tempered at 100-600° C. 14 ref. (N10b, P15g, 2-64; Cu-b, Al, Zn)

149-N. (Russian.) Formation of Martensite During High Velocity Deformation. A. P. Gulyaev and A. S. Shigarev. Fizika Metallov i Metallovedenie, v. 10, May 1960, p. 691-697.

Hardened KH15N9Yu and KH12F1 alloy steel are exposed to impact and explosive loading at deformation rate of 150 m. per sec. Effect of deformation rate on the mechanism of austenite-martensite transformation and hardness. 15 ref. (N8p, Q29n, 3-68; AY)

150-N. (Russian.) Effect of the Ordering Process Occurring in Alpha-Phase on the Alpha-Gamma Transformation in Fe-Co-V Alloy. I. L. Aptekar' and V. I. Gorbunov. Fizika Metallov i Metallovedenie, v. 10, May 1960, p. 710-713.

Dilatometric and X-ray study of structure and kinetics of alpha-gamma transformation in alloys containing 2.5-3% V and 52% Co during tempering. Ordering process in alpha-phase precedes and facilitates gamma phase segregation and provides more uniform structure. 4 ref. (N10b, M22g, M23b; Fe-b, Co-b, V)

151-N. (Russian.) Ordering Process in Hardened Fe_3Al Alloy During Low Temperature Tempering. Ya. P. Selisskii. Fizika Metallov i Metallovedenie, v. 10, May 1960, p. 714-719.

Measurements of changes in electric resistivity and lattice spacing in samples quenched in He from 800-825° C., cooled at varying rates and subsequently tempered at 200-250° C. 6 ref. (N10b, P15g, M26, 2-64; Fe-b, Al)

152-N. (Russian.) Effect of Iron and Nickel Additions on Self Diffusion in Alpha Zirconium. V. S. Lyashenko, V. N. Bykov and L. V. Pavlinov. Fizika Metallov i Metallovedenie, v. 10, May 1960, p. 727-731.

Determination of diffusion coefficients in alloys containing up to 4% Fe and Ni at 650-830° C. using Zr^{95} radioactive isotope. 9 ref. (N1d, 2-60; Zr-b, Fe, Ni)

153-N. (Russian.) Recrystallization of Pure Metal Powders. V. I. Iveronova and N. N. Osipenko. Fizika Metallov i Metallovedenie, v. 10, May 1960, p. 736-742.

Comparative study of polygonization and recrystallization processes in deformed and annealed Al and Cu samples in powdered or solid form. Recrystallization as a function of polygonization, mosaic block size and second order stresses. 5 ref. (N4, N5, 3-66, 3-71; Al, Cu, 6-68)

154-N. (Russian.) Selfdiffusion Mechanism in Zirconium Base Binary and Ternary Alloys. V. S. Lyashenko, V. N. Bykov and L. V. Pavlinov. Fizika Metallov i Metallovedenie, v. 10, May 1960, p. 755-762.

Diffusion coefficient determined at 900-1200° C. in Zr-Cb alloy with and without Sn, Cr or Mn additions using Zr^{95} radioactive isotope. Activation energy and diffusion coefficient as a function of composition. 4 ref. (N1d, 2-60; Zr-b, Cb, Cr, Mn, Sn)

155-N. (Russian.) Effect of Plastic Deformation on Phase Composition of Chromium-Manganese Steels. B. A. Apaev and Yu. A. Sysuev. Fizika Metallov i Metallovedenie, v. 10, May 1960, p. 767-771.

Study of phase transformations in alpha phase and cementite structures in cold plastic deformed and tempered SHKh15 and 10G12 steels. Phase composition as dependent on plastic deformation, initial structure and steel composition. 8 ref. (N8k, 2-60, 3-68, 3-71; ST, Cr, Mn)

156-N. (Russian.) Effect of Carbon on Phase Composition in Fe-Cr-Ni Base Austenitic Alloys. I. G. Ivantsov, V. A. Finkel', Fizika Metallov i Metallovedenie, v. 10, May 1960, p. 780-782.

Phase composition of high vacuum melted and heat treated Fe-Cr-Ni alloys containing 0.2-0.02% C. Dependence of sigma phase upon carbon content and aging temperature. Dissolution of carbon in gamma solid solution as dependent upon amount of sigma phase. 13 ref. (N8, 2-60, 2-65; SS-e)

157-N. (Russian.) Effect of Vanadium Ore Phase Transformations in Manganese-Steel. V. R. Golik, V. A. Dubrov, N. I.

Sandler and V. V. Kukol'. Fizika Metallov i Metallovedenie, v. 10, May 1960, p. 786-790.

Data on kinetics of solid solution decomposition and temperature intervals for formation and dissolution of carbides in Mn-steel containing vanadium. Additions are obtained by measurements of coercive force, hardness, specific electric resistivity and X-ray diffraction lines. 7 ref. (N8r, N12p, 2-60, Q29n, P15g, P16a, M22g; ST, Mn, V)

158-N. (French.) Structural Phenomena in Hot Rolling of Rimming Steel Sheets. U. Berrati, S. Michelluci and G. Odone. Revue de Metallurgie, v. 57, Nov. 1960, p. 1031.

Recrystallization and grain growth in steel sheets during rolling and subsequent annealing. Effect of low coiling temperatures and normalization on work hardening. (N3, N5, F23, Q23a, 2-64; ST-d, 4-53)

159-N. Physical Metallurgy of Refractory Metals (The Kinetics of $CbZn_2$ Formation on Columbium in Zinc Vapor). G. Sandoz and T. C. Lupton. Report of N. R. L. (Naval Research Laboratory) Progress, Dec. 1960, p. 30-31. $1.25. (Available as PB 161288 from U. S. Office of Technical Services, Washington 25, D. C.)

Growth characteristics of $CbZn_2$ on Cb sheet specimens as a function of time, 1-10 hr., and temperature, 1895-1927° F., of exposure in Zn vapor are studied to determine thickness control in the deposition of protective CuZn coatings on Cb. Data are given for coating thickness, microstructure and diffusion controlled formation rate. (N15g, N1, 2-61, 3-67; Cb, EG-d37, Zn)

160-N. (Japanese.) Improvement of Various Properties of 20% Cr-Ni-Fe Alloys by Nitrogen-Absorption Treatment. Masazo Okamoto and Ami Miyakawa. Tetsu-to-Hagane (Iron and Steel Institute of Japan, Journal), v. 47, Jan. 1961, p. 43-52.

Study of nitrogen-bearing austenite formation in alloys containing up to 10% Ni after nitrogen-absorption. Data are given for corrosion resistance, hardness and spring properties at elevated temperatures. 17 ref. (N8f, R-general, Q29n, Q21; Fe-b, Cr, Ni)

161-N. The Use of Heat and Mass Transfer Model Studies in the Evaluation of the Rates of Deposition of Metals in Complex Systems. G. H. Kesler, J. H. Oxley and C. E. Dryden. Metallurgical Society of AIME, Transactions, v. 221, Feb. 1961, p. 9-13.

Rates of heat and mass transfer from Al rods to recirculating air are determined on a one-quarter scale model of a metal deposition bulb for studying vapor deposition rate of Ti from Ti tetra-iodide. The dependence of local and averaged rates of transfer and consequent metal transport upon outlet geometry, number of rods, position upon a rod and air flow rate is established for flow patterns created by radial and tangential air inlets. 4 ref. (N15g, P11k; Al, Ti)

162-N. Redetermination of the Chromium and Nickel Solvuses in the Chromium-Nickel System. C. J. Bechtoldt and H. C. Vacher. Metallurgical Society of AIME, Transactions, v. 221, Feb. 1961, p. 14-18.

Homogenized, aged and quenched alloys, prepared by powder metallurgical techniques are examined by microscopic and X-ray diffraction methods. The compositions (5-95% Ni) and heat treatments are chosen so that the Cr and Ni solvuses can be determined and a range of composition and temperature, in which a eutectoid has been reported, can be explored in small intervals. 16 ref. (N9m, N12p, M24b, 2-64; Cr-b, Ni-b)

163-N. Intragranular Precipitation of Intermetallic Compounds in Complex Austenitic Alloys. H. J. Beattie, Jr., and W. C. Hagel. Metallurgical Society of AIME, Transactions, v. 221, Feb. 1961, p. 28-35.

Seven austenitic alloys of Fe, Ni and Co base compositions and minor alloy additions are solution treated, aged systematically at 1200-1800° F. and examined by X-ray and electron metallography. Intergranular precipitations of eta, laves, sigma, gamma prime and chi phases are observed as a function of composition and aging time and temperature. Phase solubility limits are determined within 100° F. intervals. 27 ref. (N7, N-general, M-general, 2-60, 2-65; Co-b, Fe-b, Ni-b)

164-N. Self Diffusion of Aluminum in $CaO-SiO_2-Al_2O_3$ Melts. John Henderson, Ling Yang and G. Derge. Metallurgical Society of AIME, Transactions, v. 221, Feb. 1961, p. 56-60.

Self diffusion coefficients of Al as a function of Al_2O_3 concentration and temperature are measured by the capillary reservoir technique in liquids of the system containing equimolar portion of CaO and SiO_2 at 1400-1520° C. using radioactive Al-26 in the capillary and inactive Al in the reservoir. Activation energies are calculated and a concept of the constitution of these melts is developed. 13 ref. (N1d, P13a, 1-59, 2-60, 2-61; Al)

165-N. Self Diffusion of Copper in Molten Copper. John Henderson and Ling Yang. Metallurgical Society of AIME, Transactions, v. 221, Feb. 1961, p. 72-73.

Self diffusion coefficients of Cu in molten Cu are measured by the capillary reservoir method at 1140-1260° C. using Cu-64 as the radioactive tracer. Equations are derived for the diffusion constant and energy of activation with correlation between the diffusivity and coefficient of viscosity. 7 ref. (N1d, 1-59; Cu)

166-N. The Isothermal Transformations of Ti-2.5Al-16V and Ti-4Al-3Mo-1V. L. E. Tanner. Metallurgical Society of AIME, Transactions, v. 221, Feb. 1961, p. 74-83.

T-T-T diagrams constructed from metallographic examination and hardness testing data and by X-ray diffraction, electrical resistivity and dynamic elastic modulus determinations for sheet alloys after step quenching to aging temperatures from a beta solution anneal and water quenching from an alpha + beta solution anneal followed by reheating to aging temperatures. 13 ref. (N7c, M-general, 2-64; Ti-b, Al, Mo, V)

167-N. Strain Aging in Silver Base Al Alloys. A. A. Hendrickson. Metallurgical Society of AIME, Transactions, v. 221, Feb. 1961, p. 103-107.

Investigation of the tensile properties of Ag-based Al alloy single crystals for studying strengthening effect due to Suzuki locking with minimum complications. Yield drops are observed in all alloy crystals (1, 2, 3, 4 and 6 at.% Al) after strain aging at room temperature. The yield effects are attributed to Suzuki locking but the major portion of the solid solution strengthening to other mechanisms. 16 ref. (N7e, Q27; Ag-b, Al, 14-61)

168-N. Heterogeneous Nucleation in the Liquid-to-Solid Transformation in Alloys. B. E. Sundquist and L. F. Mondalfo. Metallurgical Society of AIME, Transactions, v. 221, Feb. 1961, p. 157-164.

The undercooling associated with the nucleation of the secondary phase from the liquid by the solid primary phase is studied in 60 binary alloys with a hot stage microscope. In a system of alpha and beta, alpha usually nucleates beta at low undercoolings, but beta does not nucleate alpha, except possibly at undercoolings approaching homogeneous nucleation. Relation to relative interfacial energies and crystallographic disregistry as a minor factor in heterogeneous nucleation from metallic liquids. 22 ref. (N2, N-general)

169-N. The Structure of Bainite in Hypoeutectoid Steels. S. J. Matas and R. F. Hehemann. Metallurgical Society of AIME, Transactions, v. 221, Feb. 1961, p. 179-185.

The existence of two distinct forms of bainite, upper and lower bainite, in hypoeutectoid steels is confirmed by carbide extraction and lattice parameter study of the structure of the product resulting from this mode of austenite decomposition. The transition between these two forms occurs at about 650° F. regardless of the alloy content of the steel and their structural differences are interpreted in terms of the kinetics of carbide precipitation from supersaturated ferrite. 44 ref. (N8m, N7, M26; ST)

170-N. The Anomaly in the Rate of Strain Hardening of Zinc Single Crystals. A. Deruyttere, E. Van den Bergen, J. Van der Planken and M. Laurent. Metallurgical Society of AIME, Transactions, v. 221, Feb. 1961, p. 204-205.

Reversible temperature dependence of the decreases and increases in strain hardening rate is determined by tensile tests at -183 and -73° C. in liquid air and solid CO_2. 4 ref. (N7e, 2-61; Zn, 14-61)

171-N. Study of Copper Precipitation Behavior in Silicon Single Crystals. G. H. Schwuttke. Electrochemical Society, Journal, v. 108, Feb. 1961, p. 163-167.

Precipitation behavior of Cu in Si at 900-1300° C. as influenced by temperature and oxygen content of Si. Application of the precipitation method to determination of dislocation density. 5 ref. (N7b; Si, Cu, 14-61)

172-N. Structure and Growth of Iron and Chromium Electrodeposits on Copper Single-Crystal Faces. A. K. N. Reddy and H. Wilman. Institute of Metal Finishing, Transactions, v. 36, 1958-1959, p. 97-106.

Growth stages, as characterized by predominant orientation and structure of body-centered cubic metals, Cr and Fe deposited at 20-45° C. on face-centered cubic Cu crystals, are examined by electron diffraction. Epitaxial (two-degree), out growth (one degree) and multiple orientations with or without random polycrystalline structure formation and twinning and rotational displacements are noted as a function of temperature, current density, codeposition of Fe $(OH)_2$, deposit thickness and stress due to lattice misfit. 28 ref. (N3, L17, M26c; Cu, Cr, 8-62, 14-61)

173-N. Detection of Zinc Diffusion Into Tin Coatings on Brass. S. C. Britton and M. Clarke. Institute of Metal Finishing, Transactions, v. 36, 1958-1959, p. 230-232.

Corroding potentials measured in 0.001 NaCl solution are used to detect Zn diffusion in Sn coatings after flow brightening and storage. Effect of corrosion product formation caused by the Zn and moisture condensation on solderability of the coatings is tested using solder spreading methods. 4 ref. (N1h, K7, 17-52, R-general; Cu-n, Sn, Zn, 8-62)

174-N. (Translation.) Low Temperature Recyrstallization of Copper. R. I. Garber, I. A. Gindin, B. G. Lazarev and Ya. D. Starodubov. Soviet Physics, Solid State, v. 2, Dec. 1960, p. 991-993. (Translation of Fizika Tverdogo Tela, v. 2, June 1960, p. 1033-1360.)

Recrystallization at room temperature following deformation at 4.2° K. and 20° K. is studied by a new method based on the fact that some of the new grains grow across the boundary of contact between two surfaces of the deformed specimen. 6 ref. (N5f, 2-61, 3-67; Cu)

175-N. Hydrogen in Carbide Steel. T. G. Owe Berg. American Ceramic Society Bulletin, v. 40, Feb. 1961, p. 78-79.

Evidence that retained hydrogen is held in carbide phases in steel is confirmed by direct analysis and used to suggest a role for the carbide phase in fish-scaling of enameled steel. (N8r, Q10c; ST, 8-71)

176-N. (Japanese.) Determination of Hydrogen in Cast Iron. Pt. 1. Evolution of Hydrogen From Fe-C-Si Alloy and Cast Iron at Room Temperature. Eiichi Kato. Japan Institute of Metals, Journal, v. 24, Nov. 1960, p. 703-707.

Time, temperature and composition effects on hydrogen evolution are measured for small, chill cast specimens of steel and malleable and cast iron containing 0.4-4.43% C and 0.14-3.65% Si at -78 to 20° C. in test tubes filled with Hg or evacuated. In general, the specimens having higher C and Si content or at lower temperature show slower evolution rates. 5 ref. (N15e, 2-60, 2-61; CI, ST, H)

177-N. (Japanese.) Isothermal Transformation of the Eutectoid and the Hypo-Euctectoid Composition in Cu-Al Binary Alloys. Hiroyasu Mitani and Norihiko Nakanishi. Japan Institute of Metals, Journal, v. 24, Nov. 1960, p. 748-751.

T-T-T diagrams are constructed for 11.44 and 12.18% Al-Cu specimens at 420-560° C. in an examination of the beta to ordered beta transformation as a transition reaction in the beta to beta prime martensite transformation or eutectoidal precipitation proceeding at temperature below the critical temperature for the beta to ordered beta transition. 12 ref. (N7c, N6q; Cu-b, Al)

178-N. (Japanese.) Isothermal Transformation of the Hyper-Eutectoid Compositions in Cu-Al. Hiroyasu Mitari and Norihiko Nakanishi. Japan Institute of Metals, Journal, v. 24, Nov. 1960, p. 752-755.

T-T-T diagrams are constructed for specimens near the ideal Cu_3Al composition, containing 12.49-12.96% Al, to re-examine the beta to ordered beta to

beta prime martensite transformation. 6 ref. (N7c, N6q; Cu-b, Al)

179-N. (Japanese.) Studies on Pure Chromium. Pt. 4. Recrystallization of High Purity Chromium. Susumu Yoshida, Yukio Ohba and Noria Nagata. Japan Institute of Metals, Journal, v. 24, Nov. 1960, p. 760-764.

Specimen of pure Cr produced by electrolysis of chromic acid are melted to 6-82% reduction with annealing at 800-1100° C. for various times. Activation energies for recrystallization are measured isothermally, with recrystallization structure, including grain growth due to boundary migration, being observed by X-ray back reflection methods. 9 ref. (N5, N3, M22g, 2-64, 3-68; Cr-a)

180-N. (Russian.) Investigation of the Graphitization Theory of White Iron. N. M. Pronman. Liteinoe Proizvodstvo, Nov. 1960, p. 37-41.

X-ray study of graphitization processes in annealed and in quenched cementite shows that centers of graphitization during the quenching process develop as a result of decomposition of the cementite at 1100° C. and lower. It is thought that hardening speeds the graphitization process. 22 ref. (N8s; CI-p)

181-N. (French.) X-Ray and Electron-Microscopic Study of the Precipitation in an Aluminum-Zinc Alloy With 40% Zinc. Rene Graf and Bernard Genty. Comptes Rendus, v. 251, Nov. 28, 1960, p. 2517-2519.

Identification of an intermediary phase during precipitation. Relation of this phase with pre-precipitation and development of pre-precipitation zones during annealing. 8 ref. (N7, 2-64, M21; Al-b, Zn)

182-N. (Russian.) Investigation of Cementite in Nongraphite Alloys. N. Z. Pozdnyak and E. K. Ponomarenko. Metallovedenie i Obrabotka Metallov, Dec. 1960, p. 39-41.

Influence of amount and form of the free cementite on wear resistance and anti-frictional properties of sintered alloy ball bearings. (N8k, Q9, T7d; Fe-b, C, 6-72, 17-57)

183-N. (French.) Role of Holes in Supersaturation for the Kinetics of Structural Hardening. Claude Leymonie. Metaux-Corrosion-Industries, v. 35, Dec. 1960, p. 474-487.

Theories concerning the kinetics of structural hardening, including hardening at low temperatures; role of short circuits of diffusion; the formation of holes during supersaturation and the interaction between holes and dislocations. 52 ref. (N-general, M26b)

184-N. Study on Carbides in Iron and Steel by Electrolytic Isolation Method. Report 2. Partition of Alloying Elements Between Carbides and Ferrite in Annealed Steels. Tomo-o Sato and Taiji Nishizawa. Tohoku University, Technology Reports, v. 25, Jan. 1960, p. 65-75.

The influence of alloying element concentration and C content on the partition of Ni, Co, Mn, Cr, Mo, W, V and Si between cementite and ferrite in low alloy steels and the composition and structure of carbides in high alloy Cr, V, Mo and W steels. (N8r, 2-60; AY)

185-N. (Japanese.) Anomalous Softening and Structure Change of Cu-2% Be Alloys Due to Discontinuous Precipitation. Takuichi Morinaga, Takeo Goto and Tsuneo Takahashi. Japan Institute of Metals, Journal, v. 24, Dec. 1960, p. 777-781.

Hardness changes with aging times at 310° C. after solution treatment at 760-810° C. is observed in commercial Cu-Be alloys of similar composition by microscopy with examination of discontinuous precipitation by electron micrography. Overaging is related to initial hardening rate, subsequent softening anomaly, grain boundary and matrix nodule formation and spheroidization. 17 ref. (N7, M-general, N-general, 2-64; Cu, Be)

186-N. (Japanese.) The Structure Dependence of 0.68% Carbon Steel on the Austenizing Process. Genjiro Mima, Shigenori Hori and Akikozu Nakagiri. Japan Institute of Metals, Journal, v. 24, Dec. 1960, p. 805-809.

Specimens having structures with lamellar and spheroidized pearlite and spheroidized pearlite with nodular graphite are austenitized at 600-800° C. for various times at rapid heating rates. The course of the austenite transformation and structural characteristics are investigated by hardness

measurement, electron microscopy and dilatation methods. 17 ref. (N8, 2-64; CN)

187-N. (Japanese.) Ni-Cr Alloys. Pt. 2. Structural Changes of Ni-Cr Alloys Containing About 45% Cr. Masazo Okamoto, Katsuro Suenaga and Isao Masaaka. Japan Institute of Metals, Journal, v. 24, Dec. 1960, p. 814-818.

Differential dilation curves and metallographic data for phase and structure changes during isothermal transformation of Ni-Cr alloys containing 35-51% Cr observed during various stages of quenching and holding treatments at 800-1250° C. Investigation of solubility or eutectoidal change in the Ni-rich solid solution, resulting in the precipitation of a fine granular and a coarse lamellar structure. 21 ref. (N7c, N12p, M23b; Ni-b, Cr)

188-N. (Russian.) Polygonization in Metals. I. A. Oding, P. V. Zubarev and Z. G. Fridman. Metallovedenie i Termicheskaya Obrabotka Metallov, Jan. 1961, p. 2-9.

Discussion of the nature of polygonization based on dislocation theory. Polygonization in steels and metals of various purity, its rate and development during creep, tensile stress and crystallization. Effect of polygonization on the mechanical properties of deformed and heat treated materials. 56 ref. (N4, N5)

189-N. (Russian.) Carbon Diffusion in Iron. S. Z. Bokshtein, M. A. Gubareva, I. E. Kontorovich and L. M. Moroz. Metallovedeni i Termicheskaya Obrabotka Metallov, Jan. 1961, p. 10-14.

Study of carbon diffusion process at 550-950° C. in alloyed and nonalloyed iron exposed to C^{14} isotope. Depth and rate of diffusion and distribution of carbon in separate grains is determined as a function of alloying iron composition and temperature. 11 ref. (N1a; Fe-b, C)

190-N. (Russian.) Fine Crystalline Structure During Martensitic Transformation. E. L. Vinogradskaya and G. A. Molchanova. Metallovedenie i Termicheskaya Obrabotka Metallov, Jan. 1961, p. 20-25.

Structural investigation of gamma and alpha phases in hardened Fe-base alloy during direct and reverse martensitic transformation. Maximum lattice distortion and transformation temperature as dependent on plastic deformation before or after cooling to -194° C. 10 ref. (N8p, M27, 3-68; Fe-b)

191-N. (Russian.) Influence of Plastic Deformation on Graphitization in Steel. A. A. Baranov. Metallovedenie i Termicheskaya Metallov, Jan. 1961, p. 25-28.

Graphitization mechanism is studied in two openhearth silicon steels with laminar pearlite and pearlite-cementite structures. Samples are subjected to graphitization annealing at 680° C. with subsequent upsetting at 20-1100° C. to show effect of microcracks, porosity and heterogeneity of deformation on graphitization. 3 ref. (N8s, 3-68; ST)

192-N. (Russian.) Structure and Recrystallization of Austenite in High-Speed Toolsteel. V. D. Sadovskii. Metallovedenie i Termicheskaya Obrabotka Metallov, Jan. 1961, p. 50-57.

Metallographic study of structural changes occuring during recrystallization of R18 steel quenched from 1280° with subsequent repeated heating to 1280-1300° C. Mechanism and factors governing the development of large size grains during the secondary heating. 13 ref. (N5, M27c; TS)

193-N. On the Determination of Diffusion Coefficients in Chemical Diffusion. R. W. Balluffi. Acta Metallurgica, v. 8, Dec. 1960, p. 871-873.

Equations describing chemical diffusion in the general case where the partial molal volumes of the diffusing components may differ and may vary with composition are reviewed to determine exactness and ease of application. Relations for obtaining chemical and intrinsic diffusivities are derived which are suggested for replacing the standard Darken equation and Boltzmann-Matano analysis whenever there is any possibility that differences and variations of the partial molal volumes are of significance. 10 ref. (N1)

194-N. Growth Substructures in Weld Metal. F. A. C. Calvo, K. P. Bentley and R. G. Baker. Acta Metallurgica, v. 8, Dec. 1960, p. 898-900.

Cell or corrugation structures on the surface of weld pools in low carbon

steel and dendritic growth in weld pools in a 18Cr-12NiCb stainless after melting and rapid cooling, using an argon tungsten arc spot welding torch. Influence of the positive liquid temperature gradient resulting from a build-up of the solid-liquid interface on substructure formation. Effect of degree of consitutional supercooling on type of structure developed. 3 ref. (N12, N3; ST, 7-51)

195-N. Electron Microscopic Investigation of the Phase Transformation of Thin Cobalt Samples. E. Votava. Acta Metallurgica, v. 8, Dec. 1960, p. 901-904.

Co in bulk form shows at 417° C. a reversible phase transformation from the hexagonal to the f-c-c. form. This transformation is observed in the electron microscope by heating to 800° C. and cooling recrystallized and electrolytically thinned Co samples in a special sample holder. The transformation is attributed to stacking fault formation and coalescence into and movement with dislocation as a function of stress and temperature. 4 ref. (N-general, M21e, M26b, 2-61, 3-66; Co)

196-N. (Translation-ConBur.) Some Features of the Crystallization of Alloys of the Eutectic Type at High Rates of Cooling. I. V. Salli and I. S. Miroshnichenko. Academy of Sciences of the USSR, Proceedings, Physical Chemistry Section, v. 132, May-June 1960, p. 557-559.

Metallographic examination and X-ray diffraction studies of alloys containing Al, Si, Pb, Sn, Bi, Ni, C, Co and Cr to determine relationships between free energy, eutectic temperature, phase diagram and solubility. (N12, M22g, M24b; Al-b, Co-b, Cr-b, Ni-b, Pb-b, Sn-b)

197-N. Surface Self Diffusion Measurements on Nickel by the Mass Transfer Method. J. M. Blakely and H. Mykura. Acta Metallurgica, v. 9, Jan. 1961, p. 23-31.

Surface self diffusion constants D_s for nickel heated in vacuum at 800-1200° C. are calculated from interferrometric measurements on the rate of smoothing of scratches. D_s is found to depend strongly on surface orientation, the effect being greatest at the lower temperatures. This is ascribed largely to orientation dependent impurity adsorption. 23 ref. (N1d, 3-69, 3-72; Ni)

198-N. Strain-Hardening and Crystalline Fracture of Polycrystalline Iron. A. W. Sleeswyk. Acta Metallurgica, v. 9, Jan. 1961, p. 32-39.

The influence of prestraining tensile specimens of Armco iron at room temperature on their yield and fracture stresses at lower temperatures and the influence of strain rate on the fracture stress at liquid-nitrogen temperature. The plastic deformation obeys an equation of state, the observed fracture stresses being explained by assuming that the crystal grains and the microcracks they contain are deformed in conformity with the bulk of the material. 39 ref. (N7e, Q26p, 3-68, 3-73; Fe-a)

199-N. Quench-Hardening for Relatively Low Vacancy Concentration. T. Mori, M. Meshii and J. W. Kauffman. Acta Metallurgica, v. 9, Jan. 1961, p. 71-72.

Vacancy coagulation is determined as the dominant mechanism in Au for the annealing out of vacancies during quenching at 1030-700° C. Yield stress and resistivity values are plotted against aging time and quenching temperature as part of the study to prove that quench hardening operates by the same mechanism throughout the temperature range. 7 ref. (N7, M26s, 2-61, 2-64, 2-65; Au)

200-N. (German.) Isothermal Austenite Transformation Below the Martensite Temperature. O. Schaaber. Radex Rundschau, Dec. 1960, p. 335-342.

Analysis of austenite transformations in heat treatable and ball bearing steel by dilatometric measurement below martensite temperature to investigate reaction mechanism of martensite formation. (N8p)

201-N. Influence of Aluminum and Titanium on the S-Curve in Molybdenum Copper Cast Iron. Youichi Tokunaga. Imono (Japan Foundrymen's Society, Journal), v. 32, Nov. 1960, p. 759-764.

Isothermal transformation in 0.2-1.2% Mo, 0.5-2.3% Cu cast irons containing 0.26-0.87% Al and 0.12-0.26% Ti additions is determined by metallographic and dilatometric methods and by Brinell hardness measurement. The S-curve movement in bainite,

pearlite and martensite ranges is determined as a function of temperature. 10 ref. (N8g, 2-60; CI, Al, Ti)

202-N. The Crystallography of Martensitic Transformations. B. A. Bilby and J. W. Christian. Iron and Steel Institute, Journal, v. 197, Feb. 1961, p. 122-131.

Crystallographic analysis showing effect of strain and deformation element on microstructure, lattice parameters and dilatation parameters. Verification of theory by thin-film electron microscope studies on steel, Fe-Ni, In-Tl, Au-Cd, Cu-Au and Cu-Be alloys. 64 ref. (N6q, M26)

203-N. The Effect of Austenite Grain Size and Temperature on the Rate of Bainite Formation. J. Bradford and W. S. Owen. Iron and Steel Institute, Journal, v. 197, Feb. 1961, p. 146-151.

Measurements of electrical resistivity of wire specimens of Fe-Mn-C alloys to determine effects of austenitizing conditions on subsequent isothermal transformations at 1000-1250° C. Nucleation of upper and lower bainite at the austenite grain interface. (N8m, N8g, N5, P15g, 2-59, 2-64; Fe-b, Mn, C)

204-N. (French.) Tempering of Quenched High Speed Steel. J. Papier, G. Pomey and A. H. Michel. Memoires Scientifiques de la Revue de Metallurgie, v. 57, Nov. 1960, p. 829-844.

Contraction, expansion and magnetic stages in the austensite-martensite transformations occurring during tempering quenched high-speed steel in a differential dilatometer or in a thermomagnetometer above 500° C. Relation to composition of matrix obtained by austenitization. (N8a, M23b; TS-m)

205-N. (French.) Influence of Alpha Forming Elements on Diffusion of Copper in Gamma Iron. F. Sirka. Memoires Scientifiques de la Revue de Metallurgie, v. 57, Nov. 1960, p. 879-887.

Diffusion of pure Cu and Cu alloyed with P, Be and Si into pure Fe (750° C.), mild and austenitic steel and ferritic steel with 25% Cr or 4% Si. Effect of alpha forming elements (Cr, Sn, Sb) on intergranular wetting. 3 ref. (N1, 2-60; Fe-b, Cu)

206-N. (German.) Influence of Neutron Irradiation on Phase Transformation in Chromium Steels. B. Weiss-Hollerwoger and R. Mitsche. Radex Rundschau, Dec. 1960, p. 318-322.

Establishment of austenite-martensite transformation curves between -200 and 800° C. of an austenitic 5.4% Cr steel after exposure to 0-10^{18} n/cm^2 neutron irradiation at 25° C. Measurement of amount of martensite by permeability and hardness measurements. Influence of irradiation on martensite temperature. Interpretation of results by "strain-embryo theory". (N8f, 2-67; SS)

207-N. (German.) Transformations in Solid Bodies With Particular Emphasis on Martensite Formation. R. Mitsche. Radex Rundschau, Dec. 1960, p. 332-334.

Interpretation of isothermal martensite, pearlite and intermediate structures by two and three dimensional plots for unalloyed, medium-alloyed and high-alloyed steels. (N8)

208-N. (German.) Grain Boundary Structure and Recrystallization. Kurt Lucke. Zeitschrift fur Metallkunde, v. 52, Jan. 1961, p. 1-12.

Review of measurements of properties of large angle grain boundaries such as plasticity, energy and diffusion. Theoretical models (island model and undercooled liquid model) used to interpret structure of small and large angle boundaries. Interpretation of recrystallization in terms of grain boundary properties and structures. (N5, M27f, 3-72)

209-N. (German.) Movement of Large Angle Grain Boundaries in Recrystallization. Paul A. Beck. Zeitschrift fur Metallkunde, v. 52, Jan. 1961, p. 13-19.

Review of factors influencing movement of large angle grain boundaries during recrystallization such as surface tension, interface tension and lineage tension of dislocations; temperature; foreign atoms in solution and dispersion of inclusions; size, lattice and grain orientation of the sample. (N5, N3, M26b, 3-69, 3-72)

210-N. (German.) Process of Nucleation in Recrystallization. Wilhelm Gerard Burgers. Zeitschrift fur Metallkunde, v. 52, Jan. 1961, p. 19-26.

Review of theories and models of the nucleation reaction mechanism and growth of nuclei in recrystallization including R. Becker's nucleation theory

(formation of nuclei caused by thermic fluctuations), "lattice block theory", deformed structure model, polygonization theory, theory of martensitic nucleation, mechanism of the (111)-(112) shearing process to explain nucleation, Rowland transformation, secondary recrystallization and the concept of stimulated twin crystals. (N2, N5, 10-54)

211-N. (German.) Interpretation of Technical Recrystallization. Klaus Detert. Zeitschrift fur Metallkunde, v. 52, Jan. 1961, p. 27-34.

Theoretical investigation of recrystallization mechanisms in terms of "primary recrystallization", steady increase in grain size and "secondary recrystallization" as a function of alloying, annealing and deformation conditions. Review of technical recrystallization in annealing of brass sheets; recrystallization of Al deep drawing sheets, grain oriented magnet sheets containing 50% Ni and grain oriented magnet sheets containing 3% Si. Relation of resultant structural changes to mechanical and physical properties. (N5; Ni-b, Al, Cu-b)

212-N. (German.) Texture Formation in Primary Crystallization. Hein-Peter Stuwe. Zeitschrift fur Metallkunde, v. 52, Jan. 1961, p. 34-44.

Classification of recrystallization textures into three groups according to relationship between orientation and deformation textures (i.e., "gray textures", "retained textures" and textures with new orientation). Models are used in oriented nucleation, growth selectivity and recrystallization "in situ" studies to interpret the classification. Application of derived conclusions to Al sheets and wire textures. (N5, M26c, 3-68, 3-72; Al, 4-53)

213-N. (German.) On the Theory of Recrystallization. Ulrich Dehlinger. Zeitschrift fur Metallkunde, v. 52, Jan. 1961, p. 44-47.

Interpretation of reaction mechanism based on X-ray investigation of 99.9% rolled Ag and Cu sheets, in terms of preformed nuclei, which are less deformed lattice areas caused by inhomogeneities during deformation. Formation of large-angle grain boundaries by dislocation clouds surrounding the less deformed lattice areas. Correlation between orientation of nuclei and nuclei growth. (N5, N2, M26b, 3-68, 3-69, 3-72)

214-N. (German.) Decomposition of Iron-Molybdenum and Iron-Tungsten Solid Solutions. Erhard Hornbogen. Zeitschrift fur Metallkunde, v. 52, Jan. 1961, p. 47-56.

Investigation of decomposition of supersaturated alpha-Fe with 8-29.5% Mo or 26.65% W after 1440-1500° C. homogenization and 500-1000° C. aging by X-ray, microstructure and microhardness examination. Continuous and discontinuous decomposition is observed depending on aging temperature, the reaction mechanism being the growth of fine dispersed aggregate of the equilibrium phase into the solid solution. (N12p, N3, M-general, 2-65; Fe-b, Mo, W)

215-N. (German.) Kinetics of Precipitation Processes in Supersaturated Aluminum-Zinc Solid Solutions. Volkmar Gerold and Werner Schweitzer. Zeitschrift fur Metallkunde, v. 52, Jan. 1961, p. 76-85.

X-ray investigation using filtered Cu radiation to evaluate small-angle X-ray scattering in aging at 20-50° C. of 15-24.5% Zn containing cast, 450° C. annealed and cold rolled specimens, after quenching from 250-500° C. to room temperature. Mechanism and kinetics of precipitation. Determination of activation energy. (N7, M22g, 2-65, 3-68; Al-b, Zn, 14-67)

216-N. (Russian.) Growth of Metallic Single Crystal Under High Hydrostatic Pressure. L. F. Vereshchagin, Yu. N. Ryabinin, A. Ya. Preobrazhenskii and V. A. Stepanov. Doklady Akademii Nauk, SSSR, v. 135, Jan. 1960, p. 45-47.

Growth of cylindrical Al and Zn single crystals in argon and nitrogen atmosphere under 10,000 atm. pressure and with moving heat front at crystallization temperature. (N3r; Al, Zn)

217-N. (Russian.) Distribution and Form of Carbon in Molten Pig Iron. A. A. Bertman and A. M. Samarin. Doklady Akademii Nauk, SSSR, v. 134, Apr. 1960, p. 629-631.

Centrifuging of molten pig iron to investigate vertical distribution of C as a function of specimen length, rotational velocity and time of rotation. Determination of C particle size. 8 ref. (N8r)

218-N. (Russian.) The Autocatalytic Character of Martensite Transformation. O. P. Maksimova, N. P. Saboleva and E. I. Estrin. Doklady Akademii Nauk, SSSR, v. 134, Apr. 1960, p. 871-874.

Review of literature on martensite transformation in Fe-Ni-Mn and Fe-Cr-Ni, relating amount of martensite to cooling and heating. Investigation of martensite formation in Fe-Ni-Mn at -30 to -196° C. Relation of transformation rate to amount of martensite present before heating. (N8p; Fe-b, Ni, Mn)

219-N. (English.) The Mode of Precipitation in Aluminum-Magnesium Alloys. Shigeru Matsuo. National Research Institute for Metals, Transactions (Japan), v. 2, Feb. 1960, p. 84-88.

Microscopy and X-ray examination of continuous and discontinuous precipitation along grain boundaries and slip bands as a function of cold deformation and heat treatment in specimens containing 7-10% Mg, after solution treatment, aging at 170-250° C. and cold swaging. 8 ref. (N7, M-general, 2-64, 3-68; Mg-b)

220-N. (English.) Continuous Cooling Transformation Diagrams of Steels for Welding and Their Applications. Michio Inagaki and Horujiro Sekiguchi. National Research Institute for Metals, Transactions (Japan), v. 2, Feb. 1960, p. 102-122.

Compilation of CCT diagrams for high strength and mild steel specimens heated at rapid rates to 1350° C. Effect of continuous cooling on microstructure, hardness and other properties of the heat affected zone. Application to determination of weldability under various arc welding conditions and prediction of weldment strength as a function of alloy composition. 24 ref. (N8, K9s, Q-general, 2-60, 2-64; ST)

221-N. (German.) Measurement of Self-Diffusion of Cobalt-60 in Alpha-Iron. Werner Lange, Alfred Hassner and Erwin Dahn. Neue Hutte, v. 6, Jan. 1961, p. 33-44.

Thin foils of Armco-Fe are electrolytically coated with Fe-59 or Co-60 and annealed under protective Ar atmosphere at 746-905° C. Evaluation of diffusion parameters as influenced by temperature using the thin foil and absorption methods. Theoretical discussion of the two methods. (N1a; Fe-a)

222-N. (German.) Methods for Studying Aging of Carbon Steel. Friedrich Erdmann-Jesnitzer and Ralf Laschimke. Neue Hutte, v. 6, Jan. 1961, p. 44-52.

Brinell hardness, microhardness and warm hardness (testing temperature 25-250° C.) testing and X-ray investigation of 100-300° C. aged 5-15% cold tensile deformed basic Bessemer and openhearth unalloyed steel of similar composition to evaluate most significant testing method to reveal aging behavior. (N7a, Q29, M22g; CN)

223-N. (Russian.) Thermodynamic Method for Determination of the Conditions of Analysis of Gases in Metals and its Use for Development of Analytical Methods. Yu. A. Klyachko and E. M. Chistyakova. Zavodskaya Laboratoriya, Dec. 1960, p. 1335-1338.

Determination of the content of O, H and N in metallic Mn (up to 30% of Mn) with the aid of Ni, Cu and Fe baths with extraction of gases during vacuum melting. Equations are derived for displacement energy and molar temperature of displacement for binary alloys Mn-Cu, Mn-Ni and Mn-Fe. 8 ref. (N15d, P12, 1-54, S11r, 1-73; Mn, O, H, N)

224-N. (Polish.) Undercooled Austenite Transformation in Low Carbon Bainitic Steels During Continuous Cooling. W. Cias. Prace Instytutow Hutniczych, v. 12, May 1960, p. 223-237.

Metallographic and dilatometric study of Cr-Mo, Cr-Ni-Mo, Mn-Cr-Mo and Mn-Cr-Ni-Mo steels with boron additions. The bainitic-ferritic transformation and critical cross section as a function of cooling rate, time, temperature and composition. 16 ref. (N8f, M23b; CN-g)

225-N. (Russian.) Liquidus-Solidus Curves of the Tantalum-Vanadium System. V. N. Eremenko, L. A. Tretyachenko and R. I. Yahimovich. Zhurnal Neorganicheskoi Khimii, v. 5, Oct. 1960, p. 2290-2293.

Investigation of Ta-V alloys by X-ray, metallographic and microhardness measurements. Determination of melting temperature, lattice parameters and microhardness. (N12p, P12n, M26, Q29q; Ta-b, V-b)

226-N. Solidification of a Eutectic Made From Zone-Refined Lead and Tin. J. P. Chilton and W. C. Winegard. Institute of Metals, Journal, v. 89, Jan. 1961, p. 162-164.

Melt grown single crystals from high purity specimen alloys are examined by Laue back reflection X-ray method after unidirectional solidification to determine whether a eutectic made from pure material solidifies with a cellular interface and to observe the structure as a function of freezing rate. A lamellar eutectic is observed with the cellular interface growing only in the presence of an impurity. 15 ref. (N12q, 3-67, 3-69; Pb-b, Sn-b, 14-61)

227-N. The Diffusion Coefficient for Oxygen in Alpha-Zirconium. M. Davis, K. R. Montgomery and J. Standring. Institute of Metals, Journal, v. 89, Jan. 1961, p. 172-174.

Zr sheet specimens are exposed to gaseous O and O-bearing Na at 400-800° C. after vacuum heating for hydrogen removal. The diffusion coefficient for oxygen is determined by microhardness measurements. 5 ref. (N1, Q29q, R1h; Zr-a, O, 4-53)

228-N. Diffusion of Gold in Lead Single Crystals. A. Ascali. Institute of Metals, Journal, v. 89, Feb. 1961, p. 218-220.

Diffusion coefficients of Au in pure Pb single crystals are measured using radioactive-tracer method and sectioning technique during annealing at 94-325° C. Comparison with polycrystalline specimens in terms of grain-boundary diffusion taking place in the system above 106° C. The activation energy obtained for the diffusion 9.35 kg-cal. per mole is compared with that reported in the literature for self-diffusion in Pb, 28 kg-cal. per mole. 8 ref. (N1, 1-59; Pb, Au)

229-N. Eutectic Structure in Cast Iron. J. Rickard and I. C. H. Hughes. BCIRA Journal (British Cast Iron Research Assoc.), v. 9, Jan. 1961, p. 11-25.

Ledeburite solidifies with only moderate undercooling and recalescence and is nucleated at points on the mold/metal interface; the plate-like eutectic, which occurs much less frequently and only when nucleation of ledeburite is avoided, is accompanied by considerable undercooling and recalescence and is nucleated at various points throughout the melt. (N12; CI-p)

230-N. APM Alloys. R. J. Towner. Metals Engineering Quarterly (American Society for Metals), v. 1, Feb. 1961, p. 24-40.

Several aluminum powder metallurgy (APM) alloys developed for use in the temperature range 400-1000° F. The alloys are dispersion hardened by either oxide particles or particles of insoluble intermetallic compounds to give high strength and stability at these temperatures; in addition, certain combinations of alloying elements produce desirable resistance to corrosion in high-temperature water. Although a variety and complexity of APM products have been fabricated, the range of such products is restricted by the amount of oxide or alloying elements present in a particular alloy. 45 ref. (N7; Al-b)

231-N. Strengthening Low-Alloy Steels by Deforming Austenite. R. A. Grange and J. B. Mitchell. Metals Engineering Quarterly (American Society for Metals), v. 1, Feb. 1961, p. 41-53.

The change in microstructure as a result of plastically deforming austenite under circumstances which preclude recrystallization of the "hot cold worked" austenite prior to transformation. The greater strength of low-tempered martensite in hot cold worked steel is attributed primarily to what is a grain refinement due to the preferred alignment of the direction of principal deformation. 10 ref. (N8; AY)

232-N. Temperature Gradient-Hardness Technique for Determination of Recrystallization Temperature. J. M. Dhosi and M. B. Pierson. Watertown Arsenal Laboratories. U. S. Office of Technical Services, PB 161473, May 1960, 22 p. $.75.

A 6-7 in. bar of a titanium-base alloy is heated for a specific time in a specially designed gradient furnace and cooled. A hardness survey is then made along the bar and cross-plotted against the temperature gradient to which the bar has been subjected. The temperature at that point of the bar where hardness value falls off abruptly is designated as the recrystallization temperature. (N5, Q29; Ti-b)

233-N. The Effect of Plastic Strain Rate on Diffusion in Aluminum-Zinc Alloys. G. A. Bruggeman. Massachusetts Institute of Technology (Wright Air Development Division). U. S. Office of Technical Services, PB 161884, Apr. 1960, 51 p. $1.50.

Effect of plastic strain rate on diffusion in Al-Zn alloys shows that strain rate has only a minor effect on the self-diffusion of Zn in the alloy, but that the effect is larger at lower temperatures and higher strain rates. (N1d, 3-68; Al-b, Zn)

234-N. Research and Development on the Effects of High Pressure and Temperature on Various Elements and Binary Alloys. J. S. Harvey. Manufacturing Laboratories, Inc. (Wright Air Development Division). U. S. Office of Technical Services, PB 161920, Apr. 1960, 99 p. $2.25.

High-pressure, high-temperature device capable of subjecting alloys used in high-pressure aircraft fabrication to 100,000 atm. pressure at temperatures above 1500° C. With this apparatus, high hydrostatic pressure is used to lower the temperature of martensitic transformations in Fe-Ni alloys and expand the temperature range of the gamma loop in the Fe-Cr system. The precipitation hardening process in both Al-Cu and Cu-Be alloys is significantly restrained and modified when carried out at high hydrostatic pressure produced by the device. (N8p, J27, 2-61, 3-74; Cu-b, Fe-b)

235-N. (German.) Diffusion in the Tin-Lead Alloy System. H. Cordes. Zeitschrift fur Anorgansiche und Allgemeine Chemie, v. 306, Oct. 1960, p. 121-132.

Measurement of diffusion coefficients in vacuum degassed Sn-Pb specimens (0-87% Sn) of different composition at 155-181° C. under vacuum. Representation of results in terms of concentration-diffusion path diagrams. Influence of temperature and concentration on diffusion coefficient. Reaction mechanism. (N1; Sn-b, Pb-b)

236-N. Layer Growth During Interdiffusion in the Aluminum-Uranium Alloy System. L. S. Castleman. Journal of Nuclear Materials, v. 3, Jan. 1961, p. 1-15.

Interdiffusion in the Al-U system is investigated as a function of annealing time and temperature and applied pressure. Determination of layer thickness and growth mechanisms, phase solubility diagram and the nature and distribution of structural defects at 400-600° C. and pressure of 1 1/4-10 tsi. for diffusion times of 24 hr. or less. 15 ref. (N1c, N1e, 2-64, 3-74; Al-b, U-b)

237-N. Some Aspects of the Growth of Diffusion Layers in Binary Systems. G. V. Kidson. Journal of Nuclear Materials, v. 3, Jan. 1961, p. 21-29.

Application of Fick's First Law to polyphase diffusion in binary systems to derive rigorous expressions for the interface positions as functions of time and temperature. Systems of two and three phases are treated and the results generalized to an n-phase system with some aspects of the temperature behavior of the rate constants. 11 ref. (N1, M24b, 2-61, 3-67)

238-N. Self-Diffusion in Beta Uranium. S. J. Rathmann, J. Gray, Jr., J. P. Hughes and A. L. Harkness. Journal of Nuclear Materials, v. 3, Jan. 1961, p. 72-76.

Autoradiographic examination of self-diffusion in cylindrical specimens, using vacuum deposited U-235 as the radioactive tracer with annealing at 678.0-760.0° C. Diffusion coefficients are plotted by an Arrhenius-type equation and self-diffusion is determined as a function of grain boundary and anisotropic volume diffusion. 11 ref. (N1d, M23q, M23r, 1-59; U)

239-N. The Diffusion of Gold in Gamma Uranium. S. J. Rothman. Journal of Nuclear Materials, v. 3, Jan. 1961, p. 77-80.

The diffusion of Au in gamma uranium is measured using a radioactive tracer and the sectioning technique. The values of D_o and the activation energy are 4.86×10^{-3} cm^2 per sec. and 30 400 cal. per mol respectively, fairly close to the values for self-diffusion in gamma uranium. 12 ref. (N1; U, Au)

240-N. The Recrystallization of Uranium During Cold or Hot Forging. J. A. Sabato and R. W. Cahn. Journal of Nuclear Materials, v. 3, Jan. 1961, p. 115-119.

Polygonization, nucleation and recrystallization mechanisms in uranium billet specimens deformed under controlled impact after 550° annealing and subsequent quenching are examined by macro and microhardness measurements and micrographic and X-ray back reflection methods. Banded and fine, inhomogenous equiaxed structure are observed as a function of recrystallization occurring before and after annealing. (N2, N5, F22, 2-64; U)

241-N. (Russian.) Polymorphic Transformations of Chromium in Cr-Ta Alloys. A. T. Grigor'ev, E. M. Sokolodvskaya, M. B. Maksimova, I. G. Sokolova and Nedumov. Zhurnal Neorganicheskoi Khimii, v. 5, Nov. 1960, p. 2640-2642.

Constitutional diagram of Cr-Ta (0.2-12%) heat treated at 1350-1750° C. Microscopic, X-ray, thermal analysis and hardness measurements reveal types of phases originating because of Cr modifications and eutectic transformations occurring at 1490, 1150, 950 and 775° C. 5 ref. (N-general, M24b; Cr-b, Ta)

242-N. (Russian.) Structure and Thermal Expansion of Delta and Eta Plutonium. S. T. Konobeevskii and N. T. Chebotarev. Atomnaya Energiya, v. 10, Jan. 1961, p. 50-57.

Structural changes occurring during allotropic transformations including epsilon-eta and eta-delta in Pu are studied in terms of the concept of increasing covalent bonding as a result of temperature decrease. 8 ref. (N6p, M27, P11g; Pu)

243-N. (Spanish.) Relation Between Substructures of Segregation and Dislocations Formed During Solidification in 99.99% Aluminum. Heraldo Biloni. Comision Nacional de Energia Atomica, no. 46, 1960, p. 1-11.

Study of segregation substructures and of macrosegregation substructures in casting polycrystals of 99.99% Al using thin surface layers and corrosion figures. Relation of impurity-dislocation interaction with segregation areas. 20 ref. (N12, M26b, M28k, 3-69, 9-69; Al)

244-N. (German.) Influence of Vibrations Causing Minor Stress on the Aging of Aluminum Alloys. A. T. Balewsky, R. H. Nikolov, W. R. Draganov and D. T. Butschkov. Comptes Rendus de l'Academie Bulgare des Sciences, v. 13, July-Aug. 1960, p. 443-446.

Samples are held at 500° C. for 4 hr., quenched to 60° C. in warm water, exposed to cyclic loads of 0.25-0.8 kg. per sq. mm. at a frequency of 6000 per min. and hardness tested at regular time intervals to study the influence of vibrating on the aging process. Effect of annealing at 165-175° C. for 14-40 hr. subsequent to vibrating. (N7a, 2-64, 3-66; Al-b)

245-N. (Japanese.) Tempering Process in Gamma-Type Heat-Resisting Alloys. Pt. 1. Change in Physical Properties During Tempering of Gamma Fe-Co-Cr-Ni Base Heat Resisting Alloy, LCN-155. Yunoshin Imai and Tsuyoshi Masumoto. Tetsu-to-Hagane (Iron & Steel Institute of Japan, Journal), v. 47, Feb. 1961, p. 139-145.

Kinetics of the tempering process and effects of solution treatment temperatures and of additional elements C, N, Mo, W and Cb on the process are investigated by dilation, specific heat, electrical resistance and hardness measurements on specimens after various water quenching, annealing and tempering treatments at 20-130° C. 22 ref. (N7d, 2-60; Fe-b, Co, Cr, Ni)

246-N. (Japanese.) Aging Behavior of Be-Cu Alloys Containing Ni With Special Emphasis on Its Relation to Solution Treatment and Cold Working. Osamu Tzumi and Hiroshi Fukuda. Japan Institute of Metals, Journal, v. 25, Jan. 1961, p. 15-19.

The effects of the temperature of solution treatment (700-850°) and of cold rolling prior to aging treatment (30 and 80% reduction) on the aging curve and age hardening characteristics of 0.5-1.1% Be-Cu alloys, containing a small amount of Ni, between 150 and 550° C. are investigated by hardness measurement and microstructural analysis. 17 ref. (N7a, J27, M27, 2-61, 2-64, 3-68; Cu-b, Be, Ni)

247-N. (Japanese.) Epsilon-Phase Transformation in Solution Treated and Heated Hadfield Steel. Yunoshin Imai and Toshio Saito. Japan Institute of Metals, Journal, v. 25, Jan. 1961, p. 57-60.

Effect of isothermal heating at 400-700° C. on grain boundary carbide and pearlitic constituent precipitation and consequent epsilon formation from the gamma phase is examined in solution treated specimens by dilatometry and X-ray diffraction methods. 19 ref. (N7, N8, M-general, 2-64; ST)

248-N. (Japanese.) Phase Translation in Isothermally Heated Hadfield Steel at 500° C. After Solution Treatment. Yunoshin Imai and Toshio Saito. Japan Institute of Metals, Journal, v. 25, Jan. 1961, p. 61-65.

Dilatometric and magnetic examination of gamma to carbide phase transformations with transitions through alpha and epsilon phases. 16 ref. (N7, N8, M-general, 2-64; ST)

249-N. (Japanese.) Aging Characteristics of Some Copper-Beryllium Alloys in Relation to Cold Working Prior to Aging Treatment. Osamu Izumi and Hiroshi Fukuda. Japan Institute of Metals, Journal, v. 25, Jan. 1961, p. 84-87.

Electrical resistivity, Young's modulus, Vickers hardness and elastic anisotropy measurements on cold rolled specimens of binary alloys containing 0.6-1.8% Be and ternary alloys containing in addition 0.3% Co after aging at 150-550° C. for various times. Influence of cold rolling, composition and recovery, over-aging and recrystallization mechanisms on the aging process. 19 ref. (N7a, N-general, P15g, Q-general, 2-60, 2-64, 3-68; Cu-b, Be, Co)

250-N. (French.) Transformations in High-Speed Steels. Jean Papier and Andre-Henri Michel. Memoires Scientifiques, v. 57, Dec. 1960, p. 901-908.

Influence of the presence of bainite or martensite on the transformation of residual austenite during heating at elevated temperatures of 18-4-0 steel and 18-4-2 and 18-4-1 steel with 1.7% Si. 8 ref. (N8, 2-62; TS-m)

251-N. (French.) Solidification Nuclei Studied by Granule Method. Claude Mascre, Aleth Touguet and Michel Drouzy. Memoires Scientifiques, v. 57, Dec. 1960, p. 909-922.

Thermal analysis of granules for the identification of solidification nuclei in pure Al and after addition of Cu, Zn, Fe, Si and Ti. Effect of undercooling and heating on the nuclei. 17 ref. (N2, N12, M23r, 2-61; Al-b)

252-N. (French.) Diffusion and Solubility of Hydrogen in Metals. Walter Eichenauer. Memoires Scientifiques, v. 57, Dec. 1960, p. 943-948.

Determination of H diffusion and solubility coefficients by measuring the degassing rate of Al, Cu, Ag, alpha Fe and Ni metal specimens after exposure to H, liquid H and, in the case of Ni, also to deuterium. 25 ref. (N1, P12e; Al, Ag, Cu, Fe-a, Ni, H)

253-N. (French.) Tempering of Quenched High-Speed Steel. J. Papier, G. Pomey and A. H. Michel. Memoires Scientifiques, v. 57, Dec. 1960, p. 949-971.

Four stages found above 500° C. after tempering of high-speed steel in either the differential dilatometer or in the thermomagnometer and their correspondence to magnetic expansion and contraction. Relation between the extent of these properties and the composition of the matrix obtained by austenitization. 36 ref. (N8a, 2-62; TS-m)

254-N. Tilt Boundary Motion in Zinc Produced by Static and Dynamic Shear Stress. T. Vreeland, Jr. Acta Metallurgica, v. 9, Feb. 1961, p. 112-116.

Crystals grown from 99.999+ Zn and zone refined Zn are subjected to static and dynamic stress. Tilt boundary motion and velocity is increased in zone refined Zn, the increased purity resulting in reduced impurity pinning and dislocation density. The stress required to initiate boundary motion is 100 times greater in the dynamic test than required in the static test. 3 ref. (N3, M26c, Q24, 2-60, 3-66; Zn-a, 14-61)

255-N. The Generalized Theory of the Martensitic Cubic to Orthorhombic Phase Transformation. M. S. Wechsler and H. M. Otte. Acta Metallurgica, v. 9, Feb. 1961, p. 117-124.

The crystallographic theory of the martensitic cubic-orthorhombic phase transformation is described in terms of a generalized lattice invariant shear. Solutions for the undistorted plane are given as explicit functions of the lattice parameters of the two phases and a possible isotropic dilatation with conditions for the existence of a solution and the criteria for the degeneracy of solutions. 15 ref. (N6q, M26)

256-N. Dislocation Configurations in $AuCu_3$ and AuCu Type Superlattices. M. J. Marcinkowski, N. Brown and R. M. Fisher. Acta Metallurgica, v. 9, Feb. 1961, p. 129-137.

Superlattice dislocations consisting of two pairs of partial dislocations held together by an antiphase domain boundary are observed by transmission electron microscopy techniques on thin films of $AuCu_3$. The separation between the pairs is measured to be about 130 Å. A theoretical calculation is made of the expected spacing, involving stacking fault, antiphase domain boundary and elastic interaction energies between the individual dislocations. 12 ref. (N10, M21e, M26b; Au-b, Cu-b, 14-62)

257-N. X-Ray Study of Aged Au-Ni Alloys. J. M. Sivertsen and R. C. Sundahl. Acta Metallurgica, v. 9, Feb. 1961, p. 162-163.

Measurement of the diffraction peak during aging of 34% Ni-Au specimens at 150° for 130 hr. after solution treatment and quenching from 850° C. and after various annealing treatments. Stacking fault formation, short range ordering and quenched-in vacancy migration and coalescence are observed during the aging process with little evidence of clustering. 7 ref. (N7a, N-general, M22g, 2-65; Au-b, Ni)

258-N. Morphology of Martensite. P. M. Kelly and J. Nutting. Iron and Steel Institute, Journal, v. 197, Mar. 1961, p. 199-211.

Transmission electron microscopy of the martensite formed in plain carbon steel, 20 Ni-0.8 carbon alloy steel and 18-8 stainless steel, in particular plate shaped grains containing numerous narrow twins and single crystal needles without internal twinning, as produced by quenching. Review of factors governing changes in martensite morphology, relationship between mechanical properties and morphology of tempered and untempered martensite and the mechanism of stabilization of austenite. 42 ref. (N8p, M-general, 2-64; ST)

259-N. Effect of Up-Quenching on the Kinetics of Bainite Formation. J. S. White and W. S. Owen. Iron and Steel Institute, Journal, v. 197, Mar. 1961, p. 241-243.

Effect of holding austenitized plain carbon eutectoid steel at 258° C. on the rate of subsequent isothermal transformation temperature with the rate at equivalent stage of the direct transformation of austenite. Differences in reaction in upper and lower bainite range. 12 ref. (N8m, 2-64; CN)

260-N. (Ukrainian.) Carbide Phase in High-Silicon Cast Iron. Ya. N. Malinochka and G. Z. Koval'chuk. Dopovidi Akademii Nauk Ukrainskoi RSR, Jan. 1961, p. 25-28.

Metallographic examination of synthetic Fe-C-Si alloys containing about 6% Si showing that crystals of eutectic and hypereutectoid carbides represent a mixture of two phases, easily revealed by etching. 9 ref. (N8r, M-general; Fe-b, Si, C)

261-N. (Translation-Brutcher no. 4653.) Effect of Temperature on Recovery and on Plasticity of Hardened Steel. S. S. Shurakov. Metallovedenie i Termicheskaya Obrabotka Metallov, July 1959, p. 10-15.

New data on effect of temperature at which recovery takes place in hardened low-carbon steels and alloy ferrite. Experimental procedure; results obtained on 0.12% C, 2 Cr, 4 Ni steel and 0.04% C, 7.2% Cr, balance Fe composition. (N4, Q23p, 2-61; CN-g, SS-d)

262-N. (Translation-Brutcher no. 4658.) Effect of Temperature of Austenitizing and Undercooling in Cycle Annealing on the Retained Austenite Content of Alloy Steels. E. S. Tovpenets and F. I. Ivanov. Metallovedenie i Termicheskaya Obrabotka Metallov, July 1959, p. 50-57.

Relationship between quantity of retained austenite and cyclic cooling treatment of hot worked steel to avoid flakiness. Cyclic annealing and quenching procedures and their results. Relation between steel composition and cyclic annealing conditions and amount and stability of retained austenite; effect of longer tempering times or repeated tempering at 650° C. (N8n; AY)

263-N. (Translation-Brutcher no. 4659.) Austenite Transformation in Continuous Cooling of Some Constructional Steels Used for Massive Components. M. P. Braun. Metallovedenie i Termicheskaya Obrabotka Metallov, July 1959, p. 58-60.

Correspondence between isothermal and thermokinetic (continuous cooling) diagrams and their usefulness for heat treatments. Differential optical dilatometer measurements for the construction of diagrams for large steel parts. (N8f; ST, SGB-s)

264-N. (Polish.) Magnetic Determination of Martensite in 18-8 Steel Type. T. Malkiewicz, J. Karp and A. Mazur. Hutnik, v. 27, Oct. 1960, p. 372-376.

Magnetic testing of martensite in steels with 7.27-8.93% Ni and 18% Cr and Armco iron of 100% ferromagnetic phase. Results of tensile stressing at room temperature and in liquid nitrogen show that deformation influences martensitic transformation to a greater degree than does lowering of the temperature. 11 ref. (N8p, M23a, 2-63, 3-68; Fe-a, SS)

265-N. Physical Metallurgy of Refractory Metals (Effects of Alloying Elements on Niobium-Zinc Coatings for Niobium). G. Sondoz and R. L. Newbegin. Report of NRL (Naval Research Laboratory) Progress, Mar. 1961, p. 31-32. (Available as PB 171316 from U. S. Office of Technical Services, Washington 25, D. C.) $1.25.

Cb specimens are tested at 1800° F. for 1000 hr. after dipping in Zn melts containing 3.0-6.8% Ni and 0.08-1.10% Al to determine the influence of the alloying elements on the oxidation resistance and healing ability of the Cb-Zn protective coating formed. (N15g, R1h, 2-61; Cb-b, Zn)

266-N. Physical Metallurgy of Refractory Metals (Kinetics of Formation of Niobium-Zinc Compounds on Niobium in Zinc Vapor). T. C. Lupton. Report of NRL (Naval Research Laboratory) Progress, Mar. 1961, p. 33-34. (Available as PB 171316 from U. S. Office of Technical Services, Washington 25, D. C.) $1.25.

Effect of the temperatures of the Zn source and of the Cb base metal being coated on the formation of unwanted $CbZn_2$ coatings. Thickness, composition and formation mechanism of the coatings are examined metallographically. (N15g, 2-61; Cb-b, Zn)

267-N. (Pamphlet.) The Role of Crystal Structure in Diffusion. Pt. 1. Diffusion Paths in Closest-Packed Crystals. Leonid V. Azaroff. Illinois Institute of Technology Research Report no. AFOSR TN60-1353. Dec. 1, 1960, 16 p. (Available from ASTIA, Document Service Center, Arlington Hall Station, Arlington 12, Va.)

Study of hexagonal and cubic closest packings in simple binary compounds to determine specific diffusion paths. Results suggest that voidal diffusion takes place without defect formation in some compounds while metal atoms block paths in others, indicating that vacancy or interstitial mechanisms account for diffusion. 13 ref. (N1, M26s)

268-N. (English.) Diffusion of Cobalt and Silver in Ordered and Disordered CuZn. S. Pace, C. Bassani and P. Camagni. Nuovo Cimento, v. 19, Feb. 1961, p. 393-395.

The conventional annealing-sectioning technique is used to study the atomic diffusion of Co and Ag in beta brass at 320-700° C. using pile-activated isotopes Co^{60} and Ag^{110} which are deposited electrolytically onto the end surface of cylindrical specimens. Diffusion coefficients of the two impurities are determined and compared with self diffusion. (N1, N10, M20n, 1-59, 3-69; Cu-n, Ag, Co)

269-N. (Japanese.) The Ms Points of Binary Titanium Alloys. Tomo-o Sato and Yen-chien Huang. Nagoya Institute of Technology, Bulletin, Dec. 1960, p. 1-5.

The temperatures at which the martensite transformation from beta solid solution to alpha prime supersaturated solid solution takes place are measured as a function of the concentration of alloying elements in titanium base binary alloys of 15 systems, Mo, V, Cb, Fe, Mn, Cr, Co, Ni, Cu, Pb, Bi, Pt, Ag, Al and Sn. Thermal analysis and electromagnetic oscillograph data are given for time and temperature curves. 12 ref. (N6q, M23r, 2-60; Ti-b)

270-N. (German.) Influence of Specimen Size on Age Hardening of an Aluminum Alloy With 3.5% Cu. Herbert Richter and Peter Wincierz. Zeitschrift fur Metallkunde, v. 52, Feb. 1961, p. 101-106.

Hardness measurements and X-ray investigation of internal stresses for quenched rod and wire specimens of 0.2-15 mm. thickness and subsequent examination of aging kinetics at 20 and 150° C. by electrical resistance measurements. (N7a, Q29, P15g; Al-b, Cu, 4)

271-N. (German.) Transformation Characteristics of Titanium-Molybdenum Alloys. Karl Dungardt and Klaus Rudinger. Zeitschrift fur Metallkunde, v. 52, Feb. 1961, p. 120-135.

Investigation of phase transformations in TiMo alloys containing 2.27-8.57% Mo during isothermal annealing at 400-850° C. by dilatometric measurements during continuous cooling by Debey-Scherrer X-ray analysis (Cu-K-alpha radiation) and by electrical resistance and modulus of elasticity measurements. (N7c, M23b, S11p; Ti-b, Mo)

272-N. (English.) Recrystallization of Stretched Iron Single Crystal Plates. Shoso Dohi. Hiroshima University, Journal of Science, Series A, v. 24, Oct. 1960, p. 313-325.

X-ray photographic examination of the effect of stretching and annealing at 700-900° C. on microstructure and crystallographic orientation. (N5, M26c, M27, 2-64, 3-68; Fe, 14-61)

273-N. (English.) Ribbon-Like Crystals of Selenium Grown From Vapor. Noboru Furuta. Hiroshima University, Journal of Science, Series A, v. 24, Oct. 1960, p. 327-337.

Relation between outer shape and ratio of supersaturation in the vapor phase and effect of illumination and temperature on shape and growth rate are observed with optical and electron microscopes and by electron diffraction. (N12g, M-general, 2-61; Se)

274-N. (French.) Detection of Zinc Diffusion Into Tin Coatings on Brass. S. C. Britton and M. Clarcke. Galvano, v. 30, Jan. 1961, p. 25-26.

Estimation of Zn diffusion by measurements of corrosion potential differences in 0.001% NaCl solutions. (N1, L17c; Cu-n, Sn, Zn, 8-62)

275-N. The Effect of Pressure on the Age-Hardening Characteristics of a Copper-Beryllium-Nickel Alloy. V. A. Phillips. Acta Metallurgica, v. 9, Mar. 1961, p. 216-224.

The effect of pressure during aging at 390° C. and solution treatment at 825° C. on the optical microstructure and microhardness of a commercial Cu-2.1% Be-0.4% Ni alloy. The application of 69-75 k-atm. pressure reduces the growth rate of precipitates nodules, reduces the solubility of Be in Cu and gives an unusually fine-grained structure due to the inhibition of grain growth. 9 ref. (N7a, N3, 3-74; Cu-b, Be, Ni)

276-N. (English.) The Influence of Heat Treatment on the Strain Aging of Aluminum-Killed Mild Steel. P. Szeki. Acta Technica Academiae Scientiarum Hungaricae, v. 32, Jan-Feb. 1961, p. 141-148.

Mild steel containing 0.008-0.049% Al is austenized for 15 min. at 930° C., quenched in an 8% NaOH solution, tempered at 600-680° C. for 3 hr. and allowed to cool in air. After 10% stretching, notched samples are machined, artificially aged at 250° C. for 1 hr. and impact tested at -60 to 20° C. Effects of tempering range and Al content on stress aging. (N7e, 2-64; CN)

277-N. (Japanese.) Substructure Hardening Effect on Aluminum and Aluminum Manganese Alloy. Asada Hiroshi and Koike Kichizo. Light Metals, v. 11, Jan. 1961, p. 35-42.

Substructures formed within the grain of polycrystalline Al and Al-0.52% Mn specimens by prestrain-annealing treatment at 400-500° C. and the hardening due to the presence of substructures is investigated by metallographic and X-ray back reflection methods. Data are given for work hardening capacity and stress-strain load elongation relations. (N7e, M27, M-general; Al-b, Mn)

278-N. (English.) Direct Observation of Subgrain-Growth of Cold Worked Aluminum by Means of Electron Microscopy. Hiroshi Fujita. Physical Society of Japan, Journal, v. 16, Mar. 1961, p. 397-406.

Observations of growth mechanisms are used to support a theory of recrystallization. 7 ref. (N3, M21e; Al)

279-N. (English.) Diffusion of Cobalt Into Silver. Tokutaro Hirone and Hisao Yamamoto. Physical Society of Japan, Journal, v. 16, Mar. 1961, p. 455-458.

Diffusion coefficient is measured as a function of temperature from 745-943° C. by tracer and lathe-sectioning techniques. (N1a; Ag-b, Co)

280-N. (French.) Micrographic Observation of the Structure of a Mg-0.6% Zr Alloy, Heated in Hydrogen. P. Lelong, J. Dosdat, J. Boghen and J. Herenguel. Journal of Nuclear Materials, v. 3, Feb. 1961, p. 222-234.

The structure of a Mg-0.6% weight Zr alloy after heating in hydrogen at 500-600° C. is studied with the optical and electron microscopes. Effect of H diffusion on Zr precipitation and grain boundary anchoring, leading to blocked microstructure and precipitation hardening. 20 ref. (N-general, M-general, Q21s, 2-64; Mg-b, Zr, H)

281-N. Estimating Critical Ranges in Heat Treatment of Steels. R. A. Grange. Metal Progress, v. 79, Apr. 1961, p. 73.

Formulas are proposed for calculating the upper and lower critical temperatures from the chemical compositions of medium carbon and low-alloy steels. Mean deviations of measured values from calculated values are between 5 and 6%. (N8, 2-60, CN, AY)

282-N. (German.) Investigation of Age-Hardenable Aluminum Alloys by Electrical

Resistance Measurements. A. Ersumer. Metall, v. 15, Mar. 1961, p. 219-220.

Measurement of electrical resistance of thin Al-Cu alloy wires on heating to 520° C., slow cooling, homogenizing, water quenching to 20° C. and subsequent aging at temperatures from 20-200° C. to determine age hardening characteristics. (N7a, P15g, 2-65; Al-b, 4-61)

283-N. (German.) Investigation of Voids and Phase Separation in the Copper-Nickel System by Electrical Resistance Measurements. Wolfgang Schule and Hans-Peter Kehrer. Zeitschrift fur Metallkunde, v. 52, Mar. 1961, p. 168-179.

Resistance measurement for temperatures from 20-1000° C. on wire (0.4 mm. diameter, 60% deformed) and foil (0.1-0.2 mm. thick, 90% deformed) specimens of 40-80 at.% Cu containing CuNi alloy after annealing (20-1000° C.) and quenching. Detection of voids; activation energy of void migration; state of order and phase separation of alloy. (N-general, M24b, P15g; Cu-b, Ni-b)

284-N. (German.) Formation of an Intermediate Phase in the Aging of Copper-Beryllium Alloys. Rudolf Reinbach and Ursula Wilke-Dorfurt. Zeitschrift fur Metallkunde, v. 52, Mar. 1961, p. 186-188.

Aging of Cu-Be alloy specimens, containing 1.45-2.03% Be at 250-400° C. for varying times with subsequent microscopic and microhardness measurements for investigating the formation of an intermediate phase in precipitation of the equilibrium phase from the supersaturated solid solution. (N7, M-general, 2-65; Cu-b, Be)

285-N. (Russian.) Hydrogen Diffusion in Steel Semi-Products. D. Ya. Povolotskii. Izvestiya Vuz Chernaya Metallurgiya, Oct. 1960, p. 79-83.

Investigation of the process of hydrogen liberation during annealing of steel blooms at 660-700° C. The amount of liberated hydrogen is determined to be in direct proportion with the diffusion coefficient and in reverse proportion with the cross section area. 9 ref. (N15d, N1, 2-64; ST, H)

286-N. (Russian.) Austenite Stability During Heating of Deformed Steel. Yu. A. Sysuev and V. G. Myasnikov. Izvestiya Vuz Chernaya Metallurgiya, Oct. 1960, p. 122-125.

Austenite decomposition of deformed Cr and Mn steel powders at 100-600° C. Phase composition and magnetization changes as influenced by deformation and temperature. 6 ref. (N8, H11p, 2-62, 3-68; AY, 6-68)

287-N. The Austenite Solidus and Revised Iron-Carbon Diagram. M. G. Benz and J. F. Elliott. Metallurgical Society of AIME, Transactions, v. 221, Apr. 1961, p. 323-331.

The austenite solidus of the Fe-C system is determined using a series of diffusion couples consisting of a specimen of austenite held in contact with a melt saturated with austenite. The solidus is found to be a straight line as a function of temperature and carbon content. Test data are used to construct a revised Fe-C temperature-composition diagram. 34 ref. (N8, M24b, 2-60, 2-61; Fe-b, C)

288-N. Fluid Flow Control During Solidification. Pt. 1. Magnetic Stirring in the Plane of the Solid-Liquid Interface. W. C. Johnston and W. A. Tiller. Metallurgical Society of AIME, Transactions, v. 221, Apr. 1961, p. 331-336.

Single pass zone-melting experiments on Pb-Sn alloys in which the liquid is caused to rotate in the plane of the solid-liquid interface due to the influence of a magnetic field. Determination of the variation of the diffusion boundary layer thickness with field strength. 10 ref. (N12, C28k, 1-69; Pb, Sn)

289-N. The Effect of Orientation on the Recrystallization Kinetics of Cold Rolled Single Crystals. W. R. Hibbard, Jr., and W. R. Tully. Metallurgical Society of AIME, Transactions, v. 221, Apr. 1961, p. 336-343.

Single crystals of Cu and Si-Fe are cold rolled in orientations chosen to produce individually the major component of the polycrystalline deformation texture. The orientation dependence of the recrystallization kinetics is studied relative to the primary recrystallization textures as effected by the interaction of adjacent crystals during the deformation. 21 ref. (N5, M26c, 3-68, 3-72; Cu, Fe-b, Si, 14-61)

290-N. The Determination of the Eutectic Composition by the Zone-Melting Method.

A. S. Yue and J. B. Clark. Metallurgical Society of AIME, Transactions, v. 221, Apr. 1961, p. 383-389.

Application of the segregation principle of the zone-melting technique for determination of the eutectic composition of a simple system, Mg-Al, in which the eutectic composition is known and in a complex ternary system, Mg-Al-Zn, in which the literature is uncertain as to the composition of the ternary eutectic. 9 ref. (N9n, C28k, M24c, 2-60; Mg-b, Al, Zn)

291-N. Comparison of Dispersion Hardening in Four Silver-Base Alloys of Equivalent Composition. J. Gurland. Metallurgical Society of AIME, Transactions, v. 221, Apr. 1961, p. 407-408.

Effect of 15% of either W, Mo, WC or Ni second-phase additions on the strength of composite alloys with a common matrix in which the second phase is distributed randomly is investigated by mechanical properties and fracture-deformation mechanisms. (N7a, Q-general, 2-60; Ag-b, Ni, Mo, W-b, 6-72)

292-N. On Secondary Recrystallization in High-Purity Alpha Iron. C. G. Dunn and J. L. Walter. Metallurgical Society of AIME, Transactions, v. 221, Apr. 1961, p. 413-414.

Recrystallization microstructure for cold rolled 99.99% Fe strip after isothermal annealing in dry hydrogen at 875° C. Annealing twins, grain boundaries and interfaces and grain size and shape effects are observed as a function of specimen thickness and impurity relations. 10 ref. (N5h, M27, 2-64, 3-69, 3-73; Fe-a)

293-N. Surface Graphitization of a Hypereutectoid Iron-Carbon Alloy. G. R. Speich. Metallurgical Society of AIME, Transactions, v. 221, Apr. 1961, p. 417-419.

Effect of austenitization temperature and austenite orientation on surface graphite formation in a 0.88% carbon steel heat treated at 1100° C. is examined by hot stage microscopy and electron diffraction. 10 ref. (N8s, M-general, 2-64, 3-72; CN)

294-N. (Translation-Brutcher no. 5111.) Crystallization of Steel Under Mechanical Pressure. B. B. Gulyaev. Liteinoe Proizvodstvo, Dec. 1960, p. 33-34.

Effect of vibration and pressure on the density, strength and toughness of carbon steels. (N12, P10a, Q27a, Q23r; CN)

295-N. (German.) Hydrogen Permeability, Absorption and Effusion of Worked and Nonworked Electrolytic Nickel at Room Temperature. Friedrich Erdmann-Jesnitzer. Bergakademie, v. 13, Jan. 1961, p. 8-16.

Measurement of hydrogen permeability in cathodic charging of 0.3 mm. thick cold rolled Ni sheet specimens and measurement of hydrogen release of saturated Ni cylinders during aging at room temperature and during bulging. (N15d, P10m, P13d; Ni, H)

296-N. (German.) Vacuum Evaporation. D. Hacman. Schweizer Archiv, v. 27, Feb. 1961, p. 62-66.

Design and operation of a high-vacuum plant for evaporation of metals including Al, Cu, Au, Fe, Ni, Mo, W, Ta, V, U, Zr, Pt and Th. Use of evaporated metal films in optical (visible and invisible spectrum range) and electrical engineering, in electronics and semiconductor technology. (N16n, 1-52; Al, Cu, Au, Fe, Ni, Mo, W, Ta, V, U, Zr, Pt, Th)

297-N. (Japanese.) Influence of Added Chromium, Vanadium, Tungsten or Boron on the S-Curve in Molybdenum Copper Cast Iron. Youichi Tokunaga. Imono (Japan Foundrymen's Society, Journal), v. 33, Jan. 1961, p. 18-23.

S-curves of 0.5% Mo-1.4% Cu cast iron containing about 0.2% or 0.5% of Cr, V, W and 0.01% of B are determined through metallographic examination and measurements of expansion time curves. Effect of alloying elements and austenizing treatments on pearlite and bainite transformations. 16 ref. (N8g, 2-60; CI, Cr, V, W, B, Cu, Mo)

298-N. (Japanese.) Nonequilibrium Segregation Due to the Beta and Alpha Phase. Transformation in Nickel-Aluminum Bronze Casting. Shoji Ueda and Masato Zama. Imono (Japan Foundrymen's Society, Journal), v. 33, Jan. 1961, p. 35-40.

Relation of alpha phase nucleation rate and cooling rate on diffusion mechanisms during the beta-alpha transformation with consequent nonequilibrium solid

solution formation and segregation during solidification is studied for bronze castings containing 8.70-9.82% Al, 4.60-4.90% Ni and 5.08-5.28% Fe. 11 ref. (N12, N-general, E25n, 9-69; Cu-s, Al, Ni, Fe)

299-N. (German.) Surface Martensite and Plastic Deformation. A. Masin and O. Bakalikova. Czechoslovak Journal of Physics, v. 11, Feb. 1961, p. 144-149.

Microscopic investigation of change of austenite grain containing surface martensite during plastic deformation by tensile stressing of 27.5% Ni, 18.3% Co-containing steel specimens. Shifting of surface martensite particles during elongation of crystal. (N8p; ST, Co, Ni, 4-53)

300-N. (Italian.) Influence of the Addition of Nickel on Austenitic Manganese Steel. Giuseppe Violi. Fonderia Italiana, v. 10, Jan. 1961, p. 5-10.

Metallography of austenitic Mn steel. Influence of Si, S, P, Cr, H and Ni on mechanical and structural properties. (N8, 2-60; SS-e)

301-N. The Kinetics of Impurity Precipitation on Dislocations. Small Drift Theory. R. Bullough and R. C. Newman. Philosophical Magazine, v. 6, Mar. 1961, p. 403-417.

A perturbation solution of the differential equation controlling the migration of impurity atoms to a dislocation is given and boundary conditions are derived appropriate to precipitation on the dislocation. Numerical results within the range of validity of the analysis are obtained for aging of carbon and nitrogen in Fe. 11 ref. (N3, N7, M26b, 3-69; Fe)

302-N. The Formation of Short Range Order in Quenched Gold-Copper Alloys. B. M. Korevaar. Acta Metallurgica, v. 9, Apr. 1961, p. 297-303.

The effect of quenching and annealing on the short range order-induced resistivity of five Au-Cu alloys with 1.5-25.4 at.% Cu is determined as a function of the movement of lattice defects and single vacancies during annealing. 11 ref. (N10, M26s, P15g, 2-64; Au-b, Cu)

303-N. Energy Changes and Kinetics of Isothermal Ordering in Au_3Cu. F. M. d'Heurle and P. Gordon. Acta Metallurgica, v. 9, Apr. 1961, p. 304-314.

Microcalorimetry at 70-230° C. and X-ray diffraction examination of 72.5% Au specimens after quenching and after annealing below the critical temperature. The kinetics of heat evolution are correlated with the formation of superlattice lines and the transformation heats are used to calculate the difference in internal energy between an ideally disordered and a perfectly ordered sample. 30 ref. (N10, P12q, 2-64; Au-b, Cu)

304-N. The Metallography of Precipitation in an Al-16% Ag Alloy. R. B. Nicholson and J. Nutting. Acta Metallurgica, v. 9, Apr. 1961, p. 332-343.

Thin foil transmission electron microscopy study of precipitation in supersaturated specimens after quenching and aging at various times and temperatures. Observation of Guinier-Preston zone formation, gamma and gamma prime phase transformation, stacking fault and dislocation modes and ordering and grain growth mechanisms as a function of heat treatment, composition and temperature. 52 ref. (N7, N-general, M21e, 2-60, 2-61, 2-64; Al-b, Ag)

305-N. Copper Precipitation in Germanium. D. J. D. Thomas. Acta Metallurgica, v. 9, Apr. 1961, p. 388-389.

Kinetics of the precipitation of Cu in "dislocation-free" Ge single crystals quenched from 850° C. Effect of temperature increase during diffusion annealing and vacancy concentration on activation energies and precipitation rate. 5 ref. (N7, M26s, 2-62; Ge, Cu, 14-61)

306-N. Research and Development on the Effects of High Pressure and Temperature on Various Elements and Binary Alloys. J. S. Kasper. General Electric Research Laboratory (Wright Air Development Division). U. S. Office of Technical Services, PB 171348, July 1960, 71 p. $2.

Effect of pressure on the properties and kinetics of transformation in various alloy systems. A shift is observed in the gamma loop of the Fe-Cr system from 12.5 to about 20% Cr. A similar shift in the gamma loop of the Fe-Al system is also found. (N-general, 2-61, 3-74; Fe-b, Cr)

307-N. Gamma to Alpha Transformation in Austenitic Stainless Steel Under Stress (Single and Repeated) Down to 20° K. J.

Menard and L. Weil. Paper from "Advances in Cryogenic Engineering". v. 6. Plenum Press, Inc., New York, 1961, p. 587-589.

Measurements of saturation magnetization during tensile testing at various stresses are used to indicate amount of austenite remaining in the steel. 5 ref. (N8n, Q27, 2-63; SS-e)

308-N. Progress in the Study of Gas-Metal Reactions at High Temperature. G. R. Wallwork and A. E. Jenkins. Paper from "Australian Atomic Energy Symposium". Melbourne University Press, Melbourne, Australia, 1958, p. 182-185.

Study of the oxidation of Ti, Zr and Hf at 600-950° C. with O_2. The solution of O_2 in the metal phase and the movement of the diffusion gradient formed are proposed as factors in the oxidation mechanism of metals. 16 ref. (N1, N15, R1h, 2-62; Ti, Hf, Zr)

309-N. (German.) Metal Melts. Erich Scheil. Forschungsberichte des Landes Nordrhein-Westfalen, no. 969, 1961, 37 p.

Review of structure of liquid metals in terms of "void theory", the theory of Borelius, liquid alloy characteristics is compared with solid solutions and mutual chemical affinity of liquid metals. Classification of metals according to their alloying behavior in liquid state. Nonequilibrium states. (N12)

310-N. (Russian.) The Ti-H_2 System. A. A. Zhurenkova. Izvestiya Vuz--Chernaya Metallurgiya, Sept. 1960, p. 8-13.

Investigation of H_2 absorbtion by Ti at 300-900° C. to form TiH_2. Absorbtion and phase distribution related to partial pressures, time, temperature and Ti purity. 5 ref. (N15d, P13d; Ti, H)

311-N. (Russian.) The Dependence Upon Alloying of the Temperature Level of Recrystallization in Single Phase Nickel Alloys. S. S. Gorelik and E. N. Spektor. Izvestiya Vuz--Chernaya Metallurgiya, Sept. 1960, p. 128-131.

Determination of recrystallization and characteristic temperatures for Ni-Fe alloys by X-ray diffraction and the method of rigid vibrations. Relation of initial recrystallization temperature and lattice period to composition. 14 ref. (N5, M26, M-general, 2-60, 2-62; Ni-b, Fe)

312-N. (Russian.) Effect of Induction Heating on the Kinetics of Isothermic Austenite Transformation in Chromium Steel. Yu. A. Bashnin and I. N. Kidin. Izvestiya Vuz--Chernaya Metallurgiya, Sept. 1960, p. 132-139.

Transformation curves determined for a number of Cr steels. Effect of heating rate, composition and type of heating on austenite composition, grain size, hardness and transformation time. 6 ref. (N8q, 2-60, 2-64; AY, Cr)

313-N. (Russian.) Peculiarities of Formation and Decomposition of Supersaturated Ferrite in Alloy Steels. A. A. Popov and L. E. Shevyakina. Izvestiya Vuz--Chernaya Metallurgiya, Sept. 1960, p. 140-147.

Theoretical and experimental phase transformation analysis for medium carbon steels. Ferrite formation and decomposition are related to annealing time, temperature and composition with attention to the influence of W and Mo on ferrite formation. (N8, 2-60, 2-62, 2-64; AY, Mo, W)

314-N. (Japanese.) The Effect of Sulphur and Manganese on the Solidification Process or Pure Fe-C-Si Alloy. Osamu Fujita and Kiyoshi Kubo. Imono (Japan Foundrymen's Society, Journal), v. 33, Feb. 1961, p. 3-11.

Microscopic observation of austenite and flake graphite formation and sulphide inclusion segregation to grain boundaries, during solidification and after quenching and furnace cooling, as a function of Mn and S contents. 14 ref. (N12, M27f, 2-60, 2-64, 9-69; Fe-b, C, Si)

315-N. Gas Atmosphere Effect on Materials. R. A. Baughman. General Electric Co. (Wright Air Development Division). U. S. Office of Technical Services, PB 161980, May 1960, 232 p. $3.50.

Effects of a special water saturated gas atmosphere on the properties of several structural materials. Results show that gas containing 5% H_2-95% N_2-70% saturated will cause a decrease in rupture strength of Fe, Ni and Co base materials with strength loss to a maximum of about 50%. The mechanism of strength loss is associated with either the surface reactions taking place during the gas testing of the penetration of hydrogen or nitrogen which

affects the barriers to dislocation movement. (N15d; Co, Fe, Ni)

316-N. Investigation of Diffusion Barriers for Refractory Metals. E. M. Passmore. Manufacturing Laboratories, Inc. (Wright Air Development Division). U. S. Office of Technical Services, PB 171400, Aug. 1960, 59 p. $1.50.

Twenty-three base barrier metal combinations are screened by annealing diffusion couples at 1700-15° C. Measurements indicating the extent of interdiffusion between barrier and base metals are made by metallographic examination and electron microbeam analysis. Hf and Ir are the most promising barriers for W at 1700° C. with V as a third choice. (N1; EG-d37)

317-N. Diffusion in Metals. P. G. Shewman and G. R. Love. I/EC (Industrial and Engineering Chemistry), v. 53, Apr. 1961, p. 325-328.

Review of research on diffusion in pure metals, alloys, liquid metals and nonmetals. (N1)

318-N. (Russian.) Structural Transformations in Low-Carbon Cr-Mo-V Steels. N. V. Ul'yanova and V. S. Teplov. Metallovedenie i Termicheskaya Obrabotka Metallov, Feb. 1961, p. 21.

Phase composition and isothermic austenitic transformation curves of 12Kh1MF and 15KhMiF heat resistant steels. Effect of normalizing and tempering at 440-700° C. for 1-20 hr. on microstructure, hardness and phase composition. (N8, M27, Q29n, 2-64; SS, SGA-h)

319-N. (French.) Recovery of A9-G3 Alloy. Maurice Bitran. Revue de l'Aluminium, v. 38, Jan. 1961, p. 69-80.

Recovery upon heating of a high-purity, heavily cold worked Al-Mg alloy (3% Mg). Determination of hardness, changes in microstructure and preferred orientation and grain growth. 8 ref. (N4, Q29n, M27; Al-b, Mg)

320-N. (Japanese.) Study of Copper-Bearing Low-Carbon Steels. Pt. 2. Mass Effects in Normalizing on the Precipitation-Hardening Characteristics of Copper-Bearing Low-Carbon Cast Steels During Subsequent Tempering. Ryohei Tanaka and Rokuro Ito. Tetsu-to-Hagane (Iron and Steel Institute of Japan, Journal), v. 47, Apr. 1961, p. 575-580.

Effect of cooling rate during normalizing on ferrite and Cu-rich phase precipitation and hardening, resultant microstructure and mechanical properties of 0.1% carbon steel containing 0-3.0% Cu. 5 ref. (N7, M27, 2-64; CN-g)

321-N. (Czech.) Formation of Intermetallic Phases by Diffusion. Stevo Trajkov. Hutnicke Listy, v. 16, Mar. 1961, p. 198-205.

A cylindrical Cu sample is immersed in liquid Zn which is allowed to solidify. Diffusion and chemical reaction of Zn on Cu at 250-419° C. are studied. Chemical analysis, microstructure testing and determination of microhardness. Presence of epsilon, gamma and beta phases at various depths. 6 ref. (N1, 2-65; Cu, Zn)

322-N. (Japanese.) Recrystallization of Tungsten Wires. Masataka Sugiyama, Yoshitsugu Mishima and Kunio Shida. University of Tokyo, Engineering Research Institute, Annual Report, v. 19, Mar. 1961, p. 52-56.

Examination of microstructures of specimens after annealing at 1500-1800° C. Recrystallization is observed first as formation of a columnar structure accompanied by secondary recrystallization at higher temperature with the recrystallization phenomena being sensitive to the nature and amount of doping additives. (N5, M27, 2-62, 2-64, 3-69; W, 4-61)

323-N. Physical Metallurgy of Refractory Metals (The Removal of Interstitial Impurities From Niobium by Zinc-Niobium Compounds). R. J. Goode, R. A. Meussner and A. J. Pollard. Report of NRL (Naval Research Laboratory) Progress, Apr. 1961, p. 36-38.

Carburized strips of Cb are reacted with Zn vapor at 1600° F. and heated in vacuum at 1800° F. for various times. X-ray and metallographic examinations show formation of protective Cb-Zn compound coatings which extract Cb carbides as stringers from the specimens during heating. Comparison with previous experiments on removal of O, N and C-N interstitials. (N15g; Cb, Zn)

324-N. The Carbide Constituents in Iron-Carbon-Silicon Alloys. J. G. Humphreys and W. S. Owen. Iron and Steel Institute, Journal, v. 198, May 1961, p. 38-45.

The carbides in Fe-C-Si alloys known as the x-constituent, the Marles carbide and the Hurst and Riley carbide are shown to have the same crystal structure. Planimetric and chemical analysis show they are iron-silico carbides containing 9% Si and 6.5% C. The composition range for forming hexagonal silico-carbide is determined by cooling slowly in vacuum and quenching. Graphitization of silico-carbide indicates that diffusion of Si is a rate controlling step. 20 ref. (N8r)

325-N. Two-Stage Isothermal Treatment of an En26 Steel. G. T. Higgins and H. J. Axon. Iron and Steel Institute, Journal, v. 198, May 1961, p. 46-49.

En26 steel of nominal composition 0.40% C, 0.22% Si, 0.62% Mn, 0.13% S, 0.015% P, 2.44% Ni, 0.71% Cr, 0.61% Mo, 0.16% Cu is homogenized and heat treated for various times and temperatures. Data are presented for the kinetics of the bainite reaction as a function of the austenite pretreatment. Conditioning of austenite is accomplished by diffusion at the selected temperatures. 9 ref. (N8g; ST)

326-N. Long-Range Order in Fe-Al Alloys. Pt. 2. Thermoelectric Power. G. Erez and P. S. Rudman. Physics and Chemistry of Solids, Journal, v. 18, Mar. 1961, p. 307-315.

The thermoelectric power is measured for the system at 100-950° C. with values determined for the critical temperature, density of states and ordering energy. The formation of new Brillouin zones accompanies ordering. 16 ref. (N10, P15j; Fe-b, Al-b)

327-N. The Effect of Thermal Treatment on the Constitution of 80-20 Nickel-Chromium Alloys Hardened With Titanium and Aluminium. E. A. Fell. Metallurgia, v. 63, Apr. 1961, p. 157-166.

Nature and morphology of the phases present investigated by X-ray diffraction and optical and electron microscope techniques. The precipitates identified are titanium carbonitride--Ti(C, N)--the chromium carbides Cr_7C_3 and $Cr_{23}C_6$ and two Ni_3Al type phases. High Ti and Al at low-carbon contents increase the normal rate of the carbide reaction $Cr_7C_3 \rightarrow Cr_{23}C_6$. 10 ref. (N7, 2-64, M21, M22g; Ni-b, Cr)

328-N. (Japanese.) The S-Curve of Molybdenum Nickel Cast Iron Containing Nodular Graphite. Youichi Tokunaga. Imono (Japan Foundrymen's Society, Journal), v. 33, Mar. 1961, p. 190-201.

Isothermal austenite transformation behavior of Mo-Ni cast irons with various alloys and fluxes added as graphite spheroidizers is examined by microscopy in the pearlite range and by dilatometry in the bainite range after austenitization at 950° C. for 30 min. 21 ref. (N8g, M-general, 2-60, 2-64; CI-r, Ni)

329-N. (Japanese.) The Influence of Heat Treatment on the Thermal Expansion Coefficient and Carbides of Steel for Turbine Shafts. Pt. 1. Studies on Reversible Deflection of Turbine Shafts. Akira Tokuda. Japan Institute of Metals, Journal, v. 25, Feb. 1961, p. 131-135.

Investigation of the effects of hardening on deflection of low-alloy steel shaft forgings in heat indication tests. Electron diffraction and microscopy, X-ray diffraction, electrolytic isolation and extraction replica techniques are used to examine carbide and transformation microstructure and to calculate thermal expansion coefficient of specimens after oil quenching, tempering and air-cooling treatments at 400-1100° C. 11 ref. (N-general, N8r, M-general, T7j, 2-64; AY, 17-57)

330-N. Protection of Refractory Metals for High-Temperature Service. Report 2. Oct. 1, 1960--Durability of the Zinc Base Coating for Niobium. B. F. Brown. Naval Research Laboratory. U. S. Office of Technical Services, PB 171159, Jan. 1961, n. p. $.75.

Effects of coating thickness, method and temperature of application of the coating, the composition of the compounds formed, test temperature and thermal cycling are examined in life tests lasting approximately 1000 hr. (N15, L25g, Q7j, 2-60, 2-62; Cb, Zn)

331-N. Protection of Refractory Metals for High-Temperature Service. Report 1. July 1, 1960--The Zinc-Base Coating for Niobium. B. F. Brown. Naval Research Laboratory. U. S. Office of Technical Services, PB 161932, Nov. 1960, 37 p. $1.

The protective action of a Zn base coating on Cb due to the formation of a tight layer of ZnO. Breaks occurring in the oxide barrier are self-healed by

the formation of additional ZnO resulting from the reaction of air with Zn vapor arriving from Zn rich intermetallic compounds between the oxide barrier and the Cb. (N15, L25g, Rlh; Cb, Zn)

332-N. Anomalous Diffusion at the Interface of Thin Bimetallic Film of Bi and Sb. Ryoji Suganuma, Toshiho Yoshida and Yoshibumi Fujiki. Physical Society of Japan, Journal, v. 16, Apr. 1961, p. 676-687.

Intermetallic diffusion is studied by electron and X-ray diffraction and electrical resistance measurements on vacuum deposited thin Bi and Sb films. 13 ref. (N1h; Bi, Sb, 14-62)

333-N. Direct Observation of the Lattice Imperfections in Pearlites by Electron Microscopy. Zenji Nishiyama, Atsuo Kore'eda, Isamu Eguchi and Koshi Kato. Physical Society of Japan, Journal, v. 16, Apr. 1961, p. 834.

Specimens are prepared from a cold rolled sheet of 0.7% carbon steel and annealed for 1/2 hr. at 950° C., then slowly cooled. Electropolished foils are then studied by transmission electron microscopy. (N8h; CN, 4-56)

334-N. Low-Temperature Ageing of Iron and Low-Carbon Steel. Ivan Hrivnak. Metal Treatment and Drop Forging, v. 28, May 1961, p. 175-181.

Carbon extraction replica study of nitride precipitates formed in spectrographically pure iron and low-carbon steel during aging at 25, 100, 200, 300 or 400° C. A mechanism is proposed for the formation of precipitates. (N7b, M20r, 2-65; Fe-a, CN-g, 14-68)

335-N. Some Structural and Physical Aspects of the Heat Treatment of Steels. K. W. Andrews. Metal Treatment and Drop Forging, v. 28, May 1961, p. 183-192.

Survey of heat treatment induced transformations and resultant structures in alloy steels and dependence of properties on these structures. Topics include effects of allotropy and alloying additions on equilibrium relationships; effects of diffusion and diffusionless transformations; relation of T-T-T diagrams to hardness and hardenability and determination of martensitic, austenitic, bainitic and ferritic transformation ranges and temperatures. 23 ref. (N-general, Q-general, 2-64; AY)

336-N. Hardness and Structural Transformations in Eutectoid Copper-Aluminium and Copper-Beryllium Alloys. E. R. Petty and H. O'Neill. Institute of Metals, Journal, v. 89, Apr. 1961, p. 281-286.

Isothermal and hot hardness test data are used to construct TTT diagrams and examine hardening and softening characteristics of aluminum and beryllium bronze specimens as a function of tempering and quenching treatments. Transformation microstructures and the nature of various phases in the system are examined metallographically. 16 ref. (N7c, N-general, M24b, Q29p, 2-64; Cu-b, Al, Be)

337-N. The Improvement in Stress-Corrosion Resistance of Aluminium D.T.D. 687 Alloys. G. Thomas. Institute of Metals, Journal, v. 89, Apr. 1961, p. 287-288.

Age-hardening treatments incorporating solution treatment, annealing and tempering with plastic deformation and subsequent aging on Cr-bearing D.T.D. 687 specimens, causing desired grain boundary embrittlement and precipitation with increased tensile strength and resistance to stress corrosion cracking. 4 ref. (N7e, Q-general, Rld, 2-64; Al-b, Cr)

338-N. Quenching Effects and Isothermal Martensitic Transformations in Au-Cd. B. S. Subramanya, G. S. Baker, D. S. Lieberman and T. A. Read. Australian Institute of Metals, Journal, v. 6, Feb. 1961, p. 3-10.

Description of experiments on two alloys which transform reversibly from an ordered cesium-chloride structure to two different structures of lower symmetry. Resistance measurements show effects of quenching on phase structures. 16 ref. (N6q; Au-b, Cd-b)

339-N. Some Isothermal Aging Effects in Gold-47.5 Atomic Per Cent Cadmium Alloys. W. Class and D. S. Lieberman. Australian Institute of Metals, Journal, v. 6, Feb. 1961, p. 11-16.

Changes in length, resistivity and hardness are observed during isothermal aging of AuCd single crystals. Results are consistent with the model of a phase separation recently proposed. Suppression of the normally observed cubic to orthorhombic transformation in favor of a transformation to a different product 35° C. lower is discussed. 14 ref. (N7a; Au-b, Cd-b)

340-N. Instabilities Due to Strain Aging in the Tensile Test. J. B. Lean. Australian Institute of Metals, Journal, v. 6, Feb. 1961, p. 62-67.

The apparent activation energy controlling the appearance of instabilities on the stress-strain curves of commercial basic Bessemer rimmed steel is measured above 50° C. Differing diffusion rates of carbon and nitrogen and the variation with temperature of the proportions of interstitial elements involved in strain aging are discussed. 17 ref. (N7e; ST-d)

341-N. (Russian.) Effect of Some Oxides on the Recrystallization of Molybdenum. D. A. Prokoshkin and Chzhan Shoo-Tzyun. Metallovedenie i Termicheskaya Obrabotka Metallov, Mar. 1961, p. 9-11.

Mo containing ZrO_2 or TiO_2 in quantities up to 0.5% or ThO_2 up to 2% is produced by powder metallurgical processes. The samples obtained are forged into rods which are exposed to 92% deformation by drawing. Recrystallization in subsequent heat treatment at 900-1300° C. is studied by microstructure, microhardness and X-ray testing. 5 ref. (N5, 2-60; Mo)

342-N. (Russian.) Recrystallization After Small Deformations. S. S. Gorelik. Metallovedenie i Termicheskaya Obrabotka Metallov, Mar. 1961, p. 12-17.

An Fe-Si alloy with 3% Si is subjected to 0-20% deformation by upsetting and subsequently heat treated at 300-1100° C. for 30 min. to 2 hr. The effect of subcritical and critical deformations on the recrystallization mechanism is deducted from the results of X-ray and structure tests. 6 ref. (N5f, 3-68; Fe-b, Si)

343-N. (Russian.) Aging N35KT Alloy. A. V. Smirnova and N. A. Solov'eva. Metallovedenie i Termicheskaya Obrabotka Metallov, Mar. 1961, p. 18-22.

The Fe base alloy containing 0.01% C, 35% Ni, 5% Co, 2.3% Ti, 0.2% Cu, 0.4% Si and 0.6% Mn is quenched from 950° C., subjected to deformation and aged at 575-900° C. for 4-100 hr. The decomposition of the solid solution during aging is studied on electron micrographs. 7 ref. (N7a, M21e; Fe-b)

344-N. (Russian.) Coagulation of Carbides in Martensite Crystals. N. A. Golovan'. Metallovedenie i Termicheskaya Obrabotka Metallov, Mar. 1961, p. 22-24.

Cast iron with and without 0.45% Cr and 1.02% Ni is poured into permanent molds to obtain test bars of 250 mm. length and 18 mm. diameter of white fracture. Structure testing after holding at 1100-1130° C. for 160-320 min., quenching and subsequent annealing at 500-700° C. for 1-100 hr. Effect of composition, annealing temperature and time and depth on carbide coagulation. (N8r; CI, Cr, Ni)

345-N. (Russian.) Effect of Chemical Heat Treatment on the Behavior of Iron and Steel in Liquid Zinc. D. Ya. Gluskin. Metallovedenie i Termicheskaya Obrabotka Metallov, Mar. 1961, p. 35-40.

Technically pure iron and steel with 0.3-1% carbon is chromized, siliconized or electrolytically chromium plated, wetted in zinc chloride and immersed in a melt of 99% pure Zn of 500° C. for 2-10 hr. Effect of the above treatments on depth of the diffusion zone formed during immersion, size reduction of Fe and steel samples, and the quantity of $FeZn_7$ present in the Zn melt. (N1, 2-64; Fe, ST, Zn)

346-N. (Russian.) Transformation of Retained Austenite in Case Hardening Steels. S. N. Krasotskaya. Metallovedenie i Termicheskaya Obrabotka Metallov, Mar. 1961, p. 42-46.

The transformation is studied by measuring magnetizability changes of case hardened 18KhNVA, 18KhNT, 12KhN3A, 12Kh2N4 and 20KhGR steels occurring in slow (5° C. per min.) heating and isothermal heat treatment of temperatures up to 650° C. (N8n; ST)

347-N. The Kinetics of Absorption and Evolution of Hydrogen by Palladium and Palladium/Platinum Electrodes. Ted B. Flangan and F. A. Lewis. Electrochemical Society, Journal, v. 108, May 1961, p. 473-477.

An equation relating absorption rate and electrode potential is derived and applied to data obtained from studies of absorption and desorption of hydrogen from electrodes supersaturated with hydrogen. 10 ref. (N15d; Pd, Pt, H)

348-N. A Method of Determining Primary Solid Solubility of an Alloy. F. N. Adgate. Welding Journal, v. 40, May 1961, p. 196s, 222s.

Tentative method of predicting solid solubility of an alloy from size factor of the atoms, electrochemical compounds and valency factors of the components. Atomic diameters and electrochemical factors of common metallic elements. (N12p)

349-N. (English.) Some Aspects of Dispersion Hardening in the Uranium-Uranium Oxide System. W. Arbiter and G. Stern. Planseeberichte fur Pulvermetallurgie, v. 9, Apr. 1961, p. 113-121.

Fabrication technique, microstructure investigation, hot (1500° F.) indentation hardness, hot (1560-1750° F.) bending and thermal cycling (1130-1350° F.) tests for a dispersion hardened material of near theoretical density (called SUP), which is obtained by controlled surface oxidation of fine uranium particles followed by hot (1500-1700° F.) pressing and extrusion. (N7a; U)

350-N. (French.) Phenomena Occurring During Annealing of Cold Rolled Mild Steel Blanks for Deep Drawing. G. Odone and V. Berruti. Revue de Metallurgie, v. 58, Feb. 1961, p. 165-176.

Investigation of recovery, polygonization and recrystallization of low-carbon steel during heating below Ac_1. Development of a heating cycle with prolonged holding at the recovery stage. 7 ref. (N4, N5, J23; CN-g)

351-N. (English.) Grain Boundary Precipitation in Alpha/Beta Brass. M. S. Wood and A. Hellawell. Acta Metallurgica, v. 9, May 1961, p. 428-433.

Cast specimen containing 45% Zn of (100) orientation are annealed at 520-600° C. for 3-30 min. to produce grain boundary precipitation of the alpha phase with subsequent examination by microscopy and X-ray back reflection. Growth, shape and orientation of the precipitate are controlled by grain boundary migration, matrix grain growth and orientation of the boundary plane. 7 Ref. (N7, N3, M27f, 2-64, 3-72; Cu-n)

352-N. (English.) Self Diffusion in Iron. F. S. Buffington, K. Hirano and M. Cohen. Acta Metallurgica, v. 9, May 1961, p. 434-439.

Self-diffusion in high-purity Fe (99.97%) is determined at 700-1436° C. using Fe^{55} and Fe^{59} with the temperature dependence of the self-diffusion coefficient in f-c-c. and in b-c-c. Fe being expressed by equations. An anomaly is found in the diffusivity below the magnetic transformation. 10 ref. (N1d, 1-59, 2-61; Fe-a)

353-N. (English.) Diffusion of Nickel Into Iron. K. Hirano, M. Cohen and B. L Averbach. Acta Metallurgica, v. 9, May 1961, p. 440-445.

Radioactive tracer study of Ni diffusion in gamma Fe and paramagnetic and ferromagnetic Fe from 600-1050° C. using Ni^{63} as a tracer and surface-decrease and residual-activity sectioning methods. An anomaly in the diffusivity is observed below the Curie temperature, associated with the effect of short range magnetic order on the formation energy of vacancies. 10 ref. (N1, P16, 1-59, 2-61; Fe, Ni)

354-N. (English.) Segregation of Solute Atoms During Strain Aging. T. Mura, E. A. Lautenschlager and J. O. Brittain. Acta Metallurgica, v. 9, May 1961, p. 453-458.

A relation between the number of solute atoms migrating to a dislocation and the aging time which eventually leads to saturation is presented with experimental data to explain strain aging of Fe and steel under several aging strains, stresses and temperatures. A term is included to account for the bulk diffusion due to the carbon concentration gradient developed in the vicinity of the dislocation. 9 ref. (N7e, N3, N1, 2-61, 3-66, 9-69; Fe-b)

355-N. (English.) The Role of Halide-Cycle Reactions in the Growth of Nickel Whiskers. R. E. Cech. Acta Metallurgica, v. 9, May 1961, p. 459-463.

Observations on the growth of Ni whiskers on NiO crystals by hydrogen reduction of halide salts in steam. Growth rates are determined as a function of orientation and hydrogen-halide reaction in which the Ni is transported from the oxide to the metal by halide-cycle reaction with the chemical driving force being supplied by the oxidation of hydrogen to steam. 4 ref. (N3, C26; Ni, 14-61)

356-N. (English.) Fine Particle Effect in Dispersion-Strengthening. G. S. Ansell.

Acta Metallurgica, v. 9, May 1961, p. 518-519.

Theoretical determination using a dislocation model of the dependence of yielding phenomena on the volume fraction of dispersed phase of alloys consisting of fine particles dispersed in a matrix. Influence of particle size and shape. Review of experimental data for alloys of Fe in Hg. 5 ref. (N7a, M26b, Q23b; Hg-b, Fe)

357-N. (Translation-ConBur.) Autocatalytic Nature of the Martensite Transformation. O. P. Maksimova, N. P. Soboleva and E. I. Estrin. Academy of Sciences of the USSR, Proceedings, Physical Chemistry Section, v. 134, Sept-Oct. 1960, p. 919-923.

Investigation of the autocatalytic effect of the martensite transformation of Fe-Ni-Mn alloy as influenced by temperature, crystal structure and heating and cooling rates. 24 ref. (N8p; Fe-b, Mn-b, Ni-b)

358-N. (German.) Recrystallization of Cold-Rolled Uranium. G. J. Sergeev, V. V. Titova and L. I. Kolobneva. Kernenergie, v. 4, Mar. 1961, p. 239-243.

Cast uranium is 80% hot rolled from 900-950° C., annealed from 720-730° C., water-quenched, 5-40% cold rolled and vacuum annealed at 350-650° C. with investigation of recrystallization by metallographic examination and by mechanical testing. Influence of 0.1% Mo additions on transformation structures. 10 ref. (N5, 2-60, 3-68; U)

359-N. (Translation.) Decomposition of a Supersaturated Solid Solution of Copper in Germanium. A. M. Elistratov and P. R. Kamadzhiev. Soviet Physics--Solid State, v. 2, May 1961, p. 2621-2630. (Translation of Fizika Tverdogo Tela, v. 2, Nov. 1960, p. 2671-2988).

Anomalous X-ray scattering is used to follow the structural changes which occur during decomposition of supersaturated solid solutions of Cu in Ge. A definite correlation is established with the change in electrical properties. 14 ref. (N7c, P15g; Cu, Ge, 14-67)

360-N. (Spanish.) Metallographic Study of "Uranus 50", an Austenitic-Ferritic Stainless Steel. Fernando Medina Garcia. Instituto del Hierro y del Acero, v. 14, Feb. 1961, p. 160-180.

Behavior of "Uranus 50" under heat treatment and with varying cooling rates. Calculation of austenite and ferrite percentages after treatments. 8 ref. (N8, 2-64; SS)

361-N. (French.) Classification of Elements Present in Iron and Steel. Journal d'Informations Techniques des Industries de la Fonderie, no. 125, Apr. 1961, p. 17-21.

Effect of Ni, Mn, Cu, Co and several other elements on the formation of gamma and alpha phases. Influence of the above elements on graphitization and hardening depth. (N-general, 2-60; Fe, ST)

362-N. The Role of Powder Metallurgy in Dispersion-Strengthened Alloy Development. C. G. Goetzel and R. F. Bunshah. Paper from "Powder Metallurgy". Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 253-265.

The most versatile technique consists of mechanically mixing fine powders of the matrix metal and a nonmetallic substance. Matrix metals encompass Cu, Ni, W, Mo, stainless steel and many others. The most effective dispersoids belong to the group of refractory oxides including alumina, thoria, titania and zirconia. Other techniques consist of precipitation from the liquid during solidification or are based on chemical reactions; for example, co-precipitation followed by reduction of one component, reaction with oxygen on either the surfaces or interior of powder particles. 15 ref. (N7a, H-general)

363-N. A Theory of Dispersion Strengthening. F. V. Lenel and G. S. Ansell. Paper from "Powder Metallurgy". Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 267-307.

Dispersion strengthening is explained by utilizing two methods. The first, a theoretical approach, predicts the yielding and creep behavior of these alloys on the basis of dislocation theory. The second, an experimental approach, shows the variation of the yield and creep strength of these alloys with both the testing conditions and the structural parameters of these alloys. The combination of these two approaches leads to a fundamental understanding of the mechanism involved. 21 ref. (N7a)

364-N. Some Features of Internal Oxidation of Dilute Copper and Nickel Alloys for Dispersion Strengthening. Noboru Komatsu, Laszlo J. Bonis and Nicholas J. Grant. Paper from "Powder Metallurgy". Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 343-358.

In applying internal oxidation as a means of producing dispersion-hardened metal-metal oxide alloys, it is preferable to accomplish this with the alloy in fine powdered form. Problems involved include powder size and shape, maximum solute content, oxide particle size as a function of temperature, time, distance of penetration and solute type. 4 ref. (N7a; Cu-b, Ni-b, 6)

365-N. Dispersion-Strengthened Steel. Yunoshin Imai and Hiroshi Hirotani. Paper from "Powder Metallurgy". Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 359-369.

Specimens are composed of powdered Fe, ferritic and austenitic heat resisting steels, in which Al_2O_3, MgO or SiO_2 are dispersed. From the change in hardness upon heating the cold worked specimens of various compositions and the results of tensile and rupture tests at high temperatures, the dispersion-strengthening phenomenon is elucidated. 5 ref. (N7a, Q27, Q3q, Q29n; Fe, SS, 6)

366-N. Theory of the Self-Diffusion Coefficient in Cubic Metals. G. M. Pound, W. R. Bitler and H. W. Paxton. Philosophical Magazine, v. 6, Apr. 1961, p. 473-483.

The kinetics of diffusion in cubic metals is examined in terms of statistical mechanics based on absolute rate theory. Self diffusion is related to atomic jump direction, entropy of activation and vibrational energy levels with diffusion in Cr and U (b-c-c.) being attributed to a ring mechanism. Experimental data are reviewed for Ti, Mo, Fe, Cu and their alloys at various temperatures. 25 ref. (N1d; Cr, Cu, Fe, Mo, Ti, U)

367-N. Precipitation and Irradiation Hardening in Iron. D. Hull and I. L. Mogford. Philosophical Magazine, v. 6, Apr. 1961, p. 535-546.

Precipitation of carbon from alpha iron during irradiation at 100° C. and thermal aging at 100-200° C. using thin film electron transmission microscopy. Precipitate density and shape, dislocation mechanism, hardening mechanism and orientation are related to temperature. 13 ref. (N7, 2-61, 2-65, 2-67; Fe-a)

368-N. The Formation of Sub-Grain Structure by Alternating Plastic Strain. J. Holden. Philosophical Magazine, v. 6, Apr. 1961, p. 547-558.

A micro-beam X-ray technique is applied to the fracture surfaces produced by slow-growing fatigue cracks propagated in mild steel, Cu and Al and Al alloy sheets subjected to pulsating tension and to large plastic strain in tension. The fracture surfaces show a highly developed subgrain structure with large misorientation down to 13°. The subgrain size is independent of the range of cyclic stress used. 16 ref. (N4, N5, M-general, Q26q, 3-68; CN, Cu-b, Al-b)

369-N. (German.) Equilibria Between Carbonmonoxide-Carbondioxide Mixtures and the Gamma Phase, Cementite and Graphite. Erich Scheil, Theodor Schmidt and Joachim Wunning. Archiv fur das Eisenhuttenwesen, v. 32, Apr. 1961, p. 251-260.

Measurement of thermodynamic activities of C in gamma iron and of phase equilibria between gamma iron, cementite and graphite by equilibrating CO-CO_2 gas mixtures with thin Fe foils from 700-1100° C. (N8, P12)

370-N. (German.) Transformation Characteristics of 50 CrV 4 Steel. Karl Bungardt, Hans Preisendanz and Helmut Brandis. Archiv fur das Eisenhuttenwesen, v. 32, Apr. 1961, p. 261-268.

End quench tests (840° C. hardening temperature) and microstructure investigation on normalized (870° C.) specimens of 50 CrV 4 steel to establish TTT diagrams. Dilatometric and X-ray investigation of austenite formation as influenced by soaking time and temperature. (N8, M27, M23b)

371-N. (German.) Recrystallization Anomalies in Metal Alloys. F. Erdmann-Jesnitzer and W. Bernhardt. Metall, v. 15, May 1961, p. 404-408.

20-700° C. annealing of 60% cold worked, recrystallizing soft annealed and again cold rolled ingots of Cu-Al alloy (0.084-9.4% Al), Cu-P alloy (0.032-1.534% P), and Cu-Mg alloy (0.36-1.61% Mg) to establish recrystallization curves by measurement of

hardness as influenced by cold rolling and annealing temperature. Anomalies of recrystallization curves. 17 ref. (N5, Q29n, 2-64, 3-68; Cu-b, Al, Mg, P)

372-N. The Solutions of the Metallurgist--Retrospect and Prospect. F. D. Richardson. Paper from "Physical Chemistry of Process Metallurgy". Pt. 1. v. 7. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 1-26.

Paper tracing the development of ideas concerning solutions of metals, salts and slags. Consideration of various models from which thermodynamic properties can be derived and their limitations. New equations for dilute ternary solutions are derived by a quasi-chemical treatment. 71 ref. (N14)

373-N. Electrolysis and Diffusion in Liquid Alloys. Paul C. Mangelsdorf, Jr. Paper from "Physical Chemistry of Process Metallurgy". Pt. 1. v. 7. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 429-445.

The Stokes-Einstein relation for relating molecular dimensions to diffusion coefficients suggests that classical hydrodynamics should be approximately applicable to transport processes in liquid metals. Data are presented to show that the mechanism of electrolysis is fundamentally the same as the "electronic friction" originally proposed by Skaupy. (N14, N1)

374-N. General Considerations of Diffusion in Melts of Metallurgical Interest. Ling Yang and G. Derge. Paper from "Physical Chemistry of Process Metallurgy". Pt. 1. v. 7. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 503-521.

Existing data on diffusion in molten metals and alloys, salts, silicates and sulphides are analyzed with regard to their general characteristics and their correlation with thermodynamic and other kinetic properties of these systems. 62 ref. (N1e)

375-N. Diffusion of Some Alloying Elements in Liquid Iron. Tunezo Saito, Yasuji Kawai, Kazuo Maruya and Michiyoshi Maki. Paper from "Physical Chemistry of Process Metallurgy". Pt. 1. v. 7. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 523-533.

Diffusion coefficients of Si, S and Mn in liquid Fe are measured at various concentrations and the relation to thermodynamic properties of the liquids. 9 ref. (N1e; Fe-b, Mn, S, Si, 14-60)

376-N. Self-Diffusion of Iron and Copper in Molten Mattes. Ling Yang, Satoshi Kado and G. Derge. Paper from "Physical Chemistry of Process Metallurgy". Pt. 1. v. 7. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 535-541.

Self-diffusion coefficients are measured in molten mattes of various compositions from 1150-1260° C. They are found to be of the same order of magnitude as those of molten metals and simple ionic melts. 4 ref. (N1d; Cu, Fe, 14-60)

377-N. (Japanese.) Phase Changes During Austempering of Si-Cr-Mn Steels. Pt. 1. Metallographic Study of Austempering. Masazo Okamoto, Ryohei Tanaka and Nobukazu Suzuki. Japan Institute of Metals, Journal, v. 25, Mar. 1961, p. 201-205.

Isothermal transformation during austempering at 300-400° C. of austenitized Si-Cr-Mn steel specimens are studied by dilatometric, microscopic and X-ray diffraction methods. Examination of retained austenite, ferrite and carbide precipitation, martensitic temperature lattice constant and transformation microstructures as a function of composition, particularly Si, and heat treatment temperature. 8 ref. (N8g, J26p, M-general, 2-60, 2-64; AY, ST)

378-N. (Japanese.) Change of Structure in Alpha and Beta Brass (58.0-62.0% Cu) by Hot Working. Pt. 1. Homogeneous Structure in Alpha + Beta. Hideo Tajiri, Masaharu Matsubara, Koshi Katayama and Tadao Nakada. Japan Institute of Metals, Journal, v. 25, Mar. 1961, p. 205-209.

Effect of hot working temperature and working reduction on structural homogeneity and phase distributions is investigated for plate specimens by forging for various holding times at 500-840° C. (N-general, M27, 2-62, 3-68; Cu-n)

379-N. (Japanese.) The Effect of Low Temperature Annealing After Cold Working of OFHC Copper. Hajime Koto, Haruo Watanabe and Michitomo Kato. Japan Institute of Metals, Journal, v. 25, Mar. 1961, p. 210-212.

Anomalous phenomena in the isothermal change of cold worked specimens, as a function of reduction, and annealing time and temperature at 10-400° C. are examined by measurement of specific electrical resistivity in vacuum. 14 ref. (N7c, P15g, 2-61, 2-64, 3-68; Cu-a)

380-N. (Japanese.) Effect of Applied Stress Upon Martensite Transformation. Iwao Hagiwara and Shogo Kanazawa. Japan Institute of Metals, Journal, v. 25, Mar. 1961, p. 213-216.

Steel specimens containing 1% C and 5% Ni are loaded in tension and compression from 10-350° C. The observed directional stress effect on the transformation and the Ms temperature is attributed to the formation of the coherent embryo of martensite due to Bain's deformation for transformation, preferentially in regions of the lattice subjected to uniaxial stress, as in the neighborhood of dislocations. 10 ref. (N8p, 3-66; AY)

381-N. (Russian.) Influence of Molybdenum and of Additional Alloying on Annealing and Austenite Stability of Manganese Structural Steel. D. Ya. Vishniakov and Lei Tin-Zuan. Chernaya Metallurgiya, Nov. 1960, p. 97-103.

Alloying of manganese steel (0.4% C and 1.8% Mn) with various quantities of Mo, Ti, Cb and Zr and anisometric determination of stability of the austenite phase as a function of annealing temperature and composition. 8 ref. (N8n, 2-60, 2-64; AY, Mo)

382-N. (Russian.) Transformations in the Co-Cr-Ti System. E. K. Zakharov and B. H. Livshiz. Chernaya Metallurgiya, Nov. 1960, p. 105-112.

Determination of the microhardness, phase stability, chemical equilibrium and temperatures for magnetic and allotropic transformation in binary Co-Cr and Co-Ti systems and for the ternary Co-Cr-Ti system. 13 ref. (N6p, M24c; Co-b, Cr-b, Ti-b)

383-N. (Russian.) Changes in Microhardness and Structure of Hardened Low-Carbon Steel Depending on Annealing Temperature. K. F. Starodubov and Y. Z. Borkowsky. Chernaya Metallurgiya, Nov. 1960, p. 121-124.

Hardening of 20-steel (0.19% C) by heating to 900° C., cooling in salted water and annealing from 200-700° C. Determination of microhardness and products of phase transformations. 4 ref. (N8, J-general, M27, Q29q, 2-61; CN-g)

384-N. (English.) Metallographic Study of Isothermal Transformation of Beta Phase in Zircaloy-2. G. Ostberg. Jernkontorets Annaler, v. 145, Mar. 1961, p. 119-142.

Isothermal transformation of high-temperature beta solid solution of Zircaloy-2. Relationship of alpha Widmanstatten pattern and structure to beta phase precipitation. 17 ref. (N7c;Zr-b)

385-N. The Degeneration of Freezing Plane Interfaces in a Controlled Solidification System. Edward E. Hucke, Merton C. Flemings, C. M. Adams and H. F. Taylor. Paper from "Physical Chemistry of Process Metallurgy". Pt. 2. v. 8. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 815-831.

Apparatus capable of independent control and variation of temperature gradients and solidification velocity used to freeze alloy melts agitated by low frequency and inductive stirring. Conditions required for interface stability and the resulting structures and segregation investigated over a range of freezing rates for Al-Zn, Al-Cu and Al-Fe alloys ranging from 2-50% Zn, 0.5-10% Cu and 0.04-0.2% Fe respectively. 5 ref. (N12, 1-52, 1-54, 3-67; Al-b, Cu, Fe, Zn)

386-N. The Effect of an Electric Field on the Segregation of Solute Atoms at a Freezing Interface. John Angus, David V. Ragone and Edward E. Hucke. Paper from "Physical Chemistry of Process Metallurgy". Pt. 2. v. 8. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 833-843.

Steady-state segregation occurring in metallic systems at a freezing interface derived for the case where electrical diffusion flux has been added to the ordinary diffusion of solute away from the interface. Effect of electric diffusion flux on the stability of a plane front interface. 7 ref. (N12, N1h, 9-69)

387-N. Morphological and Distributive Features of the Solidification Process in Chill-Cast Aluminum-Copper Ingots. W. V. Youdelis, J. U. MacEwan and J. S. Kirkaldy. Paper from "Physical Chemistry of Process Metallurgy". Pt. 2. v. 8. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 865-890.

Theoretical and experimental study of the morphology, temperature distribution and solute distributions in chill-cast Al-rich Al-Cu ingots. Morphological features and solute distributions are explained in terms of the principle of minimum rate of entropy production in the neighborhood of the growing crystal face. A model is proposed for eutectic exudation. 17 ref. (N12, M27; Al-b, Cu, 5-66)

388-N. (Russian.) Effect of Hydrogen Development on the Cathode on the Properties of Metals. O. S. Popova and A. T. Sanzharovskii. Doklady Akademii Nauk SSSR, v. 136, Mar. 1961, p. 654-656.

Fe and Ni samples are immersed for up to 23 min. in an electrolyte containing 10% H_2SO_4 and 0.1 g. per liter Na_2S while the temperature is held at 20-25° C. During the first 15 min. a current of 100 milliamp. per sq. cm. is passed. The effect of the hydrogen absorbed in different immersion times is determined by removing the samples at various time intervals from the electrolyte and subjecting them to mechanical tests and X-ray analysis. Determination of the hydrogen absorbed by vacuum extraction. 5 ref. (N15d; Fe, Ni)

389-N. (Translation.) Diffusion of Silver in Plastically Deformed Copper. L. M. Shestopalov and Yu. P. Romashkin. Soviet Physics--Solid State, v. 2, June 1961, p. 2664-2672. (Translation from Fizika Tverdogo Tela, v. 2, Dec. 1960, p. 2989-3196.)

Determination of the diffusion coefficient of Ag in coarse-grained plastically deformed Cu by using a layer removal and diffusion absorption technique and beta and gamma irradiation. Deformation is produced by compression under constant stress. 7 ref. (N1; Cu, Ag)

390-N. (Translation.) Grain Boundary Diffusion During the Creep of Copper. Yu. P. Romashkin and L. M. Shestopalov. Soviet Physics--Solid State, v. 2, June 1961, p. 2691-2699. (Translation from Fizika Tverdogo Tela, v. 2, Dec. 1960, p. 2989-3196.)

Method for investigating structural changes during creep of Cu by diffusion of radioactive Ag^{110}. Compression creep tests on Cu from 400-900° C. at various deformation rates. Grain-boundary diffusion at 600° C. in specimens previously deformed at various temperatures. 9 ref. (N1h, Q3, 2-61, 3-68; Cu)

391-N. (Translation.) The Theory of Diffusion During the Plastic Deformation of Metals. Pt. 1. Review. Yu. P. Romashkin. Soviet Physics--Solid State, v. 2, June 1961, p. 2709-2715. (Translation from Fizika Tverdogo Tela, v. 2, Dec. 1960, p. 2989-3196.)

Critical review of experimental data covering diffusion of Fe^{55}, Co^{60}, Fe^{59}, H and Ag^{110} during plastic deformation of coarse and fine grained Fe, coarse grained Cu, single crystal Ag, low-carbon steel, Ni-Mo alloys and Ni. 18 ref. (N1, Q24; Fe, Cu, Ag, CN, Ni-b, Mo, Ni)

392-N. (Translation.) The Theory of Diffusion During the Plastic Deformation of Metals. Pt. 2. Yu. P. Romashkin. Soviet Physics--Solid State, v. 2, June 1961, p. 2716-2720. (Translation from Fizika Tverdogo Tela, v. 2, Dec. 1960, p. 2989-3196.)

Establishment of a general functional relationship between the magnitude of the diffusion coefficient acceleration effect and external parameters stress and temperature, internal parameters activation energy and lifetime of defects and parameters of the deformation derived from them. 5 ref. (N1, Q24)

393-N. (Translation.) The Theory of Diffusion During the Plastic Deformation of Metals. Pt. 3. Possible Nature of the Phenomenon. Yu. P. Romashkin. Soviet Physics-Solid State, v. 2, June 1961, p. 2722-2731. (Translation from Fizika Tverdogo Tela, v. 2, Dec. 1960, p. 2989-3196).

Thermodynamic correspondence of the phenomena of creep and diffusion. Structural nature of the diffusion acceleration effect. During plastic deformation diffusion can be accomplished by nonequilibrium vacancies whose concentrations over long times under appropriate conditions can exceed the concentration of equilibrium vacancies by several orders and these are primarily responsible for the significant acceleration of diffusion processes. (N1, Q24)

394-N. (English.) Diffusion of Nb With Cr, Fe, Ni, Mo and Stainless Steel. L. S. Birks and R. E. Seebold. Journal of Nuclear Materials, v. 3, Mar-Apr. 1961, p. 249-259.

Diffusion couples are prepared at 1100° C. from pure Cb and several compositions of stainless steels and with each of the components of the steel, the composition across the diffusion zone being measured by electron probe microanalyzer.

Diffusion coefficients are determined with stoichiometric composition of intermediate phases and miscibility and solubility relations. 5 ref. (N1, P12e, S11e, Cb, SS, Cr, Ni, Mo, Fe)

395-N. (English.) Elevated Temperature Diffusion in the Systems Nb-Pt, Nb-Se, Nb-Zn, Nb-Co, Ni-Ta and Fe-Mo. R. E. Seebold and L. S. Birks. Journal of Nuclear Materials, v. 3, Mar-Apr. 1961, p. 260-266.

The electron probe microanalyzer is used to determine the composition and extent of phases occurring in bimetallic diffusion couples at 1100° C. Data are given for solubility relations with discussion of precipitation, grain formation and cracking in the diffusion zone. 6 ref. (N1, S11e, 2-62; Cb-b, Pt, Se, Zn, Co, Ni-b, Ta, Fe-b, Mo)

396-N. (English.) Transformation Kinetics of a Zirconium-Uranium-Hydrogen Alloy. J. C. Bokros. Journal of Nuclear Materials, v. 3, Mar-Apr. 1961, p. 320-326.

Phase equilibrium diagrams, isothermal diagrams and reaction curves are constructed for the eutectoid transformation of a Zr-U-H alloy with the atom ratio of 1:0.03:1 from dilatometric and X-ray diffraction examination from 20-650° C. 5 ref. (N7c, M24c, M-general; Zr-b, U, H)

397-N. (French.) Study of the Disordering of the Phase U_2Mo by Irradiation. J. Bloch, J. Doulat and J. Blin. Journal of Nuclear Materials, v. 3, Mar-Apr. 1961, p. 327-330.

Crystallographic analysis of U-Mo alloy specimens, having the composition U_2Mo (with an ordered tetragonal structure), after reactor irradiation from -197 and 20-65° C. Transformation from the gamma prime tetragonal to the gamma cubic structure is observed as a continuous function of the burn-up with collisions during fission being responsible for disordering. 5 ref. (N10, M-general, 2-60, 2-67; U-b, Mo)

398-N. Low-Cast Bridgman-Type Single-Crystal Growing Apparatus. E. H. Olson. Ames Laboratory (Iowa State University of Science and Technology). U. S. Office of Technical Services, PB IS-178, Aug. 1960, 51 p. $1.25.

Single crystals of Zn, Pb, Sn metals and silver chloride can be successfully grown with an economical, easily operated, Bridgman-type apparatus. Costing approximately $500 to construct, the apparatus passes the melt through a steep temperature gradient. It utilizes crystallizing crucibles made of quartz and graphite, all of which have 50° conical nucleating tips. The removal of the single crystals is facilitated by tapered walls on the graphite crucibles. (N3; Pb, Sn, Zn)

399-N. Effect of Single Trace Alloy Additions on the Properties of Pure Iron. G. London. Franklin Institute (Air Research and Development Command). U. S. Office of Technical Services, n. p. $2.

Elements used are P, S, Co, Cr and Ni. Radioactive tracer techniques are utilized as a tool to determine relative alloy concentration. In the concentration levels studied, the specific alloys have the usual grain refining effects on recrystallization. However, even in the zone purified and unalloyed material, recrystallization is influenced by the residual impurities. Alloy effects on mechanical properties are slight except for low temperature embrittlement and room temperature strengthening due to phosphorus. (N5, Q-general, 3-69; Fe)

400-N. The Liquid State and the Liquid Solid Transition. David Turnbull. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 422-438.

Thermodynamic and thermochemical analysis of solidification mechanism in terms of the free volume theory for undercooling crystallization glass formation relations and by the method of distribution functions using various liquid state models. Review and correlation of data for fluidity-temperature-pressure volume relations, fusion, crystal growth, nucleation and diffusion mechanism in metals and viscous molecular compound and other nonmetals in liquid, solid and gaseous states and transitions. 61 ref. (N12, N-general, 10-54)

401-N. Secondary Recrystallization Kinetics in Singly Oriented Silicon Iron. T. V. Philip and R. E. Lenhart. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 439-445.

Commercial Si-Fe sheets of varying magnetic quality are isothermally annealed at high temperatures with extremely large grains developing in the material having good magnetic properties. The grains are of the (110) (001) orientation

and are formed by secondary recrystallization, the primary driving force being grain boundary free energy. The activation energy for nucleation is consistent with a model involving redistribution of a precipitate acting as the primary grain growth inhibitor. 22 ref. (N3, N5, N7, 3-72; Fe-b, Si)

402-N. Transformation Kinetics in High-Purity Iron and Some Iron Binary Alloys. V. Bharucha, G. A. Mancini, G. W. Powell and J. W. Spretnak. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 498-502.

The characteristics of the motion of the gamma-alpha interface during the "down" transformation in zone-refined Fe and dilute binary alloys containing Ni and Mo is examined by the thermionic emission microscope and high-speed photography. The frontal movements are found in all cases to be discontinuous with time and a number of incremental jumps proceed in the reverse direction (alpha + gamma). (N-general, M21, 3-67; Fe-b, Ni, Mo)

403-N. The Structure and Associated Properties of an Age Hardening Copper Alloy. W. D. Robertson, E. G. Grenier and V. F. Nole. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 503-512.

The electrical, mechanical and corrosion cracking properties of an age-hardenable Cu-Ni-Si alloy are studied over a range of time, temperature and deformation states developed by various combinations of heat treatment and cold working for determining the relationship between the properties and the structural state. Observation of precipitation phenomena and relation of deformation banding to strain concentration along paths which transcrystalline cracks propagate 9 ref. (N7a, P15g, Q26q, Q-general, 2-64, 3-68, 3-73; Cu-b, Ni, Si)

404-N. Nucleation Catalysis by Carbon Additions to Magnesium Alloys. V. B. Kurfman. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 540-546.

Grain refinement of Mg-Al melts by carbonaceous additions is attributed to nucleation by Al carbide. The effects of process and alloy variables are interpreted and predicted in terms of the dispersion and chemistry of this phase. Grain coarsening action is evaluated of Be, Zr, Ti and rare earth additions and for chlorination, temperature extremes and prolonged holding times. 14 ref. (N2, N3, 2-60, 2-61; Mg-b, Al, C, Be, Zr, EG-g, AD-p35, 17-57)

405-N. Diffusion in Gamma Brass. Robert F. Mehl and Carl F. Lutz. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 561-567.

A layer of gamma brass is formed on beta brass using a vapor-solid reaction technique. The variation in composition with distance within the gamma phase layer and across the gamma-beta interface is determined by an electron probe. The diffusivities are calculated as a function of concentration. The diffusion coefficient in gamma brass changes by a factor of 25 over a compositional range of 8 at.%. 17 ref. (N1c, 2-60; Cu-n)

406-N. Orientation Relationships in the Heterogeneous Nucleation of Solid Lead From Liquid Lead. B. E. Sundquist and L. F. Mondolfo. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 607-613.

A study of the undercooling and orientation relationships resulting when Pb is nucleated from the liquid by Ni, Cu, Ag and Ge to determine the importance of crystallographic disregistry between nucleating catalyst and nucleated metal. The results indicate that disregistry is not an important factor and that the process starts with the formation of an absorbed layer of nucleated metal on the nucleating impurity. 21 ref. (N2g, N12, 2-60; Pb-a, Ni, Cu, Ag, Ge)

407-N. The Production of Controlled Orientation Bicrystals for Grain Boundary Migration Studies. J. W. Rutter and K. T. Aust. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 641-642.

A technique applied to zone-refined Pb single crystals, which consists of placing a striated crystal and a striation-free crystal of controlled orientations end-to-end in a graphite trough, then melting a short zone at the junction of the two crystals and allowing the junction to freeze to form the desired grain boundary. (N3, M26c; Pb-a)

408-N. Observations on the Powdering of Yttrium Hydride. John D. Roach. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 646-647.

X-ray diffraction examination of surface of as-hydrided yttrium specimens and of hydrided specimens after exposure to nitrogen to determine the nature of the reaction and the reaction product causing solid yttrium hydride specimens to crack and crumble at room temperature. The principle surface phase is determined as YH_2 with nitrogen contamination causing an autocatalytic grain boundary reaction resulting in powdering. 8 ref. (N12, M22g, 3-69; Y-b, H, N)

409-N. (German.) Precipitation Processes at Low Temperatures in an Aluminum Alloy Containing 10 Wt.% Magnesium. Hildegard Cordier and Klaus Detert. Zeitschrift fur Metallkunde, v. 52, May 1961, p. 321-328.

Measurement of electrical resistivity and elongation in investigating precipitation hardening during aging at temperatures from 150 to -35° C. of 0.5-2 mm. diameter MgAl (9.88% Mg) worked and 420° C. homogenized wire specimens as influenced by cooling conditions. (N7, P15g, Q23p; Al-b, Mg, 4-61)

410-N. Nitrogen as an Alloying Element in Steel. The Effect of Nitrogen on the Tempering of Cold Worked Steels. Yunoshin Imai and Tetsuro Ishizaki. Tohoku University, Research Institutes, Science Reports, Series A, v. 13, Apr. 1961, p. 57-66.

Magnetic and electrical properties are measured for steels containing various percentages of N, Mn, Al and Ti after cold working and tempering from 50-700° C. Relation of nitrogen to strain aging, tempering susceptibility, deformation recovery and workability. 21 ref. (N7d, P15, P16, 2-60; AY, N)

411-N. Special Control of Malleable Iron by the Mutual Relations Between Silicon, Manganese and Sulfur. Masao Homma, Yoshihiko Abe, Hiroshi Meguro and Akira Minato. Tohoku University, Research Institutes, Science Reports, Series A, v. 13, Apr. 1961, p. 82-90.

A special malleable cast iron is produced by breaking the normal balance of Mn and S in ordinary malleable iron and increasing the Si and C contents. Improvement in mechanical properties is observed with increase in graphitization reaction rates. 6 ref. (N8s, Q-general, 2-60; CI-s)

412-N. (German.) Investigation of Atomic Faults in Copper, Silver and Gold by Electrical Resistance. Wolfgang Schule, Alfred Seeger, Falko Ramsteiner, Dieter Schumacher and Kenneth King. Zeitschrift fur Naturforschung, v. 16a, Mar. 1961, p. 323-325.

Measurement of recovery of electrical resistance above -40° C. of polycrystalline and at -80° C. of deformed and quenched Cu, Ag and Au disks (0.23 mm. thick). Interpretation of reaction mechanism of recovery in terms of migration of voids. (N3, N4, M26s, P15g, 2-63; Au, Ag, Cu)

413-N. The Martensite Transformation in Thin Foils. Zenji Nishiyama, Kenichi Shimizu and Kazuo Sugino. Osaka University, Institute of Scientific and Industrial Research, Memoirs, v. 18, 1961, p. 71-79.

Martensite transformation is studied by transmission electron microscopy using thin foils of austenite of orientation (001) made by electrolytic polishing from bulk Fe-30.64% Ni alloys. 7 ref. (N8p, M21e; Fe-b, Ni, 4-56)

414-N. (Russian.) Influence of Alpha and Epsilon Phases on Hardening of Austenitic Steels During Deformation. I. N. Bogachev and A. F. Sachavskii. Izvestiya VUZ--Chernaya Metallurgiya, Feb. 1961, p. 100-108.

Investigation of the hardening process during cold plastic deformation of an unstable austenitic steel as accompanied by phase transformation, particularly formation of deformed martensite and epsilon phases. Difference in the kinetics of hardening of Mn and Ni unstable austenitic steels. 5 ref. (N7e, N8p, 3-68; SS-e, Mn, Ni)

415-N. (Russian.) Investigation of the Diffusion Kinetics of the Carbide Phase During Heating of Iron-Nickel-Carbon Alloys by Electricity. A. V. Belotskii and V. N. Gridnev. Izvestiya VUZ--Chernaya Metallurgiya, Feb. 1961, p. 114-121.

Investigation of diffusion kinetics and austenite homogenization. Data given for chemical composition, structure uniformity, characteristics of hardened steels and alteration of austenite lattice. (N1, N8r, J2g; Fe-b, Ni, C)

416-N. (German.) Investigation of Transition Behavior, Notch Impact Strength and Susceptibility to Intercrystalline Corrosion of Iron-Chromium Alloys With Chromium Contents Up to 30%. Ewald Baerlecken,

Wilhelm Anton Fischer and Klaus Lorenz. Stahl und Eisen, v. 81, June 8, 1961, p. 768-778.

Thermomagnetic measurements from 700-1400° C. notch impact testing from 720-800° C. and microstructural investigation of variously heat treated air and vacuum melted Fe-Cr alloys (0-30.9% Cr, 0-0.2% C, 0-2.3% Si, 0-1.2% Al, 0-4.8% Ni, 0.006-0.29% N) for determination of transition temperatures, ferrite and austenite distribution and grain decomposition. (N8, M-general, Q6, Q23r, R2h, 2-60, 2-62; AY)

417-N. X-Ray Study on the Precipitation Process in Magnesium-Rich Magnesium-Silver Alloys. Shin'ichi Nagashima. Osaka University, Institute of Scientific and Industrial Research, Memoirs, v. 18, 1961, p. 129-133.

Sequence of precipitation from hexagonal solid solutions is investigated by oscillation and stationary crystal methods, Laue method and small angle diffraction method. (N7b, M22g; Mg-b, Ag)

418-N. The Effect of Hydrostatic Pressure on the F.C.C. ⇌ B.C.C. Reactions in Iron-Base Alloys. Larry Kaufman, A. Leyenaar and J. S. Harvey. Paper from "Progress in Very High Pressure Research". John Wiley & Sons, Inc., New York 16, 1961, p. 90-108.

Investigation of f-c-c.-b-c-c. reactions in the Fe-Ni and Fe-Cr systems to evaluate the thermodynamic and kinetic effects of hydrostatic pressure and effects on the nucleation of martensitic reactions. Experiments are conducted on specimens of Fe-Ni and Fe-Cr alloys and pure Fe single crystals from 400-1000° C. and under 1-50 K-atm. pressure. 13 ref. (N-general, N8p, M24b, P12, P13, 3-74; Fe-b, Ni, Cr)

419-N. The Effect of High Pressures on Transformation Rates. J. E. Hilliard and J. W. Cahn. Paper from "Progress in Very High Pressure Research". John Wiley & Sons, Inc., New York 16, 1961, p. 109-125.

Prediction of pressure effects on the various factors influencing the rate of solid-state transformations. Use of an activation volume model to describe the pressure dependence and of a graphical construction for estimating the pressure displacement of phase boundaries in a binary system. Data are given for the austenite to pearlite transformation and the rate of precipitation in Al-Cu, Au-Ni and Pb-Sn alloys. 14 ref. (N6q, N7, M27f, Q25m, 3-74)

420-N. Research and Development on the Effects of High Pressure and Temperatures on Various Elements and Binary Alloys. E. W. Goliber and K. H. McKee. Paper from "Progress in Very High Pressure Research". John Wiley & Sons, Inc., New York 16, 1961, p. 126-151.

Investigations of the pressure-temperature effects on the properties and transformation kinetics in various alloys and systems such as Cr, Cr-Ni, Fe-Ni, Fe-Al, Ni-Cu, Co-Al, Cr-Al, Ni-Al, Ni-Ti, Ni-Mo, TiMg, Ni-Al_2O_3 and high-speed toolsteel. Studies include the formation or stabilization of phases and intermediate phase suppression and displacement of a gamma loop with pressure. Results are analyzed by X-ray diffraction, light and electron microscopy and Rockwell hardness tests. 21 ref. (N-general, M-general, Q25m, 2-61, 3-74)

421-N. Melting and Other Phase Transformations at High Pressure. H. M. Strong. Paper from "Progress in Very High Pressure Research". John Wiley & Sons, Inc., New York 16, 1961, p. 182-194.

The fusion curves of the four Group VIII metals Ni, Fe, Pt and Rh and the phase diagrams of Bi and Rb are determined to 100,000 atm. Calculation of the volume changes which occur at the melting points for the Group VIII elements from the initial slopes of their fusion curves using Simon's formula. Study of alpha to gamma phase transformations in Fe. 12 ref. (N12, M24, P12n, P10d, 2-61, 3-74)

422-N. Effect of Hydrostatic Pressure Up to 8000 Atm. on the Self-Diffusion Rate in Silver Single Crystals. C. T. Tomizuka. Paper from "Progress in Very High Pressure Research". John Wiley & Sons, Inc., New York 16, 1961, p. 266-270.

Measurements of the self-diffusion coefficient of single crystal Ag at 906° C. and 1-8000 atm. pressure. The activation volume is calculated as a measure of the volume relaxation around a vacancy. 7 ref. (N1d, 2-61, 3-74; Ag)

423-N. Some Fixed Points on the High Pressure Scale. G. C. Kennedy and P. N. LaMori. Paper from "Progress in Very High Pressure Research". John Wiley & Sons, Inc., New York 16, 1961, p. 304-313.

The pressures of polymorphic transitions of Bi, Tl and Cs are determined at 25° C. by volume measurements in a supported tungsten carbide pressure vessel using a free piston gage. 12 ref. (N-general, 3-74; Bi, Tl, Cs)

424-N. A Solid-Solution Model for Inhomogeneous Systems. M. Hillert. Acta Metallurgica, v. 9, June 1961, p. 525-535.

A solid-solution model allowing compositional variations in one dimension is developed from the zeroth approximation of nearest-neighbor interactions. It predicts the existence of periodically modulated structures in ordering and in precipitation systems, provides a method for calculating the diffuse structure of grain and domain boundaries, indicates the existence of an activation energy for boundary movement and presents a new approach for treating homogeneous nucleation. 19 ref. (N-general, M24e, 17-56)

425-N. Formation of Modulated Structures in Copper-Nickel-Iron Alloys. M. Hillert, M. Cohen and B. L. Averbach. Acta Metallurgica, v. 9, June 1961, p. 536-546.

The formation of modulated structures with periodic variations in composition due to a simple interchange of atoms is studied in ternary alloy specimens, as a function of composition, temperatures and time using X-ray diffraction and a kinetic and a Guinier model. The activation energies for the transformation, evaluated at the first detectable stage and for a later stage, show that both stages are diffusion-controlled inside as well as outside the spinodal. 21 ref. (N-general, M24e, M-general, 2-60, 2-61, 3-67; Cu-b, Ni-b, Fe)

426-N. Interdiffusion in Dilute Aluminum-Copper Solid Solutions. J. B. Murphy. Acta Metallurgica, v. 9, June 1961, p. 563-569.

Investigation of the interdiffusion of Cu from an alpha solid solution into Al with special attention to minimizing experimental and computational errors. The form of the concentration-distance curves obtained show that interdiffusion is independent of concentration at 0-0.5 wt.% Cu. The activation energy is calculated with the frequency factor and related to the tracer diffusion of Cu in Al. 18 ref. (N1; Cu-b, Al, 14-67)

427-N. Pre-Precipitation in Al-Mg-Ge and Al-Mg-Si. A. Lutts. Acta Metallurgica, v. 9, June 1961, p. 577-586.

Single crystals of high-purity Al-base alloys (Al-0.7% Mg_2Si, Al-1.0% Mg_2Ge and Al-1.4% Mg_2Ge) are studied by a crystal monochromated X-ray technique and hardness measurements during isothermal aging from 135-300° C. to determine clustering or segregation of solute atoms in the matrix. The G.P. zones are formed in two steps, the first having no internal periodicity and possessing a high vacancy concentration, the second having a linear periodicity parallel to one of the matric cube directions with abruptly decreased vacancy concentration. 13 ref. (N7, M26s, 2-61, 2-65; Al-b, Mg, Ge, Si)

428-N. The Growth of Gamma Prime-Fe_4N Iron Nitride Precipitates in an Alpha-Iron Matrix. G. R. Booker. Acta Metallurgica, v. 9, June 1961, p. 590-594.

Gamma prime-Fe_4N plates are isolated in extraction replica and examined by electron microscopy and "selected-area" electron diffraction. Individual plates comprise a single crystal lattice and exhibit two sets of fine structures, giving a characteristic single crystal "spot" pattern in which the "spots" are drawn out into two sets of lines which intersect, arising from relaxation of the diffraction condition in directions perpendicular to the two sets of fine structure. Orientation and growth directions are attributed to misfit in atom spacing. 5 ref. (N7, M26q, 2-64, 3-72; Fe-a)

429-N. The Martensite Transformation in Thin Foils. Z. Nishiyama, K. Shimuzu and K. Sugino. Acta Metallurgica, v. 9, June 1961, p. 620-622.

Foils of Fe-30.64% Ni alloy in austenite state are transformed by immersion into liquid nitrogen with transmission electron microscopy and electron diffraction study of the orientation relationships of the resultant martensite crystals in the microstructure. (N6q, M-general; Fe-b, Ni, 4-56)

430-N. (French.) Crystallization of Selenium. G. Blet. Journal de Physique et le Radium, v. 22, Feb. 1961, p. 17A-26A.

Effects of holding time and temperature on electrical conductivity of high-purity cast selenium samples relative to Ge and crystallization. Structure and hardness tests. (N12, P15g, 2-61, 3-67, M27, Q29; Se, 5)

431-N. Physical Metallurgy of Refractory Metals (The Kinetics of Formation of Niobium-Zinc Compounds on Niobium in Zinc Vapor). G. Sandoz and T. C. Lupton. Report of NRL (Naval Research Laboratory) Progress, June 1961, p. 25-26. (Available as PB 1713109 from U. S. Office of Technical Services, Washington 25, D. C.) $1.25.

Kinetics study of the effects of the Cb source and the Zn source on the thickness, nature and composition of Cb-Zn coatings formed by vapor deposition from 1700-2100° F. (N15g, L25, 2-62; Cb, Zn)

432-N. Physical Metallurgy of Refractory Metals (Zinc-Vapor Coating of Binary Niobium Alloys). J. Stoop. Report of NRL (Naval Research Laboratory) Progress, June 1961, p. 26-27. (Available as PB 1713109 from U. S. Office of Technical Services, Washington 25, D.C.) $1.25.

Arc-melted binary alloys of Cr containing 13% Fe, 13.5% Co, 13.5% Ni, 7% Al and 3-12% Cr are reacted with Zn vapor from 1900-2200° F. for study of the thickness and oxidation resistance of the coatings formed as a function of alloy composition and vapor deposition temperature. (N15g, R1h, 2-60, 2-62; Cb-b, Fe, Co, Ni, Al, Cr, Zn, 17-57)

433-N. (Japanese.) Behavior of Titanium in White Iron and Its Role in Graphitization. Taira Okamoto and Masao Ibaraki. Imono (Japan Foundrymen's Society, Journal), v. 33, May 1961, p. 340-346.

The nature and amounts of Ti compounds in white iron, containing 2.55% C, 1.06% Si, 0.30% Mn and 0.093% S, are investigated by chemical analysis and X-ray diffraction methods. Relations are derived for formation of oxides, nitrides, carbides and sulphides of Ti and for graphitization reactions in terms of carbon-austenite solubility as a function of composition and temperature. 10 ref. (N8s, M26q, M-general, 2-60, 2-61; CI, Ti)

434-N. (Japanese.) Effect of Deformation Temperature on Anneal-Hardening of Type 304L Stainless Steel. Yuzo Hosoi. Tetsu-to-Hagane (Iron and Steel Institute of Japan, Journal), v. 47, May 1961, p. 721-727.

Anneal-hardening phenomena in specimens deformed by rolling from -60 to 600° C., with subsequent annealing to 900° C., are determined by measuring the change in mechanical properties. Transformation mechanisms and microstructures and deformation structures are examined by metallography and magnetic property measurement. Hardening is observed to increase with decreasing temperature. Data are given for tensile and hardness properties and effects of austenite-martensite transition. 13 ref. (N7a, N-general, M27, Q-general, 2-61, 2-64, 3-68; SS-e)

435-N. (Translation-Brutcher no. 4980.) Strain Aging of Soft Structural Steels During Static Extension. F. Althoff, D. Bohm and F. Erdmann-Jesnitzer. Metallovedenie i Termicheskaya Obrabotka Metallov, Oct. 1959, p. 6-16.

Effect of static tensile loads within the elastic range and influence of time on strain aging of low-carbon structural (openhearth and basic Bessemer) steels. Results of tensile, impact and hardness tests. Effect of dynamic loads on quench aging. (N7e; ST)

436-N. Low Temperature Ageing of Iron and Low-Carbon Steel. Ivan Hrivnak. Metal Treatment and Drop Forging, v. 28, June 1961, p. 233-240, 247.

Precipitation mechanisms for nitrides and oxides in Fe and CSN 11370.3 steel are studied in terms of the dislocation model of the high-angle grain boundaries as a synthesis of parallel Burgers boundaries. 29 ref. (N7a, M26b, 2-61; Fe-b)

437-N. (Translation-Brutcher no. 4965.) The Inhomogeneity of Martensite in Cr-Mn-Si Steel 30KhGSA After Induction Hardening. Ya. I. Spektor and A. P. Gracheva. Metallovedenie i Termicheskaya Obrabotka Metallov, Sept. 1959, p. 12-17.

449-N. Study on Carbides in Iron and Steel by the Electrolytic Isolation Method. Pt. 3. Behavior of Cementite During Cold Working and Subcritical Annealing. Tomo-o Sato and Taiji Nishizawa. Tohoku University, Technology Reports (Japan), v. 25, Feb. 1961, p. 181-192.

Electron microscope studies are made to investigate the mechanisms of deformation and spheroidization during annealing, cold rolling and subsequent annealing. 13 ref. (N8r, M21e, 2-64, 3-68; ST, 1-53)

450-N. Order in Alpha Brass. L. M. Clarebrough, M. E. Hargreaves and M. H. Loretto. Australian Institute of Metals, Journal, v. 6, May 1961, p. 104-114.

Nature and extent of order in alpha brass is investigated by calorimetry and by measurements of density, electrical resistivity and hardness. It is shown that short-range order exists in slowly cooled specimens. The degree of order can be increased by annealing at

low temperatures and decreased by deformation. 13 ref. (N10, P12, 2-64, 3-68; Cu-n)

451-N. (Japanese.) Observations of Aluminum Nitride in Steel by Electron Microscopy. Pt. 1. Study of Aluminum Nitride in Steel. Shigeo Hasebe. Tetsu-to-Hagane (Iron and Steel Institute of Japan), v. 47, June 1961, p. 809-817.

Precipitates in low-Mn steels, an Al-killed low-C steel and a medium-C steel containing 0.005-0.02% N and 0.03-0.12% Al and electron microscopy after various heat treatments from 900-1350° C. and different modes of deformation. Structures and shapes of the AlN compounds are given with precipitation kinetics along austenite and ferrite grain and subgrain boundaries. Lattice spacing is determined by electron diffraction. 23 ref. (N7, M21e, M26q, 2-62, 2-64, 3-68; ST, Al, N)

452-N. (Japanese.) Mechanical Properties of Isothermally Transformed Mn-Cr Spring Steel. Manabu Ueno, Iku Uchiyama and Akihiko Hoshino. Tetsu-to-Hagane (Iron and Steel Institute of Japan), v. 47, June 1961, p. 817-822.

The isothermal transformation diagram and the mechanical properties are determined for specimens austenitized at 850° C. and isothermally heat treated from 300-650° C. Data are given for tensile, yield, impact and impact tension strengths, Rockwell hardness, endurance limit, elongation, reduction of area and stress-strain relations. Bainitic, pearlitic, austenitic, carbide and martensitic transformation microstructures are observed by electron microscopy. 14 ref. (N8g, M27, Q-general, 2-64, 3-68; AY, Mn, Cr)

453-N. (Japanese.) Effect of V, Al and Zr on Properties of 18 Cr-12Ni Austenitic Stainless Steel. Ryuichi Nakagawa and Yasuo Otoguro. Tetsu-to-Hagane (Iron and Steel Institute of Japan), v. 47, June 1961, p. 828-833.

Aging behavior, microstructure, precipitation and precipitate structures, grain size and tensile properties are examined for specimens as a function of V, Al and Zr contents after aging and solution treatments from 600-1000° C. (N7, M27, Q27, 2-60, 2-64; SS-e, Ni, Cr, V, Al, Zr)

454-N. (Russian.) Apparatus Indicating the Start of Martensite Formation in Quenching. F. N. Tavadze and E. K. Kovshikov. Metallovedenie i Termicheskaya Obrabotka Metallov, Apr. 1961, p. 2-5.

Use of electrical apparatus to detect the start of martensitic transformation in steel parts quenched in water so that the correct instant, after which further cooling in oil must follow, can be ascertained. This provides for martensitic structure and prevents warping and cracking. (N8q, 1-53, 1-54)

455-N. (Russian.) Microscopic Investigation of Martensitic Transformation in 1KH18N9T Steel When Deep Cooled. S. G. Chernyavskaya and I. D. Kedrin. Izvestiya VUZ--Chernaya Metallurgiya, Apr. 1961, p. 89-92.

Austenitic stainless steel is cooled in liquid nitrogen. Formation of martensite, peculiarity of its structural form and arrangement and hardness. 4 ref. (N8p, M27, Q29n; SS)

456-N. (Russian.) Formation of Titanium Carbonitrides in Steel. Yu. G. Gurevich and E. D. Mokhir. Izvestiya VUZ--Chernaya Metallurgiya, Apr. 1961, p. 107-113.

Interaction of Ti with nitrogen in 1KH18N9T steel and the formation of Ti nitrides and Ti carbides as dependent on deoxidation, C and N content, heat treatment, cooling and subsequent rolling. 6 ref. (N8r, 2-60, 2-64, 3-68; AY, 14-68)

457-N. (Russian.) Complex Modification of Magnesium Cast Iron by FeSi and Al. Yu. N. Taran and A. V. Chernovol. Izvestiya VUZ--Chernaya Metallurgiya, Apr. 1961, p. 134-140.

Influence of FeSi and Al on the formation of cementite in castings. Eutectic transformation is studied by thermal analysis and micro-analysis of hardened specimens. Determination of correct sequence of modifier additions. 8 ref. (N8k, 2-60; CI, Mg, Fe, Si, Al)

458-N. Diffusion in Refractory Metals. N. L. Peterson. Advanced Metals Research Corp. (Wright Air Development Division). U. S. Office of Technical Services, AD 257860, Mar. 1961, 178 p. $3.

Data on diffusion in W, Ta, Mo, Cb, Pt, Hf, Zr, V, Cr and Ti. Information for 95 binary systems and 13 ternary or higher order systems. (N1; EG-d37, SGA-h)

459-N. Discussion on Martensite. Iron and Steel Institute, Journal, v. 198, June 1961, p. 165-169.

Study of the martensitic transformation of austenite steel alloys. An alloy containing 14% Cr, 14% Mn and 0.1% C is H_2O quenched at 1050° C. and the structural transformation is studied by X-ray examination. Data are also presented for an 18-8 austenitic stainless steel. 17 ref. (N8p; SS-e)

460-N. (Japanese.) Influence of Preheating on Recrystallization of Aluminium and Its Alloys. Takashi Ikeno and Kizo Skibata. Light Metals, v. 11, May 1961, p. 158-164.

Recrystallization temperature, grain size and microstructure of pure Al, 2S alloy and several alloys containing 0.5% Fe, Mn or Mg, or 2.2% Si, after preheating from 350-600° C., isothermal annealing and 85% cold rolling reduction. 4 ref. (N5, J23s, M27c, 2-64, 3-68; Al-b)

461-N. (Translation.) Coefficients of Self-Diffusion in Alloys. B. Ya. Pines and I. V. Smushkov. Soviet Physics--Solid State, v. 3, July 1961, p. 105-109. (Translation of Fizika Tverdogo Tela, v. 3, Jan. 1961, p. 3-310).

Calculation of coefficient of diffusion of atoms of one of the components into the alloy and the coefficient of self-diffusion of "average" atoms of the alloy as a function of composition. The relations include activity coefficients. 10 ref. (N1d, P12b, 2-60)

462-N. (Russian.) Effect of Tempering on the Diffusion and Solubility of Hydrogen in Steel. E. P. Nechai, K. V. Popov and L. S. Panenkova. Fizika Metallov i Metallovedenie, v. 10, Dec. 1960, p. 838-840.

U7A steel sheet of 0.7 mm. thickness is quench hardened and subsequently tempered at 100-700° C. after which the sample is electrolyzed using a Pt spiral as the anode in a normal solution of H_2SO_4 containing 3 mg. per l. As with a current of 0.06 amp. per sq. cm. density. Hydrogen diffusion is determined by measuring the quantity penetrating the sample and solubility is measured by vacuum heating at 600° C. after electrolysis. 14 ref. (N1, P12e, 1-54, 2-64; ST, H)

463-N. (Russian.) Self-Diffusion in Metals. S. D. Gertsriken. Fizika Metallov i Metallovedenie, v. 10, Dec. 1960, p. 873-878.

Computation of self-diffusion within the grain and close to the grain boundaries based on the melting temperature, boiling temperature, heat of evaporation at boiling temperature, melting heat, linear expansion coefficient and the activation energy of self-diffusion. 11 ref. (N1d, M27f, P-general)

464-N. (Russian.) Radiographic Determination of Diffusion Coefficients in the Nickel-Chromium System. B. Ya. Pines, I. P. Grebennik and I. V. Smushkov. Fizika Metallov i Metallovedenie, v. 10, Dec. 1960, p. 879-885.

Ni-Cr alloys with up to 50% Cr are examined at 450-1000° C. by electron and X-ray diffraction. Diffusion is determined as a function of concentration and temperature. 11 ref. (N1, 2-60, 2-61, M22; Ni-b, Cr)

465-N. (Russian.) Decomposition of the Beta Solid Solution in a Titanium-Manganese Alloy. M. A. D'yakova and I. N. Bogachev. Fizika Metallov i Metallovedenie, v. 10, Dec. 1960, p. 896-902.

Samples containing 6.5% Mn are slowly heated up to 900° C. in a vacuum and cooled to 650-300° C. in liquid saltpeter or lead. Beta phase decomposition in subsequent slow heating is studied by dilatometry. Hardness and electrical resistivity are determined as a function of cooling temperatures and holding times. 5 ref. (N-general, N7d, M23b, Q-general, 2-61, 2-64; Ti-b, Mn, 4-67)

466-N. (Russian.) Dispersion Hardening and Crystal Structure of a Carbon Steel With Small Vanadium Additions. S. G. Guterman, M. I. Gol'dshtein and A. M. Noskov. Fizika Metallov i

Metallovedenie, v. 10, Dec. 1960, p. 903-906.

ST40 steel is melted in a basic-lined induction furnace with 0.01-0.093% vanadium added in the ladle or the furnace. Ingots are cast, forged into bars which are normalization annealed, quenched from 840-950° C. and tempered at 400-650° C. Mechanical properties, size of atomic blocks and vanadium contained in carbide precipitates are determined as a function of the vanadium content. 6 ref. (N7a, M26, Q-general, 2-60, 2-64; ST, V)

467-N. (Russian.) Carbide Transformation in the Tempering of Carbon Steel. M. V. Belouc and V. T. Cherepin. Fizika Metallov i Metallovedenie, v. 10, Dec. 1960, p. 912-924.

U8A and U12A steel samples are heated up to 1000° C., water quenched and immersed in liquid oxygen or in a mixture of solid CO_2 and benzine at -78° C. During rapid resistance heating or induction heating followed by rapid cooling, transformation of epsilon carbide into cementite is investigated by dilatometric and electrical resistance measurements and X-ray diffraction. 32 ref. (N8a, N8r, M-general, 2-61; CN)

468-N. (Russian.) Connection Between Parameters of Carbide Coagulations and Carbon Solubility in the Austenite of Iron-Carbon Alloys. V. I. Psarev. Fizika Metallov i Metallovedenie, v. 10, Dec. 1960, p. 925-930.

Computation of the mean radius of coagulation based on the surface tension of phase boundaries, molecular weight of the dispersed phase, specific volume and the carbon concentration in the austenite at the carbide particle surface. 15 ref. (N8r, P12, 2-60; Fe-b, C)

469-N. (Russian.) Strain Aging of Nickel and Its Effect on Anomalies Observed in the Temperature-Velocity Dependence of the Deformation Resistance. V. F. Sukhovarov and R. P. Kharlova. Fizika Metallov i Metallovedenie, v. 10, Dec. 1960, p. 938-941.

Specimens of N1 Ni containing traces of Co, Fe, Cu and Si and 0.05% C are vacuum heat treated at 900° C., air cooled and compression tested at velocities of 2-2400% per hr. at 20-350° C. Anomalies in the flow diagrams are explained by the formation and decay of Cottrell clouds composed of carbon atoms. 13 ref. (N7e, M26b, Q23q, 2-61, 3-67; Ni-b)

470-N. Study on Precipitation Phenomena in Thin Films of Supersaturated Gold-Nickel Alloy. Yasushige Fukano. Physical Society of Japan, Journal, v. 16, June 1961, p. 1195-1204.

Structure changes in supersaturated Au-Ni alloy after successive agings are studied by electron diffraction and electron microscopy. Specimens are prepared by vacuum evaporation and subsequent quenching. 18 ref. (N7, M-general, 2-64, 2-65; Au-b, Ni, 14-62)

471-N. (German.) Electrical Transport of Gold in Silicon. B. I. Boltaks, G. S. Kulikow and R. Sch. Malkowitsch. Physikalische Abhandlungen aus der Sowjetunion, v. 4, May 1961, p. 249-254.

Investigation of diffusion and solubility of Au in Si by studying electrical transport of radioactive Au^{198} isotopes at 1088-1363° C. Relation of the diffusion mechanism to effective electron mobility. 10 ref. (N1, P12e, 2-61; Si, Au)

472-N. (Russian.) Coagulation of Carbide Particles in Carbon Steels Below the A_1 Temperature. V. I. Psarev. Izvestiya VUZ--Chernaya Metallurgiya, Dec. 1960, p. 91-96.

Formation and coagulation of cementite particles are investigated in U10, U12, U17, I10, I12 and I17 alloy steels. Particle size and number are related to carbon content, heat treatment and coagulation temperature. Brinell hardness as dependent on carbide phase surface area. 7 ref. (N8r, N8k, Q29b, 2-60, 2-61, 2-64; CN)

473-N. (Russian.) Effect on Volume of the "Third Transformation" During Tempering of Quenched Steel. V. G. Permyakov and M. V. Belous. Izvestiya VUZ--Chernaya Metallurgiya, Dec. 1960, p. 99-105.

Specimens of U8A, U10A and U12A steels are austenitized, quenched and reheated in a dilatometric furnace to 600° C. and slow cooled. Residual austenite is measured by ballistic magnetometer and data given for dilatometric curves and specific volume of carbide. 15 ref. (N8a, N8n, P10d, M23, 1-53; CN)

474-N. (Russian.) Effect of Dendritic Liquification of Silicon on Phase and Structure Transformations in Spring Steel. Ya. N. Malinochka. Izvestiya VUZ--Chernaya Metallurgiya, Dec. 1960, p. 106-110.

Cast and rolled steels are austenitized, quenched and tempered by various methods. Nital and sodium picrate are compared as etchants of partially austenitized steel for effectiveness in showing dendritic structure. Microstructure is investigated as a function of time and temperature of heat treatment. (N12b, J22, M-general, 2-64; ST, Si)

475-N. (Russian.) Nature of the Secondary Martensitic Transformation in Steels. G. V. Korotushenko. Izvestiya VUZ--Chernaya Metallurgiya, Dec. 1960, p. 114-123.

Austenitization at 1240-1260° C., quenching and heat treating from -150 to 570° C. of steels containing 0.85% C, 12.3-14.6% Cr and 0-1.63% Ni. Residual austenite measured by magnetic anisometer. X-ray diffraction analysis and dilatometric measurements. Secondary microhardness, martensite transformation temperature and lattice parameters are investigated as functions of steel composition and final heat treatment. 20 ref. (N8p, J-general, M-general, Q29q, 2-60; ST)

476-N. Investigation of the Sputtering of Silicon. S. P. Wolsky and E. J. Zdanuk. Journal of Applied Physics, v. 32, May 1961, p. 782-786.

A vacuum microbalance is used to determine the sputtering yield for the ArSi system energies of 34-800 ev. Variation of the discharge voltage yields the relative sputtering effectiveness of monovalent and divalent Ar ions. The data indicates that the sputtering surfaces are clean and reproducible. 18 ref. (N15g; Si, Ar)

477-N. Self-Diffusion in Silver During Plastic Deformation in Torsion. J. B. Darby, Jr., C. T. Tomizuka and R. W. Balluffi. Journal of Applied Physics, v. 32, May 1961, p. 840-848.

Study of self-diffusion in Ag polycrystals at 700-800° C. using a sectioning technique before and after deformation. Effect of strain rate and dislocation interaction on diffusivity. 18 ref. (N1d, M26b, 2-61, 3-68; Ag)

478-N. Mercury Ion Beam Sputtering of Metals at Energies 4-15 Kev. G. K. Wehner and D. Rosenberg. Journal of Applied Physics, v. 32, May 1961, p. 887-890.

Sputtering yields for 14 metals from the 4th, 5th and 6th periods are measured for normally incident Hg ions. The sputtering rate is determined by measuring the time required for the ion beam to pierce the target foil. 17 ref. (N15g)

479-N. Experimental Study of Intermetallic Diffusion in Large Temperature Gradients. C. J. Meechan. Journal of Applied Physics, v. 32, May 1961, p. 945-950.

Chemical diffusion in Kirkendall diffusion couples as influenced by temperature gradients of 2000-3000° C. per cm. imposed across the interface of couples fabricated from fcc. metal systems including Au-Ni, Cu-Ni, gamma Fe-Ni, gamma Fe-Pd and Ni-Pd. 16 ref. (N1e, 2-61; Au-b, Cu-b, Fe-b, Ni, Pd)

480-N. (Czech.) Retained Austenite. Ales Kalivoda. Hutnicke Listy, v. 16, Feb. 1961, p. 135-138.

CSN 16341 steel containing Cr, Ni and Mo is hardened at 820-1000° C., water or oil quenched to 200-100° C. and held at these temperatures for 10-24 hr. Effect of subsequent tempering at 20-400° C. and of previous heat treatment on quantity of retained austenite. 12 ref. (N8n, 2-64; AY)

481-N. (Russian.) The Role of Surface Phenomena During Hydrogen Redistribution Between the Metal and the Gas Phase. V. B. Dzhoshi, A. F. Vishkarev and V. I. Yavoiskii. Izvestiya VUZ--Chernaya Metallurgiya, Mar. 1961, p. 23-30.

Investigation of hydrogen behavior during melting of Armco steel. The regularity and speed of hydrogen absorption and adsorption are shown to depend on the gaseous film composition of the boiling metal, entrance of hydrogen into the metal through the slag and the influence of C, O and Si on surface tension in the presence of H. 14 ref. (N16m, P13h; ST, C, O, Si, H)

482-N. (Russian.) Examination of the Metal Composition at Different Levels of a Martin Furnace Bath. E. V. Chelishchev, D. I. Turkenich, N. P. Zhetvin and V. P. Tunkov.

Izvestiya VUZ--Chernaya Metallurgiya, Mar. 1961, p. 31-36.

Investigation to find the zone of the most active development of decarbonization, the distribution of carbon and oxygen according to the depth of the metal bath and the amount of each that is present and the mechanism of diffusion as a function of metal-slag proportions and temperature. (N16m, N1c, D11n, 2-61, 3-69)

483-N. (Russian.) The Influence of Carbon Content on the Diffusion of Hydrogen Into Carbon Steels. G. I. Batalin and A. L. Balyasnyui. Izvestiya VUZ--Chernaya Metallurgiya, Mar. 1961, p. 120-125.

Experimental investigation of the speed of hydrogen diffusion into various steels (grade 20, 30, 40, U8, 20KH) as dependent on carbon content and temperatures (400-935° C.) 5 ref. (N1, 2-60, 2-61; CN, H)

484-N. (Russian.) Investigation of the Recrystallization Temperature of Bimetallic Nickel Alloys. S. S. Gorelik, E. N. Spektor and S. N. Minkina. Izvestiya VUZ--Chernaya Metallurgiya, Mar. 1961, p. 138-147.

Investigation of Ni-Be, Ni-Cu, Ni-Al systems where Be, Cu and Al have smaller atomic radii than Ni, to find the influence of this difference on the temperature of recrystallization, the influence of the diffusibility of the added elements on the cohesive forces of the alloy and the influence of small additions of Cr on the temperature of recrystallization. 8 ref. (N5, 2-60; Ni-b, Be, Cu, Al, Cr)

485-N. (Russian.) Recrystallization of 40Kh Steel During Deformation at High Temperatures. V. P. Severdenko and P. P. Ankut. Izvestiya VUZ--Chernaya Metallurgiya, Mar. 1961, p. 148-153.

Investigation of grain size as a function of deformation area and speed, chemical composition, temperature and thermal treatment before and after deformation. (N5, M27c, 2-60, 2-61, 3-68; ST)

486-N. (Italian.) Diffusion of Metals. T. Federighi. Metallurgia Italiana, v. 53, June 1961, (Atti-Notizie, v. 16, May-June 1961, p. 126-129.)

Mechanism of diffusion and auto diffusion phenomena of metals are studied. Determination of diffusion coefficient and activation energy. Kirkendall effect and movement of atoms with respect to their lattice structure are described. (N-general)

487-N. The Effect of Titanium Upon Austenitic Spheroidal Graphite Cast Iron. Irving B. Elman. Current Engineering Practice, v. 3, May 1961, p. 23-27.

Cr-free austenitic spheroidal gray cast iron specimens are tested to determine necessary Mg content for providing spheroidal graphite structure in irons having various Ti contents. Effect of section size and Ce additions. (N8q, 2-60, 3-73; CI-r, Ti, Mg, Ce)

488-N. (Translation-Brutcher no. 4992.) The Martensitic Transformation in Steel. A. P. Gulyaev. Metallovedenie i Termicheskaya i Obrabotka Metallov, Nov. 1959, p. 5-18.

Previously abstracted. See item 85-N, 1960. (N8p, 2-61, 2-63, 3-68; ST)

489-N. (Translation-Brutcher no. 4993.) Changes in Strength and Plasticity During Direct and Reverse Martensitic Transformations. M. E. Blanten and A. K. Mashkon. Metallovedenie i Termicheskaya Obrabotka Metallov, Nov. 1959, p. 13-19.

Previously abstracted. See item 86-N, 1960. (N8p, Q27a, Q23, M26, Q29n, 3-68, 2-63; Fe-b, Ni, Mn, C)

490-N. (Translation-Brutcher no. 4994.) Transformations in Steel During Heating. N. N. Lipchin. Metallovedenie i Termicheskaya i Obrabotka Metallov, Nov. 1959, p. 19-23.

Previously abstracted. See item 87-N, 1960. (N8, 2-64; AY)

491-N. (Translation-Brutcher no. 5001.) Carbide Transformation in Alloy Steels. A. P. Gulyaev. Metallovedenie i Termicheskaya Obrabotka Metallov, Nov. 1959, p. 54-61.

Decomposition of Me23C6 carbide in tungsten steel; carbide transformations in Cr-W-V die steels; carbides formed during tempering of 12% chromium steel; carbide transformations in molybdenum steels. (N8r; AY)

492-N. (Ukranian.) Study of the Effect of Small Inclusions of Cadmium on Volume

and Border Diffusion of Cadmium in Copper. A. L. Revo. Ukrainskii Fizichnii Zhurnal, v. 6, no. 1, 1961, p. 143-144.

Diffusion of Cd in pure Cu and in Cu with 0.1% inclusion of Cd at 340-900° C. is determined using isotope Cd^{115} (N1, 1-59, 2-60; Cu-b, Cd)

493-N. Degassing and Permeation of Gases in Tube Materials. R. H. Collins and J. C. Turnbull. Paper from "Advances in Electron Tube Techniques" Fifth U. S. National Conference, Proceedings (Sept. 1960). Pergamon Press Inc., New York 22, 1961, p. 186-190.

Permeation by H, N, CO, He and CO_2 is studied for Monel, Inconel, Ni, 52 alloy, Kovar and stainless steel. Thermal outgassing of 403 Monel and 304 stainless steel after various degreasing and firing procedures is measured during heating to 1000° C. (N15, P11m, 2-62, T1; Ni-b, SS, 17-57)

494-N. Thermal Degassing of Tube Materials. R. H. Collins and J. C. Turnbull. Paper from "Advances in Electron Tube Techniques". Fifth U. S. National Conference, Proceedings (Sept. 1960). Pergamon Press Inc., New York 22, 1961, p. 191-195.

Gas evolution rates are measured for Ni, cold rolled or clad steel, Ta, Cu, Mo, N, Ti and various ceramic materials during degassing by continued heating at 400-1000° C. (N15, P11m, 2-60, T1; ST, Ni-b, EG-d37, NM, 17-57)

495-N. Kirkendall Effect and Diffusion in the Gold-Platinum System. Pt. 1. A. Bolk. Acta Metallurgica, v. 9, July 1961, p. 632-642.

Measurement of the Kirkendall effect as a function of time temperature in a number of "sandwich type" couples consisting of pure Au and Pt, polycrystalline and monocrystalline, and of pure Au and a Au-rich alloy. Phenomena associated with the Kirkendall effect including porosity, dimensional and structural changes and phase boundary displacement. 22 ref. (N1; Au, Pt)

496-N. Kirkendall Effect and Diffusion in the Gold-Platinum System. Pt. 2. The Concentration Penetration Curves and the Diffusion Coefficients. A. Bolk. Acta Metallurgica, v. 9, July 1961, p. 643-652.

The over-all diffusion coefficient is calculated from concentration penetration curves by the Matano graphical method. From the observed Kirkendall displacement and the data concerning the concentration gradient and the concentration in the marker interface, partial diffusion coefficients are calculated. Method for expressing the Kirkendall effect in a numerical value between 1 and 0. 18 ref. (N1; Au, Pt)

497-N. A Study of the Recrystallization and Grain Growth of Cold Rolled and Annealed Titanium -10% Molybdenum Alloy. T. H. Schofield and A. E. Bacon. Acta Metallurgica, v. 9, July 1961, p. 653-669.

Distribution of dislocations in a Ti-10% Mo alloy after cold deformation and annealing is studied using a decoration technique to reveal dislocation sites. Specimens are deformed at various degrees of strain by the cold rolling between 4 and 80% reduction and subsequently reheated at 820-850° C. for increasing periods in the beta phase field followed by cooling at the critical rate. (N5, N3, 2-64, 3-68; Ti, Mo)

498-N. Investigation of Strain Ageing of Quench-Aged Alpha Iron Containing Nitrogen, Using Internal-Friction Techniques. W. S. Carswell. Acta Metallurgica, v. 9, July 1961, p. 670-677.

The strain aging of alpha iron containing nitrogen quench-aged from 60-180° C. for 6 to 17 days is examined after slight strain by torsional pendulum damping. Changes in damping after strain are described in three stages. Variation in density of dislocations with strain and quench-aging temperature is explained by Koehler's model for the generation of dislocations. 19 ref. (N7e, M26q, X28q; Fe)

499-N. Dendritic and Spheroidal Growth. G. Horvay and J. W. Cahn. Acta Metallurgica, v. 9. July 1961, p. 695-705.

Exact solutions to the diffusion equation are obtained which correspond to diffusion controlled growth of elliptical paraboloids (dendrites; forward growth with linear time dependence)

and spheroids (growth with square root of time dependence). The elliptical dendrite includes as special cases the dendrite of circular cross section and the dendrite platelet. 17 ref. (N8q, N12b)

500-N. The Crystallography of the Martensite Reaction in Steel. A. G. Crocker and B. A. Bilby. Acta Metallurgica, v. 9, July 1961, p. 678-688.

Computer programs are prepared and used to examine the crystallographic features of the martensite reactions in steels. The criteria of low or minimum values of the shape shear and the slip or twinning shear are used in assessing the predictions. 30 ref. (N8p, M27; ST)

501-N. (German.) Chemical Influences on Thermally Controlled Structural Changes in Thin Film Single Crystals of Gold. P. A. Thiessen and E. Zabel. Monatsberichte der Deutschen Akademie der Wissenschaften zu Berlin, v. 3, Jan. 1961, p. 22-26.

Structural changes are observed microscopically and electron microscopically on single crystals heated in Au leaves. Transition temperature as influenced by surrounding atmosphere (nitrogen, oxygen, ozone). (N11h, M26, 2-60, 2-61, 2-66; Au, 14-61, 14-62)

502-N. (German.) Observation of Phase Formation in Cathodic Spraying of Metals. P. A. Thiessen and Chr. Stolpe. Monatsberichte der Deutschen Akademie der Wissenschaften zu Berlin, v. 3, Jan. 1961, p. 26-29.

Microscopic investigation in cathodic spraying of Pt and Au on Al_2O_3 films, submicroscopic asbestos fibers and undercooled (200° K.) ice under pure nitrogen atmosphere. Mechanism of crystal growth. (N15g, L25h, M26; Pt, Au, Al)

503-N. Basic Studies of the Metallic State (The Recalescence of Supercooled Liquids on Freezing). M. E. Glicksman. Report of NRL (Naval Research Laboratory Progress, July 1961, p. 20-21. (Available as PB 171320 from U. S. Office of Technical Services, Washington 25, D. C.)

Nonisothermal solidification in supercooled liquid metals is discussed as a materials-energy balance within an adiabatic system. An equation expressing the total mass friction solidified at the end of recalescence is developed and graphed for a number of pure metals. 8 ref. (N12n, 1-54)

504-N. (Russian.) Crystallization of a Binary Alloy for the Assumed Case of Stability. V. T. Borisov. Doklady Akademii Nauk SSSR, v. 136, Mar. 1961, p. 583-586.

Crystallization under the assumed condition that the temperature and concentration on the phase boundaries correspond to those of the equilibrium diagram. An intermediate binary zone located between the liquid and solid phases is assumed. Diffusion and heat exchanges. (N12)

505-N. (German.) Improved Method for X-Ray Determination of Retained Austenite in Hardened Steels. Gerhard Lucas and Hans Nutzel. Siemens Zeitschrift, v. 35, May 1961, p. 445-451.

Nondestructive analysis of retained austenite in hardened steels (100 Cr 2 steel and 100 CrMn 6 steel) by Debye-Scherrer technique eliminating Fe radiation. Determining calibration curves for mixtures of steel filings and austenitic deep drawing steel strip. (N8n, 1-53, S11p; SS-c)

506-N. The Ledge Theory of Recrystallization in Polycrystalline Metals. P. W. Davis, A. P. Greenough and B. Wilshire. Philosophical Magazine, v. 6, June 1961, p. 795-799.

Ledges forming at grain boundaries in plastically deformed metals (corresponding to slip lines formed on the surface) are related to grain boundary migration, energy density and nucleation during deformation as a function of temperature for polycrystalline Ag, Au, Al, Cu and Pb. Recrystallization, grain size, orientation and growth are related to temperature of strain on this basis. 11 ref. (N5, N3, Q24, 2-61, 3-68; Ag, Au, Al, Cu, Pb)

507-N. (Japanese.) Effect of Nickel and Copper Addition on Carbide Precipitation in Hadfield Steel. Pt. 3. Study of Austenitic High-Manganese Steel. Yunoshin Imai and Toshio Saito. Tetsu-to-Hagane (Iron and Steel Institute of Japan, Journal), v. 47, July, 1961, p. 929-935.

Hadfield steels containing 12. 44-14. 87% Mn with additions of

3.02% Cu and 2.79-3.16% Ni are examined microscopically after solutioning and isothermal heat treatments. Carbide and pearlite precipitation on grain boundaries and within grains is noted with data given for tensile properties and Vickers hardness as a function of composition. 13 ref. (N7, N8r, Q-general, 2-60, 2-64; ST, Mn, Cu, Ni)

508-N. (Russian.) Effect of Cooling in Solidification on the Quantity of Eutectic in Aluminum Alloys. V. S. Zolotorevskii and I. I. Novikov. Izvestiya Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk, Metallurgiya i Toplivo, Jan. 1961, p. 39-43.

Alloys with 2-5% Cu and 6% Mg are heated and allowed to cool in crucibles of graphite fireclay or steel of varying wall thickness, in the furnace, in air or in water. Effect of cooling rate on eutectic structure, dendritic liquation and the microhardness of dendritic cells measured at their center and circumference. 12 ref. (N9, N12b, N12q, 3-67; Al-b, Cu, Mg)

509-N. (Russian.) Effect of Previous Aging on the Graphitization of White Cast Iron. I. E. Brainin, Ya. A. Smolyanitski and S. I. Shapovalov. Izvestiya Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk, Metallurgiya i Toplivo, Jan. 1961, p. 49-54.

Cylindrical samples containing 2.73-2.97% C, 1% Si, 0.52-0.68% Mn, 0.17-0.20% S and 0.052-0.054% Cr are aged at 200-700° C. for 0.5-192 hr. and subsequently malleablized at 930° C. for 3-6 hr. Effect of aging and malleablizing temperatures and times on size and shape of graphite inclusions. 9 ref. (N8s, 2-65, J23b; CI-p, 9-69)

510-N. (Russian.) Coalescence, Spheroidizing and Closing of Micropores and Microcracks in Iron Alloys. E. N. Pogrebnoi. Izvestiya Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk, Metallurgiya i Toplivo, Jan. 1961, p. 58-63.

A cast steel is homogenization annealed at 900-1200° C. for 0-10 hr. in the cast state after a 30% cold deformation or previous water quenching from 1100° C. Effect of homogenization temperature and time on number and shape of graphite inclusions and the disappearance of microcracks and pores caused by crystallization, deformation or quenching. 6 ref. (N3, N8q, N12, 2-64, 3-68; ST, 5, 9-69)

511-N. (Russian.) Kinetics of the Recrystallization of Technical Iron During Continuous Rapid Heating. V. I. Ivanov. Izvestiya Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk, Metallurgiya i Toplivo, Jan. 1961, p. 74-77.

Hollow cylinders with a wall thickness of 1 mm. are manufactured from 99.76% pure Fe subjected to a cold deformation of 55%. Determination of the temperatures and times of starting and completed recrystallization during induction heating at 1-1450° C. per sec. Computation of average recrystallization speed. (N5f, 2-64; Fe)

512-N. (Russian.) Redistribution of Carbon in Iron Alloys With Ferritic Austenitic Structure. B. I. Bruk. Izvestiya Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk, Metallurgiya i Toplivo, Jan. 1961, p. 78-86.

Bimetals composed of carbon steel with 0.1-0.2% carbon on one side and austenitic Kh22N15 steel, a Fe-Cr-Ni alloy with 18% Cr and 4-18% Ni, an Fe-Ni alloy with 3.2-23% Ni or carbon steel with 1.08% carbon on the other side are held at 500-1200° C. for 1-100 hr. Effect of heating on final distribution of carbon over the two metals in contact is determined autoradiographically making use of the radioactive isotope C^{14}. 14 ref. (N1e, N8r, 2-64, M23q; CN, AY, C)

513-N. Strain Aging Effects in Columbium Due to Hydrogen. B. A. Wilcox and R. A. Huggins. Paper from "Columbium Metallurgy". v. 10. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 257-278.

The activation energies calculated for strain aging of both as-received commercial arc-melted Cb and hydrogenerated Cb are found to be in close agreement with the activation energy for the diffusion of hydrogen in Cb. It is therefore concluded that hydrogen is the interstitial element responsible for strain aging in Cb at low temperatures.

Hydrogen-charging Cb to the point of forming an internal hydride second phase is shown to cause severe embrittlement. (N7e, P13a, Q26s, 2-61, 3-69; Cb, H)

514-N. Recovery and Recrystallization of Columbium-1.0% Zirconium Alloy. J. R. Stewart, W. Lieberman and G. H. Rowe. Paper from "Columbium Metallurgy". v. 10. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 407-432.

Behavior follows classical theory in that increasing cold work results in decreasing temperature for initiation of recovery and recrystallization. Tests in the as-cold-worked condition show that the elevated temperature yield strength decreases and primary creep rate increases with increasing cold work. The best combination of properties is obtained by a 1200° C. anneal following a cold reduction of 20-40%. (N4, N5, Q-general, 2-61, 2-64, 3-68; Cb-b, Zr)

515-N. The Recrystallization Behavior of Columbium--Vanadium Alloys. B. S. Shabel, F. W. Kunz and D. L. Douglass. Paper from "Columbium Metallurgy". v. 10. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 435-457.

A grain size effect is noted on the recrystallization kinetics in one alloy. A Fourier analysis of the (110) line provides a qualitative description of line broadening in the cold rolled specimens; the application of this technique to annealed specimens suggests that the particle size contribution, probably the result of polygonization, increases to a measurable extent as the temperature is raised above 900° C. The cold rolled textures are similar to those obtained in other b-c-c. metals. 7 ref. (N5, N4, 2-59; Cb-b, V)

516-N. (Translation.) Diffusion of Tungsten in a Cobalt-Based Alloy. I. I. Kovenskii. Soviet Physics--Solid State, v. 3, Aug. 1961, p. 252-254. (Translation of Fizika Tverdogo Tela, v. 3, Feb. 1961, p. 317-670).

A radioactive tracer method, with W-185, is used to determine the diffusion coefficients for tungsten diffusion in a binary alloy (98.66% Co, 0.82% W) at 1100-1350° C. 4 ref. (N1e, 1-55; Co-b, W)

517-N. A High Temperature X-Ray Study of Ordexing in Iron-Aluminium Alloys. A. Lawley and R. W. Cahn. Physics and Chemistry of Solids, v. 20, Aug. 1961, p. 204-221.

The variation with temperature of long-range order in Fe-Al (19-50%Al) solid solutions is studied up to 800° K. using a high temperature diffractometer and short-range order is studied at room temperature by measuring diffusely scattered X-rays. The order disappears gradually during heating with no sudden drop at the critical temperature. The degree of order at a given temperature below critical temperature depends on the thermal history. Magnetic properties at high temperature are given with superlattice and atomic configurations and a proposed phase diagram. 47 ref. (N10, M22g, 2-61, P16; Fe-b, Al)

518-N. Germanium Dendrite Studies. Pt. 1. Studies of Twin Structures and the Seeding Mechanism. J. W. Faust, Jr., and H. F. John. Electrochemical Society, Journal, v. 108, Sept. 1961, p. 855-860.

Review of orientation and twin requirements of suitable seeds for dendrite growth of long ribbons of semiconductors. Study of seeding mechanisms, growth buttons and button wings and the initiation and mechanism of spontaneous and controlled dendritic growth from buttons. 10 ref. (N12b, Q24a, 3-72; Ge)

519-N. Germanium Dendrite Studies. Pt. 2. Lateral Growth Processes. J. W. Faust, Jr., and H. F. John. Electrochemical Society, Journal, v. 108, Sept. 1961, p. 860-863.

Ge dendritic ribbons are studied by metallographic techniques, showing, that the formation of a ribbon is a complex process involving the lateral extension of arms from the central core to give, at one stage, and H-shaped cross section, which is not dependent on the twin structure. 12 ref. (N12b, M-general; Ge)

520-N. Germanium Dendrite Studies. Pt. 3. Dislocations. J. W. Faust, Jr., and H. F. John. Electrochemical

Society, Journal, v. 108, Sept. 1961, p. 864-868.

The dislocation arrays in fractured and etched Ge dendritic ribbons are described with the three main areas where they can occur. The source is entrapped molten Ge which causes plastic deformation on freezing. 15 ref. (N12b, M26b; Ge)

521-N. Single Crystal Silicon Overgrowths. Albert Mark. Electrochemical Society, Journal, v. 108, Sept. 1961, p. 880-885.

The pyrolytic process for the vapor phase deposition of single crystal Si overgrowths on parent substrates is described. The method utilizes the dissociation of $SiCl_4$ by H in an open tube flow process at 1150-1200° C. with flow rates of 250-2000 milliliters per min. Free energy and vapor pressure data and the dissociation relationship are discussed with the dependence on temperature of the Si morphologies. (N15g, M26, 2-61; Si, 14-61)

522-N. Grain-Boundary Diffusion. A. E. Austin and N. A. Richard. Journal of Applied Physics, v. 32, Aug. 1961, p. 1462-1471.

Diffusion of Ni into grain boundaries of various tilt angles in Cu bicrystals is studied. Concentration contours from the grain boundary and the lateral lattice diffusion are measured by means of electron-probe microanalysis. The product of grain boundary width and diffusion coefficient is calculated and comparisons made with theoretical solutions. The grain boundary coefficient is concentration dependent above 3% Ni in a 45° tilt boundary. With lower tilt angles, the coefficient is concentration dependent above 0.5% nickel. 17 ref. (Ni, N10; Cu, Ni)

523-N. Surface Kinetics and Physics Investigation of the Reaction Between Single-Crystal Germanium and Iodine. W. J. Heinecke and S. Ing, Jr. Journal of Applied Physics, v. 32, Aug. 1961, p. 1498-1504.

The kinetics of the reaction and the resulting electrical surface are studied. Activation energy of 18.5 kcal/mole is found; however, frequency factors are found to differ with orientation. Aging effect of the surface is found through field-effect surface measurements. A surface acceptor-like trap with an energy level of 0.44 ev. is investigated with an indicated density of 1.4×10^{12}/cm.^{2} 13 ref. (N15e; Ge, I)

524-N. Single-Crystal Tin Films. Richard W. Vook. Journal of Applied Physics, v. 32, Aug. 1961, p. 1557-1561.

High-purity films made in ultra high vacuum by evaporation on (001) faces of NaCl yield single-crystal formation at liquid nitrogen temperature, using cleaved surfaces and short successive evaporation times. With substrates at 0° C., or with one continuous evaporation rate of more than 10 sec., films are polycrystalline and (100) oriented. Factors influencing grain growth are discussed. (N15g, N3, 2-61; Sn, 14-62)

525-N. Ferromagnetic Nucleation Sources on Iron Whiskers. R. W. De Blois. Journal of Applied Physics, v. 32, Aug. 1961, p. 1561-1563.

A temperature-dependent shift of nucleation-field contour, increases in nucleation field following electropolishing and a correlation between microscopic surface imperfections and regions of nucleation-field minima are observed. Results indicate that abrupt surface contour variations are primarily responsible for reducing the observed nucleation fields for iron whiskers to below the ideal value. 8 ref. (N2q, 2-61; Fe, 14-61)

526-N. Study of Electron Bombardment of Thin Films. G. B. Gilbert, T. O. Poehler and C. F. Miller. Journal of Applied Physics, v. 32, Aug. 1961, p. 1597-1600.

Methods of changing physical properties of thin metallic films including alterations of crystal structure resulting from electron bombardment. Films vapor deposited on amorphous substrates are bombarded by a 35-kev. electron beam in a Zn recrystallization process. X-ray diffraction photographs and photomicrographs indicate substantial crystal growth in films of In, Bi and Ge. 8 ref. (N3, P-general, 2-67; In, Bi, Ge, 14-62)

527-N. X-Ray Diffraction Study of Interdiffusion in Cu-Ni Powder Compacts. Bertina Fisher and P. S. Rudman. Journal of Applied Physics, v. 32, Aug. 1961, p. 1604-1611.

Interdiffusion in Cu-Ni powder compacts studied by X-ray diffraction line

shape analysis. The dominant mechanism from 750-950° C. is grain boundary diffusion. At 1050° C. a new mechanism with a higher activation energy dominates, identified as bulk diffusion. Metallographic observation indicates that, prior to appreciable interdiffusion, the Cu, by surface diffusion, envelopes the Ni particles with subsequent interdiffusion between the Ni-rich core and Cu-rich shell. 7 ref. (N1c, 2-61; Cu, Ni)

528-N. Polygonization in Bent Zinc Crystals. P. P. Sinha and Paul A. Beck. Journal of Applied Physics, v. 32, July 1961, p. 1222-1226.

A dislocation etching technique for revealing the edge dislocations produced by bending is used to examine mechanical polygonization mechanisms in annealed and unannealed high purity Zn crystals. Low angle boundaries are formed in bending suitiably oriented specimens, the process being independent of thermal activation. 12 ref. (N4, N5, M26b, 3-68, 3-72; Zn, 14-61)

529-N. The Sub-Critical Graphitization of Steels and Related Alloys. J. E. Harris, J. A. Whiteman and A. G. Quarrell. Paper from "Steels for Reactor Pressure Circuits". no. 69. Iron and Steel Institute, London SW 1, England, 1961, p. 54-76.

Graphitization characteristics of a number of vacuum melted pure Fe-C and Fe-C-Si alloys. Increasing the impurity contents, raising the Al levels and quenching to martensite accelerate graphitization. Little advantage is to be gained from making Ni-Mg additions to a hypereutetoid steel; the stablizing effect of the Mg is counter balanced by the graphitizing action of the Ni. (N8s, 2-60, 2-64, 3-69; ST)

530-N. The Decomposition of Cementite in Low-Carbon Steels. G. V. Jeminson and G. T. Higgins. Paper from "Steels for Reactor Pressure Circuits". no. 69. Iron and Steel Institute, London SW 1, England, 1961, p. 77-88.

The extent of graphitization in 0.15% C steels at 600° C. is critically dependent upon the nucleation rate and in particular upon the strain energy term associated with the formation of a graphite nucleus. Above 600° C. the restricted nucleation gives rise to a reversion in the graphitization rate. At lower temperatures nucleation occurs more readily and the growth rate assumes greater importance in the over-all control of the graphitization rate. Growth is controlled initially by the rate of carbon diffusion and in the later stages by the rate of solution of cementite. (N8s, N8k, N2, 2-60, 2-62; CN-g)

531-N. The Graphitization of Low-Carbon Steels. M. Farrow. Paper from "Steels for Reactor Pressure Circuits". no. 69. Iron and Steel Institute, London SW 1, England, 1961, p. 89-100.

Importance of deoxidation technique on the susceptibility of a particular steel to graphitization. Certain alloying elements are shown to enhance graphitization (Al, Si, Ni, Cu and Co) while others (Cr, Ti, V and Mo) retard the process. The importance of nitrogen as a graphitization inhibitor. (N8s, 2-60; CN-g)

532-N. (Ukranian.) Analysis of Experimental Data of Metal and Alloy. S. D. Hertzriken. Ukrainskii Fizichnii Zhurnal, v. 6, Jan. 1961, p. 138-139.

Equation and tables for diffusion parameters of Ag in AgSn, AgCd and AgCu systems and for the diffusion of Fe in FeAl system at the solidus temperature. (N1e; Ag-b, Fe-b, Al)

533-N. (English.) Diffusion of Nitrogen in Iron-Titanium Alloys. T. Konkoly. Periodica Polytechnica, v. 5, Jan. 1961, p. 5-12.

Alloys of Armco iron with 0-4.25% Ti and having Ti/C ratios between 0 and 85 are nitrided for 5 hr. at 460-660° C. with determination of microhardness, microstructure, diffusion coefficient and case properties as a function of Ti/C ratio. (N1, J28k, M27, Q29, 2-60; Fe-b, Ti)

534-N. (German.) Age Hardening of Lead-Antimony Alloys Containing 2-16% Antimony. H. Borchers and K. Bunnenberg. Metall, v. 15, Aug. 1961, p. 765-771.

Investigation of age hardening of cast, air cooled or quenched, as-cast or diffusion-annealed (160-240° C.) and (-60 to 100° C.) aged specimens with and without pre-aging at 0 to -60° C. by hardness, microhardness and tensile testing and by microscopic examination. (N7a, M-general, Q-general, 2-61, 2-65; Pb-b, Sb)

535-N. Self-Diffusion in 50-50 Gold-Cadmium. H. B. Huntington, N. C. Miller and V. Nerses. Acta Metallurgica, v. 9, Aug. 1961, p. 749-754.

Studies on annealed specimens by the standard sectioning technique using radioisotopes Cd^{115} and Au^{198} at 303-601° C. The ratio of the diffusivities is roughly 4:3 throughout and is consistent with a mechanism of nearest neighbor vacancy jumping. Data are given for diffusion coefficients and the activation energies for diffusion as a function of temperature. 16 ref. (N1d, M26s, 1-59, 2-61; Au-b, Cd-b)

536-N. Diffusion. P. H. Sutter. Chapter 7 from "Thermoelectricity--Science and Engineering". Interscience Publishers, Inc., New York 1, 1961, p. 154-180.

Various diffusion processes which occur in thermoelectric materials are discussed, giving coefficients for several semiconductors (S, Se, Te, Ge, In, Ga, Si, Sb, Cd) in InAs, InSb, GaSb, ZnSb, PbTe, PbSe, PbS, Bi_2Te_3 and Bi_2Se_3 at 200-1120° C. 45 ref. (N1e; EG-j)

537-N. Investigation of Aging of Welded Joints After Heat Treatment. V. F. Grabin, S. M. Gurevich, V. A. Rafalovskii and V. I. Trefilov. Avtomaticheskaya Svarka, v. 14, June 1961, p. 3-13.

Kinetics of aging of tempered weldments composed of three alloys containing different concentrations of beta stabilizing elements. Effect of aging on hardness, electrical resistance, dilatometry and microstructure. 17 ref. (N7d, M23b, M27, P15g; Ti-b, 7-51)

538-N. (Russian.) Crystallization Fissures Occurring in Weldments. N. F Lashko and S. V. Lashko-Avakyan. Avtomaticheskaya Svarka, v. 14, June 1961, p. 37-46.

Polygonization character of formation of hot cracks in welded austenitic steel weldments. Formation of fissures along the boundaries of crystallites in the solid state and propagation to the crystallization front. Etching methods and microstructure. 15 ref. (N5, M20q, M27f; SS, 7-51, 9-72)

539-N. Recrystallization of Iron and Iron-Manganese Alloys. W. C. Leslie, F. J. Plecity and J. T. Michalak. Metallurgical Society of AIME, Transactions, v. 221, Aug. 1961, p. 691-700.

Isothermal recrystallization and grain growth in zone and vacuum method Fe and Fe-Mn alloys with up to 0.60% Mn are studied at 480-650° C. after 60% cold reduction. The recrystallization is typical of a growth controlled process and rate of growth is determined by the extent of recovery, both processes being time, temperature and composition (Mn) dependent. 31 ref. (N3, N4, N5, 2-60, 2-61, 3-67; Fe-b, Mn)

540-N. The Growth of Large Single Crystals of 99.9% Iron of Controlled Orientation. D. F. Stein and J. R. Low. Metallurgical Society of AIME, Transactions, v. 221, Aug. 1961, p. 744-746.

Single crystals are grown from different lots of Ferrovac "E" iron at 825-940° C. in a temperature gradient furnace by the strain anneal method. Using a technique to seed the crystal similar to Dunn's for Si-Fe, it is possible to orient the crystals in both direction and plane of growth. Technique requirements include pre-annealing below growth temperature before straining, critical strain of 2.2-2.6% and growth temperature of 890° C. 6 ref. (N3r, M26c, 2-61, 2-64, 3-68; Fe-a)

541-N. Structural Relationships Between Precipitate and Matrix in Cobalt-Rich Cobalt-Titanium Alloys. R. W. Fountain, G. M. Faulring and W. D. Forgeng. Metallurgical Society of AIME, Transactions, v. 221, Aug. 1961, p. 747-751.

Precipitation of the phase Co_3Ti (Cu_3 Au Type) from a Co-5% Ti alloy is investigated using single-crystal X-ray and electron diffraction techniques. Oscillation and transmission Laue patterns of specimens aged for short times at 600° C. indicate the formation of Ti-rich and Ti-poor zones coherent with the (100) matrix planes. Longer aging times at 600° C. establish that the equilibrium phase also forms on the (100) matrix planes as platelets. 13 ref. (N7, M22g, M26c, 2-65; Co-b, Ti)

542-N. The Effect of Hydrostatic Pressure on Self-Diffusion in Lead. John B. Hudson and Robert E. Hoffman. Metallurgical Society of AIME, Transactions, v. 221, Aug. 1961, p. 761-768.

The self-diffusion coefficient of pure Pb is over a temperature range of about 150° C. near the melting point at five pressures between atmospheric and 40 kb. using a radiotracer technique. The coefficient is represented by an equation for constant temperature. 24 ref. (N1d, 1-59, 2-61, 3-74; Pb)

543-N. The Thermal Diffusion of Hydrogen in Alpha-Delta Zircaloy-2. J. M. Markowitz. Metallurgical Society of AIME, Transactions, v. 221, Aug. 1961, p. 819-824.

The movement of hydrogen in two-phase Zircaloy-2 under the influence of a thermal gradient is studied in tubular specimens at 250-500° C. in a thermal gradient. A gross displacement of hydrogen toward the cooler regions of the specimen is observed with consequent copious precipitation of delta zirconium. The kinetics of the diffusion are analyzed. 8 ref. (N1c, N7, 2-61; Zr-b, H)

544-N. Recrystallization of a Silicon-Iron Crystal as Observed by Transmission Electron Microscopy. Hsun Hu and A. Szirmae. Metallurgical Society of AIME, Transactions, v. 221, Aug. 1961, p. 839-844.

The early stages of recrystallization during 550-600° C. annealing of a 70% cold rolled, 3% Si-Fe crystal of the (110) (001) orientation are studied with a Siemens electron microscope and compared with previous electron diffraction texture analysis. The driving energy for recrystallization and the critical radius for growth are calculated from the dislocation energy and the energy of the subgrain boundaries. The recrystallization characteristics are discussed for crystals with different initial orientations. 15 ref. (N5, N3, M26, M21e, 2-64, 3-68, 3-72; Fe-b, Si)

545-N. Solute Segregation During Dendritic Growth. F. Weinberg. Metallurgical Society of AIME, Transactions, v. 221, Aug. 1961, p. 844-850.

Measurements of solute segregation in Pb and Sn-based binary alloys during dendritic growth using radioactive Ag^{110}, Tl^{204}, Zn^{65}, Sb^{124}, Sn^{113} and Co^{60} solute elements and measuring the activity of dendrites cut from decanted specimens. The ratio of the dendrite to matrix concentration is dependent on the equilibrium distribution coefficient. 8 ref. (N12b, 1-59, 2-60, 9-69; Sn-b, Pb-b, Ag, Tl, Zn, Sb, Co)

546-N. The Hardening Mechanism in Nitralloy-N Steel. G. C. Gould and H. J. Beattie. Metallurgical Society of AIME, Transactions, v. 221, Aug. 1961, p. 893-895.

A low-alloy Ni-Al age hardening steel, Nitralloy-N, in the tempered martensitic or carbide spheroidized conditions is variously heat treated at 975-1750° F. with extraction replica, X-ray diffraction and electron microscopy studies and Rockwell C hardness measurements of resulting structures. The age hardening mechanism is attributed to an Ni-Al precipitate which goes in and out of solution reversibly without losing coherency. 4 ref. (N7a, N7b, M-general, Q29n, 2-60, 2-64, 2-65; AY)

547-N. The Strain Ageing of Mild Steel Flat Rolled Products. W. J. S. Roberts. South Wales Institute of Engineers, Proceedings, v. 76, June 1961, p. 71-80.

Aging induced by cold work is discussed in terms of the mechanical and working properties, aging rate and strain-aging propensity of a given steel with means for elimination or reduction of the effect. 9 ref. (N7e, 3-68, 1-67; CN, 4-53)

548-N. The Recovery and Recrystallization of Copper and Aluminum Under Stress. P. H. Thornton and R. W. Cahn. Institute of Metals, Journal, v. 89, Aug. 1961, p. 455-463.

Tensile and microhardness tests, with metallographic examination, on single and polycrystal high purity Al and Cu annealed and deformed in creep after various amounts of prestrain. Hardness changes and grain growth are used as indexes of recrystallization and recovery as a function of stress. 21 ref. (N3, N4, N5, Q-general, 3-66, 3-68; Cu-a, Al-a)

549-N. (Translation-AIP.) Pulsations in the Growth Rate of a Crystal and Their Effect on the Structure and Properties of Material Produced by the Czochralski Method. L. S. Milevskii. Soviet Physics--Crystallography, v. 6, Sept-Oct. 1961, p. 193-198.

The conditions for the formation of crystal lattice defects in striated impurity

distribution in a grown Si crystal are investigated, showing that impurity accumulation, particularly oxygen, on the crystallization front may result in a modulation of the growth rate and, in the case of unsymmetical thermal conditions, in spiral growth of the crystal. 9 ref. (N3, 3-67, 3-69; Si)

550-N. (Translation-AIP.) Some Aspects of the Crystallization of Germanium-Silicon Alloys During Zone Melting. V. G. Fomin, A. V. Ovodova, O. V. Bogorodskii and S. Sh. Shil'shtein. Soviet Physics--Crystallography, v. 6, Sept-Oct. 1961, p. 199-201.

X-ray metallography showing that various imperfections occur in Ge-Si monocrystals grown by zone melting. The etch figures increase in number and decrease in size along the length of the crystal; the block size becomes smaller and the angle between blocks increases. The effects are caused by the increase in Si and by the rise in the microscopic inhomogeneity with the continuous accumulation of defects resulting in a polycrystal. 12 ref. (N12, M26s, C28k, 2-60; Ge-b, Si, 14-61)

551-N. (Russian.) Investigation of Interdiffusion in Powder Mixtures by the Method of Concentrated Distributions. A. I. Raichenko. Fizika Metallov i Metallovedenie, v. 11, June 1961, p. 870-877.

Investigation of Cu-Ni alloy powders to develop a mathematical method for calculating concentrated distributions for binary powder systems having an homogeneous diffusion. 11 ref. (N1, 1-54; Ni-b, Cu, 6)

552-N. (Russian.) Solidification of Binary Alloys in the Interval of Temperatures. M. K. Likht and S. B. Kuz'minskaya. Fizika Metallov i Metallovedenie, v. 11, June 1961, p. 878-882.

The crystallization process of binary alloy is considered to be an interaction between diffusion and heat exchange. Equations indicate conditions for the existence of a solid-liquid zone and its development in an alloy assumed to be stationary. 7 ref. (N12)

553-N. (Russian.) Phase Transformations During Oxidation of Metallic Uranium. A. F. Bessonov and V. G. Vlasov. Fizika Metallov i Metallovedenie, v. 11, June 1961, p. 957-959.

Radiographic investigation during oxidation in air and CO_2 at different temperatures and time periods. Radiogram analysis by the Debye-Sherrer method. 8 ref. (N-general, R1h, 2-61, 2-66, 3-67; U)

554-N. (German.) Influence of Tensile Stresses on Temperature of Starting Martensite Formation. Heinrich Beisswenger and Erich Scheil. Archiv fur das Eisenhuttenwesen, v. 32, July 1961, p. 501-502.

Magnetic measurement of the temperature of the start of martensite formation during cooling of tensile-stressed wire specimens (0.5 mm. diameter) of Fe-Ni alloy (26% Ni) from the austenite temperature under protective atmosphere. (N8p, 2-61, 3-66; Fe-b, Ni)

555-N. (Russian.) Nickel Distribution Between Phases in White Iron. K. I. Vashchenko, R. P. Todorov and G. I. Koshovnik. Liteinoe Proizvodstvo, Feb. 1961, p. 25-26.

Samples cast from white iron (2% Ni) show different distribution of Ni in ferrite, austenite and cementite phases. Arrest points and temperature changes in eutectoid transformations as influenced by Ni contents. (N8, 1-53, 2-60; CI-p, Ni)

556-N. (Russian.) Influence of Some Factors on Graphitization of Ductile Iron. P. I. Stepin. Liteinoe Proizvodstvo, Feb. 1961, p. 34-37.

Experiments with molten iron in an autoclave to study nodularization, growth, diffusion and decomposition of graphite, kinetical changes in microstructure, composition of matrix and distribution of graphite and Mg under heat, cooling and pressure. 5 ref. (N8s, 2-60, 2-61, 3-74; CI, Mg)

557-N. (Translation-Brutcher no. 5076.) Gases in Ferroalloys. R. Limpach and B. Marincek. Archiv fur das Eisenhuttenwesen, v. 31, Nov. 1960, p. 639-643.

Previously abstracted. See item 110-N, 1961. (N15, 2-60; Fe-b)

558-N. (Translation-Brutcher no. 5145.) Effect of Alpha and Epsilon Phases on the Strain Hardening of Austenitic Steels While Being Worked. I. N. Bogachev and A. F. Sachavskii. Izvestiya VUZ--Chernaya Metallurgiya, Feb. 1961, p. 100-108.

Previously abstracted. See item 414-N, 1961. (N7e, N8p, 3-68; SS-e, Mn, Ni)

559-N. (Translation-Brutcher no. 5183.) Solidification and Crystallization of Steel in the Mold as a Source of Defects in Ingots and Forgings. V. Koselev and S. Burda. Hutnik, v. 11, Mar. 1961, p. 110-117.

Review of defects found in steel forgings and caused by shrinkage during solidification in the mold, the change from the liquid to the solid state. Dimensions of the main pipe and micropipes; formation of voids and shrinkage cracks. (N12; 9, 4-51, 5-59; ST)

560-N. (Translation-Brutcher no. 5128.) Effect of Additional Alloying of Silicon-Manganese Steel Upon Austenite Transformation. M. P. Braun. Dopovidi Akademii Nauk Ukrainskoi RSR, v. 3, Apr. 1961, p. 335-339.

Investigation of isothermal austenite decomposition in Si-Mn constructional steels (0.60% Si, 1.30% Mn) additionally alloyed with Ni, Si, Cr, Cu, Mo and Ti, either jointly or separately in part, to improve ductility and toughness of the steel and the austenite stability in the upper and intermediate temperature ranges. (N8, 2-60; ST)

561-N. Activation Energy Determination of Secondary Carbide Growth During Malleabilizing. D. S. Eppelsheimer and D. S. Gill. Indian Institute of Metals, Transactions, v. 14, Mar. 1961, p. 53-60.

The activation energy of the carbide growth process is determined for an Fe-1.45% Si-2.45% C alloy from the measured degree of graphitization produced by annealing at various temperatures. 5 ref. (N8, J23b, P13a, 2-61; CI-s)

562-N. (German.) A Remarkable Deformation Mechanism of Lamellar Pearlite. Karl Wellinger and Manfred Proger. Naturwissenschaften, v. 48, June 1961, p. 451-452.

Deformation tests on small cylindrical specimens of CK 35 steel (0.35% C) after annealing 5 1/2 hr. at 970° C. and subsequent microscopic investigation of deformation mechanism. (N8h, Q24, 2-64; ST)

563-N. (Ukranian.) Determination of Dislocation Density Formed During Deformation of Armco Iron and Magnesium. S. D. Herzricken, N. N. Novicov and N. Y. Horidko. Ukrainskyi Fizychnyi Zhurnal, v. 6, Mar-Apr. 1961, p. 229-232.

Volume changes during annealing of samples, deformed by bending at 100-750° C. for various degrees of deformation. Density of dislocations is studied as a function of lattice structure. (N10, P10d, 3-68; Fe, Mg)

564-N. (Ukranian.) Effect of Calcium on Form of Graphite Inclusions in Fe-C-Si Alloy. V. M. Svechnikov. Dopovidi Akademii Nauk Ukrainskoi RSR, July 1961, p. 911-914.

Microstructure and mechanical properties of Fe-C-Si cast iron and especially the formation of spheroid and lamellar graphite grains are studied as functions of Ca additions and cooling rate. 7 ref. (N8, Q-general, 2-60, 3-67; CI)

565-N. Self-Diffusion in Body-Centered Cubic Zirconium. G. Kidson and J. McCurn. Canadian Journal, Physics, v. 39, Aug. 1961, p. 1146-1157.

Measurement of self-diffusion coefficients in crystal-bar Zr by sectioning techniques at 1100-1500° C. using radioactive Zr^{95} as the tracer. The diffusion mechanism is explained in terms of vacant lattice sites. 18 ref. (N1d, 1-59, 2-61, 3-73; Zr)

566-N. Effect of Solute Atoms on Grain Boundary Migration in Pure Metals. E. L. Holmes and W. C. Winegard. Canadian Journal, Physics, v. 39, Aug. 1961, p. 1223-1226.

Investigation of grain growth in zone refined Sn with 0.002-0.10 at.% Pb added. Effect of solute concentration on grain boundary migration and activation energies. 5 ref. (N3, 2-60; Sn, Sb)

567-N. (Japanese.) Metallurgical Behavior of Magnox Alloy. Pt. 1. Grain Growth and Mechanical Properties. Ryukichi Nagasaki and Kensuke Shiraishi. Atomic Energy Society of Japan, Journal, v. 3, Aug. 1961, p. 623-633.

Changes in microstructure and room and elevated temperature mechanical properties of extruded specimens of Magnox E, C and A12 and Mg-1% Al alloys after annealing and soaking heat treatment as a function of composition,

strain rate, temperature (20-720° C.) and heat treatment time. Data are given for hardness, tensile and creep properties, strain and age hardening effects, fracture modes, stress-strain relations, plasticity, recrystallization grain growth and grain size. 4 ref. (N3, N-general, M27, Q-general, 2-60, 2-64, 3-68; Mg-b, Al, 4-58)

568-N. Transformations in the Ta-H and Ta-D Systems. W. E. Wallace, Per Kofstad and L. J. Hyvonen. Pure and Applied Chemistry, v. 2, no. 1-2, 1961, p. 281-285.

X-ray and neutron diffractions and measurements of electrical resistance, magnetic susceptibility, internal friction, heat capacity, residual entropy and vapor pressure of Ta_2H and Ta_2D compounds. Determination of the mechanism of transformation of the solid solution of H in Ta (alpha-phase) to Ta_2H (beta-phase) as a rearrangement of the H atoms, rather than as a magnetic phenomenon. 5 ref. (N15e, P-general; Ta)

569-N. Growth of Metal Crystals From the Vapor Phase. Technical News Bulletin (National Bureau of Standards), v. 45, Aug. 1961, p. 130-131.

Zn, K and Hg are crystallized from a high purity, supersaturated phase under controlled conditions to determine rate and pattern of growth. 5 ref. (N15g, N3r, 1-54; Hg, K, Zn)

570-N. (English.) Grain Boundary Migration in Recrystallized Armco Iron During Grain Growth. Wu Cheung-hung and Chuang Yu-chih. Scientia Sinica, v. 10, June 1961, p. 182-188.

Use of the vacuum-etching method to study effects of time, temperature, interfacial energy of the grains and presence of grain substructures on the rate and direction of grain growth in specimens heat treated at 770-810° C. for various times. 10 ref. (N3, N5, 2-61, 2-64, 3-67; Fe-a)

571-N. Application of Rare Earths to Ferrous and Nonferrous Alloys. J. F. Collins, V. P. Calkins and J. A. McGurty. Chapter 20 from "The Rare Earths". John Wiley & Sons, Inc., New York 16, 1961, p. 499-511.

Determining the effects of yttrium and rare-earth metal additions on the properties of ferrous-base alloys, Cr-base alloys and V. Grain growth and rates of oxidation for Fe-Cr-Al and Fe-Cr-Y alloys are determined at 1475-2300° F. 36 ref. (N3, Q-general, R1h, 2-60; Fe, Cr, AD-n, EG-g45)

572-N. Diffusion Kinetics. Aron Kuppermann. Nucleonics, v. 19, Oct. 1961, p. 38-42.

A mathematical model of the diffusion kinetic or radical diffusion process is formulated for a dilute aqueous solution in order to calculate the amounts of each chemically stable product formed. The theory is tested experimentally with graphical analysis showing the influence of linear energy transfer and solute concentration of Co^{60} gamma rays on the molecular yield. 33 ref. (N1c, 1-54)

573-N. (German.) Behavior of Nodular Cast Iron as a Material for Dies in Aluminum Pressure Die Casting. A. T. Balewsky and J. Dimov. Freiberger Forschungshefte, no. B 59, 1961, p. 7-25.

Microscopic investigation and impact testing of nodular cast iron specimens containing Mg, after annealing at 600-800° C. to determine effect of precipitation of Mg-phosphide along ferrite grain boundaries on impact cracking. (N7d, Q6, W19n, 17-57; CI-r, Mg, Al)

574-N. (German.) Material Problems in Die Casting of Steel. Joseph Czikel and Gunter Quapil. Freiberger Forschungshefte, no. B59, 1961, p. 27-44.

Microstructure investigation and mechanical testing of sand and die cast GS 52 steel to study mechanical properties and normalizing time as influenced by solidification rate. (N12, J24, Q-general, 3-67; ST)

575-N. (German.) Prerequisites for Production of Castings of High-Strength Cast Iron. Miklos Csiszar. Freiberger Forschungshefte, no. B 59, 1961, p. 64-83.

Investigation of microstructure and mechanical properties of cast iron, as influenced by composition, inoculation with Si and Cr and cooling rate. (N8, Q-general, 2-60, 2-64, 3-67; CI, Si, Cr)

576-N. (German.) Influence of Manganese on Stabilization and Kinetics of Decomposition of Cementite in Malleable Cast Iron.

Stanislav Drapal. Freiberger Forschungshefte, no. B 59, 1961, p. 84-98.

Microscopic and X-ray examination and electrolytic carbide isolation applied to malleable cast iron specimens (1.26-2.25% C, 0.77-1.40% Si, 0.019-0.290% S, 0.02% Cr and 0.2-1.6% Mn) after heat treatment at 720-960° C., to determine stability and decomposition rate of cementite as a function of Mn content. (N8, 2-60, 2-64, M21, M22; CI-s, Mn)

577-N. (German.) Interaction of Al, V and N in Al-Killed, V and N Alloyed Weldable Constructural Steels Containing Approximately 0.2% C and 1.5% Mn. Paul Konig, Werner Scholz and Horst Ulmer. Archiv fur das Eisenhuttenwesen, v. 32, Aug. 1961, p. 541-556.

Acid steel is studied after various heat treatments at temperatures from 500-1350° C. to determine Al-N and V-N equilibria and the precipitation and dissolution of Al and V nitride. (N1e, N7, 2-64; ST, 1-64, Al)

578-N. (German.) Crystallographic Mechanism of Iron Nitride Precipitations in Ferrite. Wolfgang Pitsch. Archiv fur das Eisenhuttenwesen, v. 32, Aug. 1961, p. 573-579.

Theoretic interpretation of iron nitride precipitations in ferrite, in terms of the formation of Fe_8N by diffusion and the precipitation of Fe_4N by martensitic transformation. (N1, N7, N8)

579-N. (Russian.) Kinetics of the Growth of Grains in Alpha-Iron of High Purity. V. I. Ivanov and K. A. Osipov. Doklady Adademii Nauk SSSR, v. 138, Feb. 1961, p. 338-341.

Investigations on cold deformed, heat treated Fe. 24 ref. (N3; Fe)

580-N. (Russian.) General Rules for the Stabilization of a Beta Solid Solution in Titanium Alloys. N. V. Ageev and L. A. Petrova. Doklady Akademii Nauk SSSR, v. 138, Feb. 1961, p. 359-360.

Influence of the electron concentration in a binary and ternary alloy on the formation of a metastable phase during fast cooling. 6 ref. (N5, N12; Ti-b)

581-N. (Russian.) The Possibility of Formation of Solid Solutions in Some Quaternary Systems. N. A. Goryunova, A. V. Voitsekhovskii and V. D. Prochukhan. Vestnik Leningradskogo Universiteta, v. 16, Oct. 1961, p. 156-158.

Investigation in Cu-Te-In-Sb solid solutions based on the principle of the heterovalent substitution. (N12p, 1-54)

582-N. (Russian.) X-Ray Study of Liquid Eutectic Alloy Systems. A. S. Lashko and A. V. Romanova. Izvestiya Akademii Nauk SSSR--Metallugiya i Toplivo, 1961, p. 135-137.

Experimental and theoretical study of the structural correlations of binary alloys in solid and liquid states including the disappearance of quasi-eutectic structure in Pb-Sn, Al-Ag and Au-Sn systems due to the mixing of atoms at 200-400 C. 11 ref. (N12q; Al, Ag, Au, Pb, Sn)

583-N. (French.) Monoclinic Phases in Uranium-Molybdenum Alloys. J. Lehmann. Journal of Nuclear Materials, v. 4, July 1961, p. 218-225.

Martensitic transformation and formation of phases with a monoclinic structure in U-Mo alloys containing 4.8-9.9 at.% upon quenching. The lattice parameters of these phases, designated alpha-b double prime are determined by X-ray diffraction with results being used to plot the parameters as a function of increasing Mo content. 14 ref. (N6q, M26, 2-60, 2-64; U-b, Mo)

584-N. Role of Crystal Structure in Diffusion. Pt. 1. Diffusion Paths in Closest-Packed Crystals. L. V. Azaroff. Journal of Applied Physics, v. 32, Sept. 1961, p. 1658-1662.

The effect of crystal structures of the ZnO, alpha ZnS, BiO_3, $CrCl_3$ and CdI_2 types and anion size, interstices and voids on the diffusion paths are discussed. 12 ref. (N1, M26, 1-54)

585-N. Role of Crystal Structure in Diffusion. Pt. 2. Activation Energies for Diffusion in Closest-Packed Structures. L. V. Azaroff. Journal of Applied Physics, v. 32, Sept. 1961, p. 1663-1665.

The effect of diffusion paths on the activation energies and vacancy formation energies of crystals of the beta AgI, gamma AgI, ZnO, BiSe and Bi_2Se_3 structure types is calculated. 13 ref. (N1, M26, P13a, 1-54)

586-N. Precipitation Sites in Aluminum Alloys. G. R. Frank, Jr., and D. L. Robinson. Journal of Applied Physics, v. 32, Sept. 1961, p. 1763-1764.

Sessile dislocation in the region of a stacking fault are shown to be nucleation sites for gamma prime phase precipitation in Al-Ag alloys and the Ag segregation is explained in terms of extinction fringe contrast. Grain boundary diffusion is observed. 12 ref. (N7, M26, 1-54; Al-b, Ag, 9-69)

587-N. Slip Patterns on Boron-Doped Silicon Surfaces. H. J. Queisser. Journal of Applied Physics, v. 32, Sept. 1961, p. 1776-1780.

High concentrations of B are diffused into Si surfaces and the etch patterns developed are interpreted as slip lines introduced by stress from the nonuniform B distribution in the Si lattice. 25 ref. (N1, 1-54, 3-66; Si, B, 14-61)

588-N. Vapour Deposition of Metals. C. H. J. Johnson. Australian Journal of Applied Science, v. 12, Sept. 1961, p. 303-323.

Calculations are made using thermodynamic and flow theory for the metal deposition rate in a vapor deposition process using a parallel plate cell. The rate is found to be a function of filament temperature and examples include curves for Th, Zr and Ti. (N15g, 1-54)

589-N. (German.) Grain Size Relations in Steels. A. Legat, F. Kubik and A. Moser. Radex Rundschau, no. 4, Aug. 1961, p. 657-663.

Review of role of Al in the production of fine-grain steel with emphasis on austenitic grain size and secondary ferrite grain size as influenced by precipitated aluminum nitride. Amount of aluminum nitride as influenced by temperature (800-1200° C.), soaking time and heating rate in heat treatment. (N3, N8, 2-61, 2-64; Al)

590-N. The Influence of Impurity Atoms on the Annealing Kinetics of Electron Irradiated Copper. D. G. Martin. Philosophical Magazine, v. 6, July 1961, p. 839-846.

Spectroscopically pure Cu and dilute Cu alloys containing 0.05% of Ag, Cd and Be are irradiated with 4 Mev. electrons at -196° C. and annealed at temperatures up to 50° C. The recovery of the irradiation damage is measured by changes in electrical resistance, measured in liquid helium. Annealing peaks are observed in pure Cu and in the dilute alloys as a function of temperature. 7 ref. (N7d, P15g, 2-61, 2-64, 2-67; Cu)

591-N. The Effect of Ordering on the Strength and Dislocation Arrangements in the Ni_3Mn Superlattice. M. J. Marcinkowski and D. S. Miller. Philosophical Magazine, v. 6, July 1961, p. 871-893.

The dislocation configurations and stacking fault behavior in thin foils of Ni_3Mn are examined by transmission electron microscopy for various intermediate states of long-range order and for complete long-range disorder. The flow and yield stress are measured and analyzed in terms of present theories of order strengthening. A mechanism is proposed which is associated with the destruction of the component of short-range order co-existing with long-range order. 30 ref. (N10, M21e, Q23b; Ni-b, Mn)

592-N. The Critical Temperatures of Binary Alloys With One Magnetic Component. G. M. Bell and W. M. Fairbairn. Philosophical Magazine, v. 6, July 1961, p. 907-928.

Binary alloys containing a ferromagnetic or antiferromagnetic component with an arbitrary number of Bohr magnetons such as Ni, Fe, Co and Mn and a component which is neither, such as Pt, Pd, Rh, Al, Si, V, Au or Zn, are studied by a statistical method. The effect of local order in the lattice distribution of the atoms on the Curie or Neel temperature is examined for equilibrium (annealed) alloys where the local order is temperature dependent and for quenched alloys where the lattice distribution is fixed. Values for critical temperatures are given as a function of composition and interaction energies. 20 ref. (N-general, M24b, P16d, 2-61, 2-63)

593-N. Effect of Carbon and Manganese Contents on the Stability of Austenite in Hadfield-Type Manganese Steels. H. R. S. Rao and V. G. Paranjpe. Tisco (Tata Iron & Steel Co., Journal), v. 8, Oct. 1961, p. 192-209.

Influence on carbide precipitation and transformation characteristics

as determined by standardized end-quench tests on steel specimens with Mn content ranging from 11-14%. Effect of cooling rate, cold working and prior precipitation illustrated with diagrams of test results. 20 ref. (N8, 1-53, 2-60, 3-68; ST, Mn)

594-N. Diffusion of Oxygen in Single Crystals of Nickel Oxide. Michael O'Keefe and Walter J. Moore. Journal of Physical Chemistry, v. 65, Aug. 1961, p. 1438-1439.

The diffusion of O^{18} is measured in monocrystals by following the exchange of gaseous O enriched in O^{18} with the NiO crystals, at an O pressure of 50 mm. from 1100-1500°. Entropy and diffusion coefficients are measured. 10 ref. (N1, 1-54; Ni, 14-68)

595-N. (German.) Investigation of Self-Hardening AlZnMg-Alloys. Pt. 2. W. Rosenkranz. Metall, v. 15, Sept. 1961, p. 894-899.

Investigation of recrystallization by examination of microstructure and macrostructure and by mechanical testing of extruded self-hardening Al-ZnMg alloys after various heat treating and warm aging operations. (N5, M27, M28, Q29, 2-64, 2-65, 3-68; Al-b, Zn, Mg)

596-N. (German.) Grain Boundary Migration of Germanium. Friedrich Erdmann-Jesnitzer, Gunter Hotzsch and Ernst Gunther. Bergakademie, v. 13, May 1961, p. 300-303.

Thermal vacuum etching at 500-800° C. of pure zone-melted disk specimens and microscopic investigation of grain boundary migration and formation of etch pits. Density of dislocation lines in front of and behind migrating grain boundaries. (N3, M20q, M21c, 1-54; Ge)

597-N. Crystal Filaments. W. S. Hollis. Production Engineer, v. 40, Sept. 1961, p. 611-661.

Growth mechanisms for crystal filaments of pure single crystal and metal whiskers (Fe, Cu, Be, Si, Sn, W, Ag, Cd, Zn) are explained by the presence of irregularities in the atomic structure of dislocations. Stress-strain patterns and relative strength of filament and bulk materials are given. 8 ref. (N3r, 1-54, Ag, Be, Cd, Cu, Fe, Si, Sn, W, Zn)

598-N. (German.) Investigation of Age Hardening in Discontinuous Precipitations. Horst Bohm. Zeitschrift fur Metallkunde, v. 52, Aug. 1961, p. 512-517.

Studies of internal stresses of discontinuously precipitated solid solution by hardness, microhardness and X-ray examination of cold worked and as-cast Cu-In specimens containing 12.5-15% In, aged at 300-400° C. (N7a, Q-general, 2-65, 3-66, 3-68; Cu, In)

599-N. (German.) Cause of Discontinuous Precipitation. Horst Bohm. Zeitschrift fur Metallkunde, v. 52, Aug. 1961, p. 518-524.

Microstructure investigation of discontinuous precipitation in aging of Cu-In alloy (12.5-20% In), Cu-Sb alloy (10% Sb) and Cu-Mg alloy (1.5-2.5% Mg) specimens at 300-450° C. Precipitation mechanism as controlled by kinetics and grain boundary diffusion. (N7, N1, M27f, 1-54; Cu, In, Sb, Mg)

600-N. Structural Changes During the Deformation of Copper, Aluminium and Nickel at High Temperature and High Strain Rates. D. Hardwick and W. J. McG. Tegart. Institute of Metals, Journal, v. 90, Sept. 1961, p. 17-21.

Structural changes during plastic deformation of heat treated specimens by hot torsion at 0.7 absolute melting temperature and strain rates of approx. 1 $sec.^{-1}$ are observed metallographically after quenching. Behavior of the metals is dependent on competition between polygonizations and recrystallization which is rationalized in terms of the relative magnitude of their stacking-fault energies. 14 ref. (N4, N5, 2-62, 3-68; Al, Cu, Ni)

601-N. The Occurrence of Recrystallization During High-Temperature Creep. D. Hardwick, C. M. Sellars, W. J. McG. Tegart. Institute of Metals, Journal, v. 90, Sept. 1961, p. 21-22.

Review of data for compression creep tests on Au and Ni at constant stress at 820-940° C. in which recrystallization is observed and comparison with tensile, torsion and compression creep data for Pb, Cu, Al, alpha and gamma Fe, Cd, Mg, Zn and Sn. Recrystallization during creep is proposed to be polygonization-dependent

as a function of dislocation annihilation and climb, plastic deformation and work-hardening, stacking-fault energy, impurity level, temperature and stress-strain conditions of the experiment. 24 ref. (N5, Q3, Q28, 2-61, 3-66, 3-68, 3-69; Fe, Al, Cd, Cu, Mg, Pb, Sn, Zn)

602-N. A Calorimetric Investigation of the Beta to Alpha + Gamma$_2$ Eutectoid Transformation in Certain Aluminium Bronzes. G. V. T. Ranzetta and D. R. F. West. Institute of Metals, Journal, v. 90, Sept. 1961, p. 22-23.

Effects of 0.5-1% tenary additions of Co, Fe or Mn on the eutectoid transformation in 11.6-11.9% aluminum bronze is studied for isothermally heat treated, pearlitic specimens. Data are given for specific heat and free energy and heat of transformation, as a function of composition with heating curves being derived and the transformation arrest being established as 568° C. for the binary alloys. 5 ref. (N9, M24, P12a, P12q, P12r, 2-60; Al-b, Cu-s)

603-N. The Mechanism of Boundary Migration in Recrystallization. Paul Gordon and R. A. Vandermeer. Illinois Institute of Technology, Technical Rept. no. 3 and 8, Aug. 1961, 50 p.

Recrystallization of polycrystalline, Zn-refined Al and Al alloys with specified percentages of Cu is considered in terms of the effect of Cu content and competing recovery process on migration rates. The mode and retardation of recrystallization are studied, giving correlative data for theory and experimentation. 16 ref. (N5, 1-53; Al-b, Cu)

604-N. The Diffusion of Metals in Relation to Glass Mould Equipment. E. G. Weatherley. Glass Technology, v. 2, Aug. 1961, p. 146-149.

A suggested composition for gray iron to promote a high strength, abrasion resistant surface by diffusion of Cr, Al and Si. (N1, T29a, 2-60; CI-n, Al, Cr, Si)

605-N. (Yugoslavian.) Continuous and Isothermic T-T-T Diagrams of C 35 and 37 Mn Si 5 Steels. M. Majdic, A. Podgornik and C. Rekar. Rudarsko-Metalurski Zbornik, no. 1, 1961, p. 21-31.

Metallographic analysis of C 35 and 37 MnSi 5 structural steels subjected to austempering and hardening to determine T-T-T diagrams, grain size, structure and hardness. (N8g, Q29; CN, SGB-s)

606-N. (English.) Quenched-In Vacancy in Solid Solution Alloys. Yoshikazu Hamaguchi. Physical Society of Japan, Journal, v. 16, Sept. 1961, p. 1692-1697.

Calculation of the binding energy for a vacancy and a solute atom from measurements of the resistivity change induced by quenching between pure Au and Au-Pd solid solutions. 12 ref. (N12p, N7d; Au, Pd)

607-N. New Ways to Strengthen Metals. Donald Peckner. Materials in Design Engineering, v. 54, Oct. 1961, p. 115-126.

Advances in precipitation hardening, order-disorder transformation, strain hardening, solid solution hardening and dispersed phase hardening processes. 18 ref. (N7, N10, N12p, Q29n, 1-53)

608-N. (German.) Precipitation Characteristics of Binary Copper Alloys as Influenced by Additions of a Third Element. Horst Bohm. Zeitschrift fur Metallkunde, v. 52, Sept. 1961, p. 564-571.

Investigation of continuous and discontinuous precipitation, after homogenizing at 600-750° C., in binary alloys of Cu with 1.5-2.5% Mg, 35-55% Mn, 0.8-1.5% P, 5-10% Sb and 15% Sn, with and without additions of 0.5 at.% Fe, Si, Be, In, Mg and Sb, respectively, by microstructure examination and hardness measurements. (N7d, Q29, 2-60; Cu-b)

609-N. (German.) Production of Tantalum Single Crystals by Electron Beam Melting. Barry L. Mordike. Zeitschrift fur Metallkunde, v. 52, Sept. 1961, p. 587-591.

Design of apparatus and method for electron beam melting of single crystals of refractory metals. Production, mechanical testing and investigation of crystal properties (active slip systems in compression) of Ta single crystals. (N3r, M26, 3-66; Ta)

610-N. (Czech.) Precipitation in Low-Carbon Steel During Cyclic Loading. Mirko Klesnil and Premysl Rys. Hutnicke Listy, v. 16, Aug. 1961, p. 565-572.

A low-carbon steel containing 0.05% C and 0.0042% N is held at 1000° C. for 1 hr. and subsequently allowed to cool in the furnace. CSN 12010 steel is normalization annealed to obtain a grain size of approx. 0.02 mm. Both steels are then alternate-bend tested, the first at a frequency of 400 cpm.,

the second at 1470 cpm., with or without previous heating and quenching from 700° C. Effect of cycling and previous heat treatment on microscopic surface structure, microhardness, hardness and carbide precipitation. 21 ref. (N7, M28p, Q7j, Q29, 1-54, 2-64; CN-g)

611-N. (Russian.) Electrodeposition of Zinc-Tin Alloy From Pyrophosphate Electrolytes. E. A. Prandetskaya and L. P. Nosova. Izvestiya VUZ--Tsvetnaya Metallurgiya, Mar. 1961, p. 136-139.

Study of composition, corrosion resistance and surface luster of an alloy layer electrolytically precipitated on a carbon steel electrode from complex pyrophosphate salts as a function of current density, electrolyte composition and effect of gelatine or glue additions. 4 ref. (N12d, 2-60, 2-66; Zn, Sn)

612-N. Metal Evaporation, "Cold Welding" in Vacuum of Space Studied at Hughes. Nat Wood. Western Metalworking, v. 19, Oct. 1961, p. 42-43.

Evaporation and condensation behavior of Cd, Zn, Mg alloys, Ti, Fe, steel, Pt and plastics is tested in simulated space conditions. Study of lubricant vaporization, effect of molecule adherence on friction rate and subsequent cold welding. (N16n, 1-73, K6, Q9p, T24e; ST, Cd, Zn, Mg-b, Ti, Fe, Pt, NM-d31)

613-N. Self-Diffusion of Lead, Thallium and Bismuth in the Solid Lead -Thallium System. H. A. Resing and M. H. Nachtrieb. Physics and Chemistry of Solids, v. 21, Oct. 1961, p. 40-56.

Radioactive tracer study and thermodynamic analysis of the self-diffusion of Pb and Tl and of diffusion of trace impurity Bi in solid solutions containing 0-87% Tl at 206-323° C. The results are compared with the predictions of the corresponding states principle and with theories based upon the Johnson vacancy-solute complex mechanism, with modification based upon lattice parameter deviations from Vegard's Law, showing dependence on alloy composition and some evidence of order. 36 ref. (N1d, N1e, 2-60; Pb-b, Tl-b, Bi)

614-N. Migration Energy of a Vacancy Adjacent to an Impurity. A. Ascoli and A. C. Damask. Physics and Chemistry of Solids, v. 21, Oct. 1961, p. 124-127.

Interpretation of impurity diffusion in terms of the migration of the impurity-vacancy molecule involving the interchange of the vacancy with a lattice atom for transporting the impurity. Calculation of the effect of altering the path on the lattice atom-vacancy interchange using a Morse function as a potential. 7 ref. (N3, N1, M26s, 3-69)

615-N. (French.) Preferential Nucleation of Chromium Carbide on Twin Dislocations in Stainless Alloys of the 18/8 Type. H. Hatwell and E. Votava. Acta Metallurgica, v. 9, Oct. 1961, p. 945-948.

The nucleation of precipitates on the coherent twin boundaries in austenitic stainless steels is interpreted in relation to the structure of recrystallization twins. Observations with the electron microscope suggest that the elastic field of the dislocations piled up on the coherent twin boundaries could induce the movement of partial dislocations during precipitation heat treatment which constitute sites for the preferential nucleation of the precipitate. 7 ref. (N2, N8r, N5, M26b, 2-64; SS-e)

616-N. (English.) Strain-Induced Diffusion and Precipitation in Aluminum-Lithium Alloy During Creep. R. P. Marshall. Acta Metallurgica, v. 9, Oct. 1961, p. 958-960.

Diffusion of solute Li with subsequent precipitation as LiAl in grain boundaries oriented 45-90° to the direction of stress are observed for binary, two-phase 12% Li-Al alloys during third stage creep under tensile loading at 50-250° C. The phenomena are associated with relief of stress concentration by the formation of a low-density beta phase. (N1, N7, Q3, 2-61, 3-66, 3-68; Al-b, Li)

617-N. (English.) Grain Boundary Mobility in Bismuth. M. J. Fraser, R. E. Gold and W. W. Mullins. Acta Metallurgica, v. 9, Oct. 1961, p. 960-961.

Measurement of the boundary migration in deformed single crystal specimens using a magnetic field exerting pressure on the boundary as the driving force. (N3, M27f; Bi, 14-61)

618-N. (French.) Kinetics of the Precipitation of the Hematite Phase From Oxygen-Rich Magnetite During Isothermal Tempering. J. Paidassi and J. Lopez. Acta Metallurgica, v. 9, Oct. 1961, p. 963-965.

Determination of the morphology and quantity of hematite precipitating as a function of time and temperature of tempering and impurity and oxygen content from magnetite specimens prepared by oxidation of Puron and Armco iron (or from FeO mixtures) heated at 200-1200° C. in air or water vapor. T-T-T diagrams are constructed for the reaction at 300-600° C. (N7, M-general, R1h, 2-60; Fe-a)

619-N. (English.) Phase Transformation of Cobalt. W. Bollmann. Acta Metallurgica, v. 9, Oct. 1961, p. 972-975.

Electron microscopy study at room temperature of the shift from f-c-c. to h-c-p. structures in Co on cooling with a dynamic mechanism being proposed in terms of stress fields produced at the intersection of stacking faults. Comparison is made with Seeger's kinematic screw dislocation mechanism. 5 ref. (N-general, M26, 3-66; Co)

620-N. (English.) X-Ray Study of Order in $CuAu_3$ Alloys. R. G. Davies and A. J. Funes. Acta Metallurgica, v. 9, Oct. 1961, p. 978-979.

Alloys containing 65-80% Au are equilibrated at 150-450° C. after quenching with lattice parameter measurements being made by X-ray diffraction. Data are computed for degree of order and domain size. 8 ref. (N10, M26; Cu-b, Au-b)

621-N. (English.) Effect of Cold Work Upon Order in Au_3Cu Alloys. R. G. Davies and A. J. Funes. Acta Metallurgica, v. 9, Oct. 1961, p. 979-980.

X-ray study of superlattice lines in deformed 65-75% Au-Cu alloys quenched from 450° C. Extent of ordering and antiphase domain size are related to elastic interaction between vacancies and dislocations and to dislocation density as a function of deformation. 4 ref. (N10, M26b, 3-68; Au-b, Cu)

622-N. (English.) Study of Substructures of the Martensite in Fe-Ni Alloy Using Transmission Electron Microscopy. Z. Nishiyama and K. Shimizu. Acta Metallurgica, v. 9, Oct. 1961, p. 980-981.

Twinning and stacking faults are observed in the fine structure of transformed martensite in a 30.64% Ni-Fe alloy by selected area electron diffraction and transmission electron microscopy. (N6q, M27e, M21e; Fe-b, Ni)

623-N. (English.) Precipitation of Niobium Carbide on Dislocations in Austenite. D. M. Haddrill, R. N. Younger and R. G. Baker. Acta Metallurgica, v. 9, Oct. 1961, p. 982-984.

Transmission electron microscopy and selected area diffraction examination of CbC precipitates in 18Cr/12Ni/1Cb stainless steel thin foil specimens after solution treating at 1300° C., 3% deformation in tension and aging for various times at 650-950° C. Precipitation occurs on dislocation lines as a function of plastic deformation and on dislocation loops formed either during straining or by the condensation of vacancies, with a unique orientation relationship between the precipitate and the austenite matrix. (N7, N8r, M26b, 2-60, 2-64, 3-68; SS-e, Cb)

624-N. Melting Ranges and Flow Points of Brazing Alloys. Karl M. Weigert. Assembly & Fastener Engineering, v. 4, Nov. 1961, p. 37.

Analysis of primary, binary and ternary phases for Ag, Cu, Zn, Sn, Ni and Cd alloys providing data on effective brazing temperatures, flow points and melting ranges. Phase identification by solidification mechanism and microscopy. (N12, P12h, K8; SGA-f, 17-57)

625-N. Evaporation Rates of Several Alloys in Vacuum at High Temperatures. R. C. Bates. Metal Treating, v. 12, Oct-Nov. 1961, p. 16-18, 42.

Weight loss, evaporation rate and oxidation resistance are determined for Cr, Fe, Ni, Co, Va, Mo, Cb, Ta and W alloys by heating at 850-1250° C. under 1 micron pressure for 2-32 hr. Composition of alloys meeting requirements of vacuum heating furnace components. (N16n, W27n, 1-73, 2-61; Cr-b, Ni-b, Co-b, Va-b, Mo-b, Cb-b, Ta-b, W-b, 17-57)

626-N. Marworking High-Speed Steel. Richard F. Harvey. Metal Treatment and Drop Forging, v. 28, Oct. 1961, p. 421-422.

Improvement of mechanical and physical properties of steels by working in the metastable austenite condition is investigated for high-speed steels by deformation at 900-1000° F. Data are given

for Rockwell hardness, transformation microstrutures and workhardening and grain size effects. (N-general, Q-general, 2-61, 2-64, 3-68; TS-m)

627-N. Investigation of Abnormal Structure in a 1.5% Mn Mild Steel. J. Nield. Iron and Steel Institute, Journal, v. 199, Sept. 1961, p. 22-26.

Discussion of abnormal structures and mechanical properties which are sometimes observed in normalized samples of 1.5% mild steel and may be associated with notch brittleness as caused by microsegregation of Mn and C. Methods are suggested for removing the microsegregation such as soaking near 1200° C. or corrective tempering at 630° C. 6 ref. (N-general, J-general, M27, Q23s, 9-69; CN)

628-N. (French.) Use of a Special Isothermal-Heat Treatment Furnace in Studying the Recrystallization of Cold Rolled Sheet. G. Jegaden and R. Tarriant. Revue de Metallurgie, v. 58, Aug. 1961, p. 667-684.

Rimming steel and killed steel subjected to cold deformations of 50-75% are isothermally heat treated at 460-740° C. The effect of annealing temperature on the recrystallization process is examined by means of hardness measurements and micrographs. (N5, J24, M-general, 1-52, 2-61; ST)

629-N. Effects of Grain Boundary Structure on Precipitate Morphology in an Fe-1.55% Si Alloy. S. Toney and H. I. Aaronson. Metallurgical Society of AIME, Transactions, v. 221, Oct. 1961, p. 909-917.

When the component grains of ferritic bicrystal specimens are disoriented through an angle "o" about a common (110) axis, the tendency for preferential growth of austenite crystals along the grain boundary during transformation at elevated temperatures is dependent on angle size indicating that grain boundary diffusion promotes preferential growth along large angle boundaries. Differences between crystals suggest that precipitate morphology can be dependent on the dislocation structure of the boundary. 27 ref. (N7, N1, M27, M26, 2-62; Fe-b, Si)

630-N. Metal Deposition Coefficients in Filament Bundles. J. H. Oxley, J. E. Oberle, C. E. Dryden and G. H. Kesler. Metallurgical Society of AIME, Transactions, v. 221, Oct. 1961, p. 927-936.

Heat-transfer rates are measured in a model of a multifilament vapor-deposition bulb for the preparation of high-purity metals. Local transfer coefficients for heat transfer from the filaments to the circulating process stream are determined as a function of gas flow rates and bulb, inlet and filament geometries and are converted to a mass-transfer basis to provide a method of correlating vapor-deposition rates and to predict the performance of commerical units. 13 ref. (N15g, L25, 1-54, 17-56)

631-N. Determination of Interstitial Solid-Solubility Limit in Tantalum and Identification of the Precipitate Phases. Dale A. Vaughan, Oliver M. Stewart and Charles M. Schwartz. Metallurgical Society of AIME, Transactions, v. 221, Oct. 1961, p. 937-946.

Solid-solubility limits at 1500, 1000 and 500° C. for C, N and O in high-purity Ta are determined by X-ray lattice-parameter and electron micrography methods. The phases Ta_2C, the low-temperature modification of Ta_2O_5 and Ta_xN of unknown composition but which has a superlattice structure based upon the original b-c-c. Ta lattice are identified as the initial precipitates in the respective systems. The etching behavior of Ta is discussed in terms of lattice imperfections and precipitate phases. 8 ref. (N12p, N7, N10, M-general, 2-60, 3-69; Ta-b)

632-N. Silver Diffusion in the Intermetallic Compound AgMg. W. C. Hagel and J. H. Westbrook. Metallurgical Society of AIME, Transactions, v. 221, Oct. 1961, p. 951-957.

Using a sectioning technique with Ag^{110} as the tracer, the diffusion of Ag in Ag-excess (45.8% Mg), near-stoichiometric (49.8% Mg) and Mg-excess (52.0% Mg) cylinders of CsCl-type AgMg is determined at 500-700° C. Diffusion coefficients, lattice-parameters, density, substitutional defects and activation energies for rate processes in the alloys are determined as a function of composition. 25 ref. (N1, M-general, 1-59, 2-60; Mg-b, Ag-b, 14-68)

633-N. Solid Solution Strengthening of Ag by Al. A. A. Hendrickson and M. E. Fine. Metallurgical Society of AIME,

Transactions, v. 221, Oct. 1961, p. 967-974.

The critical resolved shear stress and the strain rate dependence of the flow stress are reported for Ag-base single crystals containing up to 6% Al at 4.1-470° K. At room temperature the solid solution strengthening is attributed principally to an increase in the dislocation density on alloying. At 4.2° K. the alloys are relatively stronger because the dislocations widen on alloying and are more difficult to cut. 22 ref. (N12p, M26b, Q24, 2-60, 2-63; 3-68; Ag-b, Al, 14-61)

634-N. The Recrystallization of Dilute Alpha Iron-Molybdenum Solid Solutions. W. C. Leslie, F. J. Plecity and F. W. Aul. Metallurgical Society of AIME, Transactions, v. 221, Oct. 1961, p. 982-989.

During isothermal recrystallization, the rate of grain growth in dilute Fe-Mo alloys decreases rapidly with increasing Mo content up to 0.04% and less rapidly thereafter. Rate of growth also decreases sharply with time at constant temperature. The observed rates of boundary migration do not correspond to predictions of the Luke-Detert theory and it is proposed that the growth of recrystallized grains is inhibited by clustering of solute atoms at imperfections in the unrecrystallized matrix. 19 ref. (N5, N3, M26, 2-60, 2-61, 3-67; Fe-b, Mo, 14-67)

635-N. Quantity and Form of Carbides in Austenitic and Precipitation Hardening Stainless Steels. R. J. Bendure, L. C. Ikenberry and J. H. Waxweiler. Metallurgical Society of AIME, Transactions, v. 221, Oct. 1961, p. 1032-1039.

Carbon which is present as insoluble carbides in austenitic stainless steels is measured quantitatively by dissolving the steel in iodine methanol and analyzing the residue for carbon. Severe sensitization is observed in Type 302 due to precipitation of only 0.003% carbon. Both cold work and the presence of delta ferrite cause a marked acceleration in rate of carbide precipitation. Rates in 17-7 PH are studied for effects of austenite conditioning and also the aging heat treatment. 10 ref. (N8r, N7, 2-64, 2-65, 3-68; SS)

636-N. Measurement of the Surface Self-Diffusion Coefficient of Copper by the Thermal Grooving Technique. N. A. Gjostein. Metallurgical Society of AIME, Transactions, v. 221, Oct. 1961, p. 1039-1046.

The self-diffusion coefficient for a surface near the (100) plane in Cu is determined by the Mullins theory of thermal grooving and is found to obey an Arrhenius relationship. A model is presented which indicates that activation energy, as determined by a mass-transport technique, may involve both the activation energy needed to form an adsorbed atom from a ledge in the surface as well as that for the movement of the adsorbed atom. 31 ref. (N1d, M20, 2-64; Cu)

637-N. Strain Aging Effects in Arc-Cast Molybdenum. G. W. Brock. Metallurgical Society of AIME, Transactions, v. 221, Oct. 1961, p. 1055-1062.

Tensile tests at -186 to 985° C. on overstrained, aged and nitrided specimens on recrystallized arc-cast Mo. The strain aging behavior of Mo was found to be strongly dependent on the degree of plastic strain present in the lattice, the reason for this being the low solid solubility for the common interstitial elements in Mo. 22 ref. (N7e, N12p, M26, Q27, 2-61, 3-68; Mo-a)

638-N. Structural Transformations in a Ag-50 At.% Zn Alloy. H. W. King and T. B. Massalski. Metallurgical Society of AIME, Transactions, v. 221, Oct. 1961, p. 1063-1064.

X-ray diffraction study of the effect of cold work and annealing on the stability of the beta prime and zeta degree phases in alloys subjected to annealing, aging and quenching treatments at 20-630° C. with plastic deformation by filing. An h-c-p. zeta phase may be induced by cold working the beta prime phase but reverts to beta prime on aging. No change occurs when working the zeta degree phase, but beta prime is formed in the deformed alloy on room temperature aging, suggesting that ordered b-c-c. beta prime is the equilibrium structure at room temperature. 10 ref. (N-general, M-general, 2-60, 2-64, 3-68; Ag-b, Zn-b)

639-N. Aging of Supersaturated Alpha Phase in a Cu-Si Alloy. Gary A. Dreyer

and D. H. Polonis. Metallurgical Society of AIME, Transactions, v. 221, Oct. 1961, p. 1074-1080.

The aging processes at 200-525° C. are studied by metallography, microhardness and electrical resistivity measurements. During the initial stage of aging an anisotropic phase, kappa prime, which is visible as striations in the microstructure, forms prior to the appearance of the gamma phase and increases with aging temperature. The over-all precipitation reaction in this system involves four stages: formation of kappa prime, formation of gamma at alpha grain boundaries, growth of gamma particles in kappa prime regions and coagulation of gamma into large particles dependent on the temperature of aging. 7 ref. (N7a, N-general, 2-61, 2-65; Cu-b, Si)

640-N. The Composition of the Gold-Silicon Eutectic. E. G. Heath. Journal of Electronics and Control, v. 11, July 1961, p. 13-15.

Use of gravity segregation to determine the Si content of the eutectic as 3.15 ± 0.05 wt.% or 18.6 ± 0.3 at.%. Experiment verifies experience gained in the use of Au alloys in Si semiconductor devices that the liquidus curves are incorrect near the eutectic. (N9n, S11f, 1-54; Au, Si)

641-N. The Pearlite Reaction in a High Alloy Steel. R. R. Russell and W. C. Hagel. Metal Progress, v. 80, Nov. 1961, p. 107.

Nucleation sites for pearlite are saturated first at grain corners and edges, then along grain surfaces and finally at random points within the grain. The matrix is martensitic except for a short distance ahead of the advancing colonies of pearlite where carbon depletion permits the retention of austenite. (N8h; SS)

642-N. Strengthening Stainless Steel by Cold Working. Digest of "Strain Strengthening of Type 304 Stainless Steel". Paper (Preprint 83) presented at 64th Annual Meeting, A.S.T.M., Atlantic City, N.J., June 1961. Walter Hammer, Jr., Leonard Stemann and E. E. Weismantel. Metal Progress, v. 80, Nov. 1961, p. 178-180.

Bars of Type 304 can be strengthened to a minimum yield strength of 100,000 psi. by cold straining. After straining, the bars must be aged to prevent dimensional instability. (N7e, 1-52, 1-67; SS)

643-N. Cold Alloying to Germanium, Silicon and Aluminum-Silicon Eutectic Surfaces. L. Bernstein. Semiconductor Products, v. 4, Aug. 1961, p. 35-39.

Determining the mechanism for "purple plaque" phase formation in the synthesis of $AuAl_2$ and Au_2Al in sealed evacuated quartz capsules at 40-1100° C. The wettability of pure Au, AuSi(6%), Au-Ge(12%), AuSn(20%) and Au-In(1-2%) alloys is determined by alloying onto Al-Si eutectic at temperatures in excess of 400° C. 24 ref. (N12q, P13h, P12, 2-60, 2-61; Au-b)

SECTION P

PHYSICAL PROPERTIES and TEST METHODS

1-P. The Thermoelectric Power of Pure Copper. A. V. Gold, D. K. C. MacDonald, W. B. Pearson and I. M. Templeton. Philosophical Magazine, v. 5, Aug. 1960, p. 765-786.

High purity Cu samples with low residual resistivity ratios measured at 0.1-350° K. to show the effect of various scattering mechanisms on the thermo-electric power. 32 ref. (P15j, 2-61; Cu)

2-P. Strain-Broadening of Nuclear Magnetic Resonance Lines in Copper. E. A. Faulkner. Philosophical Magazine, v. 5, Aug. 1960, p. 843-851.

The mean-square-width of the nuclear magnetic resonance absorption line in Cu sheet is measured to show the effect of plastic deformation and stored energy. 11 ref. (P16f, 3-68; Cu, 4-53)

3-P. Measurements of Thermoelectricity Below 1° K. Pt. 4. D. K. C. MacDonald, W. B. Pearson and I. M. Templeton. Philosophical Magazine, v. 5, Aug. 1960, p. 867-870.

Thermoelectric power of alloys of Cu, Sn and Fe in Pd as a function of temperature and type of impurity. 7 ref. (P15j, 2-63, 3-69; Pd-b, Cu, Fe, Sn)

4-P. Rare Earths: Sixteen New Metals Are Ready to Use. Materials in Design Engineering, v. 52, Nov. 1960, p. 134-137.

Electrical, magnetic and mechanical properties and corrosion resistance of rare earth metals. (P-general, Q-general; EG-g45)

5-P. Solubility of Oxygen in Delta Iron. Edwin S. Tankins and Nev A. Gokcen. American Society for Metals, Transactions, Preprint no. 236, v. 53, 1961, p. 843-852.

Solubility of oxygen determined by equilibrium with gaseous mixtures of H_2O and H_2 in the range of 1420-1510° C. Results show that the solubility of oxygen increases with increasing temperatures. 16 ref. (P12e; Fe, O)

6-P. (German.) Atomic Heat Capacity of Magnesium Between 12 and 300° K. for Varying Hydrogen and Silicon Concentrations. Kurt Bornkessel. Bergakademie, v. 12, Sept. 1960, p. 506-507.

Isothermal measurements in a vacuum glass calorimeter using Nernst-Eucken's differential method on Mg containing 0-21 ml. H_2 per 100 g. Mg and 0.013-0.22% Si. 3 ref. (P12r, 2-60, 2-61; Mg, H, Si)

7-P. Advancements in Technical Ceramics--Performance of Refractory Materials to 5000° F. C. D. Pears and David S. Neel. Ceramic Age, v. 76, Nov. 1960, p. 30-35.

Measurement of thermal, electrical and mechanical properties of refractory metals and refractory oxide, carbide, boride, nitride and Si-bearing compounds at 5000° F. in an inert atmosphere. (P11, P15, Q-general, 2-62; EG-d37)

8-P. (German.) Growth of Uranium Bars in Aggressive Gases. I. V. Batenin, A. N. Rudenko and B. V. Sarov. Kernenergie, v. 3, June 1960, p. 532-535.

Dilatometric measurement of growth and X-ray analysis of technical uranium bars and Cu wires exposed to air, nitrogen and CO at 500-900° C. and 0-1 atm. pressure. (P10d, M23, 2-61, 2-66; U, 4-55, Cu, 4-61)

9-P. Composite Materials for Thermal Protection. E. Scala. Metals Review, v. 33 Nov. 1960, p. 4-9.

Physical properties of composites of Be, Cu, Ni and stainless steel and graphite for aircraft hot structures requiring high temperature strength. (P-general, T24; SGA-h, Be, Cu, Ni, SS, NM-k36, 8-66, 17-57)

10-P. Specific Heats and Enthalpies of Technical Solids at Low Temperatures. Robert J. Corruccini and John J. Gniewek. National Bureau of Standards Monograph 21, Oct. 3, 1960, 20 p. (Available from U. S. Government Printing Office, Washington 25, D. C.) $.20.

Data for specific heats and enthalpies from 1-300° K. of several metals, graphite, natural rubber, plastics and other material. (P12r)

11-P. (German.) Investigation of Heat Transfer for Turbulent Current of Liquid Heavy Metals in Tubes. M. Ch. Ibragimov, V. I. Subbotin and P. A. Usakov. Kernenergie, v. 3, Aug. 1960, p. 780-782.

Measurement of heat transfer from liquid 99.9% Hg (temperature 24-48° C.), liquid Pb (400-420° C.) and a liquid eutectic Pb-Bi alloy (25-340° C.) to water in a steel tube system under an Ar atmosphere. (P11k; Hg, Pb-b, Bi, 14-60)

12-P. Magnetic Domains. General Electric Research Laboratories Bulletin, Summer 1960, p. 17-20.

Effect of domain structure on the magnetization changes in metals and alloys. (P16c, M27f)

13-P. (German.) Thermal Expansion of Alpha Plutonium. N. T. Cebotarev and A. V. Beznosikova. Kernenergie, v. 3, June 1960, p. 561-562.

Measurement of lattice parameters and thermal expansion of 0.5 mm. diameter Pu wire by X-rays (Cu radiation) at -196 to 100° C. 3 ref. (P11g, 2-61; Pu, 4-61)

14-P. Time Decrease of Permeability of Substitutional Ferromagnetic Alloys. Chinji Kuroda. Physical Society of Japan, Journal, v. 15, Oct. 1960, p. 1898.

Measurement of the disaccommodation of Ni-Co alloys using a sinusoidal magnetic field. Dependence of magnetic permeability on time, activation energy and relaxation time. 5 ref. (P16q; Ni-b, Co-b)

15-P. Magnetic Properties of Malleable Irons. W. K. Bock and T. D. Hutchinson. American Society of Mechanical Engineers, Transactions, Paper no. 60-WA-218, 1960, 9 p.

Magnetic properties of ferritic, pearlitic and martensitic malleable Fe produced by heat treatment of white Fe are evaluated for establishing a compromise between loss of desirable magnetic properties and increased strength or hardness. 6 ref. (P16; CI-s)

16-P. (French.) Study of Heats of Precipitation of Eutectics Containing 11.3 at.% Si in the Aluminum-Silicon System and 17.3 at.% Cu in the Aluminum-Copper System. Marc Genot. Comptes Rendus, v. 251, Oct. 10, 1960, p. 1499-1501.

By a calorimeter technique involving simultaneous recording of temperatures. of specimen and calorimetric liquid, heat of eutectic fusion is determined to be 124 ± 2.5 cal. per g. for Al-Si and 85 ± 1.5 cal. per g. for Al-Cu, the figures coinciding (within 5%) with those obtained by study of equilibrium diagrams. 6 ref. (P12g, N12e; Al-b, Cu, Si)

17-P. (French.) Width of the Magnetic Resonance of the 4^3P1 Level of Zinc Excited by Electron Bombardment. Albert-David May. Comptes Rendus, v. 251, Oct. 3, 1960, p. 1371-1372.

Influence of parasite magnetic field in experimental laboratory and inhomogeneity of radiofrequency field on short life as determined in magnetic resonance experiments with Hertzian spectroscopy. (P16f; Zn)

18-P. Thermal Conductivity in Ceramic-Metal Laminates. R. K. Francis and J. R. Tinklepaugh. American Ceramic Society, Journal, v. 43, Nov. 1960, p. 560-563.

Thermal conductivity values parallel and perpendicular to laminates of forsterite-stainless steel laminates. Comparison with calculated values. 4 ref. (P11h; SS, NM-f, 7-68)

19-P. The Measurement of Thermal Conductivity. Defoe C. Ginnings. Chapter 8 from "Thermoelectric Materials and Devices". Reinhold Publishing Corp., New York, 1960. p. 113-132.

Principles and methods with emphasis on meaurements at moderate to high temperatures. Measurements limited to solids. (P11h, 1-54)

20-P. Basics Stressed--Republic Takes Analytic Road. Samuel Korman and Robert Bastian. Missiles and Rockets, v. 7, Nov. 28, 1960, p. 42-43.

Determination of physical and chemical properties of high-temperature metals, alloys, ceramics, plastics and composites through spectroscopy, gas chromatography, metallography, X-ray analysis, electron microscopy and application of solid-state theory. (P-general, M-general, S11; SGA-h)

21-P. (Russian.) Temperature Hysteresis of the Domain Structure in Silicon-Iron Crystals. Ya. S. Shur and I. E. Startseva. Zhurnal Eksperimentalnoi i Teoreticheskoi Fiziki, v. 39, Sept. 1960, p. 566-573.

The domain structure of mono and polycrystals of Fe-Si (3.5% Si) is studied by powder diffraction technique before and after heating from room to 550° C. temperature. Domain structure changes irreversibly with the cyclic temperature variations. 8 ref. (P16c, 2-61; Fe-b, Si)

22-P. (Russian.) Dependence of Germanium Surface Tension Upon Temperature. V. B. Lazarev and P. P. Pugachevich. Doklady Akademii Nauk SSSR, v. 134, Jan. 1960, p. 132-133.

Determination of surface tension by capillary rise method within the 980-1400° C. temperature range. Deviations of experimental measurements from theoretical computations are explained by structural changes of the melt taking place during temperature elevation. 15 ref. (P12h; Ge)

23-P. Frequency Characteristics of Anodized Film Formed on Several Metals. Akira Miyata and Akio Furuichi. Institute of Physical and Chemical Research (Japan), Scientific Papers, v. 54, June 1960, p. 184-193.

Frequency range and dielectric properties of anodized films of varying thicknesses on Al, Ta, Ti and Cb substrates are measured with an equivalent circuit. (P15n; Al, Cb, Ta, Ti, 14-62)

24-P. (German.) Measurement of Heat of Transformation of Martensite Formation for Iron-Nickel Alloys by a Dry Ice (Solid Carbon Dioxide) Calorimeter. Erich Scheil and Egon Saftig. Archiv fur das Eisenhuttenwesen, v. 31, Oct. 1960, p. 623-632.

Transformation heat for Fe-Ni alloys containing 5-28% Ni measured by calorimetry and microscopy. Determination of retained austenite by density measurements using the buoyancy method, comprising weighing in air and ethylene bromide at 20° C. (P12q, N8n; Fe-b, Ni)

25-P. (Japanese.) Magnetic-Field-Cooling Treatment at Low Temperature of Alnico-V Type Alloy. Sadao Koshiba and Terumi Nishinuma. Japan Institute of Metals, Journal, v. 24, July 1960, p. 433-436.

Formation of abnormal structures in cast alloys at room temperature due to gamma to alpha phase transformations; and adverse effects of these structures on magnetic properties. Effect of cooling in a magnetic field, in air and water to 850° C. from the monophase temperature (1250° C.) on magnetic properties and microstructure. 3 ref. (P16, M27, N-general, 2-64; Fe-b, Co, Ni, SGA-n)

26-P. (Japanese.) Solution Rate of Solid Nickel in Liquid Bismuth. Tadao Sano, Masanobu Miyake and Takao Konishi. Japan Institute of Metals, Journal, v. 24, July 1960, p. 452-456.

Solution rate and activation energy of dissolution at 300-400° C. as determined by electrical resistivity measurements and chemical analysis. 8 ref. (P12e; Bi, Ni)

27-P. (Japanese.) Effect of Isothermal Magnetic Annealing on the Magnetization and Magnetostriction at High and Room Temperatures in a Fe_3Cr Superlattice Alloy. Hakaru Masumoto, Hideo Saito and Minoru Takahashi. Japan Institute of Metals, Journal, v. 24, July 1960, p. 465-469.

Data for magnetic measurements at 20-577° C. on thermally demagnetized specimens, with continuous tracing of time change at constant temperatures under external fields of 71.3 and 285 Oersted. 10 ref. (P16, 2-64; Fe-b, Cr)

28-P. (Russian.) Magnetic Susceptibility of Molten Nickel, Cobalt and Iron at Elevated Temperatures. A. A. Vertman and A. M. Samarin. Doklady Akademii Nauk SSSR, Tekhnicheskaya Fizika, v. 134, Feb. 1960, p. 326-329.

Measurement of magnetic susceptibility at 800-1700° C. using the Faraday method and Curie-Weiss low. Effect

of molecular-polymorphic transformations, coordination number and chemical composition on degree of magnetic susceptibility. 13 ref. (P16n, P16p, 2-60, 2-62; Co, Fe, Ni, 14-60)

29-P. (Russian.) Activation Energy in Alpha-Iron and Alpha-Titanium During Creep Testing Under Vacuum. K. A. Osipov and A. L. Sotnichenko. Doklady Akademii Nauk SSSR, Tekhnicheskaya Fizika, v. 134, Feb. 1960, p. 333-336.

Limiting values for activation energy are determined taking into account the degree of loading, diffusionless transformations and slip of the atomic planes. 15 ref. (P13a, Q3, 1-73; Fe-a, Ti-a)

30-P. Lattice Frequencies and Specific Heats of Germanium and Silicon. B. Sharan and S. P. Singh. Journal of Scientific Research of Banaras Hindu University, v. 10, Dec. 1959, p. 60-66.

Calculation of specific heats and frequencies of vibration of Ge and Si crystals at 40-700° K. by Raman's theory of crystal vibration; comparison with experimental values at all temperatures. 12 ref. (P12r, M26, 2-61; Ge, Si, 14-61)

31-P. (French.) Some Transverse Characteristics of Resistors in the Form of Films. P. Thureau, B. Lemiere and A. Colombani. Comptes Rendus, v. 52, Oct. 17, 1960, p. 1618-1620.

Directional variations of resistivity, after deformation by bending and tensile stresses in thin films of Bi, Sn and Sb deposited by vacuum evaporation on glass and plexiglas supports. 8 ref. (P15g, 3-68; Bi, Sn, Sb, 14-62)

32-P. Solutions of Metals in Molten Salts. Daniel Cubicciotti. Journal of Chemical Education, v. 37, Oct. 1960, p. 540-544.

Data for miscibility, electrical conductivity, magnetic susceptibility, phase composition, activity and vapor pressure of metal systems in their molten halides. (P-general; 14-60)

33-P. (Japanese.) Changes in Magnetic Properties During Aging of Alnico V. Tatsuo Fujiwara and Tetsuo Kato. Japan Institute of Metals, Journal, v. 24, Aug. 1960, p. 526-530.

Magnetic measurements of Alnico V specimens aged at 550-900° C. with and without magnetic field. Aging effect on reversibility of properties is determined for coercive force, maximum energy product and demagnetization curve. 20 ref. (P16, 2-64; Fe-b)

34-P. (Japanese.) Surface Tension of Cu-Se and Cu-Te Alloys. Pt. 6. Kaizo Monma and Hajime Suto. Japan Institute of Metals, Journal, v. 24, Aug. 1960, p. 544-547.

The effects of dissolved Se and Te on the surface tension of liquid Cu measured by a sessile drop method at 500-1400° C. Effect of Se and Te high surface activity. Calculations of maximum surface excess and solute element adsorption. (P13h; Cu-b, Se, Te)

35-P. (Pamphlet.) Herculoy. ASARCO Bulletin No. 113 R. 4 p. American Smelting and Refining Co., 120 Broadway, New York 5, N. Y.

Mechanical and physical properties, corrosion resistance and foundry characteristics of a new Si bronze alloy. (P-general, Q-general, R-general, E-general; Cu-s, Si)

36-P. Thermoelectric and Crystallographic Properties of Ag_2Se. J. B. Conn and R. C. Taylor. Electrochemical Society, Journal, v. 107, Dec. 1960, p. 977-982.

Ag_2Se is prepared by fusion technique and found to be a good thermoelectric material. Seebeck coefficient, resistivity and thermal conductivity are measured as a function of temperature. Crystal lattice structure is determined by X-ray diffraction. (P11, P15, 2-61, M26, M22g; Ag-b, Se)

37-P. (Japanese.) Effects of Dissolved Sulphur on the Surface Tension of Iron, Cobalt and Nickel Saturated With Carbon. Kaizo Monma and Hajime Suto. Japan Institute of Metals, Journal, v. 24, Sept. 1960, p. 611-614.

Measurements by sessile drop method at 1300° C. Effect of surface excess of sulphur. 10 ref. (P13h; Co, Fe, Ni, C, S)

38-P. (Japanese.) The Influence of Aging Treatment on the Temperature Dependence of the Electrical Resistance of Alnico 5. Tatsuo Fujiwara and Tetsuo Kato. Japan Institute of Metals, Journal, v. 24, Sept. 1960, p. 597-600.

Electrical resistivity-temperature curves for specimens aged at 20-800° C. 12 ref. (P15g, 2-61, 2-65; Fe-b, SGA-n)

39-P. (Japanese.) Analysis of the Resistivity-Distribution Curve of Silicon Single Crystal. Masabisa Sammonyi. Japan Institute of Metals, Journal, v. 24, Sept. 1960, p. 593-597.

A segregation equation is used for mathematical analysis of the resistivity distribution of pulled Si single crystals of N and P type conductivity. Application to determination of impurity concentration in specimens containing boron. 5 ref. (P15g, 3-6a; Si, 14-61)

40-P. (Japanese.) Sintered Fe-Al-Ni System Magneta. Pt. 6. Masataka Sugiyama and Kunio Shida. Japan Institute of Metals, Journal, v. 24, Sept. 1960, p. 569-570.

Effect of 0.2-0.5% TiH_2 addition to sintered permanent magnet MK3 alloy (11% Al, 18% Ni, 12.5% Co, 6% Cu, balance Fe) on linear shrinkages, density, magnetic properties and pore size distribution. 6 ref. (P10, P16, H-general; Fe-b, SGA-n, AD-n32)

41-P. (Japanese.) Effects of Various Factors on the Nitrogen-Absorption of 20% Cr-Fe Alloys in Nitrogen. Masazo Okamato and Omi Miyakawa. Japan Institute of Metals, Journal, v. 24, Sept. 1960, p. 573-577.

Effect of heating time and temperature, specimen surface condition and the purity of the gas employed on the nitrogen absorption of specimens heated at 1000-1300° C. for one-half to 4 hr. in very pure nitrogen. Data are given for weight gain and hardness distribution. 11 ref. (P13d, Q29n, 2-61, 3-67; Fe-b, Cr, N)

42-P. (French.) Electrical Properties of Gallium-Sodium Alloys. E. Rinck and P. Feschotte. Comptes Rendus, v. 251, Aug. 8, 1960, p. 869-871.

Resistivity of Ga-Na alloys confirms existence and composition of a compound having the formula Na_5Ga_8, resistivity of which is 1000 times greater than that of Ga. Experimental apparatus is described. 5 ref. (P15g; Ga-b, Na)

43-P. (German.) Effect of Irradiation on Metals. Erich Schmid and Karl Lintner. Zeitschrift fur Metallkunde, v. 51, Nov. 1960, p. 615-620.

Ge, 5.4% Cr steel and a steel containing 22.4% Ni and 3.48% Mn are neutron irradiated while Al, Zn, Cu and Au are subjected to alpha irradiation. Data for effect of irradiation on electrical resistance and austenite-martensite transformation. (P15g, N6, N8, 2-67; Al, Au, Cu, ST, Zn)

44-P. (Russian.) Thermodynamic Properties of Chromium-Tantalum. H. O. Piloyan, A. M. Evseev and Ya. I. Herasimov. Zhurnal Fizicheskoi, v. 34, Aug. 1960, p. 1768-1772.

Determination by measuring the pressure of saturated vapor at 1228-1303° C. Determination of liquidus and solidus temperatures for Ta in presence of ground Cr particles. Discussion of the possibility of existence of intermediate $TaCr_2$ phase. 8 ref. (P12; Cr-b, Ta-b)

45-P. (Russian.) Heat Treatment of Low Carbon Electrotechnical Steels. N. P. Zhetvin, L. N. Podvoiskii, A. I. Paisov and E. P. Kapustina. Metallovedenie i Termicheskaya Obrabotka Metallov, Nov. 1960, p. 20-24.

Effect of annealing temperature and time and rate of cooling on the coercive force and its tendency to magnetic aging in killed and rimming steels. 5 ref. (P16a, 2-64, ST-c, ST-d)

46-P. Molybdenum. Richard F. Allen. Cornell Engineer, v. 26, Nov. 1960, p. 36-41.

Review of the physical and mechanical properties of Mo. Description of a method for rapid growing of Mo single crystals. 5 ref. (P-general, Q-general, N12; Mo)

47-P. Note on the Interaction of Interstitially Dissolved Carbon Atoms in Alpha-Iron. A. J. Bosman, P. E. Brommer, L. C. H. Eykelenboom, C. J. Schinkel and G. W. Rathenau. Acta Metallurgica, v. 8, Oct. 1960, p. 728-729.

Effect of interstitial carbon interaction on the relaxation phenomena observed in time decrease of permeability in alpha iron is measured at 273° K. 4 ref. (P16q, M26s; Fe-a)

48-P. Method for Measuring the Free Energy of a Solid Surface. M. J. Fraser. Acta Metallurgica, v. 8, Oct. 1960, p. 732-734.

Thermodynamic calculation method applicable to solids that evaporate by a lamellar mechanism in which a crystal loses atoms from the edge surfaces of lamellae whose flat surface are low index crystallographic planes. Calculation are made in terms of the equilibrium

shape of the lamella edge surface, as a function of its surface free energy, temperature and partial pressure of the vapor above the surface. 16 ref. (P12a)

49-P. (German.) Detection of Structural Changes in Metals by Exoelectrons. Herbert Steiner. Anzeiger, v. 96, Oct. 1959, p. 177-181.

Exoelectron emission measurements with counting tubes under hydrogen, argon and hydrogen-argon-alcohol mixtures are used to study liquid-to-solid phase changes in pure Sn, beta-to-alpha phase changes in pure solid Tl and aging of duraluminum. (P15k, N-general; Al-b, Sn, Tl)

50-P. (German.) Exoelectron Emission of Aluminum After Alpha Radiation. Peter Koss. Anzeiger, v. 96, Oct. 1959, p. 182-189.

Emission measurements are made on alpha irradiated Al after various oxidizing treatments using a Gieger-Mueller counting tube under Ar-alcohol gas. Results are interpreted in terms of oxide structure. (P15k, 3-71; Al)

51-P. Electrical and Optical Properties of p-Type Cadmium Telluride Crystals. Shoji Yamada. Physical Society of Japan, Journal, v. 15, Nov. 1960, p. 1940-1944.

Effect of heat treatment on the electrical and optical properties of synthetic single crystals. Measurement of intrinsic energy gap, ionization energy of acceptors and Hall mobility of holes. 10 ref. (P15, P17a, 2-64; Cd, Te, 14-61)

52-P. Concentration Dependence of the Hall Coefficient on Magnesium-Cadmium Alloys. Seiichiro Noguchi and Takao Sato. Physical Society of Japan, Journal, v. 15, Nov. 1960, p. 1945-1949.

Measurement of Hall coefficient as a function of composition at 20-300° C. with magnetic field strength of 6.5 kg. A relation between energy gap and concentration is determined from these data. 7 ref. (P15p, 2-60; Mg-b, Cd-b)

53-P. Theory of Resistance Minimum in Dilute Paramagnetic Alloys. Kensuke Tani. Physical Society of Japan, Journal, v. 15, Nov. 1960, p. 1960-1962.

Electrical resistance of Cu and Mn alloys is calculated to determine whether the resistance minimum could arise from the short range order of the spins of the solute atoms. (P15g; Cu-b, Mn-b)

54-P. Antiferromagnetic Resonance in NiO in Far-Infrared Region. Hisamoto Kondoh. Physical Society of Japan, Journal, v. 15, Nov. 1960, p. 1970-1975.

Measurements of the optical absorption are made on a single crystal composed of NiO at wave-lengths from 210-385 microns and at 90-470° K. using a far-infrared spectrometer. The constant of the anisotropy energy which constrains the sublattice magnetizations in the easy plane is calculated and compared with the theoretical value. 23 ref. (P17a; Ni, 14-61)

55-P. Magnetostriction and Crystal Anisotropy of Nickel-Chromium and Nickel-Vanadium Alloys. Toluo Wakiyama and Soshin Chikazumi. Physical Society of Japan, Journal, v. 15, Nov. 1960, p. 1975-1981.

Magnetostriction constants are measured at room and liquid nitrogen temperatures by a strain gage method and expressed as a function of alloy composition. Data are analyzed on the basis of Neel's theory. 17 ref. (P16b, 2-60; Ni-b, Cr, V)

56-P. The Magnetic Anisotropy of Single Crystals of Chromium Telluride. Tokutaro Hirone and Shoko Chiba. Physical Society of Japan, Journal, v. 15, Nov. 1960, p. 1991-1994.

The anisotropy of a ferromagnetic single crystal of CrTe with NiAs structure is studied by magnetic torque measurements. Axis of easy magnetization is measured as a function of temperature. 6 ref. (P16, 2-60; Cr-b, Te-b, 14-61)

57-P. Magnetic Properties of Cr_2As and Cu_2Sb. Motoyoshi Yuzuri. Physical Society of Japan, Journal, v. 15, Nov. 1960, p. 2007-2012.

Thermomagnetic properties of the above compounds and a phase diagram of the Cr-As System are used to determine Neel point, reciprocal susceptibility and heat absorption due to the vanishing of antiferromagnetic order in the spin arrangement. 6 ref. (P16, M24b; Cr-b, As)

58-P. Effect of Plastic Deformation on Cluster Formation in an Al-Cu 4% Alloy.

Keisuke Matsura and Shigeyasu Koda. Physical Society of Japan, Journal, v. 15, Nov. 1960, p. 2106-2107.

Effect of plastic deformation on the clustering of solute atoms is determined by measuring the electrical resistivity. Discussion of the role of dislocations and vacancies in the process. 8 ref. (P15g, 3-68; Al-b, Cu)

59-P. Magnetic Properties of $NiBr_2$. Ichiro Tsubokawa. Physical Society of Japan, Journal, v. 15, Nov. 1960, p. 2109.

The magnetic susceptibility and its variation with temperature, the inverse susceptibility above the Neel point, the asymptotic Curie temperature, the Curie constant and the effective Bohr Magneton number are calculated for $NiBr_2$ crystals. 5 ref. (P16, 2-61; Ni, 14-61)

60-P. The Resistance Anomaly of Dilute Zinc Alloys at Low Temperatures. Yoshio Muto. Physical Society of Japan, Journal, v. 15, Nov. 1960, p. 2119-2120.

Effect of temperature on the specific resistance of dilute Zn-Mn, Zn-Cr and Zn-Sn alloys prepared by melting small amounts of Mn, Cr and Sn with high-purity Zn. 4 ref. (P15g, 2-61; Zn-b, Cr, Mn, Sn)

61-P. (German.) Yttrium, Scandium and the Rare Earths. Survey on Present State of Research. Pt. 2. K. Strnat and H. Weik. Metall, v. 14, Dec. 1960, p. 1163-1170.

Electron confirguration, physical and mechanical properties of La, Ce, Pr, Nd, Pm, Sm, Eu, Gd, Tb, Dy, Ho, Er, Tm, Yb, Lu. Casting, extrusion, forging, hot and cold rolling and machining methods. Industrial applications. (P-general, Q-general, F-general, G-general; EG-g45)

62-P. (German.) Metallic and Ceramic Materials for Aircraft and Missile Engineering. E. Meckelburg. Metall, v. 14, Dec. 1960, p. 1182-1189.

Physical properties, with emphasis on heat resistance, of cast and sintered Al and Mg alloy with and without Al_2O_3 additions, corrosion resistant steels, Ti and Be alloys, super alloys, workable cermets and sandwich structures composed of Al alloy and Ti or corrosion resistant steel. Protective coatings are used to control heat conductance, erosion, lubrication and vibration damping. (P12r, T24; Al-b, Be-b, Mg-b, ST, Ti, SGA-h, 17-57)

63-P. (Japanese.) Thermodynamic Studies of Lead-Bismuth Alloys. Kichizo Niwa, Mitsuo Shimoji and Osamu Mikuni. Japan Institute of Metals, Journal, v. 24, Oct. 1960, p. 668-672.

Electromotive force measurements of Pb-Bi specimens at 370-480° C. using electrode concentration cells are applied to calculated heats of mixing, deviation from Raoult's Law and excess free energy and entholpy. 11 ref. (P12; Bi-b, Pb-b)

64-P. (Japanese.) Thermodynamics of the Iron-Chromium System. Pt. 1. Activity of Chromium in Liquid Iron-Chromium Systems. Hanue Wada, Yasuji Kawai and Tunezo Saito. Japan Institute of Metals, Journal, v. 24, Oct. 1960, p. 684-688.

Activity coefficients at up to 40% Cr in the system and in systems saturated with carbon are determined by a vaporization method at 1630° C. using radioactive Cr^{-51}. Data are given for interchange energy, effect of carbon on interaction parameter and deviation from Raoult's Law. 15 ref. (P12b; Fe-b, Cr-b)

65-P. Why Cobalt for Magnetic Development. E. Ascher and A. Janner. Cobalt, Dec. 1960, p. 22-26.

Effect of crystalline anisotropy and magnetostriction on the coercive force, initial susceptibility, relative retentivity and response to magnetic annealing of Co and magnetic substances containing Co. (P16; Co)

66-P. High-Temperature Bearing Properties and Cobalt-Base Alloys. M. F. Amateau. Cobalt, Dec. 1960, p. 27-33.

Mechanical and physical properties and corrosion resistance of high-temperature bearing alloys. (P-general, Q-general, R-general; SGA-c, SGA-h)

67-P. Survey of Materials Problems Resulting From Low-Pressure and Radiation Environment in Space. Robert A. Lad. NASA Technical Note D-477, Nov. 1960, 18 p.

Effect of pressure and radiation on the optical transmission, emissivity, coefficient of friction and composition of Cr, Pt, Al, W, Cu and Ni, plastics and ceramics. Ultraviolet radiation impairs the transparency of the materials while surface sputtering affects emissivity. 12 ref.

(P17a, 2-67, 3-74; Al, Cr, Cu, Ni, Pt, W, NM-d30)

68-P. (English.) Effects of Molybdenum, Wolfram and Copper on the Solubility of Graphite in Liquid Iron and a Method for Calculation of the Activity Coefficient of Carbon in Multicomponent Alloys. Toshisada Mori, Kan Aketa, Hitoshi Ono and Hiroshi Sugita. Kyoto University, Memoirs of the Faculty of Engineering, v. 22, Oct. 1960, p. 401-421.

Iron alloys containing 4.23-5.28% C, 0-16.6% Mo, 0-16.7% W and 0-4.6% Cu are heated in a graphite crucible, held at 1550° C. and analyzed chemically. Graphite solubility and carbon activity coefficient determined as functions of composition. Interaction parameters are calculated at graphite saturation. 24 ref. (P12b, P12e, 2-60; Fe-b, C)

69-P. (German.) Contact Resistance of Stationary Heavy-Current Sintered Alloy Point Contacts at High Temperatures. Anton Wollenek. Elektrotechnische Zeitschrift, v. 12, Oct. 31, 1960, p. 533-536.

Contact resistance for sintered symmetric and unsymmetric W-Cu and W-Ag alloy contacts at 20-800° C. and for varying contact pressures as a function of composition. Effect of Cu precipitation at high temperature as influenced by tungsten content of W-Cu contacts and influence of Ag plating on resistance. (P15g; W-b, Cu, Ag, SGA-r)

70-P. Composite Material Does Double Duty. Steel, v. 148, Jan. 9, 1961, p. 65.

Physical and electrical properties of a Cu plated steel for use in contact arms for open type fuse cutouts on rural power lines. (P-general, P15; ST, Cu, 8-62)

71-P. Some Equilibrium Constants of Transition Metal Halides. M. W. Lister and P. Rosenblum. Canadian Journal of Chemistry, v. 38, Oct. 1960, p. 1827-1836.

Study of the formation of complex ions $CoCl^+$, $NiCl^+$, $CuCl^+$ and $CuBr^+$ using a spectrophotometric method for Cu and a cell voltage method with Ni and Co. Various explanations are given for the anomalous variation of the equilibrium constant with temperature. 21 ref. (P12d, 2-61, M25; Co, Cu, Ni, 14-68)

72-P. Nonferrous Metals. Pt. 2. Frank A. Crossley. Midwest Engineer, v. 13, Oct. 1960, p. 6-11.

History, physical properties and applications of pure metals, compounds and alloys of Mn, Hg, Mo, Ni, Pt, Os, Ir, Ru, Td, Te, Se, Rh, Ag, Ta, Cb, Sn, Ti, W, U, V, Zr and Zn. 4 ref. (P-general; EG-a38)

73-P. Solubility of Nitrogen in Liquid Iron Alloys. 1. Thermodynamics. Robert D. Rehlke and John F. Elliott. Metallurgical Society of AIME, Transactions, v. 218, Dec. 1960, p. 1088-1101.

The solubility of nitrogen in liquid pure Fe and liquid Fe alloys is studied by the Sievert's Method and by sampling, as a function of temperature, pressure and composition. The solubility is decreased by Al, C, Co, Cu, Ni, O, Si and Sm and it is increased by Cr, Cb, Mn, Mo, Ta, W and V. Data are given for interaction coefficients and the temperature coefficient of solubility. 32 ref. (P12e, P12b; Fe-b, N)

74-P. Vapor Pressure of Iron at 1600° C. E. T. Turkdogan and L. E. Leake. Metallurgical Society of AIME, Transactions, v. 218, Dec. 1960, p. 1136-1137.

The transportation method is used to measure the vapor pressure of high purity Fe heated in an argon atmosphere. Vapor pressure is calculated from the weight loss of the sample and the volume of the carrier gas as a function of gas flow rate. (P12c; Fe-a)

75-P. The Solubility of Nitrogen in Liquid Fe-Cr-Ni Alloys. J. C. Humbert and J. F. Elliott. Metallurgical Society of AIME, Transactions, v. 218, Dec. 1960, p. 1076-1088.

The solubility of nitrogen in liquid pure Fe, Cr and Ni in liquid Fe-Ni, Fe-Cr and Ni-Cr alloys and Fe-Cr-Ni alloys is measured by the Sievert's type apparatus at 1500-1800° C. Solubility data, activity coefficients, heats of solution and interaction coefficient of the several elements in Fe, Cr and Ni are reported. 13 ref. (P12e, P12b; Fe-b, Cr-b, Ni-b, N)

76-P. (Czech.) Hot Rolled Thin Transformer Sheet. Frantisek Kulhanek. Hutnicke Listy, v. 15, Nov. 1960, p. 884-886.

Magnetic properties of 0.35-1 mm. thick sheets rolled from GOST 802-58,

DIN 64400, CSN ESC 61-1950 and CSN A20230 steels. Allowable shape and thickness tolerances. (P16; ST, SGA-n, 4-53)

77-P. Electrical Resistivity of Metals. Magnesium Products, Nov. 1960, Insert.

Electrical resistivities of several Mg, Al and Ti alloys are compared to those of Ag, Cu, Al, Mg, brass bronze, Zn alloys, Sn alloys, steels, malleable and cast iron, Inconel, Nichrome and Hastelloy B. (P15g)

78-P. (Russian.) Factors Causing Increase of Coercive Force With the Reduction of Thickness of Ferromagnetic Sheets. V. A. Zaikova and Ya. S. Shur. Fizika Metallov i Metallovedenie, v. 10, Mar. 1960, p. 350-358.

Study of domain structure changes by powder pattern methods and measurement of coercive force in heat treated Fe-Si and permalloy samples of various thickness and crystallographic orientation. Coercive force is determined as a function of temperature, thickness and magnetic field scattering on the surface of a sample. 13 ref. (P16a, P16c; Fe-b, Ni-b, SGA-n)

79-P. (Russian.) Irreversible Thermal Dimensional Changes in Zinc. N. N. Davidenko, V. A. Likhachev and G. A. Malygin. Fizika Metallov i Metallovedenie, v. 10, Mar. 1960, p. 412-424.

Review of literature. Experiments and computations of thermal stress, evaluation for U, Zn, Se, Cd, Sn, Zr, Sb, Bi, Mg and Te. Dimensional changes as influenced by composition, relaxation of microstructure thermal stresses, temperature, heat treatment parameters, grain size and texture. 19 ref. (P10d, P11, Q25p; Zn)

80-P. (English.) Thermodynamics of the System Chromium-Nickel. O. Kubaschewski, W. A. Dench and G. Heymer. Zeitschrift fur Elektrochemie, v. 64, June 1960, p. 801-805.

Thermochemical investigation of Cr-Ni alloy systems by a Mo effusion cell to determine partial free energy, calorimetric heat of formation, partial entropy of solution and phase boundaries. 13 ref. (P12, M24b; Cr-b, Ni-b)

81-P. (English.) Magnetic Susceptibilities of Sulphur, Selenium and Tellurium From Room Temperature to 1100° C. Shotaro Tobisawa. Chemical Society of Japan, Bulletin, v. 33, July 1960, p. 889-893.

Effect of temperature on the magnetic susceptibility of S, Se and Te is measured by a recording magnetic balance. 36 ref. (P16n, P16p, 2-61; Se, Te)

82-P. (Translation-ConBur.) A Study of the Thermodynamic Properties of Solid Solutions in the Nickel-Chromium System. E. Z. Vintaikin. Academy of Sciences of the USSR, Proceedings, Physical Chemistry Section, v. 129, Nov-Dec. 1959, p. 951-954.

A combination of the method of radioactive isotopes and the Knudsen procedure is used to determine the free energy, heat and enthalpy of the nickel-chromium system. (P12, 1-59; Cr-b, Ni-b)

83-P. (Translation-ConBur.) The Calculation of the Thermal Conductivities of Molten Metals. G. F. Butenko and M. I. Radchenko. Soviet Journal of Atomic Energy, v. 6, Sept. 1960, p. 122-123.

Extrapolation of data to high temperatures based on temperature dependence of the Lorentz function and values of electrical resistance. 5 ref. (P11h; 14-60)

84-P. (Translation.) Some Electrical Properties of the AlSb-InSb System. Ya. Agaev and D. N. Nasledov. Soviet Physics-Solid State, v. 2, Nov. 1960, p. 758-760. (Translation of Fizika Tverdogo Tela, v. 2, May 1960, p. 781-1032).

Investigation of the effect of temperature on the Hall effect and electrical conductivity and of changes in the electrical resistance in a transverse magnetic field for the AlSb-InSb system. Data are given for carrier mobilities, carrier densities and energy gap values. 5 ref. (P15, 2-61; Al-b, In-b, Sb-b)

85-P. (Translation.) An Investigation of the Semiconducting Properties in the Silicon-Cobalt System. E. N. Nikitin. Soviet Physics, Solid State, v. 2, Oct. 1960, p. 588-591. (Translation of Fizika Tverdogo Tela, v. 2, Apr. 1960, p. 561-780.)

Electrical conductivity and thermoelectric power of cobalt-silicides. Effect of elevated temperatures. 9 ref. (P15, 2-61, M24b; Co-b, Si)

86-P. (Translation.) Concerning the Effect of Heat Treatment on the Electrical

Properties of p-Type Silicon. I. D. Kirvalidze and V. F. Zhukov. Soviet Physics, Solid State, v. 2, Oct. 1960, p. 537-540. (Translation of Fizika Tverdogo Tela, v. 2, Apr. 1960, p. 561-780).

Influence of heat treatment on specific resistance and carrier concentration in p-type monocrystalline Si. Spontaneous recovery of resistivity with time. 15 ref. (P15, 2-64; Si, 14-61)

87-P. (German.) Temperature Dependence of "Hall" Effect of Ni_3Mn Alloy. N. W. Wolkenstein and G. W. Fedrow. Physikalische Abhandlungen aus der Sowjetunion, v. 3, Feb. 1960, p. 128-134.

Hall voltage for rolled sheets of 1000° C. homogenized Ni_3Mn (23.8 at.% Mn) of varying order is measured at 4.2-296° K. using Cu electrodes and a direct current compensator with cooling and holding at constant temperatures by liquid He, N_2 and H_2. Influence of state of order and of temperature on spontaneous and common Hall constant. (P15p, 2-61; Ni-b, Mn)

88-P. Silicon Iron--The Influence of Carbon and Nitrogen on Its Magnetic Properties. Iron & Coal Trade Review, v. 181, Oct. 28, 1960, p. 935-937.

Effect of carbon and nitrogen content on specimens of very pure vacuum-melted (3%) Si-Fe alloy. Influence of N_2 on the hysteresis loss of high-purity (3%) Si-Fe containing Ti (0.009%-0.025%). Static hysteresis loss and coercive force of the very pure Si-Fe alloy measured after heat treatment, high-temperature annealing and slow cooling to room temperature. (P16, 2-60; Fe-b, Si)

89-P. (German.) Specific Heat of Bismuth-Telluride at Low Temperatures. Je. S. Izkewitsch. Physikalische Abhandlungen aus der Sowjetunion, v. 3, Feb. 1960, p. 135-145.

Calorimetric measurements on a plastic coated Bi_2Te_3 cylinder under high vacuum at 1.37-64.8° K. using liquid and gaseous hydrogen and helium for cooling and Pt, bronze and carbon resistance thermometers to measure temperature. Data are given for specific heat, crystal structure, "Hall" effect and electrical resistance of Bi_2Te_3. (P12r, P15, M27; Te-b, Bi)

90-P. Soft X-Ray Emission From Potassium Metal in the 40-1000 Å Range. R. S. Crisp. Philosophical Magazine, v. 5, Nov. 1960, p. 1161-1169.

Emission in the 40-1000 Å range excited in a K target by electron bombardment is examined using a grazing incidence photon counting spectrometer. A total of seven lines and bands are observed of which two are identified as the L and M valence spectra, three are identified as diagram lines and two broad lines remain unidentified. (P17d; K)

91-P. Equipment and Procedures for Evaluation of Total Hemispherical Emittance. Joseph C. Richmond and William N. Harrison. American Ceramic Society Bulletin, v. 39, Nov. 1960, p. 668-673.

Apparatus and procedure for determining the total hemispherical emittance of coated or uncoated sheet metal specimens of Inconel Al-clad Fe, bright Ni, carbonized Ni, 430 stainless steel and 321 stainless steel. Method consists of heating a metal strip in vacuum equilibrium, then measuring the temperature of and power input to the specimen. (P17d; Fe, Ni, SS, 4-53, 8)

92-P. A Critical Review of Viscosity of $CaO-MgO-Al_2O_3-SiO_2$ Melts. E. T. Turkdogan and Patricia M. Bills. American Ceramic Society Bulletin, v. 39, Nov. 1960, p. 682-687.

Review of the effects of alumina, silica, magnesia, CaO content and temperature on the viscosity of blast furnace slags. Data on the $CaO-SiO_2$, $CaO-Al_2O_3-SiO_2$ and $CaO-MgO-Al_2O_3-SiO_2$ melts. 27 ref. (P10f, 2-60, 2-61; RM-q)

93-P. (German.) Use of Magnified Magneto-Optical "Kerr" Effect to Visualize Magnetic Element Areas of Polycrystalline Cobalt and Nickel. Jakob Kranz and Alois Schauer. Naturwissenschaften, v. 47, Sept. 1960, p. 392-393.

Evaporation of a ZnS interference film on electrolytically polished and high-vacuum annealed Co and Ni specimens to make visible the magneto-optical rotation or "Kerr" effect. (P16e; Co, Ni, 8-72)

94-P. (English.) Magnetic Susceptibilities of Nonferromagnetic Transition Metals. Masao Shimizu and Takeshi Takahashi. Physical Society of Japan, Journal, v. 15, Dec. 1960, p. 2236-2242.

Increase of the paramagnetic susceptibility with temperature of Se, Ti, V, Cr, Mn, Fe, Co and Ni is investigated theoretically using the band picture. Theoretical results are compared with data on susceptibilities of pure Cr and dilute alloys of Fe in Cr. 12 ref. (P16n, P16p, 2-61; Cr-b, Fe)

95-P. The Magnetic Properties of Single Crystals of Chromium Selenide. Ichiro Tsubokawa. Physical Society of Japan, v. 15, Dec. 1960, p. 2243-2247.

Magnetic susceptibilities of single crystal and powder specimens of Cr selenides are measured from 4-900° K. Asymptotic Curie temperature, Curie constant and spin quantum number are determined from susceptibility data. 5 ref. (P16, 2-61; Cr, 14-61, 14-68)

96-P. The Change of the Curie Temperature of Iron-Nickel Alloys Due to Hydrostatic Pressure. Tokijiro Kaneko. Physical Society of Japan, Journal, v. 15, Dec. 1960, p. 2247-2251.

Variation in Curie temperature is measured for Fe-Ni alloys containing 30 and 32% Ni, with hydrostatic pressure produced by an apparatus of Bridgman's type and measurement magnetization by the ballistic method. 6 ref. (P16d, 3-74; Fe-b, Ni-b)

97-P. (Japanese.) Alloying Elements for Mg-Zr System Alloys. Pt. 1. Riei Ichikawa. Light Metals, v. 10, Sept. 1960, p. 353-359.

Solubility of Zr in molten Mg alloy and the grain refining effect of Zr on the cast structure of such alloys when a third metal is included as an alloying element. Solubility studies are made at 700° C. with 18 alloying metals. 10 ref. (P12e, E25q, 2-60; Mg, Zr)

98-P. Measurement of Tellurium Vapour Pressure Using Electrical Discharge. Journal of Scientific Instruments, v. 37, Dec. 1960, p. 491-492.

Te vapor pressure is measured at 10^{-6}mm. Hg and 762° C. by a silica apparatus consisting of a discharge chamber having electrodes of tungsten with 4 mm. in diameter hemispherical ends. (P12c; Te)

99-P. Compound Is Magnetic When it Is Heated. Steel, v. 148, Jan. 16, 1961, p. 78.

Effect of temperature on the magnetic properties of CrMn antimonide. Effect of the Cr content on the transition temperature of the compound. (P16, 2-61, Q23r, 2-60; Cr, Mn, 14-68)

100-P. (English.) Solution-Rate Studies of Solid Metals in Liquid Metals. Pt. 1. Nickel in Bismuth. Masanobu Miyaki, Takao Konishi and Tadao Sano. Osaka University, Technology Reports, v. 10, Mar. 1960, p. 453-461.

Solution rate of dissolution measured under static and isothermal conditions at 300-450° C. by electrical resistivity variation and as a function of concentration. Equations are derived for activation energy. 6 ref. (P12e, P15g, 2-60; Bi, Ni, 14-60)

101-P. (German.) Antiferromagnetic Properties of Ni_3Fe Alloy Depending on Atomic State of Order. M. W. Dechtjar. Physikalische Abhandlungen aus der Sowjetunion, v. 3, Mar. 1960, p. 187-196.

Isothermal measurement of magnetization for ordered and unordered specimens obtained by heating to 1200° C. (with subsequent water quenching) in a Pt furnace by an astatic magnetometer (at compensated earth field) from room temperature to transition temperature to paramagnetic state. (P16p, N10; Ni-b, Fe)

102-P. (German.) Heats of Formation in the Aluminum-Zinc System at 330, 370 and 430° C. Pt. 15. Contributions to Energetics of Metallic Systems. Franz Eberhard Wittig and Leopold Schoffl. Zeitschrift fur Metallkunde, v. 51, Dec. 1960, p. 700-707.

Calorimetric measurements of heats of solution for alloys with 4.43-88.65 at. % Zn (bal. Al) and computation of heats of formation by means of an auxiliary function. Interpretation of results derived from expected values in terms of dislocation formation and dilation of lattice. (P12q, M24b, M26; Al-b, Zn-b)

103-P. (German.) Magnetic After Effects in Age-Hardenable Nickel-Beryllium and Iron-Molybdenum Alloys. Hans-Dieter Hahlbohm and Karl Heinz Bornig. Zeitschrift fur Metallkunde, v. 51, Dec. 1960, p. 708-710.

Age hardenable Ni-Be (2% Be) and Fe-Mo (19.6% Mo) alloys are quenched from solid solution temperatures (for

Ni-Be = 1110° C.) and subsequently annealed to 450 and 600° C. with measurement of magnetic properties at varying annealing times. Evaluation of type and cause of magnetic after effect. (P16e, 2-64; Fe-b, Mo, Ni-b, Be)

104-P. (German.) Conductivity and Hall Constant. Pt. 12. Long Range Order in Cu-Ni-Zn Solid Solutions. Werner Koster. Zeitschrift fur Metallkunde, v. 51, Dec. 1960, p. 716-721.

Measurement of electrical resistance, Hall constant and modulus of elasticity in 95% cold deformed or recrystallized Cu-Ni-Zn specimens with a Ni/Zn ratio of 1:1 and 43-72% Cu at 20-800° C. Structure determination of a long range order phase by X-ray (Cu-K-alpha radiation) examination. (P15g, P15p, M-general, N10, 2-61; Cu-b, Ni, Zn)

105-P. On Thermal Conductivity of Aluminum at Low Temperatures. H. N. Patil. Indian Journal of Physics, v. 34, Aug. 1960, p. 395-396.

Temperature variation of the thermal conductivity of Al at 2-12.5° K. is explained in terms of variation in the Debye characteristic temperature and lattice conduction effects. (P11h, 2-61; Al)

106-P. (German.) Wetting of Oxides by Metals. W. Schatt. Planseeberichte fur Pulvermetallurgie, v. 8, Dec. 1960, p. 122-129.

Wetting test by measuring border angle for Hg, Sn and Ag on 0-16% Cr_2O_3 containing Al_2O_3 in air and hydrogen atmosphere resistance of Al_2O_3 containing 0-8% Cr_2O_3 at room temperature. Wetting theories including those of Naiditsch-Eremenko and of Williams and Murray. (P13h, 2-61; 14-68, Hg, Sn, Ag)

107-P. Measurement of Debye-Waller Temperature for Silver and Alpha Iron. C. W. Haworth. Philosophical Magazine, v. 5, Dec. 1960, p. 1229-1234.

Variation with temperature of X-ray diffraction line intensities from Ag and Fe at 286-1190° K. is measured to determine Debye-Waller temperature factor. Diffraction intensities show no discontinuity at the Curie temperature and there is no anomaly in the spacing of the (110) planes. 10 ref. (P12r, M22g; Ag, Fe)

108-P. Magnetic Susceptibility of Vanadium-Chromium Solid Solutions. B. G. Childs, W. E. Gardner and J. F. Penfold. Philosophical Magazine, v. 5, Dec. 1960, p. 1267-1280.

Magnetic susceptibility of Cr in vanadium is measured at 20, 77 and 293° K. and found to be dependent upon composition. Fine structure is observed in several regions in the susceptibility-composition curve. 23 ref. (P16n, P16p, 2-60, M27; V-b, Cr-b)

109-P. Determination of the Specific Volume of Liquid Copper-Lead Alloys. Tore Malmberg. Institute of Metals, Journal, v. 89, Dec. 1960, p. 137-139.

A method for determining the density of liquid metals, based on the pyknometric principle used to measure Cu and Pb and their binary alloys at 972-1170° C. 17 ref. (P10a, P10d, M24b, 2-61; Cu-b, Pb-b)

110-P. The Heats of Formation in the Vanadium-Titanium-Aluminum System. O. Kubaschewski, C. Wainwright and F. J. Kirby. Institute of Metals, Journal, v. 89, Dec. 1960, p. 139-144.

Heats of formation determined by calorimetry are used to construct isoenthalpy diagram for 50 furnace cooled alloys in the system with examination of phase relationships by X-ray diffraction and microscopy. A correlation between ductility and heat of formation is indicated. 8 ref. (P12, M24c, Q23p; Al-b, Ti-b, V-b)

111-P. Transient Strain--Induced Electrode Potentials. Ken Nobe, Eric Baum and Wm. F. Seyer. Electrochemical Society, Journal, v. 108, Jan. 1961, p. 97-100.

Measurement of transient potentials produced when Cu and Zn-plated Cu wires are strained elastically in $CuSO_4$ and $ZnSO_4$ solutions. Experimental results are predicted by theoretical considerations of the electrical double layer. 4 ref. (P15j, 3-68; Cu, Zn, 4-60)

112-P. Electrical Conduction in Thin Films of Silver Telluride. W. M. Kone and C. Wood. Electrochemical Society, Journal, v. 108, Jan. 1961 p. 101-102.

Electrical contact is made to the films by pressure using a Pt wire or by painting on an In-Ga amalgam. Upon application of constant voltage, current

through the film is found to vary with time and dendrites appear in the area of the contacts. 5 ref. (P15g; Ag, 14-62)

113-P. High Temperature X-Ray Study of the Thermal Expansion of Pd_9Se_8 and Rh_9S_8. Arne Kjekshus. Acta Chemica Scandinavica, v. 14, July 1960, p. 1623-1626.

X-ray powder photography of Pd_9Se_8 and Rh_9S_8 at 20-940° C. to determine the linear thermal expansion coefficients and the volume expansion coefficients. 6 ref. (P11g; Pd, Rh, 14-68)

114-P. The Hydrides of Palladium and Palladium Alloys. F. A. Lewis. Platinum Metals Review, v. 5, Jan. 1961, p. 21-25.

Review of the physical properties of the Pd hydrides and the Pd alloy-H systems. Relationship between relative electrical resistance and hydrogen content. Isotherms are given for a series of Pt-Pd-H systems and for Ag-Pd-H systems. 19 ref. (P15g, P-general, 2-60, M24c; Pd, 14-68)

115-P. The Refractory Noble Metals and Rhenium. Platinum Metals Review, v. 5, Jan. 1961, p. 19-20.

Melting point, acid resistance, oxidation resistance and mechanical strength of the Pt group metals, Rh, Ru, Ir and Os and the neighboring transition metal Re. Effects of Re and refractory noble metal additions on the ductility, twinning and hardness of Mo, W and Cr. (P12n, R-general, Q27a; Ir, Os, Pt, Re, Rh)

116-P. The Critical Field of Superconducting Aluminium Under Pressure. D. Gross and J. L. Olsen. Cryogenics, v. 1, Dec. 1960, p. 91-95.

Effect of pressure on the critical field of Al is measured between 0.3° K. and the transition temperature to permit calculation of specific heat. Pressures up to about 1700 atmospheres are produced by the ice-bomb technique. Results are also reported for Zn, although in this case the technique used for creating the pressure does not yield a pressure which is sufficiently isotropic to allow quantitative conclusions. 20 ref. (P12r, P15g, 3-74; Al)

117-P. The Magnetic Susceptibility of Ag-Mn and Cu-Mn Solid Solutions Between 1.2 and 368° K. A. van Itterbeek, W. Peelaers and F. Steffens. Applied Scientific Research, v. 8, Apr. 1960, p. 337-348.

Determination of Curie constant and Curie temperature for the temperature region in which the alloys obey the Curie-Weiss law. Comparison of values calculated for the effective magneton number with other published values. Measurement of field dependence of the susceptibility. (P16, 2-60, 2-61; Ag-b, Cu-b, Mn)

118-P. Measurements on the Permeability of Hydrogen From H_2 and H_2O Through Steel, Stainless Steel and Aluminum. F. Boeschoten, W. van Egmond and H. M. J. Kinderdijk. Applied Scientific Research, v. 8, Apr. 1960, p. 378-386.

Permeation rate tests are conducted at 100-675° C. through 0.1 mm. tubes using H_2 at varying pressures and superheated steam at atmospheric pressure as sources of hydrogen. 11 ref. (P10m; Al, SS, ST, H)

119-P. (Slovakian.) Determination of Thermodynamic Constants of Solid Material With a Special Apparatus. Bohumil Zitnansky and I. Sebestian. Hutnicke Listy, v. 15, Dec. 1960, p. 951-955.

Study of evaporation kinetics, evaporation velocity, vapor pressures, diffusion coefficients, sublimation temperature and activation energies of Fe-Cr-Mn alloys as functions of temperature and composition, based on temperature measurements and the method of ion exchange. Central unit of the apparatus used is a vacuum furnace. 12 ref. (P12, P13a, N1, N16r, N15g, 2-60, 2-61; Fe-b, Cr-b, Mn-b)

120-P. Effect of Impurity Doping Upon the Electrical Properties of Cadmium Telluride. T. Ichimiya, T. Niimi, K. Mizuma, O. Mikami, Y. Kamiya and K. Ono. Solid State Physics in Electronics and Telecommunications, Proceedings of the International Conference, Brussels, Belgium, June 2-7, 1958, v. 3. Magnetic and Optical Properties, Pt. 1, 1960, p. 845-853.

Electrical resistivity, Hall coefficient and electron mobility at -140 to 250° C. of Cd-Te doped with Ag, In and As. (P15, 3-69; Cd, 14-68)

121-P. (English.) The Dissolving of Oxides in Carbon Steel Melts Under Vacuum. L. Tiberg. Jernkontorets Annaler, v. 144, Oct. 1960, p. 771-793.

The rate of solution for oxides, quartz glass and ceramic materials in a steel melt containing 0.8% C under a vacuum is investigated at 1600-1650° C. The relationship of gas evolution because of boiling at the crucible wall to the formation and growth of surface bubbles is analyzed theoretically. (P12e; CN, 14-68)

122-P. Thermodynamics of the Liquidus and Solidus Curves in System With Complete Solid Solubility; The System Silver-Gold. O. J. Kleppa. Acta Metallurgica, v. 8, Nov. 1960, p. 804-806.

A general expression is derived which permits the calculation of the free energy of formation of solid and liquid phases from the phase diagrams in binary systems. Application to determining the liquidus-solidus gap in Ag-Au alloys. 4 ref. (P12a, M24b, N12p; Ag-b, Au-b)

123-P. Porosity in Plastically Deformed Single Crystals. F. D. Rosi and M. S. Abrahams. Acta Metallurgica, v. 8, Nov. 1960, p. 807.

Single crystal specimens of Ag, Cu and a Cu-0.1% Al alloy are extended to fracture at room temperature and at uniform strain rate. Metallographic examination of porosity occurring parallel to the fracture surface and perpendicular to the stress axis as a function of multiple glide and vacancy coalescence. (P10m, M26s, Q24; Ag, Cu-b, Al, 14-61)

124-P. (German.) Means of Control of Magnetic Properties of Permalloys. Friedrich Pfeiffer. Elektrotechnische Zeitschrift, v. 81, Dec. 19, 1960, p. 945-949.

Permalloys (71-76% Ni, 4.5-14% Cu, 0-4% Mo, 0-2.4% Cr, rest Fe) are annealed under hydrogen at 600-1200° C. and heat treated at 300-750° C. to determine the variation of temperature coefficient of initially permeability, small hysteresis coefficient and rectangular hysteresis loop. (P16, 2-64; Ni-b, Cu)

125-P. Ultra-High Pressure Physics. William G. Field. American Society of Mechanical Engineers, Paper no. 60-WA-331, Dec. 16, 1960, 8 p. $1.

Ultra-high pressures and temperatures are applied to metals such as steel, Ta, W, Ni and Pt and nonmetals to determine the effect of geometry of the resulting crystal structure and on the material's melting point, rigidity and compressibility. (P12n, Q21e, 2-61, 3-71, 3-74; Mo, Ni, Pt, ST, Ta, W)

126-P. Reactive Metals. Donald R. Spink. I/EC (Industrial and Engineering Chemistry), v. 53, Feb. 1961, p. 97-104.

Physical and chemical properties and corrosion resistance of Ti, Zr and Hf as they affect chemical industry applications where strong oxidizing conditions prevail. (P-general, Q-general, R6, R7, T29; Hf, Ti, Zr, 17-57)

127-P. Less Common Elements--Relationship to the Chemical Industry. Ivor E. Campbell. I/EC (Industrial and Engineering Chemistry), v. 53, Feb. 1961, p. 112-114.

Physical and mechanical properties of Ta, Cb, Re, Mo, W, Cr, Ti, Zr and Hf. Effect of nonmetallic additions on properties. (P-general, Q-general; Cb, Cr, Hf, Mo, Re, Ta, Ti, W, Zr)

128-P. (German.) Solution Rate of Ferrochromium Alloys in Steel Baths and Behavior of Chromium Carbides During the Dissolution Process. K. Blankenstein and E. Plockinger. Technische Mitteilungen Krupp, v. 18, Nov. 1960, p. 37-43.

Dissolution behavior of Fe-Cr alloys containing 0.02-6.40% C, 61.7-71.7% Cr and the mixed carbide $(Cr, Fe)_{23}C_6$ at 0.40-60% and of Cr_7C_3 in nonboiling steel baths with 0.30 and 1.0% C. Examination of carbide microstructures during dissolution by microscopy and isolation of residues. 6 ref. (P12e, M-general, N8r; ST, Cr, 14-68)

129-P. (German.) Iron-Cobalt Permanent Magnetic Alloys With Additions of Vanadium and Chromium. Pt. A. Basic Investigation. W. Baran, W. Bruer, H. Fahlenbrach and K. Janssen. Technische Mitteilungen Krupp, v. 18, Nov. 1960, p. 81-90.

Magnetic and mechanical properties of a heavily cold worked 52% Co, 8% V, 4% Cr, balance Fe alloy heat treated at 20-700° C. Data are given for Vickers hardness, elastic modulus, tensile strength, thermal expansion and temperature and monoaxial anisotropy dependency of magnetic properties. (P16,

Q-general, 2-61, 3-72; Co-b, Fe, V, Cr, SGA-n)

130-P. (Japanese.) Plastics Coated Steel Sheet. Yoshio Yamagata. Metal Finishing Society of Japan, Journal, v. 11, Oct. 1960, p. 603-605.

Data are given for electrical, chemical and mechanical properties and wear, corrosion and heat resistance of plastic coated sheet. (P15, Q-general, R-general, Q9n; ST, NM-g33, 8)

131-P. (Book.) High Frequency Magnetic Materials, Their Characteristics and Principal Applications. W. J. Polydoroff. 215 p. 1960. John Wiley & Sons, Inc., 440 4th Ave., New York, N. Y.

Ferromagnetic and dielectric properties, resistivity, permeability and Curie point of magnetic alloys containing Fe, Al, Sn, Sb and Si. (P16; Al-b, Fe-b, Sb-b, Si-b, Sn-b)

132-P. (Translation.) The Equation of State of Metals by a Statistical Method. V. P. Trubitsyn. Soviet Physics--Solid State, v. 2, Nov. 1960, p. 820-823. (A translation of Fizika Tverdogo Tela, v. 2, May 1960, p. 781-1032.)

Derivation of an approximate equation of state for metals at pressure from 0-1X10^6 atm. and T=0^{o}K. with an explicit analytical expression for the dependence of the energy and pressure on the volume. Comparison of calculated and experimental values of sublimation energy, pressure and equilibrium volume for Mg. 6 ref. (P10, P12; Mg)

133-P. (Translation-ConBur.) Thermodynamic Properties of Indium Antimonide. A. V. Nikol'skaya, V. A. Geiderikh and Ya. I. Gerasimov. Academy of Sciences of the USSR., Proceedings, Physical Chemistry Section, v. 130, Jan-Feb. 1960, p. 163-166.

Enthalpy, entropy and free energy of formation of In-Sb are determined by an electrochemical technique. (P12; In, 14-68)

134-P. (Translation-ConBur.) The Interphase Surface Energy of a Metal at the Crystal-Metal Interface. S. N. Zadumkin. Academy of Sciences of the USSR., Proceedings, Physical Chemistry Section, v. 130, Jan-Feb. 1960, p. 103-105.

Theoretically calculated values of the interphase surface free energy compared with those determined experimentally for Ag, Au, Cu, Pb, Al, Pt, B-Ni and B-Co. (P13h; Ag, Al, Au, Co, Cu, Ni, Pb, Pt)

135-P. (Translation-ConBur.) Measurement of the Vapor Pressure of Solid Chromium by Means of Radioactive Indicators. An. N. Nesmeyanov and De Dyk Man. Academy of Sciences of the USSR, Proceedings, Physical Chemistry Section, v. 131, Mar-Apr. 1960, p. 373-375.

Measurement by an integral variant of the effusion method of Knudsen, using the radioactive isotope of Cr^{51} for determining the amounts of condensate. Chrome is exposed in sealed ampoules to neutrons in a nuclear reactor. 8 ref. (P12c; Cr)

136-P. (Translation-ConBur.) The Enthalpy of Formation of Compounds of Cadmium With Phosphorus, Arsenic and Antimony. S. A. Shchukarev, M. P. Morozova and M. M. Bortnikova. Journal of General Chemistry of the USSR., v. 28, Dec. 1958, p. 3315-3317.

Enthalpies of formation are determined for synthesized Cd_3P_2, Cd_3As_2 and Cd_3Sb_2 compounds by reaction with 1N KBr saturated with an excess of Br and measurement of the resulting reaction temperature. 14 ref. (P12; Cd, 14-68)

137-P. Design Information on Titanium Alloys for Aircraft and Missiles. W. P. Achbach and R. J. Favor. Defense Metals Information Center, Battelle Memorial Institute, DMIC Rept. 145, Jan. 10, 1961, 84 p. (Available as PB 151104 from U. S. Office of Technical Services, Washington 25, D. C.)

Design allowances and physical and mechanical properties of 8Mn, 4Al-3Mo-1V, 5Al-2Cr-2Mo-2Fe, 6Al-4Zr-1V and 5Al-5Zr-5Sn Ti alloys in sheet, plate, strip and bar form at temperatures up to 1000^{o} F. (P-general, Q-general, 17-51, T24; Ti-b)

138-P. Metallurgy in Nuclear Power Technology. J. C. Wright. Metal Treatment and Drop Forging, v. 28, Jan. 1961, p. 21-30.

Review of the physical and mechanical properties and corrosion and oxidation behavior of Al, Mg, Magnox alloys, Zr, Zircaloy and Cb in their application as fuel element canning materials.

(P-general, Q-general, R-general, T11; Al, Cb, Mg, Zr-b, 17-57)

139-P. (German.) Anode Potential of Zinc in Saturated Zinc-Sulphate Solution. K. Schwabe and F. Lohmann. Zeitschrift fur Physikalische Chemie, v. 215, Mar-Apr. 1960, p. 158-166.

Potential measurements are made in a saturated $ZnSO_4$ solution of pH=1.5 by an indirect method using a mechanical breaker. Theory is given to explain reaction mechanisms of anodic polarization. (P15; Zn)

140-P. (German.) Thermodynamic Properties of Several Copper Alloys. A. A. Wetscher and J. I. Gerassimow. Zeitschrift fur Physikalische Chemie, v. 215, Mar-Apr. 1960, p. 194-202.

Evaluation of free enthalpy and entropy of mixing in binary Cu-Ni, Cu-Pd and Cu-Sb solid solutions by electromotive force measurements at 400-750° C. using liquid iodine and chlorine salts as electrolyte. (P12; Cu-b)

141-P. (Russian.) Heat Treatment of Iron-Aluminum Magnetically Soft Alloys. G. V. Krasnoperov and N. I. Lapkin. Fizika Metallov i Metallovedenie, v. 10, May 1960, p. 668-671.

Effect of temperature of heat treatment and quenching media on magnetic properties and electrical resistivity of hot rolled Yu16 alloy samples containing 16% Al. Heat treatment parameters are developed for obtaining magnetic properties equivalent to those of Fe + 50% Ni alloys. 5 ref. (P15g, P16, 2-64; Fe-b, Al, Ni)

142-P. (Russian.) Temperature Dependence of Paramagnetic Susceptibility of Iron Nickel Alloys. V. I. Chechernikov. Fizika Metallov i Metallovedenie, v. 10, May 1960, p. 672-675.

Paramagetic susceptibility of Fe-Ni alloys containing 38.8-89.6% Ni at 200-1200° C. is measured as a function of temperature, composition and diamagnetic properties of the metal. 9 ref. (P16p, 2-60, 2-61; Fe-b, Ni-b)

143-P. (Russian.) Magnetic and Electrical Properties of Some Construction Steels in Relation to Structure and Tendency to Temper Brittleness. G. S. Tomilov. Fizika Metallov i Metallovedenie, v. 10, May 1960, p. 681-689.

45, 30KhGS and 45Kh NMFA steels are oil quenched from 850-1200° C. with subsequent tempering at 100-700° C. Hardness, impact strength, electric conductivity, coercive force, Hall constant, magnetic saturation and permeability are measured as dependent upon carbide transformations, initial grain size and tempering temperature. 11 ref. (P15, P16, Q29n, Q6n, 2-59, 2-64, 3-71; ST, SGB-s)

144-P. Alloys for Temperature Compensation of Electrical Instruments. C. A. Clark. Instrument Practice, v. 15, Jan. 1961, p. 56-61.

Physical properties of 70-30 Fe-Ni and 70-30 Ni-Cu base alloys at -50 to 200° C. with reference to applicability in temperature-compensation of instruments employing eddy-current damping control. Magnetic induction as a function of temperature and martensite transition point is measured for variously fabricated and heat treated alloys containing differing amounts of C, Si, Mn and Mo. (P16, P-general, N6q, X10; Fe-b, Ni-b, Cu, 17-57)

145-P. (German.) The Stabilizing Field of the Magnetic After Effect in Silicon Iron at High Temperatures. G. Hellbardt. Technische Mitteilungen Krupp, v. 18, Aug. 1960, p. 25-28.

Oscillographic recording of the stabilizing field of the magnetic after effect before and after stabilization at 500° C. in an Fe-Si alloy. Comparison with the H.-D. Dietze theory of domain wall stabilization by vacancies. Effect of induction, high temperature and grain boundary relaxation on disappearance of the field. 8 ref. (P16e, 2-62, 3-72; Fe-b, Si)

146-P. (Czech.) Transformer Sheet. Josef Teindl and Bohuslav Otta. Sbornik, v. 6, Mar-Apr. 1960, p. 297-302.

Various transformer sheets are tested by a special apparatus which measures magnetic permeability. Effect of storage at 5-30° C. for 85 days on hysteresis loss and permeability. (P16, 2-61; SGA-n)

147-P. Radiation Damage of Metals (Experimental Design to Study the Effect of Elevated Temperature on Neutron-Induced Changes in Steel). L. E. Steele and J. R.

Hawthrone. Report of N. R. L. (Naval Research Laboratory) Progress, Dec. 1960, p. 28-29. $1.25. (Available as PB 161288 from U. S. Office of Technical Services, Washington 25, D. C.)

An experimental multitemperature assembly, incorporating four units of steel specimens within a framework of Al and sheathed in stainless steel forming a controlled temperature capsule attaining progressively higher temperature from unit to unit, is exposed to irradiation in a water cooled reactor at 240-570° C. to study radiation damage and temperature effects. (P10d, 2-61, 2-67; ST)

148-P. (Czech.) Influence of Lattice Distortions and Characteristic Temperature on the Heat Resistance of Low Alloy Steel. Zdenek Bembenek and Vaclav Foldyna. Sbornik, v. 6, Jan. 1960, p. 33-49.

Wires of low alloy steel with 0.16% C, 0.09% Mn, 1.42% Mo, 0.024% P and 0.022% S are held at 1200° C. for 20 min. and subsequently annealed in a Sn bath at 400-700° C. Effect of annealing on distortions of the third order is tested by X-ray diffraction. 24 ref. (P12r, 2-64, 9-74; AY, 4-61)

149-P. Transient Heat Conduction in a Rod of Finite Length With Variable Thermal Properties. W. H. Chu and H. N. Abramson. Journal of Applied Mechanics (ASME, Transactions), Series E, v. 27, Dec. 1960, p. 617-622.

Theoretical solution for determination of thermophysical properties by replacing the ore-dimensional heat conduction equation with a difference equation. Temperature-dependent diffusivity of a Cu bar is determined for 300° K. 16 ref. (P11m, 10-51; Cu)

150-P. Solubility of Nitrogen in Molten Iron Manganese Alloys. Sylvan Z. Beer. Metallurgical Society of AIME, Transactions, v. 221, Feb. 1961, p. 2-8.

The solubility of nitrogen in molten Fe-Mn alloys is measured as a function of concentration of Mn, temperature and pressure. Experimental values for the solubility and heats of solution are compared with those obtained from excess free energies calculated using a ternary Gibbs-Duhem relationship. 14 ref. (P12e, P12q, 2-60, 2-61, 3-74; Fe-b, Mn-b, N)

151-P. Thermal Diffusivity of Armco Iron. G. D. Cody, B. Abeles and D. S. Beers. Metallurgical Society of AIME, Transactions, v. 221, Feb. 1961, p. 25-27.

The thermal diffusivity (thermal conductivity divided by specific heat) of Armco iron is measured at 30-1025° C. Differences from values computed from published thermal conductivity and specific heat data are ascribed to a rapid variation in the electronic thermal conductivity near the Curie point and a decrease in the lattice thermal conductivity at alpha to gamma phase transition. 9 ref. (P11m, P11h, 2-61; Fe-a)

152-P. The Effect of Plastic Deformation on the Electrical Resistivity of Composite Silver Alumina Alloys. H. R. Peiffer. Metallurgical Society of AIME, Transactions, v. 221, Feb. 1961, p. 60-63.

The increase in electrical resistivity is measured as a function of elongation at 78° K. for a 2% finely divided alumina in Ag material. The amount of increase in electrical resistivity is influenced by the amount of dispersed alumina present. 9 ref. (P15g, 3-68; Ag-b, Al)

153-P. Uranium Solubility in Bismuth-Base Liquid Solutions. A. F. Weinberg, R. J. Van Thyne and R. E. Steiner. Metallurgical Society of AIME, Transactions, v. 221, Feb. 1961, p. 83-90.

Uranium solubility in molten Bi is determined at 350-600° C., varying from 0.09 wt.% to near 2 wt.%, respectively. Zr and Mg, simulated fission products and Na are found to increase or decrease uranium solubility at 370-420° C. depending upon the addition or temperature. Data are obtained by chemical analysis of samples obtained by filtration from saturated melts and by measurement of the variation of electrical resistance with temperature. 8 ref. (P12e, 2-60, 2-61; Bi, U, 14-60)

154-P. Reaction of Pure Tantalum With Air, Nitrogen and Oxygen. W. M. Albrecht, W. D. Klopp, B. G. Koehl and R. I. Jaffee. Metallurgical Society of AIME, Transactions, v. 221, Feb. 1961, p. 110-117.

Kinetic studies are made of the reaction of Ta with O, N and air at 400-1500° C. The Ta-O reaction is linear from

500-1250° C. The Ta-N reaction follows a cubic rate law at 400-700° C. and a parabolic rate law at 800-1475° C. The reaction behavior in air is initially parabolic followed by a transition to linear behavior. 31 ref. (P13b, R1h; Ta, N, O)

155-P. Thermodynamic Properties for the Zn-Cd System From Electromotive Force Measurement. D. J. Wynnemer and G. W. Preckshot. Metallurgical Society of AIME, Transactions, v. 221, Feb. 1961, p. 186-191.

Electromotive force measurements are made on the Zn-Cd system at 700-900° C. Activity coefficients, partial free energies, enthalpies, entropies, integral heat of mixing and vapor-liquid equilibrium composition are determined over the composition range. 19 ref. (P12, P15g, M24b; Cd-b, Zn-b)

156-P. Kinetic and Equilibrium Studies of Redox Reaction in Liquid Bismuth. D. G. Schweitzer and D. H. Gurinsky. Metallurgical Society of AIME, Transactions, v. 221, Feb. 1961, p. 192-198.

The empirical equilibrium constants and the heat of reaction for the reduction are determined at 300-500° C. The mechanisms of the oxidation of U and Mg from dilute Bi solutions are investigated. The kinetics of some of the reactions are affected by air adsorbed on the uranium oxides. 3 ref. (P13, R1h; Bi, Mg, U)

157-P. Solubility of Nitrogen in Liquid Manganese. Nev A. Gokcen. Metallurgical Society of AIME, Transactions, v. 221, Feb. 1961, p. 200-201.

Nitrogen solubility in electrolytic Mn at 1273-1500° C. is determined using quenching, dissolution and solution distillation methods. Activity coefficients and standard free energies are calculated with the reaction being considered exothermic. 4 ref. (P12e, P13; Mn, N)

158-P. Galvanic Behavior in Fused Electrolytes. Pt. 3. Potentials of Calcium, Magnesium and Nickel in LiCl-KCl-K_2CrO_4 and NaCl-KCl-K_2CrO_4. Sidney M. Selis and Laurence P. McGinnis. Electrochemical Society, Journal, v. 108, Feb. 1961, p. 191-195.

Difference of electrode potentials in electrolytes containing Li and Na is explained by formation of a semiliquid electrode surface film which inhibits polarization. (P15m; Ca, Mg, Ni)

159-P. (Translation.) Anistropy of Electrical Properties of Single Crystals of Cadmium Antimonide. I. K. Andronik and M. V. Kot. Soviet Physics, Solid State, v. 2, Dec. 1960, p. 1022-1026. (Translation of Fizika Tverdogo Tela, v. 2, June 1960, p. 1033-1360.)

Conductivity, Hall effect, resistivity and thermal emf. as influenced by temperature and magnetic field. 9 ref. (P15, 2-61; Cd, 14-61, 14-68)

160-P. (Translation.) The Optical and Photoelectric Properties of Zinc Selenide and Telluride. G. A. Zholkevich. Soviet Physics, Solid State, v. 2, Dec. 1960, p. 1009-1011. (Translation of Fizika Tverdogo Tela, v. 2, June 1960, p. 1033-1360.)

Absorption spectra, photoconductivity and luminescence are measured on wafers obtained by direct reduction of the constituent elements. 4 ref. (P17a, P15k; Zn, 14-68)

161-P. (Translation.) Electrical Conductivity and Photoelectric Properties of Cadmium and Zinc Telluride Layers. P. P. Konorov and I. B. Shevchenko. Soviet Physics, Solid State, v. 2, Dec. 1960, p. 1027-1032. (Translation of Fizika Tverdogo Tela, v. 2, June 1960, p. 1033-1360.)

Electrical conductivity as influenced by temperature and photoconductivity as influenced by intensity of incident light. 9 ref. (P15g, 2-61; Cd, Zn, 14-68)

162-P. (Translation.) Anisotropy of Certain Electrical Properties of Single Crystals of Zinc Antimonide. M. V. Kot and I. V. Kretsu. Soviet Physics, Solid State, v. 2, Dec. 1960, p. 1134-1139. (Translation of Fizika Tverdogo Tela, v. 2, June 1960, p. 1033-1360.)

Effect of temperature on electrical conductivity, Hall effect and thermal emf. is measured on test specimens prepared by Bridgman's method and zone melting. 3 ref. (P15, 2-61; Zn, 14-61, 14-68)

163-P. (English.) Annealing Effect of Commercial Silicon Steel Sheets. Komei Haga and Hirokuni Mizuno. Scientific Papers of the Institute of Physical and Chemical Research, v. 54, Sept. 1960, p. 285-294.

Testing Si steel transformer sheet specimens to determine the effect of various annealing conditions on the magnetic properties of the steel sheet. Effects of annealing time, temperature and hydrogen or oxidizing atmosphere on the magnetic permeability of the specimens. 13 ref. (P16, 2-64; SGA-n, ST)

164-P. (Japanese.) Changes in Specific Surface Area of Iron Salts and Iron Oxides Powders on Heating. Akira Moriyama, Jyoichiro Moruyama and Isao Kushima. Japan Institute of Metals, Journal, v. 24, Nov. 1960, p. 699-703.

Measurement of the contraction of specific surface area of Fe oxides produced by thermal decomposition of Fe salts, by heating at constant temperatures (300-900° C.) and in densification through sintering. Equation is derived for rate kinetics and activation energy. 19 ref. (P10c, P13; Fe-b, 6-68, 14-68)

165-P. Studies of Shock Propagation and Vibration and Their Measurements. I. Vigness and E. W. Kammer. Report of NRL (Naval Research Laboratory) Progress, Jan. 1961, p. 23-24.

Effect of mechanical strain upon the resistance of an Au-Cu alloy in both the ordered and disordered state is measured at 78 and 300° K. to study the influence of impurities and lattice imperfections on thermoelectric potentials. The study is part of a program for determining suitability of the properties of materials for bonded wire strain gage applications in instrumentation of shock and vibration measurements. (P15g, Q6p, X28j, 3-68, 3-69; Au-b, Cu-b, 4-61, 17-57)

166-P. (Translation.) The Dispersion and Reestablishment of Contacts Between Microblocks During Plastic Deformation. R. I. Garber, I. A. Gindin and L. M. Polyakov. Soviet Physics, Solid State, v. 2, Dec. 1960, p. 984-990. (Translation of Fizika Tverdogo Tela, v. 2, June 1960, p. 1033-1360.)

Porosities caused by structural disorientation in steel foil and tubing at -196° C. disappear upon returning to room temperature. 15 ref. (P10m, 3-68; ST, 4-56, 4-60)

167-P. Properties and Applications of Some Specialty Wires. Donald E. Thomas. Wire and Wire Products, v. 36, Jan. 1961, p. 73-74, 115-116.

Data are given for electrical conductivity, tensile strength, elongation, density and solderability of bare and metal coated wire composed of stainless steel, Zn, Pb, Ag and Cu, Sn, Ni, Fe and their alloys. Applications in electrical conductors, cables, wire cloth and various consumer goods. (P-general, Q-general, K8, 17-52; 4-61, 17-57)

168-P. Review of Developments in Iron-Aluminum-Base Alloys. J. W. Holladay. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo 82, Jan. 30, 1961, 57 p.

Physical and mechanical properties of ferritic and austenitic Fe-Al alloys are compared with those of 302, 321, 403 and 430 stainless steels. Data are also given for corrosion and oxidation resistance, workability and elevated temperature properties. (P-general, Q-general, R-general; Fe-b, Al, SS)

169-P. (English.) The Mathiessen Rule in Disordered Binary Alloys. A. Corciovei and G. Musa. Acta Physica Polonica, v. 19, June 1960, p. 647-662.

Theoretical calculation of the vibrational, disorder and mixed components of the electrical resistivity and their deviation from the Mathiessen rule. (P15g)

170-P. (French.) Titanium and Its Alloys. Pt. 1. Principal Properties, Weldability. R. Develay. Soudage et Techniques Connexes, v. 14, Nov-Dec. 1960, p. 409-420.

Compilation of data for physical properties, including density, fusion point, electric resistance, dilation, thermal conductivity, resistance to chemical agents and oxidation and allotropic transformation (at 885° C.), separating an alpha and a beta phase. Influence of O, N and C (present as impurities), of chemical reactivity and of heat treatment on the weldability of Ti and of its alloys, T-A5E, T-A8-Nb2Ta, T-A6V, T-A4M, T-A4D3V, T-D6A and T-V16A. 4 ref. (P-general, K9s, 2-60, 2-64; Ti-b)

171-P. Thermal Fluctuation Effects in Thin Magnetic Films. E. P. Wohlfarth.

Journal of Electronics and Control, v. 10, Jan. 1961, p. 33-37.

Interpretation of thermal fluctuation in small crystallite particles of thin Ni films evaporated on a glass substrate at 200° C. Time dependency of Ni film's coercive force is analyzed according to the anisotropy field, mean effective crystallite size and thermal fluctuation. 10 ref. (P16a, 2-61, 3-67; Ni, 14-62)

172-P. (French.) Action of Sulphur on Copper at Elevated Temperatures. Jacques Oudar. Metaux-Corrosion-Industries, v. 35, Dec. 1960, p. 455-473.

Thermochemical reactions and transformations in Cu exposed to H_2S at 600-1000° C. Correlation of interaction between metal surface defects and nucleation and polygonization characteristics. Data are given for sulphur solubility and absorbtion coefficients. 38 ref. (P12e, P13d, N2, N5, 9-71; Cu, S)

173-P. (Japanese.) Magnetostriction in Alnico 5 Magnets. Tatsuo Fujiwara and Tetsuo Kato. Japan Institute of Metals, Journal, v. 24, Dec. 1960, p. 773-777.

Strain gage measurements and X-ray diffraction patterns for magnet alloy specimens aged at 600° C. and annealed at 900-1300° C. in magnetic fields for various times. Magnetostriction and permeability are determined as a function of magnetization force and direction and heat treatment time and temperature. 34 ref. (P16b, P16q, 2-64; Fe-b, Ni)

174-P. Metals for a New Age. South African Mining and Engineering Journal, v. 71, Dec. 16, 1960, p. 1551-1553.

Discussion of Cu-base alloys, soldering and brazing metals and Ti with regard to their melting points, density, strength, high temperature properties, corrosion resistance and oxidation resistance. (P12n, P10a, Q27, R-general; Cu-b, SGA-f, Ti)

175-P. (Russian.) Solubility of Magnesium in Iron. F. N. Tavadze, E. S. Kartoziya and A. Ya. Shinyaev. Metallovedenie i Termicheskaya Obrabotka Metallov, Jan. 1961, p. 33-35.

Radioactive tracer study of diffusion layers produced in electrolytic Fe and pure Mg under pressure at 1200° C. Self diffusion coefficients of Fe are determined as indicators of Mg solubility as a function of the number of dislocations and vacancies formed during the Mg dissolution process. (P12e, N1a; Fe-a, Mg)

176-P. Magnetic Properties of Chromium Between 0 and 350° C. E. W. Collings, F. T. Hedgcock and A. Siddiqi. Philosophical Magazine, v. 6, Jan. 1961, p. 155-158.

Magnetic susceptibility measurements on high-purity Cr indicate that an antiferromagnetic transition takes place at 39 ± 0.5° C. (P16, 2-61; Cr)

177-P. (Russian.) Electromotive Force Study on Thermodynamic Properties of Binary Systems. V. A. Geiderikh, A. A. Vecher and Ya. I. Gerasimov. Zhurnal Fizicheskoi Khimii, v. 34, Dec. 1960, p. 2789-2794.

Dependence of thermodynamic functions on composition of Fe-Sb alloy at 400-700° C. and 830° K. Values for enthalpy of $FeSb_2$ formation and constitution diagram. Comparison with results obtained calorimetrically by Korber and Oelsen. 14 ref. (P12, 2-60; Fe-b, Sb)

178-P. Magnetic Analysis of the Precipitation of Iron From Beta Brass. A. E. Berkowitz and P. J. Flanders. Acta Metallurgica, v. 8, Dec. 1960, p. 823-832.

Single crystals of beta brass containing 0.07 wt.% Fe are annealed at 300 and 400° C. to precipitate the Fe. Magnetization curves, hysteresis loops and torque curves are measured and analyzed in terms of the concepts of fine particle ferromagnetism to derive size and shape distributions of the Fe precipitate particles and the orientation of their crystallographic and shape symmetry axes. 31 ref. (P16, M26c, N7, 3-72; Cu-n, Fe, 9-61, 14-61)

179-P. Thermodynamics of the Solid Solutions of Mercury in Silver and Gold. H. W. Rayson and N. A. Alexander. Acta Metallurgica, v. 8, Dec. 1960, p. 833-840.

Thermodynamic properties of the Ag-Hg and Au-Hg f-c-c. solid solutions are determined using an isopiestic technique, the equilibrium composition of the alloys being obtained by X-ray analysis. Reciprocal temperature isobans, entropies, heats of solution and solid solubilities are determined at 100-500° C. 19 ref. (P12, N12p; Ag-b, Au-b, Mg)

180-P. Dilute Solutions in Alloys. C. B. Alcock and F. D. Richardson. Acta Metallurgica, v. 8, Dec. 1960, p. 882-887.

An equation is derived by a quasi-chemical approach for the activity coefficient of a dilute solute in a mixture of two metals. This is simply related to the activity coefficients of the solute in each metal separately and the separate activity coefficient of the metals in the mixture. Application of the equation to data on sulphur and oxygen in various liquid Fe, Ni and Co alloys leads to the conclusion that the pairwise interaction energies of a solute atom with each of the surrounding metal atoms may vary considerably with alloy composition. 8 ref. (P12e, P13, 2-60; Fe-b, Co-b, Ni-b, O, S)

181-P. Activities of Manganese in Solid Platinum. H. P. Abraham, M. W. Davies, J. L. Barton and F. D. Richardson. Acta Metallurgica, v. 8, Dec. 1960, p. 888-890.

Activities of Mn in solid alloys of Mn and Pt are measured at 1500-1650° C. The activity coefficients range from 1.3×10^{-5} at extreme dilution to 6.0×10^{-4} and 1.4×10^{-3} at 25 at.% Mn. Heat of formation and heat capacity data are used to calculate the heat of solution. 5 ref. (P13a, P12; Pt-b, Mn)

182-P. (German.) Influence of Ordering Processes and Working on Electrical Properties of a Nickel Silver Alloy of the Composition Cu_2NiZn. G. Bartsch and B. Tehnzen. Metall, v. 15, Feb. 1961, p. 127-136.

Measurement of thermovoltage, electrical resistance and hardness of Cu_2Ni Zn specimens after varying heat treatments (homogenizing at 750° C., quenching from 300-600° C., annealing at 100-300° C.) and working by hammering. Results are discussed in terms of dislocation theory. Kinetics of ordering processes. (P15, 2-64, 3-68, N10; Cu-b, Ni, Zn)

183-P. (French.) Simultaneous Solubility of Hydrogen and Oxygen in Copper and Bronze Melts in the Presence of Water Vapor. Wilhelm Hofmann and Hans-Jurgen Schneider. Memoires Scientifiques de la Revue de Metallurgie, v. 57, Nov. 1960, p. 876-878.

Equilibrium pressure of hydrogen and oxygen content of Cu and bronze (12% Sn) melts under the influence of water vapors. Calculation of dissolved H. 6 ref. (P12e; Cu-b, O, H)

184-P. (Russian.) Investigation of Thermodynamic Properties of Liquid In and Bi Alloys. N. V. Alekseev, Ya. I. Gerasimov and A. M. Evseev. Doklady Akademii Nauk, SSSR, v. 134, Mar. 1960, p. 618-620.

Determination of activities, entropies and heats of solution for In-Bi alloys by electrochemical means using a KCl, LiCl and $ZnCl_2$ electrolyte at 240-300° C. Electrodes of nearly pure In and varied composition In-Bi. (P12; In-b, Bi-b)

185-P. (Russian.) Measurement of Heat Conductive Anisotropy of Zn and Cd in the Superconducting State. N. V. Zavaritskii. Zhurnal Eksperimentalnoi i Teoreticheskoi Fiziki, v. 39, May 1960, p. 1193-1197.

Determination of thermal conductivity of Zn and Cd at 0.1-1.0° K. Relation of thermal conductivity and critical magnetic intensity to temperature. Critical temperatures calculated from magnetic intensity plots. (P11h, P16, 2-63; Cd, Zn)

186-P. (Translation-Brutcher no. 5039.) Electrical Properties of Lanthanum Boride. Yu. B. Paderno. Fizika Metallov i Metallovedenie, v. 10, Apr. 1960, p. 633-634.

Usefulness of lanthanum hexaboride for electronic apparatus. Relation between electrical resistance and porosity (2-27%) of lanthanum boride. (P15; La, B, 14-68)

187-P. (German.) Change of Magnetic Atomic Momentum of Ferromagnetic Metals in Hydrostatic Compression. Je. I. Kondorski and W. L. Sedow. Physikalische Abhandlungen aus der Sowjetunion, v. 3, Apr. 1960, p. 269-277.

Measurement of change of magnetic momentum and electrical resistance at 4.2 and 20.4° K. for Fe, Ni, Fe-Ni alloy (34.7-90.2% Ni) and Ni-Cu alloy (10.2-48.4% Cu) specimens under hydrostatic pressure in magnetic fields of up to 8600 Oe. Interpretation of results in terms of a theory of "latent antiferromagnetism". (P16, P15g; Cu-b, Fe-b, Ni-b)

188-P. Metallurgy of High-Temperature Heat-Transfer Systems (Temperature Dependence of the Surface Tensions of Liquid Metals). S. W. Strauss. Report of NRL (Naval Research Laboratory) Progress, Feb. 1961, p. 34-35. (Available as PB 171315 from U. S. Office of Technical Services, Washington 25, D. C.)

Empirical surface tension-temperature relations are obtained for liquid metals by equation correlating melting point and energy of vaporization per unit volume with critical temperature at which surface tension vanishes and with melting temperatures. Calculated and experimental data are compared for Ag, Al, Au, Bi, Be, Ce, Cu, Fe, In, K, Na, Pb, Sn and Hg. Relations are drawn between surface tension of metals and heat transfer and container. Corrosion characteristics when used as liquid coolants. (P13h, 2-61; 14-60)

189-P. (French.) Quadrupole Effects in the Nuclear Magnetic Resonance of Dilute Alloys. A Blandin and J. Friedel. Journal de Physique et le Radium, v. 21, Oct. 1960, p. 689-695.

Dissolved impurities in Cu and Al base alloys, spatially removed from a nucleus, create electronic density oscillations which result in strong intensity change in nuclear magnetic resonance. A mathematical formula for calculating the magnitude of these oscillations is given which is dependent on the constant affected by Bloch wave formations at the Fermi level. 18 ref. (P16f; Al-b, Cu-b)

190-P. (German.) Anisotropy of Surface Tension on the Boundary Between the Supraconductive and Normal Conductive Phase of Tin. Je. W. Scharwin and W. F. Gantmacher. Physikalische Abhandlungen aus der Sowjetunion, v. 3, Apr. 1960, p. 292-310.

Investigation of surface tension on specimens of varying crystal orientation using ferromagnetic powders and measurement of momentum of forces which act in a magnetic field on a spheric specimen, at temperatures from 2.08-3.69° K. Temperature dependence of surface tension and crystal geometry. (P13h, P15g, P16, 2-61, 3-72; Sn, 6-78)

191-P. (German.) Investigation of Abnormal Temperature Dependence of Initial Permeability by Magnetic After-Effect in Iron and Iron-Silicon Alloys at Temperatures From 300-700° C. H. Fahlenbach and G. Sommerkorn. Solid State Physics in Electronics and Telecommunications, v. 3. Magnetic and Optical Properties. Pt. 1, 1960, p. 201-207.

Measurement of permeability changes in 5-300 mOe magnetized sintered Fe, Fe alloy containing 3% Si, steel with 1% Al and Fe alloy with 0.2% Mn at temperatures from 300-700° C. Interpretation of abnormalities in terms of diffusion of voids. (P16q, 2-61; Fe-b, Al, Mn, Si)

192-P. (German.) Characteristic Magnetic Properties of Alloys With Finely-Dispersed Ferromagnetic Precipitation. E. Kneller. Solid State Physics in Electronics and Telecommunications, v. 3. Magnetic and Optical Properties. Pt. 1, 1960, p. 210-222.

Review of magnetic properties of alloys with superparamagnetic precipitations (Fe and Co amalgams, Cu-Co alloys with 2% Co, Ni-Mn alloys with more than 25% Mn) in terms of: magnetizing curve; temperature-dependency of spontaneous magnetization; Curie temperature as influenced by particle size and thermally stable remanence. (P16; Co-b, Cu-b, Fe-b, Ni-b, Mn)

193-P. Fundamental Materials Considerations in Liquid Metal Heat Exchanger. B. F. Brown and S. W. Strauss. Society of Automotive Engineers, Inc., 485 Lexington Ave., New York 17, N. Y. Preprint 280D, 1961, 10 p.

Relationships of temperature, surface tension, specific heat, atomic weight, stability, solubility, thermal conduction, viscosity and melting point for numerous metals useful in liquid metal heat exchangers. (P-general, W13b)

194-P. The Behavior of Titanium in a High Vacuum. J. Morrison. Paper from "Vacuum Technology Transactions". Pergamon Press, New York, 1959, p. 291-296.

Data are given for gettering properties at 200° C., hydrogen evolution rate at 1000° C., vapor pressure and spectral emissivity. (P13, P12c, P17d, 1-73; Ti)

195-P. Thermal Expansion of Aluminum at Low Temperatures. Eva Huzan, C. P. Abbiss and G. O. Zones. Philosophical Magazine, v. 6, Feb. 1961, p. 277-285.

Thermal expansion is measured by a sensitive optical method at 15-100° K. At lowest temperatures the Gruneisen parameter shows a significant use. 19 ref. (P11g, 2-63; Al)

196-P. (Japanese.) Intrinsic Magnetization and Magnetic Structures of Iron Group Alloys With Chromium and Vanadium. Yoshi Kono and Soshin Chikazumi. Kobayashi Institute of Physical Research, Bulletin, July-Dec. 1959, p. 12-21.

Saturation magnetization is measured for Fe-Cr-Co, Co-Ni-Cr, Fe-Co-V and Co-Ni-V alloys. Addition of Cr and V causes a decrease in intrinsic magnetization in any ferromagnetic alloy. 8 ref. (P16; Co-b, Fe-b, Cr, Ni, V)

197-P. (Translation.) Determination of the Activation Energy of the Work-Function Stabilization Process of the Gold-Barium System. E. D. Pavlovskaya, I. L. Sokol'skaya and Yu. G. Shishkin. Soviet Physics--Solid State, v. 2, Feb. 1961, p. 1671-1672. (Translation of Fizika Tverdogo Tela, v. 2 Aug. 1960, p. 1681-2006).

Work function measurements at 20-1000° C. on layers of Au and Ba deposited on tungsten strips. Effects of formation of an intermetallic compound between the two elements. (P15k; W, Au, Ba, 8)

198-P. (Translation.) Thermoelectric Properties of the Intermetallic Compound $MnAl_3$. N. V. Kolomets and E. A. Popova. Soviet Physics--Solid State, v. 2, Feb. 1961, p. 1758-1761. (Translation of Fizika Tverdogo Tela, v. 2, Aug. 1960, p. 1681-2006).

Investigation of $MnAl_3$ to ascertain thermoelectric properties and electrical conductivity as influenced by composition and temperature. (P15j; Al, Mn, 14-68)

199-P. Thermal Methods. J. H. Woodhead. Paper from "The Physical Examination of Metals". Edward Arnold, Ltd., London, England, 1960, p. 169-224.

Thermodynamic, thermal and thermoelectric properties of metals and alloys and relation to structure and composition changes. Principles and techniques for measurement by thermal analysis, dilatometry and calorimetry. 120 ref. (P11, P12, M23b, 1-54, 10-54)

200-P. Magnetic Analysis. K. Haselitz. Paper from "The Physical Examination of Metals". Edward Arnold, Ltd., London, England, 1960, p. 225-251.

Principles of ferromagnetism, demagnetizing fields and magnetization curves in metals and alloys. Measurement of secondary magnetic properties and application to study of structural transformations, phase constitution, inclusion content, crystal orientation and physical properties. Application of thermomagnetic and magnetic stress-analysis. 37 ref. (P16, P-general, M23a, M-general, 1-54)

201-P. (Translation-ConBur.) Change in the Electrical Resistance of Metals During Electrolytic Saturation With Hydrogen. V. V. Kuznetsov and V. A. Frolov. Journal of Applied Chemistry of the USSR, v. 33, Mar. 1960, p. 633-637.

Specific electrical resistance of steel wires is measured before and after cathodic saturation with hydrogen. The change in resistance is then plotted against saturation time, current density and concentration of additives. 15 ref. (P15g, Q26s; ST, 4-60)

202-P. (German.) Usefulness of "Centanin" Wires for High Precision Resistances. Walter Hetzel and Friedmund Melchert. Zeitschrift fur Instrumentenkunde, v. 68, Nov. 1960, p. 264-270.

Investigation of resistance-temperature curves at 20-50° C. of annealed Centanin (67% Cu, 27% Mn, 5% Ni) wire of varying diameter as influenced by impurities, mechanical deformation by winding, aging at 140-500° C. and surface treatment (etching). Constance of resistance with time. (P15g, 2-61; Cu-b, Mn, Ni, 4-61)

203-P. (German.) Influence of Heat Treatments on Resistance and Magnetizibility of the CuMnNi Alloy "Centanin". Alfred Schulue and Heinz Eicke. Zeitschrift fur Instrumentenkunde, v. 68, Nov. 1960, p. 261-264.

Measurement of electrical resistance and of magnetic susceptibility at temperatures from 10-65° C. of cold worked "Centanin" wires (27% Mn, 5% Ni, rest Cu) after vacuum annealing at 75-450° C. Interpretation of results in terms of recovery and recrystallization. (P15g, P16n, P16p, 2-61, 2-64; Cu-b, Mn, Ni, 4-61)

204-P. (German.) Direct Measurement of the Uniaxial Magnetic Anisotropy of Evaporated Thin Layers of Iron, Nickel, Permalloy and Cobalt. Zdenek Malek and Walter Schuppel. Annalen der Physik, v. 6, May-June 1960, p. 252-261.

Measurement of the parameters of uniaxial anisotropy and their change with time at room temperature by torque measurements on thin layers of Fe, Ni, Co and Permalloy, which are evaporated on a vertical or inclined heated or non-heated support. Interpretation of anisotropy in terms of a short-range order effect caused by faults. (P16; Co, Fe, Ni-b, 14-62)

205-P. (German.) Calorimetry and Thermodynamics of Copper-Bismuth Alloys. Willy Oelsen, Eberhard Schurmann and Dietrich Buchholz. Archiv fur das Eisenhuttenwesen, v. 32, Jan. 1961, p. 39-46.

Calorimetric measurement of heat content-temperature curves for Cu-Bi alloys over the entire concentration range to evaluate thermodynamics (partial and integral enthalpies and entropies; thermodynamic activities) and phase diagram of the binary Cu-Bi system by thermodynamic analysis. (P12, M24b; Bi-b, Cu-b)

206-P. (German.) Optical Constants of Massive Metals. M. Otter. Zeitschrift fur Physik, v. 161, Feb. 1961, p. 163-178.

Measurement of optical constants of hemispheric single crystal Cu, Ag and Au specimens by the Drude method, using a vacuum apparatus which allows production of single crystal specimens as well as optical examination at any temperature. Interpretation of results in terms of the classical theory of metal electrons. (P17a; Ag, Au, Cu, 14-61)

207-P. An Estimate of the Effect of Radiation on the Thermal Conductivity of Beryllium. G. J. Dienes and A. C. Damask. Journal of Nuclear Materials, v. 3, Jan. 1961, p. 16-20.

The thermal conductivity and electrical resistivity of Be at low temperatures is analyzed in terms of the Wiedemann-Franz law and correlated with existing data on the effect of reactor irradiation on electrical resistivity. Thermal conductivity is predicted for 10-100° K. as a function of radiation dosage, temperature and annealing effects. 6 ref. (P11h, P15g, 2-67, Be)

208-P. Thermal Expansion of Alpha-Uranium Single Crystals. Lowell T. Lloyd. Journal of Nuclear Materials, v. 3, Jan. 1961, p. 67-71.

Dilatometry is used to measure the thermal expansions of alpha-uranium single crystals between 25 and 650° C. Equations for length in the three principal crystallographic directions and volume as functions of temperature are derived and compared with values calculated from lattice parameter data. 8 ref. (P11g, M23b, 2-61; U-a, 14-61)

209-P. Irradiation Growth of Zirconium-Plutonium Alloys. J. A. Horak and H. N. Rhude. Journal of Nuclear Materials, v. 3, Jan. 1961, p. 111-112.

Cold worked specimens of 5-7% Pu-Zr specimen rods are exposed to reactor radiation in NaK filled capsules at 500° C. to total burnup. Elongation with accompanying reduction in cross sectional area and distortion is observed as a function of irradiation dose, time and temperature. Anisotropic growth is attributed to preferred orientation introduced by cold working. (P10d, 2-67, 3-68, 3-72; Zr-b, Pu)

210-P. Properties of Refractory Materials: Collected Data and References. W. G. Bradshaw and C. O. Matthews. Lockheed Aircraft Corp. U. S. Office of Technical Services, PB 171101, June 1958, 110 p. $2.50.

Comprehensive survey of the properties of refractory materials with melting points above 2500° F. to assist in the selection of materials which show promise for use in high-temperature missile and nuclear applications. The physical, mechanical and chemical characteristics of these materials at elevated temperatures are presented in tabular form. Data on the melting points, ductility and elevated-temperature stability of the refractory metals, carbides, nitrides, oxides, silicides, sulphides, beryllides, aluminides, other intermetallics, phosphates and uranates. (P-general, Q-general; EG-d37)

211-P. (German.) Solubility of Electrolytically Deposited Alpha and Beta Cobalt. N. Pangarov, Zv. Mutaftschiev and St. Rashkov. Comptes Rendus de l'Academie Bulgare des Sciences, v. 13, Nov-Dec. 1960, p. 705-708.

A Co sample is immersed in IN-hydrochloric acid, IN-sulphuric acid or 0.005

N-nitric acid while the solution is stirred and the temperature kept at 25° C. Measurements are made of solubility and polarization curves. 4 ref. (P12e; Co-a)

212-P. Ablation, Heat Sink and Radiation. John O. Collins and Sidney Speil. Materials in Design Engineering, v. 53, Mar. 1961, p. 114-118, 149-150.

Principles of temperature control by ablation, heat sink and radiation systems. Thermal properties of materials with potential use in systems including Be, Mg, Al, Ti, Cr, Cu, Mo, ceramics, plastics and foams. (P11; Be, Mg, Al, Ti, Cr, Cu, Mo, SGA-h, NM-d, NM-b, 17-57)

213-P. (Czech.) Irreversible Change in Electrical Resistance of Thin Tellurium Layers During Artificial Aging. Karel Cermak. Ceskoslovensky Casopis Pro Fysiku, June 1960, p. 517-520.

When a vacuum deposited thin film of Te is heated to temperatures above 190° C., an irreversible change in the electrical resistance of the film is observed which is attributed to the destruction of the film at high temperatures. 14 ref. (P16, 2-62, 2-65; Te, 14-62)

214-P. (Ukranian.) Influence of Gamma Irradiation on Some Magnetic Properties of Iron and Its Alloys. I. Ya. Dekhtyar and A. M. Shalaev. Ukrainshii Fizichnii Zhurnal, v. 5, May 1960, p. 677-680.

Gamma irradiation of hardened and heat treated Fe-Ni, Fe-Cr alloys and electrolytic Fe. Origination of Frankel defects and dislocation loops and changes in coercive force, magnetization and galvanomagnetic effect as a function of irradiation. 9 ref. (P16, M26, 2-67; Fe-b)

215-P. (Japanese.) Studies of Cermets. Pt. 8. Thermodynamics of Surface Tension. Kaizo Monna and Hajime Suto. Japan Institute of Metals, Journal, v. 25, Jan. 1961, p. 65-68.

A formula is proposed for calculating thermodynamically the surface tension of binary liquid systems which form imperfect solution. Application to CuO, CuS, CuSe, CuTe, FeS, CoS and NiS compounds. 9 ref. (P12e, M24b; 14-60)

216-P. (Translation-ConBur.) Heat of Formation of UBe_{12}. M. I. Ivanov and V. A. Tumbakov. Soviet Journal of Atomic Energy, v. 7, Dec. 1960, p. 559-561.

A mixture of Be powder and finely dispersed uranium prepared by the decomposition of its hydride is heated and a substance consisting of UBe_{13} and a small quantity of Be is obtained. The heat of formation of UBe_{13} is determined from the difference between the heat of solution of UBe_{13} and of the corresponding mixture of its components. 10 ref. (P12; Be-b, U)

217-P. (Czech.) Thermal Expansion in Chilled Cast Iron and Its Effect on Stresses Present in Rolling Mill Rolls. Robert Kamensky and Ludmila Hyspecka. Hutnicke Listy, v. 16, Jan. 1961, p. 38-41.

Dilatometric analysis at 100-600° C. of samples are cut from a roll in tangential direction. At low temperatures the expansion of white iron is inferior to that of gray iron. With rising temperature, the white iron expansion approaches and finally reaches that of gray iron. Thermal tensile stresses leading to crack formation upon chilling operate as functions of the different thermal expansion coefficients. 13 ref. (P11g, Q25p, W23k, 2-61, 9-72; CI, 17-57)

218-P. (Czech.) Surface Tension on Austenitic Grain Boundaries. Karel Mazanec and Emilie Kamenska. Hutnicke Listy, v. 16, Jan. 1961, p. 41-49.

Surface tension measurement by determination of the angles formed between the austenitic-ferritic grain boundaries, the angles of grooves appearing at 1050-1100° C., under a hot stage microscope, and the contact angle formed between a lead drop brought to an austenitic plane surface at 900° C. 28 ref. (P12e, M27f, N8, 2-62; CN)

219-P. Enthalpy and Specific Heat of Nine Corrosion-Resistant Alloys at High Temperatures. Thomas B. Douglas and Andrew C. Victor. Journal of Research, National Bureau of Standards, Engineering and Instrumentation, v. 65C, Jan-Mar. 1961, p. 65-69.

Measurement of specific heat at 0-900° C. of two alloys, 90Ni-10Cr and 316 stainless steel, with accuracies within 0.3% being calculated from enthalpies determined with a drop method and precision Bunsen ice calorimeter. Results are compared with high temperature specific heats of seven other alloys, 80Ni-20Cr, 76Ni-15Cr (three different

samples), 347 and 446 stainless steel and Monel (67% Ni, 30% Cu.) 10 ref. (P12r; SGA-g, Ni-b, SS)

220-P. (Translation-ConBur.) Influence of Cathodic Polarization of Tantalum on Its Electrical Conductivity. Kh. L. Tseitlin, E. K. Revazov and V. A. Strunkin. Journal of Applied Chemistry of the USSR, v. 33, Apr. 1960, p. 851-854.

The amount of hydrogen absorbed by Ta during cathodic polarization is deduced from electrical resistivity measurements and expressed as a function of current density, time and temperature of polarization. 8 ref. (P15g; Ta)

221-P. The Emittance of Titanium and Titanium Alloys. W. D. Wood, H. W. Deem and C. F. Lucks. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 91, Mar. 17, 1961, 26 p. (Available as PB 161241 from U. S. Office of Technical Services, Washington 25, D. C.)

Data given for normal total emittance and reflectance and normal spectral emittance and reflectance of Ti, 5Al-2.5 Sn Ti alloy, 8Mn Ti alloy, 6Al 4V Ti alloy and V Ti alloys as a function of temperature and wave length. (P17a; Ti-b)

222-P. (Russian.) Thermal Conductivity of High-Purity Thallium and Tin. N. V. Zavaritskii. Zhurnal Eksperimentalnoi i Teopeticheskoi Fiziki, v. 39, June-Dec. 1960, p. 1571-1577.

The thermal conductivity of Tl and Sn single crystals of different purity levels in normal (Kn) and superconducting (Ks) states. Electron scattering on lattice imperfections and thermal oscillations are related to Ks-Kn variations. 17 ref. (P11h; Sn, Tl)

223-P. (Russian.) Ferromagnetic Resonance in Silicon Iron Crystals and Its Relation to the Domain Structure. Ya. S. Shur and O. I. Shiryaeva. Zhurnal Eksperimentainoi i Teopeticheskoi Fiziki, v. 39, June-Dec. 1960, p. 1596-1601.

Measurements of resonance absorption curves in polycrystalline disks with varying directions of constant magnetic field and powder diffraction pattern examination of domain structure. An additional magnetic peak in the weaker fields in the presence of many-domain structures is found along with the resonance peak found in saturating fields. 7 ref. (P16f; Fe-b, Si, 14-61)

224-P. The Electrical Resistivity of Plutonium, Neptunium and Some Plutonium Alloys. Cryogenics, v. 1, Sept. 1960, p. 52-53.

Determination of the electrical resistivity of rod specimens of Pu, Np and three gamma phase stabilized Pu-Al alloys at 1.5-300° K. with neutron diffraction examination of the Pu rod to determine its antiferromagnetic properties. (P15g, P16p, M22j, 2-61; Np, Pu-b, Al)

225-P. Anomalies in the Magnetic Susceptibility and Electrical Resistivity of Vanadium. Michael Alan Taylor and Jean-Paul Burger. Physical Review Letters, v. 6, Feb. 15, 1961, p. 185-187.

A previous undetected anomaly in the temperature dependence of the magnetic susceptibility of vanadium and its association with the resistivity anomaly are reported for a specimen of 99% purity at 20-293° K. 8 ref. (P15g, P16n, P16p, 2-61; V-a)

226-P. The Melting Points of Tantalum Carbide and Tungsten. Charles F. Zalabak. NASA Technical Note D-761, Mar. 1961, 21 p. (Available from National Aeronautics and Space Administration, Washington, D. C.) $.75.

Resistance heating and electron-bombardment heating of TaC and W to determine their melting points. Carbon impurities are found to lower the melting point of tungsten. X-ray diffraction of TaC after heating indicates a single phase present and the lattice parameters are given. 14 ref. (P12n; Ta, W, 14-68)

227-P. (Translation-Brutcher no. 4652.) Characteristics of Thermal Softening of Alloyed Austenite. M. E. Blanter, V. F. Gorshkova and M. G. Lozinskii. Metallovedenie i Termicheskaya Obrabotka Metallov, July 1959, p. 2-10.

Effects of Cr, W, Mo, Co and Ni in amounts usually found in constructional steels, upon the thermal softening (constants) of alloyed austenite. Effect of alloying elements on critical temperature of physical softening. (P11, 2-60; SS-e)

228-P. (Translation-Brutcher no. 4839.) Effect of Titanium, Aluminum and Oxygen on the Solubility of Nitrogen in Liquid Iron. S. Maekawa. Tetsu-to-Hagane (Iron and Steel Institute of Japan, Journal), v. 36, Mar. 1960, p. 241-243.

Experimental study of the solubility of nitrogen in the liquid Fe-Ti, Fe-Al and Fe-O systems and of interaction with third elements. Effect of Ti, Al and O on solubility of nitrogen in liquid Fe. (P12e; Fe, N)

229-P. (Translation-ConBur.) Thermal Expansion of Alpha Plutonium. N. T. Chebotarev and A. V. Bezmosikova. Soviet Journal of Atomic Energy, v. 7, Dec. 1960, p. 585-589.

Determination of the coefficient of thermal expansion of alpha-phase Pu wire at -196 to 100° C. Data are given for the lattice parameters of the sample at room temperature. 3 ref. (P11g, M26, 2-61; Pu-a, 4-61)

230-P. X-Ray Mass Absorption Coefficients for Mo, Nb, Zr and Ti. W. R. Sweeney, R. T. Seal and L. S. Birks. Report of NRL (Naval Research Laboratory) Progress, Mar. 1961, p. 17-18. (Available as PB 171316 from U. S. Office of Technical Services, Washington 25, D. C.) $1.25.

Fluorescent X-ray spectroscopy measurements of the X-ray mass absorption coefficients for Mo, Cb, Zr and Ti using monochromatic incident radiation wave lengths between 0.5A and 1.5A. Comparison with published data. (P17c; Mo, Cb, Zr, Ti)

231-P. (English-French.) General Data on Cobalt. Paper from "Cobalt". Societe Generale Metallurgique de Hoboken, Belgium. 1961, p. 33-37.

Electrical, magnetic, optical and mechanical properties, phase transformations and solubility of oxygen in Co. (P-general, Q-general, M24; Co)

232-P. (English.) Anisotropy of Resistivity in Iron and Dilute Silicon Iron. Fiji Tatsumoto, Kaizo Kuwahara and Hitoyasu Kimura. Hiroshima University, Journal of Science, Series A, v. 24, Oct. 1960, p. 359-365.

Measurements at room temperature to the Curie point to determine effect of temperature and magnetic field strength on magnetic domain structure, anisotropy resistivity coefficient, saturation magnetoresistance effect and Hall coefficient for Fe and 1.08% Si. (P15g, P16, 2-61; Fe-b, Si)

233-P. (English.) Temperature Dependence of the Magnetostriction Constants of Dilute Aluminum Iron. Fiji Tatsumoto, Kaiyo Kuwahara, Hitoysau Kimura and Tetsuhiko Okamoto. Hiroshima University, Journal of Science, Series A, v. 24, Oct. 1960, p. 367-369.

Measurement of magnetostriction constants of 0.66 and 1.32% Al-Fe alloy single crystal strips at temperatures below the Curie point, 50-1000° K. Comparison of temperature dependent curves with those of pure Fe. (P16b, 2-61; Fe-b, Al, 14-61)

234-P. A Simple Method of Determining the Specific Heats of Blast Furnace Raw Materials. U. P. Mahapatra, P. R. Dhar and I. N. Gupta. Research & Industry (India), v. 6, Jan. 1961, p. 6-7.

Data for the specific heats of Fe ores and limestone are used in calculating the heat balance of a blast furnace and a low-shaft furnace. 3 ref. (P12r; Fe, RM-n)

235-P. (Translation-ConBur.) Experimental Determination of the True Specific Heats of Uranium, Thorium and Other Metals. E. A. Mit'kina. Soviet Journal of Atomic Energy, v. 7, Feb. 1961, p. 669-670.

True specific heats of U, Th, beryllium sodium and a Bi-Pb alloy are determined by a relative heating and cooling method and an absolute method involving the use of an electron-radiation calorimeter in an inert-gas atmosphere and in a vacuum. 3 ref. (P12r; Bi-b, Pb-b, Th, U)

236-P. Relative Thermodynamic Properties of Solid Iron-Aluminum Alloys. S. V. Radcliffe, B. L. Averbach and M. Cohen. Acta Metallurgica, v. 9, Mar. 1961, p. 169-176.

The relative thermodynamic properties of solid 5-73% Al-Fe alloys obtained at 875-1000° C. as a function of composition and temperature by patented metric emf. measurements using a molten chloride electrolyte. Data are given for the negative heats of mixing and entropy of mixing at the equiatomic composition. The negative entropy changes are discussed in terms of magnetic, vibrational and electronic effects. 19 ref. (P12, M25, 2-60, 2-64; Fe-b, Al)

237-P. Thermodynamic Properties of Uranium Bismuth Alloys. A. Cosgarea, Jr., E. E. Hucke and D. V. Ragone. Acta Metallurgica, v. 9, Mar. 1961, p. 225-236.

Thermodynamic properties of U-Bi alloys determined at 725-875° C. by measuring the vapor pressure of Bi in equilibrium with the condensed phase using an optical absorption technique. Data are given for Bi activity and for enthalpy, entropy free energies, equilibrium constant and solubility limit with construction of a phase diagram for the system. 8 ref. (P12, M24b; Bi-b, U-b)

238-P. Precision Density Measurements on Deformed Copper and Aluminum Single Crystals. M. J. Hordon and B. L. Averbach. Acta Metallurgica, v. 9, Mar. 1961, p. 247-249.

Hydrostatic measurements of the fractional decrease of density are used to estimate the number of dislocations in annealed and plastically strained single crystals of high-purity Cu and Al. An almost linear increase in dislocation density with shear strain is observed and compared with values obtained from X-ray measurements. 4 ref. (P10a, M22g, M26b, 3-68; Al-a, Cu-b, 14-61)

239-P. (Russian.) Anisotropy of the Hall Effect in Sn. V. N. Kachinskii. Doklady Akademii Nauk SSSR, v. 135, Apr. 1960, p. 818-821.

Investigation of magnetic and electrical anisotropy of Sn monocrystals at 4.2° K. in a magnetic field. Dependence of electrical intensity vector on magnetic intensity and orientation and crystallographic orientation. 8 ref. (P15p; Sn)

240-P. Solubility of Antimony in Mercury. A. E. Zebreva and M. T. Kozlovsky. Czechoslovak Chemical Communications, Collection, v. 25, Dec. 1960, p. 3188-3194.

Polaragraphic and potentiometric measurement of Sb solubility in Sb and Cu-Sb amalgams, using the method of Hartmann and Scholzel. Effect of anodic oxidation and Cu-Sb intermetallic compound formation on solubility curve. (P12e; Hg, Sb)

241-P. Dielectric Characteristics of Tantalum Anodic Films as Related to Film Structure. Donald Mohler and Robert G. Hirst. Electrochemical Society, Journal, v. 108, Apr. 1961, p. 347-351.

Very thin films on the metal surface influence the structure and leakage current of anodic films formed thereon. Sufficiently long cleaning with HF removes these films leaving clean metallic Ta and when this is anodized, excellent oxide films are formed. 4 ref. (P15n; Ta, 14-62)

242-P. (Ukrainian.) Application of the Theory of Regular Solutions to an Analysis of Alpha-Gamma Equilibrium and Fusibility Curves of Iron-Aluminum, Iron-Vanadium and Iron-Molybdenum Systems. A. G. Lesnik and V. P. Skvorchuk. Tsvetnaya Metallurgiya, Oct. 1960, p. 1408-1412.

Thermodynamic analysis of the systems at low concentrations of various alloying elements and in the regions of the melting points. Data are given for interatomic interaction parameters. (P12, M24b, N-general; Fe-b, Al, Mo, V)

243-P. (Russian.) Physico-Chemical Study of Joint Zinc and Manganese Solubility in Solid Magnesium as a Function of Temperature. F. T. Bumazhnov. Tsvetnaya Metallurgiya, June 1960, p. 138-143.

Method for joint melting of Zn and Mn in solid Mg. Influence of Zn-Mn ratio and hardening temperature on solubility, strength and corrosion resistance of ternary Mn-Zn-Mg alloy. 6 ref. (P12e, R-general, Q27; Mg-b, Mn, Zn)

244-P. (German.) Thermal Dimensional Changes of Copper Plated Fe-Ni Leads Used in Evacuated Tubes and Bulbs. E. G. Fuchs. Acta Technica Academiae Scientiarum Hungaricae, v. 32, Jan-Feb. 1961, p. 53-63.

Computation of the radial dimensional changes from the longitudinal expansion of the Fe-Ni alloy and Cu. By correct choice of the ratio wire-diameter/thickness-of-plating, a lead not differing in its expansion from the surrounding glass is obtained. 3 ref. (P10d; Fe-b, Ni-b, Cu, 8-62)

245-P. (English.) Solution Rate Studies of Solid Metals in Liquid Metals. Pt. 2. Cu in Bi and Ag in Bi. Tadao Sano, Masanobu Miyake and Takao Konishi. Osaka University, Technology Reports, v. 10, Oct. 1960, p. 815-824.

The solution rate of dissolution of solid Cu and Ag in liquid bismuth under static and isothermal condition at 300-500° C. is measured by electrical resistivity and chemical analysis methods.

The solution rates and the activation energy for the reaction are discussed in terms of a diffusion mechanism. 5 ref. (P12e, P13a, N1; Cu, Ag, Bi)

246-P. (English.) Effects of Special Heat Treatment on Permalloys. Sadami Tomita. Physical Society of Japan, Journal, v. 16, Mar. 1961, p. 393-396.

Magnetic properties and electrical resistance of Mumetal and 50-Permalloy are measured after low temperature heat treatments at 200-600° C. A theory based on inhomogeneous internal structure is developed to explain the phenomena. 9 ref. (P15g, P16, 2-64; Ni-b)

247-P. (Russian.) Investigation of Resistivity in Ni-Pd Alloys in the Temperature Range 0-700° C. S. Yazliev. Zhurnal Neorganicheskoi Khimii, v. 5, Nov. 1960, p. 2440-2445.

The thermal coefficient of resistance for all compositions in the system are shown to reach a maximum at the Curie point and, independent of temperature, a minimum at 75 at.% Pd. At high temperatures the difference between alloy and pure component resistivities is a temperature independent constant. 4 ref. (P15g, 2-61; Ni-b, Pd-b)

248-P. (Translation.) Irreversible Thermal Changes of Shape in Cadmium-Lead and Cadmium-Zinc Alloys. N. N. Davidenkov, V. A. Likachev and G. A. Malygin. Soviet Physics, Solid State, v. 2, Apr. 1961, p. 2183-2187. (Translation of Fizika Tverdogo Tela, v. 2, Oct. 1960, p. 2349-2668.)

Investigation of the effect of the anistropy of thermal expansion on dimensional change of Cd-Pb and Cd-Zn alloys. Results of thermal cycling at 270-400° C. indicate that irreversible expansion is possible and that the dependence of coefficient of growth on composition is nonlinear. 3 ref. (P10d, P11g, 3-72; Cd-b, Pb, Zn)

249-P. Zirconium-Copper Alloy...High Strength and Conductivity. A. E. Moredock and D. K. Fox. Metal Progress, v. 79, Apr. 1961, p. 75.

Copper with 0.15% Zr added combines good electrical conductivity (96% I. A. C. S. after aging) with moderate strengths and hardnesses up to 660° F. Uses include all types of electrical apparatus which need electrical and mechanical properties throughout a range of operating temperatures. (P15g, Q-general, T1, 17-57; Cu-b, Zr)

250-P. (Translation-ConBur.) Growth of Uranium Rods in an Aggressive Gaseous Medium. I. V. Batenin, A. N. Rudenko and B. V. Sharov. Soviet Journal of Atomic Energy, v. 7, Mar. 1961, p. 811-814.

Investigation to determine the growth of heated U specimens exposed to air, N and CO_2 and its dependence on temperature, pressure of medium, specimen rod diameter and degree of initial U surface oxidation. (P10d; U)

251-P. (German.) Influence of Orientation on Resistance Changes in Zinc Crystals Caused by Alpha Irradiation. M. Haager. Physikalische Verhandlungen, v. 11, Oct-Nov. 1960, p. 203-204.

Alpha irradiation and resistance measurements by a Wheatstone bridge of Zn crystals of varying orientation at the temperature of liquid air. (P15g, 3-72; Zn, 14-61)

252-P. (German.) Optical Constants of Solid Metals as Influenced by Temperature. M. Otter. Zeitschrift fur Physik, v. 161, Feb. 1961, p. 539-549.

Measurement of optical constants of hemispheric single crystal specimens of Cu, Ag and Au by the "Drude method" in the visible spectrum range from room temperature up to melting temperature and of molten Cu and Au at melting temperature. (P17a, 2-61; Ag, Au, Cu)

253-P. (German.) Conductivity and Hall Constant. Pt. 13. Alpha Copper-Aluminum Alloys. Werner Koster and Hans-Peter Rave. Zeitschrift fur Metallkunde, v. 52, Mar. 1961, p. 158-161.

Measurement of electrical resistance and Hall constant of recrystallized cold rolled (70% deformed) 0.1 mm. thick sheet (4-9% Al in Cu) after annealing at 600-1000° C., quenching from various temperatures (20-1000° C.) with and without subsequent aging at 20 and 150° C. Influence of voids on measured properties. (P15g, P15p, 2-64, 3-68, 3-71; Cu-b, Al)

254-P. (German.) Conductivity and Hall Constant. Pt. 14. Alpha Copper-Manganese and Alpha Silver-Manganese Alloys. Werner Koster and Hans-Peter Rave.

Zeitschrift fur Metallkunde, v. 52, Mar. 1961, p. 161-167.

Measurement of electrical resistance and Hall constant of cold rolled 0.1 mm. thick sheet of Cu-Mn (5-40 at.% Mn) and Ag-Mn (5-35 at.% Mn) alloy after annealing (500-800° C.) and quenching with and without subsequent aging at 113-142.5° C. (P15g, P15p, 2-64; Cu-b, Ag-b, Mn)

255-P. (German.) Magnetic Susceptibility and Electrical Resistance of Homogeneous and Heterogeneous Iron-Copper Alloys. Cornelius Berghout. Zeitschrift fur Metallkunde, v. 52, Mar. 1961, p. 179-186.

Susceptibility and resistance measurements at 20-350° K. on 1000° C. homogenized, hammered and rolled Cu strip of 0.1 mm. thickness containing 0.11-3.0% Fe and on a cylindrical specimen containing 0.66% Fe during aging at 430° C. and after varying degrees of cold rolling. Influence of alloy element concentration, phase homogeneity, precipitation, temperature and plastic deformation on resistivity and anisotropy of susceptibility. (P15g, P16n, P16p, 2-60, 2-61, 2-64, 3-68; Cu-b, Fe)

256-P. (Russian.) Study of Types of Deviations of Raoult's Law. D. M. Laptev. Izvestiya Vuz Chernaya Metallurgiya, Oct. 1960, p. 5-13.

Computation of deviations in Raoult's law based on values of the activation coefficient. Vapor pressure and activation coefficient in relation to composition are studied in Fe-Cu, Ag-Au and Cr-Ni melts at 952 and 1550° C. 4 ref. (P12b, P12c)

257-P. Solubility of Nitrogen in Liquid-Iron Manganese Alloys. R. A. Dodd and N. A. Gokcen. Metallurgical Society of AIME, Transactions, v. 221, Apr. 1961, p. 233-236.

Solubility of nitrogen in liquid Fe-Mn systems at 1550° C. and 1 atm. pressure is determined by an equilibration and sampling method. The solubility increases from 0.040% for pure Fe to 1.41% for pure Mn. 9 ref. (P12e; Fe-b, Mn-b, N)

258-P. The Free Energy of Formation of CdSb. Richard J. Borg. Metallurgical Society of AIME, Transactions, v. 221, Apr. 1961, p. 242-243.

The vapor pressure of Cd in equilibrium with CdSb in the presence of excess Sb is measured using the Knudsen effusion method at 276-379° C. An equation is derived for the free energy of formation and the enthalpy and entropy are obtained from the temperature coefficient of the free energy. 9 ref. (P12a, P12c; Sb-b, Cd, 14-67)

259-P. A Study of the Spectral Emissivities and Melting Temperature of Osmium and Ruthenium. R. W. Douglass and E. F. Adkins. Metallurgical Society of AIME, Transactions, v. 221, Apr. 1961, p. 248-249.

An equation is derived for the variation of the spectral emissivity of Os and Ru with temperature by calculation applying Wein's law to the true temperatures and surface temperature for sintered bar specimens resistance heated to 2600° C. The melting temperature of Os and Ru are determined as 3010 ± 10° and 2250 ± 10° C., respectively. 3 ref. (P12n, P17d, P17e, 2-61; Os, Ru)

260-P. The Effect of Arsenic and Tellurium on the Surface Tension of Lead. Douglas J. Harvey. Metallurgical Society of AIME, Transactions, v. 221, Apr. 1961, p. 266-270.

The surface tension of 0-6.7% Te-Pb and 0-10.3% As-Pb alloys is examined by the maximum bubble pressure method at 350-750° C. The surface tension of pure Pb is determined as a function of Te and As contents and temperature, using Gibbs adsorption equation. Data are given for surface activity and concentration of Te and As. 19 ref. (P12b, 2-60, 2-61; Pb-b, As, Te)

261-P. Thermodynamic Properties of Cr_3C_2 at High Temperatures. S. Fujishiro and N. A. Gokcen. Metallurgical Society of AIME, Transactions, v. 221, Apr. 1961, p. 275-279.

The dissociation pressure of Cr_3C_2 is measured at 1908-2237° K. using graphite Knudsen effusion cells. Data are given for vapor pressures, equilibrium pressure, free energy, enthalpy, heat of formation and the kinetics of the vaporization reaction. 18 ref. (P12; Cr, C, 14-68)

262-P. The Solution Rate of Copper, Nickel and Their Alloys in Lead. David A. Stevenson and John Wulff. Metallurgical Society of AIME, Transactions, v. 221, Apr. 1961, p. 279-285.

The rates of solution of Cu, Ni and three Cu-Ni alloys in liquid Pb are studied at 527 and 727° C. under dynamic conditions to determine the effect of relative velocity at a solid-liquid interface on the dissolution kinetics of pure solid materials in liquid metals. 12 ref. (P12e; Pb, Cu-b, Ni-b)

263-P. A Thermodynamic Study of Dilute Solutions of Sulphur in Liquid Tin and Lead. L. L. Cheng and C. B. Alcock. Metallurgical Society of AIME, Transactions, v. 221, Apr. 1961, p. 295-300.

Use of radiochemical methods for the study of the gas-liquid equilibria at low temperature and for the determination of the sulphur contents of metal beads which have been equilibrated with H_2S/H_2 mixtures of known sulphur potential to obtain the liquid solubility and the free energy of solution of sulphur in liquid Sn and Pb at 500-680° C. 33 ref. (P12a, P12e; Sn, Pb, S)

264-P. Free Energies of Formation of Gaseous Metal Oxides. Molly Gleiser. Metallurgical Society of AIME, Transactions, v. 221, Apr. 1960, p. 300-304.

The standard free energies of formation of Al, Be, Mo, Si, Ta, V, W and Zr gaseous metal oxides together with those of their condensed oxides are plotted against temperature with tabulation of the heats of formation of the gaseous oxides. 9 ref. (P12a, Al-b, Be-b, Mo-b, Si-b, Ta-b, V-b, W-b, Zr-b, 14-68)

265-P. Calculation of Activities in Binary Systems Having Miscibility Gaps. H. A. Wriedt. Metallurgical Society of AIME, Transactions, v. 221, Apr. 1961, p. 377-383.

Utilization of the continuous free energy function for computing the thermodynamic activities in the beta-sigma solution of binary systems as a function of compositive with interrelation of gap location and symmetry to Henry's law. Application to calculation of values for the Al-Zn and CaO-SiO_2 systems. 8 ref. (P12b, M24b, 2-60; Al-b, Zn-b, 14-68)

266-P. Thermal Expansion of Beta Titanium. D. N. Williams. Metallurgical Society of AIME, Transactions, v. 221, Apr. 1961, p. 411-412.

Dilatometric measurement at 68-2800° F. on A-55 unalloyed Ti and Ti-8V, Ti-20V and Ti-6Al-4V alloys to determine the thermal expansion coefficient. (P11g, 2-60; Ti-b, Al, V)

267-P. (Russian.) Effect of Carbon on Surface Tension of Molten Co and Ni and Their Interphase Tension on the Alumina Boundary. V. N. Eremko and B. I. Nizhenko. Ukrainskii Khimicheskii Zhurnal, v. 26, Apr. 1960, p. 423-428.

Determination of surface tensions for various carbon alloys of Ni and Co. Effect of carbon on interphase tension between liquid metal-solid alumina at 1550-1600° C. test temperatures and vacuum conditions. Data are applied to surface tension and carbon adsorption isotherm plots. 12 ref. (P12h, P13d, 2-60; Ni-b, Co-b, C, Al)

268-P. (Russian.) Effect of H_2O_2 on the Potential of an Oxygen Electrode on an Oxidized Steel Surface in Alkali Solution. A. S. Afanasev and B. I. Sotnikova. Ukrainskii Khimicheskii Zhurnal, v. 26, Apr. 1960, p. 466-470.

Investigation of cell characteristic changes in an electrolytic cell composed of oxidized steel electrodes and .1N KOH electrolyte. Determination of H_2O_2 stability in KOH. Relation of cell voltages and H_2O_2 decomposition to time, pH and KOH concentration. 17 ref. (P15; ST)

269-P. (Russian.) Wettability of Molten Ti and Sn Alloys and Their Interphase Tension on the Boundary With Alumina. V. N. Eremenko and V. I. Nizhenko. Ukrainskii Khimicheskii Zhurnal, v. 26, May 1960, p. 605-607.

Investigation of the effect of Ti additions on surface tension of Sn in contact with solid Al_2O_3. Determination of interphase tension between Sn and alumina. Effect of Ti and oxygen impurity on the adsorption of Ti on the alumina surface. 10 ref. (P12h, P13d, 2-60, 3-69; Sn-b, Ti, Al)

270-P. (Russian.) Role of H_2O_2 During Polarization of a Steel Electrode in Alkali Solution With Small Current Density. A. S. Afanasev, A. N. Burmistrova and E. N. Chankova. Ukrainskii Khimicheskii Zhurnal, v. 26, May 1960, p. 579-584.

Investigation of H_2O_2 addition effects on characteristics of an electrolytic cell containing oxidized and reacidified steel electrodes and 1.86 N NaOH electrolyte. Anodic polarization, limiting diffusion

current and potential are related to electrode preparation, H_2O_2 concentration and current. 13 ref. (P15; ST)

271-P. (Russian.) Thermodynamic Properties of the Cadmium-Tin System. N. V. Alekseev and A. M. Evseev. Zhurnal Fizicheskoi Khimii, v. 34, Nov. 1960, p. 2460-2462.

Liquid Cd-Sn system is studied within 567-600° K. by the effusion method. Values for activity of both components as well as partial and integral heats of mixture and entropy are computed. Insignificant deviations of system (with small Cd concentrations) are observed in comparison with those predicted by regular solution theory. 6 ref. (P12; Cd-b, Sn-b)

272-P. Analysis of Effective Thermal Conductivities of Honeycomb-Core and Corrugated Core Sandwich Panels. Robert T. Swann and Claud M. Pittman. NASA Technical Note D-714, Apr. 1961, 62 p. (Available from National Aeronautics and Space Administration, Washington, D. C.) $1.75.

Equations are derived for the transfer of heat in sandwich panels. An exact method is developed for considering internal reflections of radiant heat and for reducing the given problem to an equivalent problem which may be solved by black-body methods. Equations are derived which give the effective thermal conductivities as functions of geometric parameters and material properties. 7 ref. (P11h; 4-57)

273-P. (German.) Measurement of Electromotive Forces Between Slag and Steel Bath and Its Application in Openhearth Furnace Process Control. Karl-Ludwig Kiesel. Neue Hutte, v. 6, Mar. 1961, p. 157-166.

Measurement of emf. between slag and metal in the openhearth furnace by graphite electrodes under normal operation conditions. Thermodynamic interpretation of measured emf. as influenced by basicity and FeO content of slag; usefulness in control of dephosphorization and desulphurization. (P15g, D2, D11n, 2-60; ST)

274-P. Measurement of the Thermal Properties of Metals at Elevated Temperatures. R. L. Rudkin. U. S. Naval Radiological Defense Laboratory. U. S. Office of Technical Services, PB 171185, May 1960, 24 p. $.75.

Thermal properties of tungsten, used in the construction of rocket nozzles and combustion chambers and at the surfaces of missile nose cones and re-entry vehicles, are measured from 1500-2900° K. using a resistance heated 10 mil wire suspended in a vacuum of 10-5 mm. Hg. The total hemispherical emittance is determined by measuring the electrical power dissipated at the center of the wire. (P11, 2-61, T24e; W)

275-P. Thermo-Electric Phenomena in Relation to Structural Changes in Metals and Alloys. G. P. Chatterjee. Indian Institute of Metals, Transactions, v. 13, Dec. 1960, p. 315-322.

Potentiometric measurements of thermal electromotive force of strip and wire specimens of Al, Cu, Ni, Nichrome, brass, steel and Duralumin after annealing, tempering and aging treatments and cold working. Relation of deformation, work hardening and heat treatment induced microstructural changes to thermo-electric properties. 9 ref. (P15j, M26, M27, 2-64, 3-68; Al-b, Cu-b, Ni-b, ST)

276-P. Interface Energy Studies in Some Nonferrous Alloys Containing a Liquid Phase. V. Ramachandran and A. A. Krishnand. Indian Institute of Metals, Transactions, v. 13, Dec. 1960, p. 323-331.

Relation of interphase and intergranular energies of alloys containing an insoluble liquid or brittle phase on microstructure and working properties such as hot shortness and cold brittleness. Effect of alloying elements on interfacial energy and dihedral angle of several Cu, Al and Zn-based binary and ternary alloys. 9 ref. (P13h, Q26s, 2-60; Al-b, Cu-b, Zn-b)

277-P. (French.) Hall Effect of Nickel at Low Temperatures. R. Huguenin and D. Rivier. Helvetica Physica Acta, v. 33, Dec. 31, 1960, p. 973-977.

Ni of 99.999% purity is exposed to a magnetic field at 4-293° K. while immersed in liquid He, nitrogen or distilled water with intermediate temperatures obtained by a heating device. The Hall coefficient is determined as a function of temperature and field strength. 7 ref. (P15p, 2-61; Ni)

278-P. (German.) Residual Resistance of Gallium and Its Alloys. T. Frederking

and R. Reimann. Helvetica Physica Acta, v. 33, Dec. 31, 1960, p. 998-1002.

The electrical resistance of wires cast from pure Ga and Ga containing up to 2.6% Al, 0.01% Zn, 0.02% Pb, 0.01% Cu, 0.33% In or 0.006% Sn is determined at 1.3-4.2° K. to study the effects of composition, temperature and wire diameter. 5 ref. (P15g, 2-60, 2-63, 3-73; Ga-b, 4-61)

279-P. (French.) Magnetic Susceptibility of Selenium and Tellurium Between 80 and 1300° K. M. Risi and S. Yuan. Helvetica Physica Acta, v. 33, Dec. 31, 1960, p. 1002-1005.

Temperature dependence of susceptibility change of pure Se and Te in the liquid state and effect of previous heat treatments on solid state susceptibility. Relation of susceptibility change to the increase of free-spinning electrons. 5 ref. (P16n, P16p, 2-61, 2-64; Se, Te)

280-P. (English.) Magnetoresistance of Dilute Alloys of Manganese in Copper, Manganese in Zinc and Chromium in Zinc at Liquid Helium Temperatures. Yoshio Muto. Tohoku University, Science Reports of the Research Institutes, v. 13, Feb. 1961, p. 1-7.

Potentiometric measurement of resistances in 5.4% Mn-Cu, 0.12% Mn-Zn and 0.10% Cr-Zn alloys as a function of magnetic field strength and temperature. Hysteresis is noted with decrease of magnetoresistance at increasing field strength. 11 ref. (P16, P15g, 2-63; Cu-b, Zn-b, Mn, Cr)

281-P. Zinc Castings. Schrade F. Radtke. Foundry, v. 89, May 1961, p. 144-147.

Chemical requirements and physical and mechanical properties of Zn alloys for die casting. Coatings to increase corrosion resistance. 4 ref. (P-general, Q-general; Zn, 5-61)

282-P. The Soft X-Ray Emission Spectra of Sodium, Beryllium, Boron, Silicon and Lithium. R. S. Crisp and S. E. Williams. Philosophical Magazine, v. 6, Mar. 1961, p. 365-369.

Emission band forms of the K and L 23 spectra of elements obtained with a photon-counting spectrometer are compared with previously published spectra. 9 ref. (P17e; B, Be, Li, Na, Si)

283-P. The Hall Coefficient of Liquid Mercury. N. Cusack and P. Kendall. Philosophical Magazine, v. 6, Mar. 1961, p. 419-427.

Development of a technique for measuring the Hall coefficient of liquid metals using the d-c. method with a glass Hall cell. Hall coefficient and other electrical properties of liquid Hg are compared with those of solid Hg as a function of temperature and size and shape effects. 25 ref. (P15p, 2-61, 3-73; Hg, 14-60)

284-P. Correlation Between Magnetic Susceptibility and Hydrogen Solubility in Alloys of Early Transition Elements. D. W. Jones, N. Pessall and A. D. McQuillan. Philosophical Magazine, v. 6, Mar. 1961, p. 455-459.

Hydrogen absorption capacities of b-c-c. binary alloys of systems having electron to atom ratios of 4, 5 and 6 for Ti, Cb and Mo, respectively, are calculated as a function of the heat of solution for hydrogen. The magnetic susceptibility of the alloys reaches a minimum at the point at which hydrogen solubility disappears, which is attributed to a change in electronic structure as a function of composition. 3 ref. (P16n, P16p, P12e; Cb-b, Ti-b, Mo-b, H)

285-P. The Resonance Integral of Thorium Metal Rods. Eric Hellstrand and Jakob Weitman. Nuclear Science and Engineering, v. 9, Apr. 1961, p. 507-518.

Neutron activation study of cross sections using Au as a standard for the calibration. (P18j, S11q; Th)

286-P. Low-Temperature Research on Transuranic Metals. K. Mendelssohn. Paper from "Advances in Cryogenic Engineering". v. 6. Plenum Press, Inc., New York, 1961, p. 622-626.

Description of techniques and equipment used in measuring the electrical resistance of pure Np and Pu and their alloys at 300-100° K. 4 ref. (P15g, 2-63; Np, Pu)

287-P. Report on Behavior of Magnetic Materials Under Extreme Environmental Conditions. Communications and Electronics, Mar. 1961, p. 58-60.

Study of the performance of principal components used in magnetic amplifiers (cores, wires, rectifiers, insulation and

potting) under 20-700° C. temperature cycling, nuclear radiation, mechanical stress (20,000 psi.) and oxidizing atmospheres. Materials studied include Mo-Permalloy, Supermalloy, Supermendur, ferrites and Si steel. 12 ref. (P16, Q-general, R1h, X11g, 2-62, 2-67, 3-66; SGA-n, Fe-b, Ni-b, 17-52, 17-57)

288-P. Measurement of Electrical Resistivity of Bulk Metals. J. E. Zimmerman. Review of Scientific Instruments, v. 32, Apr. 1961, p. 402-405.

Alternating current induction measurements are made at 1-4.2° K. using coils of Cu and Cb wire to determine resistivity of cylinders of Cu and CuMn alloy. Derivation of theoretical expressions for a sphere and infinite circular cylinder using Maxwell's equations. (P15g; Cu-b, Mn)

289-P. The Wetting of Solid Metals by Liquid Metals. D. O. Jordan and J. E. Lane. Paper from "Australian Atomic Energy Symposium". Melbourne University Press, Melbourne, Australia, 1958, p. 197-200.

Investigation of the spreading of liquid metal on solid metal surfaces. Results indicate that spreading is aided by the formation of intermetallic compounds and solid solutions and the addition of fluxes and other surface active agents. Spreading is reduced by oxide and sulphide formation. 34 ref. (P13h)

290-P. Some Effects of Irradiation on Uranium and Uranium-Based Alloys. H. M. Finniston. Paper from "Australian Atomic Energy Symposium". Melbourne University Press, Melbourne, Australia, 1958, p. 226-233.

Report on effects of irradiation on uranium and uranium alloys shows that two major phenomena take place: surface wrinkling caused by "grain growth" and swelling due to fission product gases. Both effects are complicated by the anisotropy of the alpha-uranium phase. 7 ref. (P10d, 2-67; U-b)

291-P. The Solution of Lime in Liquid Calcium and Its Effect on the Reducing Properties of the Metal. D. J. M. Beuan and F. D. Richardson. Paper from "Australian Atomic Energy Symposium". Melbourne University Press, Melbourne, Australia, 1958, p. 586-587.

Determination of the melting point of Ca and its solubility in molten lime by heating under vacuum at 1250° C. for various times. Solubility and melting point data are used to calculate reduction potentials for Ca in the oxide reduction of U, UO_2 and Ta. 3 ref. (P12e, P13; Ca, RM-q)

292-P. (German.) Influence of Residual and Alloying Elements on Viscosity of Cast Iron Melts. Anton Koniger. Forschungsberichte des Landes Nordrhein-Westfalen, no. 970, 1961, p. 1-26.

Measurement of viscosity by a rotating viscosimeter for high-carbon Fe alloys of varying S, P and Si content. Test casting to investigate influence of phosphorus on casting properties. Graphical representation of mutual relations between viscosity, casting properties and phosphorus content as influenced by temperature. (P10f; CI, 14-60)

293-P. (Russian.) Surface Tension of Ge. T. P. Kolesnikova. Izvestiya Vuz--Chernaya Metallurgiya, Sept. 1960, p. 15-17.

Surface tension measurement using the stationary drop method in a vacuum with drop support plates of quartz and carbon. Relation of surface tension to test temperature and type of support. 7 ref. (P12e; Ge)

294-P. Measurement of Thermal Expansion at Low Temperature. G. K. White. Cryogenics, v. 1, Mar. 1961, p. 151-158.

Determination of the linear thermal expansion of Cu, Fe, Be and Cr at 4-300° K. using a three-terminal capacitor to measure very small length changes. Design consideration for transformer bridge, reference capacitor, expansion capacitor and associated cryogenic problems. 28 ref. (P11g, 1-52, 2-63; Cu, Cr, Fe, Be)

295-P. Atomic Heats of Tin and Tin-Indium. M. Yagub. Cryogenics, v. 1, Mar. 1961, p. 166-170.

Specific heats of pure Sn and Sn-In alloys (1-2% In) are measured in the normal state between 0.6 and 1.8° K. Temperatures below 1° K. are obtained by adiabatic magnetization of the specimens. A magnetic field of 500 gauss is used to suppress superconductivity. Atomic heat measurements are made in the superconducting state at 2-4.5° K. for Sn and Sn-In alloy. 14 ref. (P12r; Sn-b, In)

296-P. The Superconductive Transition in a Transverse Field at Various Orientations for Thin Tin Films. Cryogenics, v. 1, Mar. 1961, p. 180.

Determination of the shape of transition curves for Sn film by electrical resistance measurement at 3.55-3.836° K. as a function of the orientation of a transverse magnetic field. Specimens are prepared in a vacuum of 5×10^{-6} mm. Hg and deposited on mica to thickness of 2000-3500 Å. (P15g, 2-63; Sn, 14-62)

297-P. (German.) Hall Effect of Quench-Condensed Tin-Copper Alloy Films. Joachim Fortmann and Werner Buckel. Zeitschrift fur Physik, v. 162, Jan. 1961, p. 93-104.

Measurement of electrical resistance, transition temperature of superconductivity and Hall coefficients in Sn-Cu alloys (0-100% Cu) obtained by simultaneous quenching onto a cooled substrate during heating from 4-350° K. and recooling to 4° K. Comparison of results with properties of bulk Sn-Cu alloys. (P15p, P15g, 2-64; Sn-b, Cu-b)

298-P. The Vaporization and Physical Properties of Certain Refractories. Pt. 1. Techniques and Preliminary Studies. A. A. Hasapis, M. B. Panish and C. Rosen. Avco Corporation (Wright Air Development Division). U. S. Office of Technical Services, PB 171413, Oct. 1960, 73 p. $2.

Effusion studies of the vaporization of Rh, Ir and Os by the Knudsen effusion technique. The rate of effusion is determined by condensing the molecular beam on a target. Mass spectrometric studies are made of the vaporization of thoria from tungsten effusion cells and interactions between thoria and tungsten at elevated temperatures are noted. (P12p, P-general; Ir, Os, Rh)

299-P. The Thermal Emissivity of Some Materials Used in Thermionic Valve Manufacture. C. M. Cade. IRE Transactions on Electron Devices, ED-8, Jan. 1961, p. 56-69.

Laws governing thermal radiation are reviewed and emissivity data are given for Fe, Mo, Ni, Ta, W, Au, Ag, Zr, Ti, Al, Pt, Nichrome, Nimonic, Moly-Tungsten, ceramics, nonmetals and coated surfaces. Measurement methods include heating in vacuum using electric current, very fine potential leads, Pt/Pt-Rh thermocouple and comparing with calculated values. (P15k, P11; Fe-b, Mo-b, Ni-b, Ta, W-b, Au, Ag, Pt-b, Zr, Al, Ti, NM-f, 17-57)

300-P. Physical and Mechanical Properties of Sodium-Reduced and Electrorefined Titanium. C. N. Adams and E. D. Hull. U. S. Bureau of Mines, Report of Investigations 5772, 1961, 12 p.

Preparation of test specimens by arc furnace melting, casting, machining, cold rolling and vacuum annealing at 300-700° C. Dilatometric measurements and mechanical tests are used to determine effect of annealing time and temperature and reduction method on Vickers hardness, tensile and yield strength, recrystallized grain size, purity microstructure and coefficient of linear thermal expansion. 10 ref. (P-general, M-general, Q-general, 2-60, 2-64; Ti-a)

301-P. Researches on Hydrogen Overvoltage on Metallic Single Crystals: Silver and Lead. L. P. Bicelli and B. Rivolta. Politecnico Di Milano (Wright Air Development Division). U. S. Office of Technical Services, PB 161801, Apr. 1960, 27 p. $.75.

Measurement of hydrogen overvoltage on Ag and Pb single crystal cathodes oriented following the (100), (110) and (111) planes in sulphuric acid solutions for Ag and perchloric acid and sulphamic acid for Pb. The parameters are coincident for all of the Ag electrodes, while they are different for the Pb electrodes. (P15m; Ag, Pb, 14-61)

302-P. Superconductivity. Vernon L. Newhouse. Tech Engineering News, v. 42, Apr. 1961, p. 20-22, 24, 26, 42.

Observation of electron "tunneling" in superconducting devices such as thin films of Al, Pb, In, Sn and Ta, Ni and Cb oxides as related to temperature effect on electrical resistance of conductors. Application of discovery to computer fabrication and use of cryotrons as computer components. (P15g, 2-61; Al, Pb, In, Ta-b, Ni-b, Cb-b, 14-62)

303-P. Review of Recent Work at NRL on the Irradiation Effect in Magnetic Alloys. E. I. Salkovitz and A. I. Schindler. Report of NRL (Naval Research Laboratory) Progress, Feb. 1960, 16 p.

Effect of irradiation of Si steel, ferrite, Permalloy, Supermalloy, Sinimax,

Mumetal and Deltamax on the hysteresis loops, coercive force and remnance. 12 ref. (P16, 2-67; SGA-n)

304-P. Mechanisms of Surface Removal From Metals in Space. John L. Ham. Aerospace Engineering, v. 20, May 1961, p. 20-21, 49-52.

Examination of metal evaporation, oxide dissociation, diffusion inward, chemical reaction and other mechanisms of surface removal on Mg, Al, Zn, Cd, Pb, Cu, Ag, Cr, Fe, Co, Ni, Ti, Zr, Mo and W under space conditions. 15 ref. (P13, Q9, 1-73)

305-P. (Translation-ConBur.) Pressure of Saturated Vapor of Liquid Antimony and Its Association State. V. V. Illarionov and A. S. Cherepanova. Academy of Sciences of the USSR, Proceedings, Chemistry Section, v. 133, July-Aug. 1960, p. 901-904.

Radiometric method for the determination of the saturated vapor pressure and vapor density of liquid Sb using gamma radioactive isotopes. Calculation of the latent heat of evaporation. 17 ref. (P12c, 1-59; Sb)

306-P. (Translation.) Thermoelectric Properties of the Silicon-Chromium System. E. N. Nikitin. Soviet Physics--Solid State, v. 2, May 1961, p. 2389-2392. (Translation of Fizika Tverdogo Tela, v. 2, Nov. 1960, p. 2671-2988).

Phase compositions are determined for singular points on electrical conductivity or thermoelectric power curves. Effect of temperature and B and Ag content on thermoelectric power, electrical conductivity and thermal conductivity. 14 ref. (P15j)

307-P. Researches on Hydrogen Evolution. Wright Air Development Division. U. S. Office of Technical Services, PB 161880, Apr. 1960, 50 p. $1.25.

Potentiostatic method of applying triangular voltage is used in the investigation of adsorption phenomena, particularly on the noble metals Pt, Rh, Ir, Pd and Au. In the case of hydrogen bubbling, a continuous transition from the stationary to the instationary curve is found for Pt when increasing the voltage speed. (P13d; Au, Ir, Pd, Pt, Rh)

308-P. A Brief Review and Analysis of Thermoelectricity. W. H. Lucke. Report of NRL (Naval Research Laboratory) Progress, Apr. 1961, p. 14-25.

The three basic thermoelectric effects, Seebeck, Thompson and Pelter, are defined and the relations between them demonstrated for different conductors as a function of temperature. The effects are explained on the basis of energy changes of the current carriers and their equilibrium with the lattice. 5 ref. (P15j)

309-P. Electrical Characteristics of Four Ternary Platinum-Rhodium-Base Alloys Containing Chromium, Cobalt, or Ruthenium. Herman H. Lowell, Hubert W. Allen and Joe E. Jenkins. National Aeronautics and Space Administration, NASA TN D-867, May 1961, 17 p.

Resistivities of small cast specimens of 5 Co-15 Rh-80 Pt, 5 Cr-15 Rh-80 Pt and 10 Cr-15 Rh-75 Pt and of a wire sample of 5 Ru-15 Rh-80 Pt are determined from 20-900° C. 8 ref. (P15g, 2-61; Pt-b, Rh-b, Co, Cr, Ru)

310-P. (English.) Theory of Adsorption of Hydrogen Atom on Metal Surface. Pt. 2. Tomiyuki Tōya. Hokkaido University, Research Institute for Catalysis, Journal, v. 8, Dec. 1960, p. 209-263.

Theoretical investigation of r and s-type adsorption phenomena of H on Ni, Cu and Pt surfaces. Formula for determining heat dissolution, equilibrium distance, energy, polarization and adsorption effects on work function and conductivity. 24 ref. (P13d; Cu, Ni, Pt, H)

311-P. The Emittance of Coated Materials Suitable for Elevated-Temperature Use. W. D. Wood, H. W. Deem and C. F. Lucks. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 103, May 4, 1961, 136 p. (Available as PB 171622 from U. S. Office of Technical Services, Washington 25, D. C.)

Emittance data are compiled for boride, carbide, oxide and silicide coatings and paint and enamel coatings on such materials as W, Ta, Inconel, stainless steel, graphite, Mo, Nimonic and Cb alloys. Data are separated according to type of coating and to type of measurement, whether spectral or total. 12 ref. (P17a; Cb-b, Mo, Ni-b, SS, Ta, W, 8)

312-P. The Solubility of Silicon Nitride in Ferrite. R. Rawlings and P. M. Robinson. Iron and Steel Institute, Journal, v. 197, Apr. 1961, p. 306-308.

Nitrogen in solid solution in equilibrium with silicon nitride is determined

by measuring internal friction of steel wires containing 0.5-1.9% Si at 600-900° C. with calculation of heat of solution of silicon nitride and activity coefficient of Si. 15 ref. (P12e, P12b, N8, Q22; Fe-b, Si, 4-61)

313-P. Thermoelectric Properties of Rhodium-Platinum Alloys. A. S. Darling. Instruments and Control Systems, v. 34, May 1961, p. 861-863.

Review of thermoelectric properties of Rh-Pt alloys of various composition and the high-temperature-stability of Rh-Pt thermocouples. Effects of contamination, vaporization of Rh and gradual diffusion of Rh into pure Pt are investigated at 300-1900° C. (P15j, X9q, 2-62, 10-54; Pt-b, Rh-b, 17-57)

314-P. Hyperfine Field and Atomic Moment of Iron in Ferromagnetic Alloys. C. E. Johnson, M. S. Ridout, T. E. Cranshaw and P. E. Madsen. Physical Review Letters, v. 6, May 1, 1961, p. 450-451.

Measurement of Mossbauer absorption spectrum of Fe-Co and Fe-Ni alloys for the 14.4 Kev. radiation of Fe^{57} to establish proportional relationship between hyperfine field and atomic moments. 15 ref. (P17c; Fe-b, Co, Ni)

315-P. (Japanese.) Nickel for Glass Sealing. Satoru Mito. Japan Institute of Metals, Journal, v. 25, Feb. 1961, p. 104-108.

Glass sealing applicability of Ni as influenced by bubble formation characteristics and wettability. Effect of heat treatment time and temperature, degassing and deoxidizing and alloy additions on properties of Ni wire specimens. (P13h; Ni, NM-f42, 4-61)

316-P. (Japanese.) Experimental Data of the Thermodynamics of Surface Tension. Pt. 9. Studies on Cermets. Kaizo Monma and Hajime Suto. Japan Institute of Metals, Journal, v. 25, Feb. 1961, p. 143-147.

Review and correlation of data for surface tension with calculation of free energy curves for metallic melts of Cu-Ni, Ni-Mo, Cu-Cu_2S, Cu-Cu_2O, Cu-Cu_2Se, Cu-Cu_2Te and FeC-FeS systems at 1150-1600° C. 12 ref. (P13h, 10-54; Cu-b, Ni-b, Fe-b)

317-P. (Japanese.) Interaction Parameters of Alloying Elements in Molten Iron. Harue Wada and Tunezo Saito. Japan Institute of Metals, Journal, v. 25, Feb. 1961, p. 159-163.

Statisco-thermodynamic calculation of interaction parameters and interchange energies in Fe systems using models and Mott's equation. Comparison with data for Fe-Cr, Fe-Ni, Fe-C and Fe-S ternary systems with 40 other elements. 29 ref. (P12, P13, M24c; Fe-b, Ni, Cr, C, S)

318-P. Radiation Can Ruin Your Design. Mary Jane Ostemann, J. F. Kircher, J. W. Clark and T. D. Hanscome. SAE (Society of Automotive Engineers) Journal, v. 69, June 1961, p. 82-84.

Effect of radiation on the yield, tensile, fatigue and impact strengths; Brinell hardness; ductility; elastic constants; creep rate; work hardening; density; diffusion coefficients; microstructure; thermoelectromotive force; thermal conductivity; electrical resistivity; corrosion resistance; dimensional stability and internal friction of metals, glass, elastomers, graphite, organic fuels and lubricants, plastics and semiconductor materials and on electrical and electronic components. (P-general, Q-general, 2-67)

319-P. Ferromagnetic Resonance Absorption of Single-Crystal Thin Films of Nickel. Masao Kuriyama, Hirokage Yamanouchi and Sukeaki Hosoya. Physical Society of Japan, Journal, v. 16, Apr. 1961, p. 701-706.

Single-crystal films having (100) and (111) orientations are epitaxially grown by vacuum deposition onto heated rock salt and zinc blende. Size of crystallites is determined by electron diffraction. Data are given for saturation magnetization, crystalline anisotropy and Lande splitting factor. 8 ref. (P16f; Ni, 14-61)

320-P. Spin Wave Resonance in Pd-Ni Alloy Films. Hiroshi Nose. Physical Society, Journal, v. 16, Apr. 1961, p. 838.

Measurement of concentration dependence of exchange coupling constants and g-factors of Pd-Ni alloy films. 3 ref. (P18m; Ni-b, Pd-b, 14-62)

321-P. Lattice Spacings and Densities of Gold-Nickel Alloys. Gene F. Day. Institute of Metals, Journal, v. 89, Apr. 1961, p. 296.

Effect of vacancy concentration on deviation of measured density from

density calculated from lattice parameters is investigated for quenched Au-Ni specimens, containing 0-100% Ni, by buoyancy measurements and microexamination. (P10a, M26s, 2-64; Au-b, Ni-b)

322-P. Physical Properties of Metals. Clifford A. Hampel. Chapter 35 from "Rare Metals Handbook". Reinhold Publishing Co., New York 22, 1961, p. 687-702.

Tabulated lists of physical properties of metals; weight, number, density, expansion coefficient, thermal neutron cross section, resistivity and conductivity. 13 ref. (P-general)

323-P. Optical Properties of Anodic Oxide Films on Tantalum, Niobium and Tantalum + Niobium Alloys and the Optical Constants of Tantalum. L. Masing, J. E. Orme and L. Young. Electrochemical Society, Journal, v. 108, May 1961, p. 428-438.

Reflectivity measurements are made to obtain refractive indices, a measure of thickness. The values obtain vary with current density, temperature and electrolyte concentration at which the films are formed. Measurements are also made on unanodized Ta and anodized Zr. 15 ref. (P17a, R1h; Cb-b, Ta-b)

324-P. (Japanese.) Electrical Properties of Evaporated InSb Film. Pt. 2. S. Ebisawa and K. Kawasaki. Electrotechnical Laboratory, Bulletin, v. 25, Feb. 1961, p. 134-136.

Variation of electrical resistance of thin films with gas absorption is studied for films evaporated on quartz at room temperature and films heat treated at 400° C., exposed to O, N and H_2O. 3 ref. (P15g; In-b, Sb-b, 14-62)

325-P. Notes on the Assessment of Filler Metals and Fluxes. G. M. A. Blanc, J. Colbus and C. G. Keel. Welding Journal, v. 40, May 1961, p. 210s-222s.

Physical meaning and methods of determining surface tension and wetting power. Surface tension of Cu-Zn, Cu-Ni-Zn and Ag-Cd-Cu-Zn filler metals and boric acid and borate fluxes. Effects of various surface active substances on surface tension and wetting power. Relationship between strength of brazed joints and surface tension, viscosity and wetting power of filler metals and fluxes. 27 ref. (P13h, W29h; Cu, Zn, Ni, Ag, Cd, 17-57, RM-q)

326-P. (German.) Density of Molten Silver and Silver-Tin Alloys. I. Lauermann and G. Metzger. Zeitschrift fur Physikalische Chemie, v. 216, no. 1/4, 1961, p. 37-41.

Measurement of density and specific volume of pure Ag at 1150 and 1050° C. and in the binary system Ag-Sn over the entire concentration range at 1200° C. by a capillary method. 11 ref. (P10a; Ag-b, Sn-b)

327-P. (German.) Thermal Expansion of High-Melting Phase. H. Nowotny and E. Laube. Planseeberichte fur Pulvermetallurgie, v. 9, Apr. 1961, p. 54-59.

Measurement of thermal expansion coefficient by X-ray measurement of lattice parameter as influenced by temperature (20-1000° C.) for sintered and cast specimens of following carbides and silicides of transition metals: HfC, TaC, UC, $TaSi_2$, Ta_5Si_3 and Cb_5Si_3. 19 ref. (P11g, M26; Cb, Hf, Ta, U, 5, 6-72, 14-68)

328-P. (German.) Vacuum Sintered Fine-Particle Tantalum Carbide. D. Moskowitz and M. Humenik, Jr. Planseeberichte fur Pulvermetallurgie, v. 9, Apr. 1961, p. 60-64.

Measurement of density and electrical resistivity as influenced by sintering temperature for specimens of H_2SO_4-leached, cold pressed and vacuum sintered (20-2300° C.) microsize TaC powders, containing 18.9% combined and 1.21% free carbon. 3 ref. (P10a, P15g; Ta, 6-69)

329-P. Design Selector Chart for Copper Alloys. C. L. Bulow. Design News, v. 16, June 5, 1961, p. 64-67.

Data given for composition, electrical conductivity, machinability, strength, corrosion resistance and wear resistance of Cu alloys, leaded and nonleaded brasses, tin brasses, cupronickel alloys, nickel silvers, phosphor, silicon and aluminum-silicon bronzes. (P15g, G17k, Q27a, R-general; Cu-b)

330-P. (English.) The Effects of Imperfections on the Superconducting Critical Temperature of Tantalum. D. P. Seraphim, D. T. Novick and J. I. Budnick. Acta Metallurgica, v. 9, May 1961, p. 446-452.

The critical temperature for superconductivity in pure specimens and in

specimens doped with O, N and H interstitial impurities is investigated after cold working by resistance measurements. The nature and number of deformation induced defects which scatter the electron state are considered as influencing factors, as well as the mean free path effect as influenced by O, H and N concentrations. 23 ref. (P15g, M26s, M25, 3-68, 3-69; Ta)

331-P. (English.) Electrical Resistance of Copper-Gold Alloys at Low Temperatures. M. Hirabayshi and Y. Muto. Acta Metallurgica, v. 9, May 1961, p. 497-503.

Resistance measurements as a function of temperature on polycrystal and single crystal specimens containing 5.0-75.0% Au at 4.2-273° K. in the annealed and quenched states. Effect of order-disorder and impurity content on residual resistance and Debye temperature. 17 ref. (P15g, N10, 2-63, 2-64, 3-69; Au-b, Cu-b)

332-P. (English) The Solubility of Ni, Cr, Fe, Ti and Mo in Liquid Lithium. H. W. Leavenworth and R. E. Cleary. Acta Metallurgica, v. 9, May 1961, p. 519-520.

Solubilities of dilute liquid metal solutions are determined as a function of temperature at 1200-1700° F. using flame photometry, colorimetry and radioactive tracer methods. The magnitude of the solubility increases with the atomic size factor. (P12e, 2-61; Li, Ni, Cr, Fe, Ti, Mo)

333-P. (Translation-ConBur.) Thermodynamic Properties of Liquid Indium-Bismuth Alloys. N. V. Alekseev, Ya. I. Gerasimov and A. M. Evseev. Academy of Sciences of the USSR, Proceedings, Physical Chemistry Section, v. 134, Sept-Oct. 1960, p. 883-885.

Determination of the thermodynamic functions of the In-Bi system from 240-300° C. by emf. measurements with tabular presentation of results. (P12; Bi-b, In-b)

334-P. (Translation-Chemical Society.) Heat of Transition of the Sigma Phase Into Alpha Solid Solution in the Iron-Chromium System. I. I. Kornilov and N. M. Matveeva. Russian Journal of Inorganic Chemistry, v. 5, June 1960, p. 671-672.

Thermal analysis used to determine heat transition of the sigma phase (based on the compound FeCr) into the alpha solid solution of the Fe-Cr system. Preparation and composition of alloys. Heating curves. 7 ref. (P12q, M23r, M24b; Cr-b, Fe-b)

335-P. (Translation-Chemical Society.) Fusion Diagram of the Aluminum-Copper-Lithium System. V. I. Mikheeva, Z. K. Sterlyadkina and O. N. Kryukova. Russian Journal of Inorganic Chemistry, v. 5, Aug. 1960, p. 867-871.

Thermal analysis of the Al-Cu-Li system composed of up to 75 at.% Cu and Li. A melting point diagram is constructed; equilibrium is characterized by two incongruently melting ternary phases. The ternary eutectic representing the simultaneous crystallization of an Al solid solution occurs at the composition of 73 at.% Al, 18.6 at.% Cu and 8.4 at.% Li. 12 ref. (P12n; Al-b, Cu, Li)

336-P. (Translation-ConBur.) Determination of the Solubility of Metals in Lithium. Yu. F. Bychkov, A. N. Rozanov and V. B. Yakovleva. Soviet Journal of Atomic Energy, v. 7, Apr. 1961, p. 987-992.

The solubility of U, Zr, Fe, Li, Ti, Mo, Cb and Be in Li at temperatures of 700-1000° C. is determined to assess the stability of metals in Li and establish the mechanism of corrosion. The presence of isothermal transfer of Al, Be, Zr and Si via Li to steel and Fe is established. 6 ref. (P12e; Li, Be, Cb, Fe, Mo, Ni, U, Ti, Zr)

337-P. (Translation.) Thermoelectric Properties of Solid Solutions of Chromium, Vanadium and Titanium in Nickel. M. V. Vedernikov and N. V. Kolomoets. Soviet Physics--Solid State, v. 2, May 1961, p. 2420-2427. (Translation of Fizika Tverdogo Tela, v. 2, Nov. 1960, p. 2671-2988).

Dependence on temperature and second component concentration of the electrical resistivity and thermoelectric power of Ni-Cr, Ni-V and Ni-Ti solid solutions. 14 ref. (P15g, P15j; Cr, Ni, Ti, V, 14-67)

338-P. (Translation.) Electrical Conductivity of Liquid Selenium in Strong Electric Fields. A. A. Andreev and A. R. Regel. Soviet Physics--Solid State, v. 2, May 1961, p. 2467-2472. (Translation of Fizika Tverdogo Tela, v. 2, Nov. 1960, p. 2671-2988).

Temperature (150-370° C.), field intensity (up to 1.2 x 10^{-5} v per cm.) and impurity concentration (0.1-1.0% iodine), dependence of the electrical conductivity and strong field effect of liquid Se. 16 ref. (P15g, 2-61, 3-69; Se)

339-P. Gas Solubility in Metals. Gerald N. Goldberg. Michigan Technic, v. 79, May 1961, p. 14-16.

Investigations into the solubility of gases such as nitrogen, oxygen and hydrogen in various liquid metals and alloys including Fe, low-carbon steel and austenitic stainless steel using Sieverts apparatus. Factors such as high-temperature interaction between refractories, slag, gas phases or metal phases are taken into account. 4 ref. (P12e, D11h; CN-g, Fe, SS-e, H, N, O)

340-P. (Rumanian.) Variations of Physical Properties of Iron With Heating Time. Ovidiu Bolgiu, Maria Bolgiu and Traian Negrescu. Studii si Cercetari de Metalurgie, v. 5, Apr. 1960, p. 471-491.

Variations in dilation and metallic valence of high-purity Fe and Fe oxides during heating from 20-1000° C. 13 ref. (P-general, 2-64; Fe)

341-P. (Translation-Columbia.) Fine Structure of the Principal K Absorbtion of Transition Metals of the Iron Group, Their Alloys and Compounds. S. A. Nemnonov. Academy of the Sciences of the USSR, Bulletin, Physical Series, v. 24, Apr. 1960, p. 455-461.

Investigation of the electronic structure of transition metals Cr, Mn, Fe, Co, Ni, Cu and Zn shows that changes take place in the principal edge as concentration of the metal increases. Changes are identified by the magnitude and direction of the shifts of the three characteristic points of the K edge. 9 ref. (P17; Co, Cr, Cu, Fe, Mn, Ni, Zn)

342-P. (German.) Magnetic Properties of Sintered Iron. Hermann Dietrich. Zeitschrift fur Metallkunde, v. 52, Apr. 1961, p. 232-235.

Ballistic measurement of magnetization and measurement of coercive force at compensated gravity field for heat treated (825-1200° C. under hydrogen atm.) ring specimens of commercial unalloyed sintered Fe of given density and composition. Comparison of magnetic properties with cast and rolled pure Fe specimens. (P16; Fe, 6-72)

343-P. (German.) Conductivity and Hall Constant. Pt. 15. Alpha-Copper-Beryllium Alloys. Werner Koster and Hans-Peter Rave. Zeitschrift fur Metallkunde, v. 52, Apr. 1961, p. 252-255.

Measurement of resistivity and Hall constant for recrystallized, 65% cold rolled and differently heat treated (20-900° C.) and aged (20-250° C.) Cu-Be alloy (1.75% Be) strip specimens at 20° C. Establishment of annealing isotherms for various annealing and quenching temperatures. Hall constant as influenced by phase transformation. (P15, 2-64; Cu-b, Be, 4-53)

344-P. (German.) Conductivity and Hall Constant. Pt. 16. Au-Ni Alloys. Werner Koster and Hans-Peter Rave. Zeitschrift fur Metallkunde, v. 52, Apr. 1961, p. 255-259.

Measurement of resistivity and Hall constant for recrystallized, 65% rolled and differently heat treated (700-900° C.) and aged (110-150° C.) Au-Ni alloy (30 at.% Ni) specimens at 20° C. Establishment of annealing isotherms for various annealing and quenching temperatures. Hall constant as influenced by Ni content. Mechanism of phase transformation. (P15, 2-64, N-general; Au-b, Ni-b)

345-P. (German.) Electrical Resistance of Metallic Metals. Pt. 8. Electrical Resistance of Molten Al-Zn-Sn Alloys. Albert Roll and Anantha Swamy. Zeitschrift fur Metallkunde, v. 52, Apr. 1961, p. 260-262.

Electrodeless measurement of electrical resistance under Ar atm. at atmospheric pressure using an eddy current method for sections of constant Sn (5, 10 and 15 at.%) content and sections of constant Al (5, 10 and 15 at.%) content in the Zn-rich portion of the ternary Al-Zn-Sn system from 300-700° C. Abnormalities of resistivity as influenced by valency electron concentration. (P15g; Zn-b, Al, Sn)

346-P. (German.) Thermomagnetic Analysis of Cobalt by Electron Irradiation. Shigeto Yamaguchi. Zeitschrift fur Metallkunde, v. 52, Apr. 1961, p. 284-285.

X-ray diffraction measurement of magnetic induction as influenced by temperature (20-300° C.) and crystallographic orientation on Co particles

magnetically attached to a metal surface and heated by electron irradiation. (P16, M22g, 2-61, 3-72; Co)

347-P. Metallurgy of High Temperature Heat Transfer Systems (The Density of Liquid Bismuth and of Dilute Solutions of Copper in Bismuth). L. E. Richards and S. W. Strauss. Report of NRL (Naval Research Laboratory) Progress, May 1961, p. 24-25. (Available as PB 171318 from U. S. Office of Technical Services, Washington 25, D. C.) $1.25.

Density measurements as a function of temperature from 400-800° C. for liquid Bi using a modified Archimedean method and from 790-810° C. for 3.5% Cu-Bi solutions by interpolation on density-temperature plots. Data are given for partial molal volume and molal volume as a function of dilution. 8 ref. (P10a; Bi, Cu, 14-60)

348-P. (Russian.) Gamma Absorption by Liquid Metals. A. I. Belyaev. Isvestiya VUZ-Tsvetnaya Metallurgiya, Feb. 1961, p. 39-42.

The gamma ray absorption occurring in liquid Al-Cu, Al-Zn, Al-Sn and Al-Mg systems is measured by determining the number of impulses in gamma rays that were passed through the melt. Change of absorption with the atomic number of metals and the number of electrons in their atoms. (P17c; Al-b, Cu-b, Mg-b, Sn-b, Zn-b)

349-P. (Russian.) Removal of Silver From a Lead Melt. V. M. Andreev and F. M. Loskutov. Isvestiya VUZ-Tsvetnaya Metallurgiya, Feb. 1961, p. 58-64.

Determination of the simultaneous solubility of Ag and Zn from 320-500° C. Values found should be important for the purification of Pb by Zn additions. 8 ref. (P12e; Zn, Ag)

350-P. Total Cross Section of Lead for Slow Neutrons. M. F. Collins and G. Dalling. Philosophical Magazine, v. 6, Apr, 1961, p. 485-489.

A beam of filtered neutrons with a mean wavelength of 8.4 A is used to measure the total cross section of Pb as a function of temperature from 290-840° K. The cross section varies linearly with temperature in both solid and liquid phases to within 1° K. of the melting point. There is a jump in cross section at the melting point of (9.4 ± 0.6)%. 13 ref. (P18j, 2-61; Pb)

351-P. The Optical Properties of Liquid Germanium Tin and Lead. J. N. Hodgson. Philosophical Magazine, v. 6, Apr. 1961, p. 509-515.

The optical constants of liquid Ge, Sn, and Pb are measured by a reflection method for wave numbers between 4000 and 27,000 cm^{-1} at 20-998° C. Effect of temperatures, free electrons and electron relaxation time on variation of properties. Comparison of calculated static conductivity with electrically measured values. 5 ref. (P17a; Ge, Pb, Sn)

352-P. Internal Magnetic Field in Iron and Iron Alloys Measured by NMR. Yashitaka Koi and Akira Tsujimura. Physical Society of Japan, Journal, v. 16, May 1961, p. 1040.

Resonance line shapes, Curie point and internal magnetic field are measured on pure Fe and Fe-1% Co alloys as a function of temperature. 8 ref. (P16, 2-61; Fe-b, Co)

353-P. (Translation - AIP.) The Thermal Conductivity of High Purity Thallium and Tin. N. V. Zavaritskii. Soviet Physics JETP (Journal of Experimental and Theoretical Physics), v. 12, June 1961, p. 1093-1097.

Thermal conductivity of several Tl and Sn single crystals of various purity is studied in the normal and superconducting states. A deviation from additivity is found in the electron scattering processes in the normal state. The variation in the ratio of the states when the scattering of electrons changes from lattice defects to thermal vibrations is investigated. Results are compared with theoretical predictions. 17 ref. (P11h; Tl, Sn, 14-61)

354-P. (Translation-ConBur.) The Temperature Dependence of the Surface Tension of Germanium. V. B. Lazarev and P. P. Pugachevich. Academy of Sciences of the USSR, Proceedings, Physical Chemistry Section, v. 134, Sept-Oct. 1960, p. 823-825.

Measurement of the surface tension of molten Ge at high temperatures using the Sugden procedure to obtain maximum gas bubble pressure. 15 ref. (P13h; Ge)

355-P. (German.) Magnetic Properties of Manganese-Bismuth Alloy Powders. G. S. Kandaurowa and Ja. S. Schur. Physikalische Abhandlungen aus der Sowjetunion, v. 4, Jan. 1961, p. 18-24.

Measurement of magnetization curves on isotropic disc shaped specimens of an unmagnetic binder containing less than 15 vol.% of a high-coercive Mn-Bi alloy powder after demagnetizing at -196° C. or at room temperature. 7 ref. (P16; Mn-b, Bi)

356-P. Thermodynamic Properties of Solid Solutions. Pt. 3. Copper-Rich Solid Solutions of Copper + Zinc + Manganese. G. A. Chadwick and B. B. Argent. Faraday Society, Transactions, v. 57, Apr. 1961, p. 619-624.

Thermodynamic functions for Zn in Cu-rich solid solutions of the system Cu + Zn + Mn calculated from measurements of the vapor pressure of Zn. The magnetic susceptibilities of the alloys are determined using a Sucksmith ring balance. 26 ref. (P12, P16n, P16p; Cu-b, Mn-b, Zn-b, 14-67)

357-P. Thermodynamic Properties of Liquid Silver-Lead Alloys. A. T. Aldred and J. N. Pratt. Faraday Society, Transactions, v. 57, Apr. 1961, p. 611-617.

Using a torsion-effusion methods, vapor pressures of Pb are measured over liquid Ag-Pb alloys and the result is used to compute their thermodynamic properties. The system is found to exhibit positive heats and positive excess entropies of formation. The results are compared with other themodynamic data and it is concluded that the specific heats of the alloys deviate positively from Neumann-Kopp behavior. 17 ref. (P12; Ag-b, Pb-b)

358-P. (German.) Permanent Magnet Properties of Workable Fe-Mn-Ti Alloys. Gunter Rassmann and Otto Henkel. Zeitschrift fur Angewandte Physik, v. 13, Apr. 1961, p. 169-170.

Measurement of coercive field strength and remanence induction of Fe-Mn-Ti alloys containing 12-20% Mn, 0-2.3% Ti, 0.02-1.52% Si, 0.09-1.46% Al and 0.03-0.25% C after 1250° C. homogenizing, 98% cold working and 525° C. annealing. Shape of hysteresis slope. (P16; Fe-b, Mn, Ti)

359-P. (German.) Coercive Force of Zone-Refined Iron. Albrecht Mager and Hans Hillmann. Zeitschrift fur Angewandte Physik, v. 13, Apr. 1961, p. 171-172.

Measurement of coercive force of Fe specimens obtained by zone-refining of sintered carbonyl-Fe without crucible under Hg-Ar protective atmosphere at zone rates of 0.3-10 mm. per min. and subsequent 880° C. annealing. Coercive force as influenced by zone rate. 12 ref. (P16a; Fe)

360-P. (German.) Influence of Cold Working and Heat Treatment on Electrical and Magnetic Properties of Fe-Al Alloys. Gunther Rassmann and Harry Wich. Zeitschrift fur Angewandte Physik, v. 13, Apr. 1961, p. 172-174.

Measurement of electrical resistance, coercive force and rolling anisotropy for cold rolled Fe-Al alloys containing 9-18% Al at room temperature and after annealing up to 600° C. Correlations between magnetic and electrical properties and lattice structure. (P15, P16, 2-64, 3-68; Fe-b, Al)

361-P. (German.) Magnetically Induced Anisotropy of FeAl and FeSi Single Crystals. Hermann Gengnagel and Hans Wagner. Zeitschrift fur Angewandte Physik, v. 13, Apr. 1961, p. 174-177.

Measurement of magnetic anisotropy constant in a vacuum furnace at up to 675° C. under the influence of a 5000 oe magnetic field for FeAl (10.1-14% Al) and Fe_3Si (13.5% Si) single crystals. 4 ref. (P16; Fe-b, Al, Si, 14-61)

362-P. Incendine Frictional Sparking From Alloys Containing Aluminium. D. Rae and B. J. Nield. Safety in Mines Research Establishment. Report no. 192, Nov. 1960, 29 p.

Replacement of Al content with inert elements to reduce incendiary sparking. Hazard as a function of hardness and heat treated conditions, as well as of Al content. Significant reduction of Al produces an alloy with much greater relative density and inferior mechanical properties. (P13)

363-P. Thermodynamic Properties of Blast Furnace Slags. John Chipman. Paper from "Physical Chemistry of Process Metallurgy". Pt. 1. v. 7. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 27-64.

Review of data on the chemical thermodynamic properties of blast furnace slags which determine the equilibrium between slag, metal and gas. Application to the lime-alumina-silica-magnesia-sulphur, CaO-Al_2O_3, and CaO-SiO_2 systems. 47 ref. (P12, D11n)

364-P. Measurement of Vapor Pressures at High Temperatures by the Transportation Method. C. B. Alcock and G. W. Hooper. Paper from "Physical Chemistry of Process Metallurgy". Pt. 1. v. 7. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 325-340.

A semimicro version of the transportation method is developed and used for measurements at 1000-1600° C. Study shows the effects of sample geometry, carrier gas flow rate and absolute magnitude of the vapor pressure on the results for apparent vapor pressure obtained by this method. (P12c)

365-P. The Vapor Pressure of the Liquid Metals Copper, Silver, and Gold. P. Grieveson, G. W. Hooper and C. B. Alcock. Paper from "Physical Chemistry of Process Metallurgy". Pt. 1. v. 7. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 341-352.

Vapor pressures of liquid An and Ag are measured by the transportation technique and of liquid An and Cu by the Knudsen technique from 1100-1600° C. Results show good agreement when it is assumed that the vapors are monatomic. 17 ref. (P12c; Ag, Au, Cu, 14-60)

366-P. The Vapor Pressures of Lead-Antimony Alloys and the Atomicity of Antimony Vapor. A. W. Richards. Paper from "Physical Chemistry of Process Metallurgy". Pt. 1. v. 7. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 353-362.

Measurements are made on liquid alloys and the pure liquid components by a transpiration method. The saturated vapor of Sb consists of approximately 90% tetratomic and 10% diatomic molecules. 13 ref. (P12c; Pb-b, Sb-b)

367-P. The Activities of Aluminum in Binary Aluminum-Iron Alloys. P. Gross, D. L. Levi, E. W. Dewing and G. L. Wilson. Paper from "Physical Chemistry of Process Metallurgy". Pt. 1. v. 7. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 403-416.

The activities of Al in alloys containing 6.75% Al are measured at 920 and 1300° C. by determining, at the lower temperature, the aluminum monofluoride pressure in the reaction 2 Al (in alloy) + AlF_3 (solid) = 3 AlF (vapor) and at the higher temperature the Al vapor pressure over the alloy. 5 ref. (P12b; Al-b, Fe-b, 14-60)

368-P. Activation Energy of Flow in Liquid Metals. Mitsuo Shimoji. Paper from "Physical Chemistry of Process Metallurgy". Pt. 1. v. 7. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 471-477.

The activation energy of viscosity or diffusion in liquid metals is influenced by the existence of conduction electrons. The abnormal ratio of activation energy to vaporization energy can be explained qualitatively in terms of the energy of the free electrons which is associated with the moving ion. (P13a, N14)

369-P. Determination of Solubilities in Liquid Metals. T. R. A. Davey. Paper from "Physical Chemistry of Process Metallurgy". Pt. 1. v. 7. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 581-600.

Measurement of solubilities in low-temperature liquid metals such as Pb, Sn, Bi and Zn using a simple apparatus operating on a method involving granulating samples run from the center of a slowly cooling bath. 19 ref. (P12e; Bi, Pb, Sn, Zn, 14-60)

370-P. Further Work on the Solubility of Nitrogen in Iron-Chromium Alloys. E. T. Turkdogan and S. Ignatowicz. Paper from "Physical Chemistry of Process Metallurgy". Pt. 1. v. 7. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 617-632.

Pure Fe-Cr alloys containing up to 30% Cr are nitrided at certain nitrogen partial pressures at 1200° C. Results obtained extend the previous data on nitrogen solubility to much higher Cr contents. 22 ref. (P12e; Fe-b, Cr, N)

371-P. (Japanese.) The Change of Magnetic Properties of Alnico 5 Magnet by Heating From 300-500° C. Yasuo Kimura. Japan Institute of Metals, Journal, v. 25, Mar. 1961, p. 191-194.

Saturation and residual induction, coercive force and demagnetization values as a result of gamma and alpha phase transformation in specimens heated at 300-500° C. after aging and annealing treatment from 575-1200° C. and cooling in a magnetic field. 6 ref. (P16, N-general, 2-62, 2-64, 2-65; Fe-b, SGA-n)

372-P. (Japanese.) The Influence of Aging Treatment on Magnetostriction in Alnico

5. Tatsuo Fujiwara and Tetsuo Kato. Japan Institute of Metals, Journal, v. 25, Mar. 1961, p. 216-220.

Measurement of saturation magnetostriction in specimens after solution heating and aging from 550-800° C. with X-ray powder pattern examination of domain structures, effect of aging and related precipitation phenomena on magnetic properties. 29 ref. (P16b, P16c, M22g, 2-65; Fe-b, SGA-n)

373-P. (Japanese.) Ferromagnetic Domain Patterns on Face-Centered Cubic Nickel-Cobalt Alloy Crystals. Pt. 1. Ferromagnetic Domain Patterns on Ni-Co Alloy and Pure Cobalt Crystals. Mikio Yamamoto and Satoshi Taniguchi. Japan Institute of Metals, Journal, v. 25, Mar. 1961, p. 225-229.

Powder pattern methods are used to examine domain structures of annealed and electrolytically polished single crystals containing 4-68% Co. Magnetocrystalline anisotropy constants, internal stress distribution and orientation relationships are related with ferromagnetic domain patterns to composition, strain and f-c-c. structure. 20 ref. (P16c, M26c, M22g, 2-60, 2-64, 3-68; Co-b, Ni-b, 14-61)

374-P. (Japanese.) Ferromagnetic Domain Patterns on Two-Phase Nickel-Cobalt Alloy and Pure Cobalt Crystals. Pt. 2. Ferromagnetic Domain Patterns on Ni-Co Alloy and Pure Cobalt Crystals. Mikio Yamamoto and Satoshi Taniguchi. Japan Institute of Metals, Journal, v. 25, Mar. 1961, p. 229-233.

Powder pattern techniques are used to examine domain structures in 69-70% Co-Ni single crystals and in Co ingots after slow solidification and varied heat treatments. Crystallographic relations are determined for epsilon and gamma phase transformations with direction of easy magnetization, banding of structures and related heat treatment phenomena. (P16c, M22g, M26, N-general, 2-60, 2-64; Ni-b, Co-b)

375-P. (Russian.) Heat Content and Melting Temperature of Carbon Steel and Low-Alloy Steels. R. P. Krenzis, P. V. Held and N. N. Serebrennikov. Chernaya Metallurgiya, Nov. 1960, p. 5-11.

Determination of heat content in rail steel and St. 3sp, 09G2 and St. 3kp steel specimens from 0-1600° C. in the open air as well as in vacuum and determination of the melting temperature by extrapolarization. Dependence of heat content on temperature and carbon content. 16 ref. (P12, D11, 2-60, 2-62; ST)

376-P. (French.) Liquid Metals as Coolants. R. Darras. Energie Nucleaire, v. 3, Mar-Apr. 1961, p. 128-138.

Density, viscosity, thermal conductivity, specific heat and electrical resistivity of Li, Na, K, Hg, Pb, Bi and some of their alloys at 450° C. Solubility of Be, Mg, Si, Ce, Cr, Fe, Ni, Zn, Zr, Mo, Ag, Sb, V, Mn, Co, Cu, Cb, W, Os and Pt in Na, K and U. Effect of O, C and N dissolved in the liquid metal on the corrosion of reactor components. Compatibility of alloy steel, Ni, Co and their alloys, refractory metals, Cu alloys, Ta, Ti, W, V, Zr, Ag, Au and Pt with liquid Na. 27 ref. (P-general, R-general; NM-h. 14-60)

377-P. (Russian.) Effect of Radiation on the Electrochemical Behavior of 1Kh18N9T Steel. V. V. Gerasimov and V. N. Aleksandrova. Atomnaya Energiya, v. 10, Feb. 1961, p. 164-166.

Samples of 1Kh18N9T alloy steel containing 0.07% C, 1.23% Mn, 19.01% Cr, 10.05% Ni and 0.53% Ti are immersed in a 0.01% N solution of Na_2SO_4 or a 0.01% N solution of NaCl used alternately as an electrolyte in a testing cell. The effect of radiation by measuring the polarization from 80-90° C. with and without simultaneous neutron irradiation at a density of 10^{12} neutrons per sq. cm. per sec. (P17g, 2-67; AY)

378-P. (Japanese.) Secondary Emission. Atsumi Kondo. Electrotechnical Laboratory Researches, no. 593, Nov. 1960, 142 p.

Theoretical calculation and experimental derivation of formulae for the yield of secondary emission of primary and secondary electrons. Observations of selective oxidation of Mg in a Ag-Mg alloy during secondary emission as influenced by the relative energies of activation and dissociation of Ag and Mg. 42 ref. (P15k; Mg-b, Ag)

379-P. (German.) Permalloys With Rectangular Hysteresis Slope. Friedrich Pfeifer. Zeitschrift fur Angewandte Physik, v. 13, Apr. 1961, p. 177-180.

Heating of 1150° C. annealed ring cores made from binary Permalloy and

ternary Supermalloy (79% Ni, 0-7% Mo, bal. Fe) strip to 750° C., cooling to soaking temperature, soaking from 350-600° C. with and without application of a magnetic field and subsequent measurement of static hysteresis slope at room temperature. Data are given for remanence, coercive force and initial permeability as influenced by heat treatment. (P16a, 2-64; Ni-b)

380-P. The Kinetics and Mechanism of the Conversion of Titanium Oxides to Titanium Nitride. D. L. Douglass, G. R. St. Pierre and R. Speiser. Paper from "Physical Chemistry of Process Metallurgy". Pt. 2. v. 8. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 705-720.

The rates and mechanisms of nitride formation on TiO_2, Ti_2O_3 and TiO by nitridization with ammonia are studied from 900-1000° C. and 0.03-1 atm. pressure. Rate constants and activation energies are determined by gravimetric methods with topochemical and X-ray diffraction studies of end products of reduction. 23 ref. (P13b, B15p; Ti, 14-68)

381-P. Equilibria Between Lead, Lead Sulfide and Cuprous Sulfide and the Decopperizing of Lead With Sulfur. R. F. Blanks and G. M. Willis. Paper from "Physical Chemistry of Process Metallurgy". Pt. 2. v. 8. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 991-1028.

Experimental determination of relative stability of Cu_2S and PbS, solubility of PbS in Pb, the rate of reaction of S with Pb and equilibrium between Pb, Cu_2S and PbS. Mechanism of decopperizing of Pb with S in which S is assumed to produce high sulphur potentials which cause formation of Cu deficient cuprous sulphide with substantially reduced Cu activity. Effects of Ag, As, Sb and Sn on decopperizing Sn and Bi. 45 ref. (P12d, P13; Pb-b, S)

382-P. (Russian.) Change of the Electrical Resistance of Some Metals Under Pressures Up to 200,000 Kg. Per Sq. Cm. L. F. Vereshchagin, A. A. Semerchan, N. N. Kuzin and S. V. Popova. Doklady Akademii Nauk SSSR, v. 136, Feb. 1961, p. 320-321.

Metallic Sb, As and Ca are exposed to pressure while their electrical resistance is measured. Special attention is given to the pressure range 100,000-200,000 kg. per sq. cm. (P15g, 3-74; As, Ca, Sb)

383-P. Investigation of Feasibility of Utilizing Available Heat Resistant Materials for Hypersonic Leading Edge Applications. v. 4. Thermal Properties of Molybdenum Alloys and Graphite. I. B. Fieldhouse. Armour Research Foundation (Wright Air Development Division). U. S. Office of Technical Services, PB 171390, Oct. 1960, 86 p. $2.25.

Results of measurements of thermal conductivity, specific heat, linear thermal expansion and emittance of a 0.5% Ti alloy of Mo and of siliconized ATJ graphite as a function of temperature. Emittance measurements are made on coated and uncoated materials. (P11g, P11h, P12r, P17a; Ti-b, Mo)

384-P. (Translation.) Thermal Effects in Electrical Conductivity of Germanium in Liquid Helium. E. I. Zavaritskaya. Soviet Physics--Solid State, v. 2, June 1961, p. 2673-2675. (Translation from Fizika Tverdogo Tela, v. 2, Dec. 1960, p. 2989-3196.)

Measurement of the dependence of current on voltage applied to Ge specimens in liquid He. Volt-ampere characteristic and dependence of temperature on applied voltage. (P15g, 2-66; Ge)

385-P. (Hungarian.) The Anodic Properties of Aluminum. Kerti Jozsef. Magyar Kemiai Folyoirat, v. 67, Mar. 1961, p. 97-99.

Problems of galvanic cells based on Al anodes. Electrochemical behavior of Zn and Al is compared. The limited validity of Nernst's rule, the relationship between pH and potentials and the chemical reactions involved are studied. The possibility of contact electroplating with Al is mentioned. (P15, L19, L17; Al, Zn)

386-P. Study of the Alloys of Transition Elements. Paul A. Beck. University of Illinois (Aeronautical Research Laboratory). U. S. Office of Technical Services, PB 171113, Dec. 1960, 17 p. $.50.

Measurements of electronic specific heat in b-c-c. alloys in the systems Ti-V, V-Cr, Cr-Fe, Fe-Co, Cr-Mn and V-Fe leading to information regarding the shape of the third band. (P12r; Co-b, Cr-b, Fe-b, Mn-b, Ti-b, V-b)

387-P. Thermodynamic Activities in the Fe-Mn-C System. J. F. Butler, C. L.

McCabe and H. W. Paxton. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 479-484.

The vapor pressures of Mn in equilibrium with several alloys in the Fe-Mn system between 1200-1275° K. are measured using the Knudsen effusion technique in conjunction with a vacuum microbalance. The binary Fe-Mn system shows small negative departures from ideality and the system of mixed carbides $(Me, Mn)_7C_3$ in equilibrium with graphite behaves ideally. 14 ref. (P12, M24c, 2-60, 2-61; Fe-b, C, Mn)

388-P. Some Thermodynamic Properties of the Cadmium-Copper System. Richard Borg. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 527-531.

The partial molal free energy of Cd in each of the four intermediate phases, Cd_3Cu, Cd_3Cu_5, Cd_3Cu_4 and $CdCu_2$, is determined using the Knudsen vapor pressure technique with 580° K. selected as the common temperature. X-ray diffraction examination is used to determine lattice parameter for the sigma, epsilon and beta phases. 17 ref. (P12, M26q, M24b, 2-60, 2-61; Cd-b, Cu-b)

389-P. The Solubility of Nitrogen in Solid Iron-Nickel Alloys Near 1000° C. H. A. Wriedt and O. D. Gonzalez. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 532-535.

Alloys ranging from pure Fe to pure Ni are saturated with nitrogen gas from 918-1217° C. with the solubility of nitrogen at 1-atm. pressure being obtained as a function of Ni content and temperature for all the compositions. The heat of solution and the entropy of solution of nitrogen in the system are given as functions of composition up to 41% Ni. 10 ref. (P12e, 2-60; Fe-b, Ni-b, N)

390-P. The Thermal Decomposition of Cobalt Sulfate. J. Stuart Warner. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 591-596.

The reaction yielding $CoO(c) + SO_3(g)$ is investigated at 950-1170° K. by decomposing the sulphate in a vacuum and calculating the dissociation pressure from the measured pressure and by decomposition under controlled oxygen pressure. The difference in the results obtained is attributed to the effects of thermal diffusion. Values are calculated for standard free energy change with transformations being observed by X-ray diffraction and differential thermal analysis. 15 ref. (P12, P13, M-general, 2-61; Co-b, 14-68, S)

391-P. Growth of Voids in Copper During the Creep Process by Measurement of the Accompanying Change in Density. Raymond C. Boettner and W. D. Robertson. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 613-622.

Investigation of the change in density during the first and second stages of creep in polycrystalline and single crystal Cu as a function of stress, temperature, plastic strain, impurity and atmosphere effects and structure. Voids are hetergeneously nucleated at grain boundaries by an insoluble phase, or phases, which can be removed by directional solidification. The principal controlling mechanism of void growth appears to be condensation of vacancies at given grain boundaries. 17 ref. (P10a, P10d, N3, Q3; Cu-a)

392-P. The Solubility of Hydrogen in Alpha Iron. M. L. Hill and E. W. Johnson. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 622-629.

Equilibrium concentrations of H in Fe are measured at H_2 pressures up to 136 atm. and temperatures down to 145° C. Residual hydrogen is prominent near 600° C. in air-melted but not in vacuum-melted Fe. The diffusible hydrogen solubility is abnormally high below 390° C., confirming the hypothesis of hydrogen trapping. 17 ref. (P12e, 2-61; Fe-b, H)

393-P. Density Anomalies in the Bi_2Te-Sb_2Te System. L. R. Testardi and J. R. Wiese. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 647-649.

Investigation of ordering in the system as a function of composition by measurement of density using a hydrostatic weighing technique on annealed or quenched samples at room temperature. An anomaly in the density of the samples as a function of composition is related to solubility and energy gap changes. 5 ref. (P10a, N10, 2-60, 2-64; Te-b, Bi, Sb)

394-P. (German.) Second Boiling Point in the Gold-Sulphur and Gold-Selenium Systems. Rudolf Vogel and Rolfdieter Gerhardt. Zeitschrift fur Metallkunde, v. 52, May 1961, p. 318-320.

Measurement of the solubility of Se and S in liquid Au (equilibrium liquid gas) and of the second boiling point (equilibrium solid Au melt gas) in the binary Au-S and Au-Se system. Au-rich portion of the binary phase diagrams. (P12e, P12p, M24b; Au-b, S, Se)

395-P. (German.) Metal Optical Investigation of Silver-Palladium and Nickel-Chromium Alloys. Hans Eberhard Schmidt and Rolf E. Hummel. Zeitschrift fur Metallkunde, v. 52, May 1961, p. 337-343.

Measurement of optical constants (diffraction and absorption coefficients) of solid mechanically polished specimens of Ag-Pd (0-100% Pd) and Ni-Cr (0-12 at.% Cr) alloys, using light in the visible spectrum range. Examination of the applicability of the free conduction electron model. (P17a; Ag-b, Cr, Ni-b, Pd-b)

396-P. Metals Versus Plastics: Performance--The Key to Selection. Malcolm W. Rilet and and Donald Peckner. SAE Paper 381B, 1961, 8 p.

Comparison of electrical resistance, thermal conductivity and expansion, chemical resistance, tensile strength and other physical and mechanical properties of several plastics with metals, especially Zn. Fabrication and design characteristics. (P-general, Q-general; Zn, NM-d30, NM-d31)

397-P. (German.) Investigations Concerning Some Semimetals. W. Klemm, H. Spitzer and H. Niermann. Angewandte Chemie, v. 72, Dec. 1960, p. 985-994.

Crystal structure, lattice spacing and atomic bonds of P, As, Sb, Bi, Se and Te are studied from 0-1000° C., to investigate temperature dependence of specific gravity, entropy, enthalpy, magnetic susceptibility and changes in volume at melting temperatures. (P-general, 2-61; P, As, Sb, Bi, Se, Te)

398-P. Transverse Galvanomagnetic Effect of Bismuth Single Crystal in a Strong Magnetic Field. Kunihide Tanaka, Seiichi Tanuma and Tadao Fukuroi. Tohoku University, Research Institutes, Science Reports, Series A, v. 13, Apr. 1961, p. 67-81.

The twelve components of the galvanomagnetic tensor, with respect to magnetic field dependence, and their behavior near the quantum limit of the magnetic quantization, are determined for specimens in strong magnetic fields up to about 100 kilo oersted from 1.8-4.2° K. 20 ref. (P16e, 2-63; Bi, 14-61)

399-P. Activity of Chromium in Liquid Iron-Chromium Systems. Harue Wada, Yasuji Kawai and Tunezo Saito. Tohoku University, Research Institutes, Science Reports, Series A, v. 13, Apr. 1961, p. 96-104.

A vaporization method using radioactive Cr is used to determine the activities of Cr in liquid Fe-Cr and carbon-saturated Fe-Cr systems at 1630° C. up to 40% Cr negative. Deviations from Raoult's law are observed with the interchange energy being calculated from the phase diagram. 18 ref. (P12b, M24b, 1-59; Fe-b, Cr, 14-60)

400-P. Activities of the Component Metals in Fused Binary Alloys (Zn-Cd System and Zn-Sn System). Zensaku Kozuka, Jyoichiro Moriyama and Isao Kushima. Electrochemical Society of Japan, Journal (Overseas Edition), v. 28, July-Aug. 1960, p. E167-E169.

Activities of Zn and Cd at 550° C. in liquid Zn-Cd solution and of Zn in Zn-Sn alloy solution at 670, 720 and 770° C. are determined by measuring the vapor pressure of the individual components of the liquid systems by the transportation or carrier gas technique. 6 ref. (P12b, P12c, 2-61, M24b; Zn-b, Cd-b, Sn-b, 14-60)

401-P. (German.) Properties of Evaporated InSb and InAs Films. K. G. Gunther and H. Freller. Zeitschrift fur Naturforschung, v. 16a, Mar. 1961, p. 279-283.

Evaporation of thin InSb and InAs films on hard-glass plates and Al_2O_3 by the "three-temperature method" (evaporation of the two components in separate crucibles at different temperatures) and subsequent measurement of Hall coefficient (using evaporated Ag contacts), electrical conductivity and electron mobility. (P15p, P15g; In-b, As, Sb, 14-62)

402-P. Testing Anodized Aluminum. F. C. Porter. Metal Finishing Journal, v. 7, May 1961, p. 181-186.

Determination of film continuity, abrasion resistance, weight, density, thickness, corrosion resistance, sealing, reflectivity and fastness to light and thermal and electrical properties. 10 ref. (P-general, Q9, R-general; Al, 8-73)

403-P. (Russian.) Heat Holding Capacity of Different Materials and Concentrates. S. G. Bratchikov. Izvestiya VUZ--Chernaya Metallurgiya, Feb. 1961, p. 5-8.

Formulas for calculating average heat holding capacity of various metals, nonmetals and oxides as dependent on temperature of materials. 8 ref. (P12r)

404-P. Experimental Aspects and Application of the Mossbauer Effect. Paul P. Craig. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 22-35.

Review of recoil-free gamma-ray transition (the Mossbauer effect) and low temperature magnetization criteria for its existence. Application to measurement of nuclear magnetic resonance absorption and emission spectrum with attention to Doppler and red shifts of the energy level in rare earths and precious, reactive, refractory and heavy metals. 20 ref. (P16f, 1-54, 2-63; EG-c31, EG-d37, EG-g45, EG-h30)

405-P. Relaxation and Temperature in Magnetic Spin Systems. N. Bloembergen. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 36-51.

Survey of theory, thermodynamic consideration and experimental determination of spin lattice relaxation times and magnetic temperatures in crystals in terms of Zeeman, exchange and dipolar energy in various electron spin systems from 1.388-20.4° K. 29 ref. (P16f, P18m, 2-63)

406-P. Magnetism at Temperature Below 1° K. C. J. Conger. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 84-93.

Review of principle of magnetic cooling and magnetic properties and transition occurring in material as a result of cooling to temperature in and below the Curie-Weiss region. Survey of nuclear demagnetization experiments and resultant susceptibility, spin-orientation and thermodynamic relations. 17 ref. (P16, 2-63, 10-54)

407-P. Magnetic Cooling With Thorium-Dysprosium Alloys. R. D. Parks and W. A. Little. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 114-116.

Magnetic susceptibility and electrical resistivity of arc-melted alloy containing 0.28-13% Dy are measured from 1.2-4.2° K. after adiabatic demagnetization with calculation of thermal conductivity to determine the applicability of the alloys as magnetic coolants. (P15g, P16n, P16p, 2-63; Th-b, Dy)

408-P. Nuclear Spin Thermometry and Relaxation Below 1° K. C. Froidevaux, E. L. Hahn and R. Walstedt. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 118-121.

A pulsed nuclear free precession technique which measures directly the nuclear magnetism due to known nuclear spins at thermal equilibrium is used to determine thermodynamic temperature in metals below 1° K. Application to Na powder and Cu wire specimens after cooling by adiabatic demagnetization to 0.02° K. 6 ref. (P16f, P18m, 1-54, 2-63; Na, Cu)

409-P. Effect of Thermomolecular Flow on Low-Temperature Magnetic Susceptibility Measurements. A. N. Gerritsen and D. H. Damon. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 131-133.

Magnetic force measurements on specimens of Cu, Teflon, Cu-Teflon, Si and quartz, suspended in cryogenic fluids from 4.2-77° K., with calculation of susceptibility, to determine the interference of the thermomolecular flow of the heat exchange gas on precise relative measurements of susceptibility by the Faraday method. (P16n, P16p, 2-63; Cu-b, Si, NM)

410-P. Anisotropy in the Hall Effect and Magnetoresistance of Single Crystals of High Purity Copper. J. E. Kunzler, J. R. Klauder and G. F. Brennent. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 210-213.

Effect of orientation on the Hall constant and the magnetoresistance of specimens in a transverse and longitudinal rotating magnetic field from 4.2-273° K. Relation of Hall voltage and magnetoresistance measurements to topology of the Fermi surface. 6 ref. (P15g, P15p, 2-63, 3-72; Cu-a, 14-61)

411-P. The Transverse Magnetoresistance of Zinc and Cadmium at 4.2° K. in Fields From 0 to 7000 Oersteds. C. A. Renton. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 216-220.

Dependence of resistivity on direction and strength of applied magnetic field determined in pure single crystal specimens for $(10\bar{1}0)$ and $(11\bar{2}0)$ orientation. Relation of magnetoresistance to open and closed orbits and the Hall and de Haas-Van Alphen effects. (P15g, P16p, M25n, 2-63, 3-72; Zn, Cd, 14-61)

412-P. A Study of Cyclotron Resonance in Tin. M. S. Khaikin. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 220-223.

A frequency modulation method in which the specimen is part of a high frequency resonator placed in a magnetic field is used to measure resonance in high-purity single crystal specimens from 1.8-4.2° K. as a function of field orientation and intensity. 7 ref. (P18m, 2-63; Sn, 14-61)

413-P. The Oscillatory Dependence of the Surface Impedance of Metals Upon a Weak Magnetic Field. M. S. Khaikin. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 224-226.

Frequency modulation measurements on high-purity Sn, Cd and In single crystal specimens at 3.8° K., at -6 to +6 oersted with surface impedance determined as dependent upon oscillation as a function of magnetic field orientation and intensity. 6 ref. (P15g, P16, 2-63, 3-72; Sn, Cd, In, 14-61)

414-P. Cyclotron Resonance in Bismuth and Lead. J. E. Aubrey. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 226-228.

Values for the components of the reciprocal mass tensor in the electron band are determined for Bi. The quadriatic nature of the electron energy band is tested by investigating the dependence of the effective mass upon the orientation for directions of the magnetic field in Bi and Pb single crystals. The anisotropy of the specimen conductivities is correlated with predictions for the shape of the Fermi surface. 11 ref. (P18m, P16n, M25, 2-63, 3-72; Bi, Pb, 14-61)

415-P. The De Haas-Van Alphen Effect in Aluminum and Magnesium. M. G. Priestley. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 230-231.

Oscillation periods in Al and Mg single crystal specimens are investigated in fields to 160 kilogauss by the pulsed field method. Measured data for fast de Haas-van Alphen periods in (111) and (110) field directions are compared with data calculated from nearly free electron models. 5 ref. (P16n; Al, Mg, 14-61)

416-P. The De Haas-Van Alphen Effect on Calcium. Ted G. Berlincourt. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 231-232.

High-purity Ca single crystals are measured in magnetic fields to 200 kilogauss from 1.3-4.0° K. by an impulsive field technique to determine whether de Haas-van Alphen oscillation and Fermi surface effects in a divalent f-c-c. metal were similar to those in monovalent metals such as Al, Ag, Au, Pb and Cu. Orientation, temperature and field dependence of effects are correlated with predictions using a nearly free electron model. 8 ref. (P16n, M25; Ca, 14-61)

417-P. The Minimum in the Electrical Resistance Versus Temperature Curve:

The Progress Concerning the Cause. G. J. van den Berg. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 246-257.

Review of theory for causes of the anomaly in the resistance curve at low temperatures, with data for measurements of electrical resistivity, magnetoresistance and thermoelectric power in single crystal and polycrystalline wire specimens of transition and noble metals and their dilute alloys from 1.2-15° K. Relation of resistance minima to Fermi surface, nuclear orientation, magnetic properties and spin relaxation effects. 65 ref. (P15g, 2-63, 3-72)

418-P. The Electrical Resistance and Magnetoresistance of Noble Metals Diluted With Transition Elements of the Second Series. B. Knook and G. J. van den Berg. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 257-258.

Measurements on specimen strips of pure Au, Ag and Cu and on dilute alloys of Cu-Pd, Cu-Rh, Cu-Ru, Ag-Pd, Au-Pd, Au-Rh and Au-Mo at 1.2-2.73° K. Minimums in the electrical resistance and maximums in the magnetoresistance are determined as a function of temperature and concentrations. 7 ref. (P15g, P16, 2-60, 2-63; Au-b, Ag-b, Cu-b, Rh, Ru, Pd)

419-P. Magnetic Susceptibility and Electron Spin Resonance Studies in Dilute Mg-Mn and Al-Mn Alloys at Low Temperatures. E. W. Collings and F. T. Hedgcock. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 259-260.

Investigation of the magnetic properties of alloys containing 0.008-0.6% Mn from 1.9-293° K. Data are given for susceptibility, Curie-Weiss constants and relaxation time as affected by Mn ion interaction and magnetic transitions as a function of temperature and Mn concentration. 4 ref. (P16f, P16n, P16p, 2-60, 2-63; Al-b, Mg-b, Mn)

420-P. The Hall Effect of Diluted Alloys of Manganese in Silver. B. Franken and G. J. van den Berg. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 261-262.

Temperature and magnetic field dependence of the Hall effect in strip specimens of 0.01-4.2% Mn-Ag alloys, some Ag-Au alloys and pure Ag measured from 4.2-293° K. Hysteresis is found in the Hall coefficient of the alloys containing Mn at 4.2° K. (P15p, P16a, 2-60, 2-63; Au-b, Mn)

421-P. A Specific Heat Anomaloy at Low Temperatures in a Dilute Copper-Iron Alloy Showing a Resistance Minimum. Douglas L. Martin and J. P. Franck. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 262-264.

Measurement on an alloy of 0.05% Fe in Cu and on pure Cu specimens from 0.4-30° K., with a specific heat anomaly being observed at 5-10° K., which is consistent with a temperature dependent anomaly in the electrical resistance curve, both being related with a model involving two energy states of the Fe impurity ions. 4 ref. (P12r, P15g, 2-60, 2-63; Cu-b, Fe)

422-P. The Magnetoresistance Size Effect in Indium in High Magnetic Fields. C. Froidevaux, J. R. Keyston, J. L. Olsen and P. Cotti. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 265-266.

Thick polycrystalline wire specimens are measured in stationary magnetic fields to 40,000 oersted and in pulsed fields to 70,000 oersted at 2° K. to determine the influence of a magnetic field on the size effect in electrical resistivity, in particular, the extent of reduction of resistivity toward the bulk value for magnetoresistance. 5 ref. (P15g, P16, 2-63, 3-73; In-a)

423-P. Electrical Resistivities of Zirconium With Dilute Additions of Ag, Cd, In, Sn and Sb. J. O. Betterton, Jr., and D. S. Easton. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 270-273.

Effect of solute concentration and valency on electrical resistivity of hexagonal Zr alloys measured at 4.2° K. In-

fluence of thermal and impurity scattering and upward shift of the Fermi surface on resistivity values. 8 ref. (P15g, 2-60, 2-63; Zr-b, Ag, Cd, In, Sb, Sn)

424-P. Dislocation Resistance and the Variation of Lattice Conductivity With Impurity. P. Lindenfeld and W. B. Pennebaker. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 276-280.

Thermal conductivity of Cu-4% Zn alloy specimen measured at low temperature after annealing at 1000° C. for up to 24 hr. to determine the effect of random dislocation on lattice resistance as a function of impurity content. Lattice conductivity is not materially affected by removal of the dislocations by annealing, the resistivity changes being considered an intrinsic property of the alloy system. 8 ref. (P11h, M26b, 2-63, 2-64, 3-69; Cu-b, Zn)

425-P. Effect of Oxygen on the Thermal Conductivity of Silicon. M. G. Holland. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 280-284.

Lattice thermal conductivity of doped Si crystals of n-type and p-type conductivity containing dissolved oxygen as a result of oxygen atoms acting as point defects. Measurements are made on samples with and without dislocation from 4-300° K. 9 ref. (P11h, M26b, 2-63, 3-69; Si, O)

426-P. The Low Temperature Aspect of the Thermal Conductivity and the Thermoelectric Power of N-Type Germanium. J. F. Goff and N. Pearlman. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 284-288.

Effects of temperature, impurity concentration and electron-impurity conduction on the thermal conductivity of single crystal specimens doped with Sb, As and SbGa impurities are measured from 2-77° K. 10 ref. (P11h, P15j, 2-63, 3-69; Si, Sb, As, Ga, 14-61)

427-P. Infrared Absorptivity of Dilute Copper-Germanium Alloys at 4.2° K. J. H. Rayne. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 288-290.

The anisotropy of impurity scattering of electrons in Cu is investigated by infrared absorption measurements on pure Cu and 0.2-1% Ge-Cu alloys in the 1.0-4.0 micron wavelength range. Calculations are made relating absorptivity to resistivity as an indicator of scattering phenomenon. 6 ref. (P17c, P15g, 2-63; Cu-b, Ge)

428-P. Recent Experiments on the Electrical Properties of Superconductors. A. B. Pippard. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 320-327.

Review of measurements near 1° K. on Al, Sn and In for determining temperature and magnetic field dependence of penetration depth, its magnitude and anisotropy. Relation of phenomenons to BCS theory. 9 ref. (P15g, P16, 2-63, 3-72; Al, Sn, In)

429-P. Penetration Depth Measurements in Pure and Impure Aluminum at 170 Mc/s. W. L. McLean. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 330-331.

Changes in the penetration depth as a function of temperature and purity determined by resonant frequency measurements from 0.84-3.7° K. on pure Al and Al alloys containing 0.25% Mg. Correlation with predictions from BCS theory and Kramers-Kronig relations. 7 ref. (P15g, 2-63, 3-69; Al-b, Mg)

430-P. The High Frequency Surface Impedance of Aluminum. D. Llewelyn Williams. Paper from "Seventh International Conference on the Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 331-333.

The surface impedance of electropolished Al single crystals is investigated at a frequency of 3K Mc/s by the coaxial resonator technique. Data are given for penetration depth, anisotropy in the normal state conductivity and in the resistance curve near the transition temperature and superconducting resistance and inductance as a function of frequency, time and temperature. 7 ref. (P15g, 2-63, 3-67, 3-72; Al, 14-61)

431-P. Magnetic Field Dependence of the Surface Impedance of Superconducting Tin at 3K Mc/s. P. L. Richards. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 333-335.

Measurement of surface resistance and reactance of single crystals of pure Sn and Sn alloys containing up to 1% In by resonance techniques in longitudinal and transverse fields for various orientations. Variations and anisotropy in the impedance curve are related to field direction and state, demagnetization phenomena, electron orbit and temperature. 6 ref. (P15g, P16, M25, 2-63, 3-72; Sn-b, In)

432-P. On the Switching Time of Bulk Superconducting Tin. A. H. Nethercot, Jr. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 336-337.

Measurement from 2.5-3.7° K. using a pulsed microwave energy source coupled into a cavity resonant for determination of whether bulk Sn can be switched into and out of a superconducting state by application of a microwave magnetic field at 10,000 Mc/s. (P15g, P16e, 2-63; Sn)

433-P. Superconducting Properties of the Two Modifications of Mercury. C. A. Swenson and J. E. Schinber. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 338-345.

Critical field measurements from 0-3000 atm. pressure for alpha and beta Hg from 1-93° K. to determine low temperature-pressure effects on the superconducting state and the electron contributions to the low temperature thermodynamic properties. Critical field curve and data for penetration depth, lattice thermal expansion and specific heat are compared with superconductivity results for Ta. 9 ref. (P15g, P12, P11g, 2-63, 3-74; Hg)

434-P. The Pressure Effect in Superconducting Tantalum. C. A. Swenson and C. H. Hinrichs. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 345-347.

Electron beam-melted Ta wire specimens are vacuum degassed by electron bombardments heating at 2900° C. and an a-c. mutual inductance technique is used to measure superconducting transition at 10,000 atm. pressure and 0.2-1.0° K. Critical field data are determined as a function of pressure and temperature, and are used to calculate electronic specific heat and estimate low temperature lattice thermal expansion. 9 ref. (P15g, P12r, P11g, M26, 2-63, 3-74; Ta)

435-P. The Critical Field Curve of Impure Mercury. H. H. Wills, R. G. Chambers and J. G. Park. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 347-349.

Superconductivity transition curves for pure and impure (1.25% Cd) Hg are determined by critical field measurements from 1.2-4.2° K. to test Anderson's theory for "dirty" superconductors based on the pairing of time-reversed "dirty" wave functions accounting for deviations from BCS theory. 5 ref. (P15g, 2-63, 3-69; Hg, Cd)

436-P. The Specific Heats of Some Zirconium Alloys. G. D. Kneip, Jr., and J. O. Betterton, Jr. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 357-358.

The specific heats of dilute hexagonal alloys of Ag, In and Sn in Zr are measured from 1.2-4.5° K. and are found to consist of an electronic and vibrational term (except for two higher compositions Zr-Sn alloys which undergo a superconducting transformation at 1.25° K.) Debye temperature obtained and equations are derived for properties using a band model. (P12r, P15g, 2-60, 2-63; Zr-b, Ag, In, Sn)

437-P. Low Temperature Heat Capacities of Superconducting B-C-C Ti-Mo Alloys. R. R. Hake. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 359-361.

Calorimetric measurements from 1.1-4.3° K. on a series of metastable Ti-Mo alloys at Mo concentrations

(6.25-8.60%) near the minimum required to stablize the b-c-c. phase. The superconducting electronic heat capacity is determined as a function of temperature and Mo concentration. Data for superconductivity transitions are correlated with predictions from the BCS theory and from a band model. 8 ref. (P12r, P15g, 2-60, 2-63; Ti-b, Mo)

438-P. Critical Current for Superconducting Niobium Wire and Ribbons in External Magnetic Fields. M. A. R. Leblanc and W. A. Little. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 362-365.

The effect of strain, shape and temperature on the critical current is measured for annealed and rolled specimens from 1.7-4.2° K. in longitudinal and transverse fields to determine the applicability of superconducting properties in electromagnets. 7 ref. (P15g, 2-63; Cb, 4-53, 4-61)

439-P. The Importance of the Differential Paramagnetic Effect in Superconductors. R. L. Falge, Jr., and R. A. Hein. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 365-367.

Application of the excessive paramagnetism occurring just below the transition temperature of superconductors as an indicator of the reversibility of the magnetization curve. Determination of PME in spherical Sn and Ta specimens from 2.13-2.93° K. by measuring the magnetic moment using a sample displacement method and by measuring the susceptibility with a-c. and d-c. ballistic mutual inductance techniques, a large hysteresis or irreversibility being found for Ta. 4 ref. (P15g, P16p, P16n, 2-63; Ta, Sn)

440-P. The Intermediate State of Tin. W. DeSorbo. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 367-370.

Observation of superconducting and normal regions in the intermediate state in polycrystalline specimens at 1.40° K. in a pulsed field by magneto-optical measurement of flux trapping using polarization methods. 10 ref. (P15g, P16, 2-63; Sn)

441-P. Anisotropy of the Interphase Surface Tension in the Intermediate State of Tin. Yu. V. Sharvin and V. F. Gantmacher. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 370-373.

The dependence of the surface tension on the orientation of the interphase boundary and the tensorial character of the anisotropy are determined by domain orientation examination for cylindrical single crystals and by torsion balance measurement of magnetic properties for monocrystalline sphere, both from 3-3.6° K. (P13h, P16c, P15g, 2-63, 3-72; Sn)

442-P. The Intermediate State Structure and Surface Energy of Mercury. C. A. Shiffman. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 373-375.

Measurements of domain distribution in the intermediate state of cylindrical specimens of pure Hg at liquid He temperatures using a small Bi probe along the surface. Ginsburg-Landau and Bardeen theories are used to calculate surface energy. 9 ref. (P13h, P16c, P15g, 2-63; Hg)

443-P. Measurement of Surface Energy in Superconductors by Intermediate State Powder Patterns. F. Haenssler and L. Rinderer. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 375-376.

Domain periodic structures are determined from photographs of powder (Cb) patterns formed on In plate specimens at 2° K. by application of an electric current to the surface in a magnetic field. 7 ref. (P13h, P15g, P16c, 2-63; In)

444-P. A Search for New Superconductors. Henry A. Fairbank and Myron Strongin. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 377-379.

Investigation of superconductivity properties of high purity unannealed specimens of Y, Mo and W from 0.035-0.07° K. with low temperatures obtained by demagnetizing salt pills. Data are given for magnetic susceptibility with no superconducting transitions being found. 8 ref. (P15g, P16n, P16p, 2-63; Mo-a, Y-a, W-a)

445-P. Superconductivity in the System Niobium-Tin. H. G. Jansen and E. J. Saur. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 379-382.

Determination of superconducting midpoint transition temperatures vacuum sintered alloys containing 50-90% Cb and admixtures of Cb_3Sn with Ta_3Sn as a function of composition. Effect of sintered density, crystal structure and physical properties on superconductivity transition. 5 ref. (P15g, 2-60, 2-63, 3-73; Cb-b, Sn-b, Ta, 6-72)

446-P. Superconducting Properties of the $(Nb, Ta, V)_3$ Sn System. G. D. Cody, J. J. Havak, G. T. McConville and F. D. Rosi. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 382-385.

Transition temperatures and widths measured for powder metallurgy produced specimens of solid solution alloys in the system as a function of composition using mutual induction methods from 6-18° K. Effect of inhomogeneity and lattice parameters on properties. (P15g, 2-60, 2-63, 3-73; Sn-b, Cb, Ta, V)

447-P. Superconductivity and Ferromagnetism in the System $GdRu_2$-$ThRu_2$. R. M. Bozorth, B. T. Matthias and D. D. Davis. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 385-389.

Critical temperatures for superconductivity and the magnetic Curie points are determined in the system of solid solutions of $GdRu_2$ in $ThRu_2$ by measurement in a weak magnetic field, using mutual inductance methods, by noting the temperature of maximum initial susceptibility and by a molecular field calculation. The presence of either ferromagnetism or superconductivity exerts a decided effect on the other. (P15g, P16d, 2-63; Ru-b, Gd, Th, 14-67)

448-P. Superconducting Transition Temperatures of Titanium and Titanium Isotopes. R. G. Netzel and J. R. Dillinger. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 389-391.

Calorimetric measurements on isotopically enriched Ti^{46}, Ti^{48}, Ti^{50} and crystal bar Ti at temperature down to -20° K. with temperature-dependent transitions being observed as a function of purity and sample metallurgy. 7 ref. (P15g, 2-60, 2-63; Ti)

449-P. Irradiation Effect on the Transition Temperature of Superconducting Tin. L. Rinderer and E. Schmid. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 395-396.

Time and temperature dependent superconductive transition temperatures as a function of irradiation lattice defects are examined by resistivity measurements on strip specimens irradiated with alpha particles at 4.2° K. Radiation defects (Frenkel pairs) are shown to be homogeneously distributed in the sample and to anneal out at room temperature. (P15g, M26s, 2-63, 2-64, 2-67; Sn)

450-P. Impurity and Strain Effects in Superconductors. Bernard Serin. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 391-393.

Measurement of the change in superconductive transition temperature of impure Sn and Al as a function of coherence length and electron mean free path as influenced by impurity content. Determination of low temperature-dependent transitions and resistivity caused by electron scattering as a function of deformation strain and heat treatment time and temperature for Al rod specimens and filings aged at room temperature and annealed at 500° C. after plastic deformation. (P15g, 2-63, 2-64, 3-68, 3-69; Sn, Al)

451-P. The Specific Heat of Superconductors Near the Critical Temperature. John F. Cochran and Pieternella Cochran. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 397-399.

Measurement of the temperature dependence of the specific heat of high-purity Sn and Ta polycrystalline specimens from 3.694-4.401° K. Data are given for resistivity and the interval of the transition shift. 6 ref. (P12r, P15g, 2-63; In, Ta)

452-P. Specific Heat of Indium Between 0.35 and 4.5° K. C. A. Bryant and P. H. Keesom. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 400-403.

Equations are derived for the lattice and electron terms of the specific heat for samples in the superconducting state with data derived from heat capacity measurements. 6 ref. (P12r, P15g, 2-63; In)

453-P. Heat Capacity of Gallium and Mercury at Temperatures Below 1° K. N. E. Phillips, R. L. Douglass and R. G. Petersen. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 403-404.

Calculations using the quadrupole coupling constant are combined with measurements at 1.2° K. to determine the electronic heat capacity of Ga in the superconducting state. The superconducting state heat capacity of Hg is measured calorimetrically from 0.1-0.5° K. and correlated with a Debye temperature of 73° K. 4 ref. (P12r, P15g, 2-63; Ga, Hg)

454-P. Thermal Conductivity of Superconductors, Al, Zn and Cd. C. B. Satterthwaite. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 405-407.

Single crystal and polycrystalline specimens of varying purity are measured in magnetic fields at 0.32° K. to determine impurity and resultant electronic mean free path effects on thermal conductivity. Measured values are compared with theoretical predictions. (P11h, P15g, 2-63, 3-69; Al, Zn, Cd)

455-P. Thermal Conductivity of Pure Indium. R. E. Jones and A. M. Toxen. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 407-409.

The thermal conductivities of polycrystalline wire specimens in the normal and superconducting states are measured from 1.5-4.2° K. The phenomena are discussed in terms of theories for thermal resistance caused by phonon scattering of electrons and for the added effect of the ratio of phonon to impurity resistance, both as a function of temperature. 6 ref. (P11h, P15g, 2-63; In-a)

456-P. Thermal Conduction in Tin and Indium. A. M. Guenault. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 409-412.

Investigation of the thermal conductivity of single crystal specimens of varying purity and orientation from 2.4-4.2° K. in the superconducting state without a magnetic field and in the normal state in a field greater than the critical field. Thermal conduction phenomena are discussed in terms of impurity and electron scattering, both as a function of temperature. 4 ref. (P11h, P15g, 2-63, 3-69, 3-72; In, Sn, 14-61)

457-P. Size and Impurity Effects in Nuclear Spin Relaxation in Superconductors. Yoshika Masuda and A. G. Redfield. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 412-413.

Measurement of nuclear relaxation rate in pure Al, Al-0.3% Zn and colloidal Al from 0.5-3.00° K. as affected by impurity and particle size to investigate the density of states near the energy gap. Results for the experiments are affected by the impurities causing strain-induced electric field gradients which interact with the nuclear electric quadrupole moments and influence the nuclear relaxation process. 4 ref. (P15g, P18m, 2-63, 3-69; Al-b, Zn)

458-P. Thermodynamic and Vibrational Properties of Simple Solids at Low Temperatures. T. H. K. Barron. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 655-670.

Review of theoretical analyses and experimental measurements of lattice and electronic vibrations as a function of low temperature in transition and alkali metals, ionic alkalides and organic

compounds in solid and thin film forms to predict thermodynamic properties and to correlate them with each other and properties of the solid. Application of thermal and metallographic methods at below 1-300° K. and harmonic and anharmonic oscillation theories to determination of properties. 24 ref. (P11, P12, M-general, 2-63, 10-54)

459-P. The Debye Temperature of Beta-Tin From Elastic Constant Measurements at 4.2° K. B. S. Chandrasekhar and J. A. Rayne. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 672-675.

Measurements on single crystals specimens of 99.999% purity having various orientations from 4.2-300° K. with the Debye temperature being obtained numerically by directly diagonalizing the propagation matrix at 4.2° K. for 450 directions in the solid defined by polar co-ordinates referred to the C-axis. Results are compared with calorimetric data. 5 ref. (P12r, Q21, 2-63, 3-72; Sn, 14-61)

460-P. The Electronic Heat Capacity of Potassium, Rubidium and Cesium. W. H. Lien and N. E. Phillips. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 675-677.

A temperature scale obtained by extrapolation of the susceptibility of copper potassium sulphate from above 1° K. according to a Curie-Weiss law are used with experimental methods to obtain the electronic heat capacity for K, Ru and Cs from 0.25-1.0° K. The effective mass ratio is compared with band theory. 9 ref. (P12r, M25, P16, 2-63; K, Rb, Cs)

461-P. Thermal Expansion of Solids at Low Temperatures. G. K. White. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 685-688.

Capacitance measurements from 1.5-10° K. on Be specimen cylinders in OFHC Cu cells. Thermal and electronic expansion coefficients and Gruneisen anharmonicity parameters are determined with data given for Al, Fe and Pb. 8 ref. (P11g, Q21, 2-63; Al, Fe, Pb)

462-P. Thermal Expansion of Aluminum at Low Temperatures. C. P. Abbiss, Eva Huzan and G. O. Jones. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 688-689.

The coefficient of thermal expansion and the Gruneisen anharmonicity parameter are determined for Al crystals below 10° C. using a method employing the optical lever principle. 7 ref. (P11g, M23, Q21, 2-63; Al, 14-61)

463-P. The Coefficient of Linear Expansion and Gruneisen Parameter of Cu, Ag, Au, Fe, Ni and Al From 4° K. to 300° K. D. B. Frazer and A. C. Hollis. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 689-692.

Interferometric determination of thermal expansion in annealed, thick-walled cylindrical tube specimens with the Gruneisen anharmonicity constant being determined from elastic constant data. 6 ref. (P11g, M21g, Q21, 2-63; Cu, Ag, Au, Fe, Ni, Al)

464-P. Specific Heat of Dysprosium Metal. J. G. Dash, R. D. Taylor and P. P. Craig. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 705-706.

Measurements on samples cooled by demagnetization of Ce-Mg nitrate from 0.25-2° K. The specific heat has a hyperfine contribution and an anomaly in the entropy is observed which is compared to Gd and Tb at higher temperatures. (P12r, P12s, M25, 2-63; Dy)

465-P. (Russian.) Some Theoretical Problems on Cast Iron Heat Resistance. F. N. Tavadze. Liteinoe Proizvodstvo, Mar. 1961, p. 31-34.

Investigation of 60 high-frequency electric furnace melted cast iron specimens containing Cr, Mn, Si and C in varying amounts at temperatures of 600, 700 and 750° C. Determination of phase transformations, crystallization, hardness, mechanical heat resistance, creep resistance and growth under the influence of heat and oxidation. 27 ref. (P11h, N-general, Q29, Q3; CI)

466-P. The Thermodynamics of Activated Processes at High Pressures. Robert W.

Keyes. Paper from "Progress in Very High Pressure Research". John Wiley & Sons, Inc., New York 16, 1961, p. 70-81.

Analysis of the atomic defects responsible for the phenomena of diffusion and ionic conduction. Application of the strain energy model of lattice imperfections for calculating the changes in entropy and volume of activation. Tabulation of activation parameters for diffusive processes in solid AgBr, Na, Pb, white P, Ag, Li, V, Fe and Ag-Zn. Comparison of atomic activation with electronic activation. 23 ref. (P12, P13a, M26s, N1, 3-74)

467-P. Some Experiments at High Pressures and Low Temperatures. C. A. Swenson. Paper from "Progress in Very High Pressure Research". John Wiley & Sons, Inc., New York 16, 1961, p. 195-202.

High pressure techniques used to obtain the equation of state and thermodynamic functions of solids such as Na, or Ta as a function of temperatures and volume. Measurement of the pressure dependence of the critical field curve using an apparatus in which solid He applies pressures up to 2500 atm. to superconductors at liquid He temperatures. 18 ref. (P12, P13, P15g, 2-63, 3-74; Na, Ta)

468-P. Effect of Pressure on EMF of Thermocouples. F. P. Bundy. Paper from "Progress in Very High Pressure Research". John Wiley & Sons, Inc., New York 16, 1961, p. 256-265.

Absolute pressure thermal emf.'s are measured for constantan, Pt, Ni, alumel, 10% Rh, Cu, chromel and Ni 18% Mo for a temperature change of 100-1200° C. at pressures of 0-100,000 atm. (P15g, P15j, X9q, 2-61, 3-74)

469-P. Effects of Pressure on Magnetic Interactions in Metals. J. S. Kouvel and R. H. Wilson. Paper from "Progress in Very High Pressure Research". John Wiley & Sons, Inc., New York 16, 1961, p. 271-286.

Pressure dependence of magnetic interactions such as Curie temperature, saturation magnetization and magnetic moment are measured for specimens of Fe, Ni and their alloys and for a single Si-Fe crystal at 3000 atm. from 293-800° K. 34 ref. (P16, 2-61, 3-74; Fe-b, Ni-b, Si)

470-P. The Emittance of Stainless Steels. W. D. Wood, H. W. Deem and C. F. Lucks. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 111, June 12, 1961, 67 p. (Available as PB 171630 from U. S. Office of Technical Services, Washington 25, D.C.)

Compilation of test data on emittance, reflectance and absorptance of 18-8 stainless steel, Type 300 and 400 series, 17-7 PH, PH 15-7 Mo and Vickers FDP stainless steels. Data are separated according to material and to the type of measurement, spectral or total. 15 ref. (P17; SS, 10-54)

471-P. The Variation of the Surface Tension of Nickel With Crystallographic Orientation. H. Mykura. Acta Metallurgica, v. 9, June 1961, p. 570-576.

Interference microscopy is used to measure the grooves formed during heat treatment (1000° C., 50 hr. in vacuum) at the intersection of twin boundaries with the surface. The orientation derivatives of the surface tension are obtained from the interferograms. By graphical integration of the graphs of these derivatives plotted against orientation, the orientation dependence of the surface tension is obtained. 12 ref. (P13h, M21, 2-64, 3-72; Ni)

472-P. Theory of Al-Zn Alloy Resistivity During Pre-Precipitation. M. Asdente. Acta Metallurgica, v. 9, June 1961, p. 587-589.

The electrical resistivity of Guinier-Preston zones in Al-Zn is calculated as a function of zone radius for 50-100% Zn concentrations within the zone using an approximation by the partial wave method. The usual hypotheses of zone formation and growth are modified to suggest that the early stages of zone growth will yield a resistivity maxium. 11 ref. (P15g, N7, 2-60, 3-73; Al-b, Zn-b)

473-P. The Effect of Impurity Absorption on the Surface Energy and Surface Self-Diffusion in Nickel. J. M. Blakely and H. Mykura. Acta Metallurgica, v. 9, June 1961, p. 595-599.

Striations observed on Ni heated in vacuum at 900° C. The distribution of striating orientations suggests the presence of point cusps in the plot of surface free energy at (100),

(110) and (210) orientations and a line cusp between (410) and (510). Surface diffusion is fast at (110) and for atomically rough planes between (410) and (210) in addition to smooth (100) and (111) planes. Both effects are ascribed to impurity absorption. 7 ref. (P13h, N1d, 2-62, 3-69, 3-72; Ni)

474-P. (French.) Determination of the Diffusivity Coefficient of Metals and Semiconductors. Jean Oualid. Journal de Physique et le Radium, v. 22, Feb. 1961, p. 124-126.

Computation of the coefficient of thermal diffusivity from the heat quantity supplied to the end of an infinitely long strip or film of a metal, the side edges of which are heat insulated, the contribution of free electrons to the diffusivity, thermal conductivity and the temperature measured at a known distance from the heated end. 5 ref. (P11m, 1-54; EG-j31)

475-P. (French.) Nuclear Resonance in Cobalt Powders. G. Berthet and J. Dupuis. Archives des Sciences, v. 13, Sept. Sept. 12-16, 1960, p. 422-424.

Description of electronic equipment used in nuclear resonance measurements. The particle size of the powder tested is 2-5 microns and it shows 59% cubic as well as hexagonal structure. (P18m, 1-54; Co)

476-P. (English.) Nuclear Magnetic Resonance in Vanadium Alloys. L. E. Drain. Archives des Sciences, v. 13, Sept. 12-16, 1960, p. 425-432.

Change of V^{51} resonance in dilute solid solutions of Cr, Mn, Fe, Co or Ni in V as a function of concentration. Effect of transition metal character of the solute. 9 ref. (P18m, 2-60; V-b, Cr, Mn, Fe, Co)

477-P. (French.) Nuclear Magnetic Resonance of Fe^{57} in the Local Field of Metallic Iron. C. Robert and J. M. Winter. Archives des Sciences, v. 13, Sept. 12-16, 1960, p. 434-435.

The nuclear resonance of Fe^{57} present in the quantity of 2.25% in a Fe sample is determined by observing the dispersion of Mossbauer rays. Effects of temperature and applied magnetic field. 5 ref. (P18m; Fe)

478-P. Industrial Uses of the Platinum Metals. A. G. Dowson. New Scientist, v. 10, June 29, 1961, p. 796-799.

Review of the corrosion and oxidation resistance and catalytic activity of Ru, Rh, Pd, Os, Ir and Pt. Application of these metals in the chemical, electric, glass, petroleum and drug industries. (P13c, R-general, T-general, 17-57; EG-c, 10-54)

479-P. Research in Beryllium. W. D. Bennett. Canadian Metalworking, v. 24, July 1961, p. 29-31.

Physical and mechanical properties; machining and welding procedures; future applications. (P-general, Q-general, G17, K-general; Be, 17-57)

480-P. The Debye Temperature of Carbonyl Iron. Charles P. Gazzara. Paper from "Advances in X-Ray Analysis", v. 4. Plenum Press, New York, 1961, p. 93-107.

The Debye characteristic temperature is determined as being between 433 and 445° K. at an ambient temperature of 310° K. from an X-ray diffraction study utilizing both monochromatized and filtered radiation by both stationary and scanning slit methods. 26 ref. (P12r, M22g; Fe-a)

481-P. The Specific Heat of Hyper-Eutectoid Steel. B. Gregory and H. J. Bray. Metallurgia, v. 63, June 1961, p. 276-278.

Technique for the derivation of specific heat values for hypereutectoid steel from 500-1000° C. involves accurate thermal analysis from which it is possible to derive a differential area curve and subsequently the specific heat curve using a radiation relationship. 6 ref. (P12r, M23r, 2-61; AY)

482-P. (Translation-Brutcher no. 4989.) Solubility of Certain Transition Metals in Aluminum. V. M. Glazov, G. P. Lazarev and G. A. Korol'kov. Metallovedenie i Termicheskaya Obrabotka Metallov, Oct. 1959, p. 48-50.

Previously abstracted from original. See item 16-P, 1960. (P12e, Q29q; Al-b, Zr, Cb, Ta)

483-P. (German.) Copper and Copper Alloys. Pt. 3. Properties. A. Schwarz. Draht, v. 12, May 1961, p. 227-232.

Review of electrical, thermal and mechanical properties, corrosion and

scaling resistance, microstructure and structural changes (recrystallization) of Cu and Cu alloys. Influence of alloying elements on properties. 45 ref. (P-general, M27, N5, Q-general, R-general, 2-60; Cu)

484-P. (Translation-ConBur.) Thermodynamic Properties of Liquid Metallic Solutions in the Systems Zn-Bi and K-Cd. M. F. Lantratov and E. V. Tsarenko. Journal of Applied Chemistry of the USSR, v. 33, May 1960, p. 1107-1117.

Thermodynamic properties of the systems are calculated from the values of emf. and temperature coefficients of emf. of the concentration cell. The Zn-Bi system is studied from 420-800° C. for atomic fractions of 0.144-0.9664 Zn and the K-Cd system is investigated from 475-575° C. for atomic fractions of 0.025-0.95 K. 24 ref. (P12, P15j, 2-60, 2-61; Bi-b, Zn, Cd-b, K, 14-60)

485-P. (Japanese.) Standardization of Testing Methods for Lead Solder Wettability by Contact Angles. Ken'ichi Goto and Seinosuke Sugawara. Metal Finishing Society of Japan, Journal, v. 12, May 1961, p. 173-181.

The contact angles of melted Pb-Sn solder drops on test metal surfaces are measured by goniometer during standardized heating and melting procedure. Determination of effects of Pb-Sn ratio, melting temperature, cleanness of metal surface and type of metal and flux on wettability. (P13h, 2-60, 2-61; Pb-b, Sn-b, SGA-f)

486-P. (Translation.) Investigation of Thermal Expansion of GaAs and ZnSe. S. I. Novikova. Soviet Physics--Solid State, v. 3, July 1961, p. 129-130. (Translation of Fizika Tverdogo Tela, v. 3, Jan. 1961, p. 3-310).

Investigation carried out by using a quartz dilatometer. The GaAs sample is smelted from spectroscopically pure elements and the ZnSe samples are compressed, in a N atmosphere, into cylinders 4.78 mm. long which are annealed at 1350° C. Results correspond to the increase in strength of the ionic components of the bonds. (P11g; Ga-b, As, Zn-b, Se, 14-68)

487-P. The Effects of Alloying Elements in Titanium. Volume B. Physical and Chemical Properties, Deformation and Transformation Characteristics. D. J. Maykuth, F. C. Holden, D. N. Williams, H. R. Ogden and R. I. Jaffee. Defense Metals Information Center, Battelle Memorial Institute, DMIC Report 136B, May 29, 1961, 150 p. (Available as PB 171424 from U. S. Office of Technical Services, Washington 25, D. C.)

Diffusion of interstitial and substitutional elements. Effects of alloying additions on deformation mechanisms and textures, recovery, recrystallization and grain-growth characteristics. Reaction kinetics of Ti alloys in terms of effects of alloying additions on martensitic, beta-to-alpha, beta-to-omega and/or eutectoid transformation temperatures. 169 ref. (P-general, Q24, N-general, 2-60; Ti-b)

488-P. (Translation-ConBur.) Investigation of the Thermo-Dynamic Properties of Liquid Metallic Solutions in the Potassium-Mercury System. M. F. Lantratov and E. V. Tsarenko. Journal of Applied Chemistry of the USSR, v. 33, July 1960, p. 1524-1530.

Results of emf. measurements of K/glass/K-Hg concentration cells are used to calculate the partial and integral thermodynamic characteristics for the K-Hg system from 250-350° C. and composition of 0.04992-0.898 volume fraction K. Formation of the alloys is found to be accompanied by an exothermic heat effect. 20 ref. (P12, 2-60, 2-61; K-b, Hg-b, 14-60)

489-P. Platinum Alloy Permanent Magnets. R. A. Mintern. Platinum Metals Review, v. 5, July 1961, p. 82-88.

Magnetic properties, hardness, linear expansion coefficient, corrosion resistance and applications of Platinax II magnetic alloy of the Co-Pt system. The alloy can be machined, rolled or drawn into complex shape or very small magnets without difficulty. Magnetizing procedure. Effect of temperature cycling. 7 ref. (P16, P11g, Q29n, R-general; Pt-b, Co, SGA-n)

490-P. (Russian.) Factors Increasing the Thermoelectric Properties of a Semiconductor Type Zn-Sb Alloy. D. I. Lainer and L. M. Golubtsova. Tsvetnye Metally, Feb. 1961, p. 69-74.

Effect of Ag, Cd, In, Sn, Te, Bi, Pb, Cu, Si, Ge, Al and Fe present in quantities up to 1.50% in a Sb-Zn

alloy containing 35% Zn on thermoelectric effect and conductivity, microstructure and phase diagrams. 7 ref. (P15g, P15j, M27, 3-69; Sb-b, Zn, EG-j)

491-P. The Polarization of Metals in Boiling, Distilled Water. J. E. Draley, F. E. DeBoer and C. A. Youngdahl. Electrochemical Society, Journal, v. 108, July 1961, p. 622-628.

Samples of Al, Ti, V, Cr, Fe, Co, Ni, Cu, Y, Cb, Mo, Ag, Sn, Ta, Pt and Au are placed in contact with boiling, distilled water. Polarization curves are obtained by continuously increasing the applied current at a constant rate for about 10 min. and measuring the potential about 10 times per sec. 9 ref. (P15, R4)

492-P. Anodic Polarization Curves in Molten Carbonate Electrolysis. George J. Janz and Fumihiko Saegusa. Electrochemical Society, Journal, v. 108, July 1961, p. 663-669.

Curves for Pt, Au and Ag in molten (Li, Na, K) CO_3 at 500-900° C. are obtained with a kinetic analysis of possible process contributing to anodic oxygen evolution. 18 ref. (P15, R6m, 2-62; Pt, Au, Ag)

493-P. (German.) Metallurgical Aspects of High-Pressure Technology. Technica, v. 10, June 9, 1961, p. 782.

Physical properties of pure metals (melting and transition temperatures) and metal alloys (solubility relations) as influenced by high pressures. Technical applications of pressure relations in construction of high-pressure cells, pressure gages, control of precipitation hardening and elimination of dislocations. (P-general, 3-74)

494-P. (German.) Influence of Cu Additions on Thermal Expansion of Fe-Ni-Co Alloys. Horst Ringpfeil and Otto Henkel. Neue Hutte, v. 6, May 1961, p. 310-316.

Dilatometric investigation of thermal (-180 to 650° C) expansion of Fe-Ni-Co (45% Co+Ni) alloy with 0-11% Cu additions. Microstructure, microhardness and X-ray examination of martensite formation. 4 ref. (P11g, M23b, M-general, N6q, 2-61; Fe-b, Ni, Co)

495-P. (German.) Measurement of Heats of Mixing as Influenced by Temerature in Binary Metal Melts Using an Adiabatic High-Temperature Calorimeter. Erich Scheil and Hans Leo Lukas. Zeitschrift fur Metallkunde, v. 52, June 1961, p. 417-422.

Measurement of enthalpy of mixing in formation of binary solution for the system Sb-Zn as influenced by concentration and for the systems In-Pb, Tl-Pb and Cd-Sb as influenced by concentration and 300-600° C. temperature. (P12r, 2-60, 2-61; Cd-b, In-b, Pb-b, Sb-b, Tl-b)

496-P. (German.) Diffusion After Effect of Permeability in Iron-Nickel Alloys. Dieter Gerstner and Eckart Kneller. Zeitschrift fur Metallkunde, v. 52, June 1961, p. 426-436.

Magnetic investigations on multicrystalline Fe-Ni (50-85% Ni) specimens including measurement of initial permeability as a function of time during isothermic annealing at 300° C. to Curie temperature; magnetic saturation and electrical resistance as function of time during isothermic annealing at 460° C.; and permeability as a function of field strength from 20-800° C. and field strengths of up to 1 Oe. (P16q, P16d, Ni, 2-61, 2-64, 3-67; Fe-b, Ni, SGA-n)

497-P. Influence of Some Platinum Metals on the Wettability of Silver. J. B. Adamec and R. N. Rhoda. Welding Journal, v. 40, July 1961, p. 330s-336s.

Wetting tests at 1200° C. with Ag alloys containing up to 20% Pd, Pt and Ru. Nature of films formed on Inconel and Inconel X alloys in wet and dry Ar and H atmospheres and their effects on wetting. 10 ref. (P13h, 2-60; Ag-b, Pt, SGA-f, Ni-b)

498-P. Hybrid Metals Tame Corrosive Chemicals, Deadly Radiation. Asarco Digest, v. 3, no. 1, p. 20-22.

Heat resistance, strength and heat transfer ability are imparted to Pb by bonding it metallurgically to a base metal of Al, Cu, low-carbon steel, stainless steel and Ni alloys. Composites provide shielding requirements of the nuclear industry and pressure-corrosion resistance requirements in the chemical processing field. (P11g, P11k, L22, Q27a; Al, Cu, CN, SS, Ni-b, Pb)

499-P. Thermal Properties of Indium Selenide. Tatsuo Yoshioka. Tohoku University, Science Reports, v. 44, Nov. 1960, p. 99-102.

Specific heat, heat absorption and thermal expansion of $InSe_{1.25}$, 1.5, 1.75, 2.00 are measured from 20-300° C. (P12r, P11g; In-b, Se)

500-P. (German.) A New Chromium-Free Iron-Nickel Alloy for Microwave Tube Manufacture. W. Dusing. Telefunken Zeitung, v. 34, Mar. 1961, p. 64-68.

Investigation of Fe-Ni-Cu and Fe-Ni-Mn alloys to determine thermal expansion and residual stresses after melting in glass and effect of electroplating with Ag and Au with subsequent sintering to increase density. (P11g, L17c, Q25h, T1j; Fe-b, Ni, 17-57)

501-P. (German.) Determination of Specific Heat of Sodium and Potassium Amalgam. J. Balej and J. Vondrak. Collection of Czechoslovak Chemical Communications, v. 26, Mar. 1961, p. 881-883.

Calorimetric measurement of specific heat of liquid NaHg and Na-K amalgams at 20-50° C. (P12r; Na-b, K, Hg, 14-60)

502-P. (French.) Study of the Expansion of Zircaloy-2 Tubes on Steel. J. Jay, J. Dreuilhe and P. Thome. Revue de Metallurgie, v. 58, Apr. 1961, p. 351-362.

Determination of the expansion characteristics of Zircaloy-2 tubes--18-8 steel sheath assemblies at 60-950° C. in a nuclear reactor. A mandrel is used for testing the tightness of the joint. Replacement of this assembly while the reactor is operating is performed by remote manipulation. (P11g, 1-54, W11p; Zr-b, 4-60, SS, 4-53)

503-P. (Book-Translation.) Soviet Electrochemistry. v. 2. Oxidation and Reduction. 1961. 264 p. Consultants Bureau, Inc., 227 W. 17th St., New York 11, N. Y.

Proceedings of the Fourth Conference on Electrochemistry (Oct. 1-6, 1956) published by the Academy of Sciences of the USSR Press, Moscow, 1959. Topics include mechanisms and kinetics of electrodeposition, electroreduction, electrosolution, oxygen overvoltage, electrochemical oxidation and passivity and corrosion. (P15, A-general, L-general, 10-54)

504-P. (Russian.) Separation of Components of Alloys With Variation in Temperature. D. S. Kamenetskaya. Doklady Akademii Nauk SSSR, v. 137, Jan. 1961, p. 94-95.

Variation of free energy during redistribution of components in the process of thermal diffusion is investigated as a function of concentration and temperature. (P12a, 1-54, P11, 2-60, 2-61)

505-P. (Russian.) Anomaly in the Electroresistivity of Cold Deformed Fe_3Al Alloy Observed in Heat Treatments at Moderate Temperatures. Ya. P. Selisskii. Fizika Metallov i Metallovedenie, v. 10, Dec. 1960, p. 829-834.

Samples containing 8.3-13.9% Al, 0-0.2% Mn, 0-0.2% Si, 0.02% C and balance Fe are subjected to cold deformation of 6.5-88.8% and subsequently held at 150-250° C. for up to 8 hr. Effects of degree of deformation and heat treatment time and temperature on electrical resistivity are attributed to change of the electron structure resulting from diffusion. 10 ref. (P15g, N1, 2-61, 2-64, 3-68; Fe-b, Al)

506-P. (Russian.) Determination of the Enthalpy and Specific Heat of Beryllium From 600-2200° K. P. B. Kantor, R. M. Krasnovitskaya and A. N. Kisel'. Fizika Metallov i Metallovedenie, v. 10, Dec. 1960, p. 835-837.

Calorimetric measurements on Be samples of 99.8% purity with enthalpy and specific heat determined as functions of temperature. 7 ref. (P12r, P12s, 2-61; Be)

507-P. The Thermoelectric Power of Magnesium-Cadmium Alloys. Seiichiro Noguchi. Physical Society of Japan, Journal, v. 16, June 1961, p. 1145-1150.

Measurements are made relative to pure Cu from 20-300° C. and over the entire range of composition. Data are analyzed by a band model approximation to determine band structure of the alloys. 19 ref. (P15j, 2-60, 2-61; Cd-b, Mg-b)

508-P. The New Magnetic Phase in Manganese-Aluminum-Nickel System. Ichiro Tsuboya and Makoto Sugihara. Physical Society of Japan, Journal, v. 16, June 1961, p. 1257.

Magnetic properties, structure and composition are determined for a

magnetic cubic phase formed in the alloy by annealing at 900° C. in vacuum and cooling to room temperature at a rate of 150° C. per hr. (P16, M24c, 2-62; Al-b, Ni-b, Mn-b)

509-P. Magnetic Properties of B8 Type Compounds in Manganese-Tin System. Mitsuru Asanuma. Physical Society of Japan, Journal, v. 16, June 1961, p. 1265-1266.

Data on the variation of magnetic moments of the system as a function of composition are used to estimate the magnetic moments of Mn atoms in each lattice site. (P16, M26, 2-60)

510-P. (Italian.) Characteristics and Applications of Metallic Alloys in the Foundry. Dario Fortino. Fonderia Italiana, v. 10, May 1961, p. 174-178.

Physical and mechanical properties and corrosion resistance are discussed for Al, Mg, Zn and Cu alloys in foundry applications. Nicro-Silal, Ni-Resistal and Ni-Hard, high corrosion resistant and nonmagnetic alloys are reviewed in terms of applications in the chemical industry. (P-general, Q-general, R-general, T29; CI, Al-b, Mg-b, Zn-b, Cu-b, Ni-b, 17-57)

511-P. (Translation-ConBur.) The Problem of the Penetration of Silver Into Tungsten. V. I. Rakhovskii, A. P. Lyubimov and V. M. Garmash. Academy of Sciences of the USSR, Proceedings, Physical Chemistry Section, v. 135, Nov-Dec. 1960, p. 1139-1141.

Tungsten sheets are held in liquid radioactive Ag at elevated temperatures for extended periods to establish the possibility of penetration of Ag into W. Measurements of the sample activity are then used to determine the total amount of penetration. (P10m, R6m, 1-54; W, 4-53, Ag)

512-P. (German.) Causes of Increasing Coercive Force in Decreasing the Thickness of Ferromagnetic Sheets. W. A. Saikowa and Ja. S. Schur. Physikalische Abhandlungen aus der Sowjetunion, v. 4, Mar. 1961, p. 195-205.

Measurement of coercive force on cold rolled and electrolytically eroded single crystal and polycrystalline Fe-Si (3.5% Si) and 78-Permalloy specimens of various orientations and investigation of domain structure from -195 to 400° C. 13 ref. (P16a, P16c, 2-61, 3-72, 3-73; Fe-b, Si, Ni-b)

513-P. (German.) Fermi Surface of Tin. N. Je. Alexejewski, Ju. P. Gaidukow, I. M. Lifschiz and W. G. Pestschanski. Physikalische Abhandlungen aus der Sowjetunion, v. 4, Mar. 1961, p. 232-248.

Galvanomagnetic measurements of resistivity of zone-refined single crystal Sn disk specimens at 4.2° K. using a magnetic field of up to 27,000 A. per cm. for establishment of the geometry of the Fermi surface. 6 ref. (P15, P16, 2-63; Sn, 14-61)

514-P. The Knight Shift of Cd in Some Alloys With Group IB and IIB Metals. R. F. Grant and W. G. Henry. Canadian Journal of Physics, v. 36, June 1961, p. 841-844.

The Knight shift of the Cd^{111} and the Cd^{113} resonance in the primary solid solutions of Ag, Au, Mg, Zn and Hg in Cd are investigated. The effect of the solute metal on the Knight shift of the solvent is discussed in terms of the charge displacements. 15 ref. (P16, 2-60; Cd-b, Ag, Au, Mg, Zn, 14-67)

515-P. (Russian.) Enthalpy of Chromium and Several Chromium-Bearing Iron Alloys at High Temperatures. R. P. Krentsis, P. V. Geld and N. N. Serebrennikov. Izvestiya VUZ--Chernaya Metallurgiya, Dec. 1960, p. 5-11.

Enthalpy measurements and specific heats from 0-1600° C. investigated for aluminothermic Cr (98.66%), carbonless Fe-Cr, nitrided Fe-Cr and Cr-Al alloy containing 63.91% Cr, 18.11% Al and 16.55% Fe. 20 ref. (P12r, 2-61; Cr-b, Fe-b, Al)

516-P. (Russian.) Effect of Alloying Elements on Surface Properties of Iron. B. V. Tsarevskii and S. I. Popel'. Izvestiya VUZ--Chernaya Metallurgiya, Dec. 1960, p. 12-16.

Investigation of surface tension, contact angle, adhesion and adsorbtion of Fe-Si, Fe-Mn, Fe-Ni, Fe-Cr and Fe-O alloys on an Al_2O_3 surface utilizing the stationary drop method in an Ar atmosphere at a test temperature of 1560° C. Relation of properties to alloy composition. 14 ref. (P13h, 1-54; Al-b, Fe-b)

517-P. Effect of Magnetic Clusters on the Specific Heat of Ni-Cu and Fe-V Alloys.

K. Schroeder. Journal of Applied Physics, v. 32, May 1961, p. 880-882.

Review of data for specific heat measurements at 2-18° K. for 59-64% Cu-Ni and 70-76% V-Fe alloys with equations derived by an Einstein function for a new term, in addition to the lattice and electronic terms, on the basis of ferromagnetic clusters. 14 ref. (P12r, P16, 2-63, 3-71; Cu-b, Ni, V-b, Fe)

518-P. (German.) Temperature Hysteresis in Domain Structure of Iron-Silicon Crystals. Ja. S. Schur and I. Je. Starewa. Physikalische Abhandlungen aus der Sowjetunion, v. 4, Mar. 1961, p. 182-194.

Investigation of irreversible change of domain size during temperature cycling (20-550° C.) under vacuum using 1250° C. vacuum annealed disk shaped Fe-Si (3.5% Si) single crystals and polycrystalline specimens of 0.03-0.07 mm. thickness. 8 ref. (P16a, P16c, 2-61; Fe-b, Si)

519-P. The Market for Special Materials and Metals. D. A. Boettcher. Industrial Challenge of Nuclear Energy. Stresa Conference. Pt. 3. Organization for European Economic Co-Operation, European Nuclear Energy Agency, p. 77-90.

Radiation resistance, neutron capture cross section, cost and applications are given for Zr, Hf, Be, Ca, Mg, Cb, Zircaloy, steels, Al alloy, Sm, Gd and Eu. Permeability, density and temperature resistance are given for graphite moderator material. (P16, P17, P18, T11h; SGA-g, SGB-p)

520-P. Electrochemical Applications of Platinized Titanium. Charles E. Tirrell. Crucible Titanium Review, v. 9, July 1961, p. 2-6.

Physical properties of Pt-coated Ti anodes include "electrolytic valve" properties of Ti which passivates when made anodic in most electrolytes forming a thin, tenacious, nonconducting oxide layer on the surface. Applications include membrane cells and impressed current marine cathodic protection systems as well as potential use in caustic-chlorine industry. 11 ref. (P15; Ti, Pt, SGA-g, 17-57)

521-P. Thermal Expansion of Technical Solids at Low Temperatures. R. J. Corruccini and John J. Gniewek. U. S. Dept. of Commerce, National Bureau of Standards Monograph 29, May 19, 1961.

Tables are given of the linear concentration relative to 293° K. and the linear expansion coefficient of 35 elements, 45 alloys, 22 other inorganic substances and 20 plastics and elastomers from 0-300° K. (P11g)

522-P. Anodic Polarization of Stainless Steel in Chloride Solutions. G. M. Schmid and Norman Hackerman. Electrochemical Society, Journal, v. 108, Aug. 1961, p. 741-744.

Polarization curves are obtained for 18-8 stainless steel in KCl solution up to 1N. Maxima in the potential-time curve depend on solution pH. 16 ref. (P15; SS)

523-P. Thermodynamics of the Interaction of Niobium and Tantalum With Oxygen and Nitrogen at Temperatures Near the Melting Point. J. Paul Pemsler. Electrochemical Society, Journal, v. 108, Aug. 1961, p. 744-750.

Concentration of N and O in Cb and Ta in equilibrium with the pure gases is determined as a function of pressure at three temperatures near the melting point and at the melting point. Data are used to calculate thermodynamic constants. 12 ref. (P12d, P12n, N16; Cb, Ta)

524-P. (German.) Influence of Electrolytically Precipitated Hydrogen on Magnetization of Nickel. H. J. Bauer and E. Schmidbauer. Naturwissenschaften, v. 48, June 1961, p. 425.

Measurement of magnetic saturation and remanence of Ni foils and layers electrolytically deposited on Cu. Magnetization as a function of hydrogen charge. (P16a, 2-66; Ni, 8-62)

525-P. Thermal Coefficients of EMF of the Silver (I) and the Silver (II) Oxide-Zinc-45% Potassium Hydroxide Systems. Stanley Hills. Electrochemical Society, Journal, v. 108, Aug. 1961, p. 810-811.

Coefficients are calculated at -0.000169 and +0.0000570 v. per ° C. for cells with mono and divalent Ag, respectively, along with other electrochemical data and thermodynamic values. (P12r, P15g; Ag, Zn)

526-P. (Russian.) Heat Content and the Heat Required for Melting of Medium and High-Alloy Steels. N. N. Serebrennikov, P. V. Gel'd and R. P. Krentsis. Izvestiya VUZ--Chernaya Metallurgiya, Mar. 1961, p. 5-10.

Investigation of high-alloy (austenite base) and medium-alloy (ferrite-carbide base) steels to find their heat holding capacity, heat content from 0 to 1600° C. and the heat required to melt them. 7 ref. (P12r, P12n, 1-54; SS)

527-P. (Russian.) Influence of Carbon, Sulphur and Silicon on the Surface Tension of Cast Iron. K. I. Vashchenko and A. P. Rudoi. Izvestiya VUZ--Chernaya Metallurgiya, Mar. 1961, p. 11-15.

Measurement of pressure inside a bubble to determine influence of C, Si and S on the surface tension of molten synthetic cast iron of various compositions from 1300-1500° C. with various amounts of thermodynamic activity at the surface. 6 ref. (P13h, 2-62, 3-69; CI, C, Si, S)

528-P. (Russian.) Abnormal Change of the Properties of Chromium at Room Temperature. N. N. Myuller, E. E. Orlovskaya, E. V. Panchenko and E. M. Strug. Izvestiya VUZ--Chernaya Metallurgiya, Mar. 1961, p. 134-137.

Investigation of various compositions at various temperatures (-20 to 140° C.) to determine changes in volume, electrical resistance and emf. forces. (P10a, P15g, 2-60, 2-61; Cr)

529-P. (Italian.) Research on the Electrochemical Behavior of Metallic Monocrystals. Guido Poli and Bruna Rivolta. Rendiconti, v. 94, Nov. 1960, p. 299-308.

Study of cathodic-anodic behavior of Ag monocrystal electrodes in AgCN, AgI and AgCNS solutions at 25° C. having the active surface oriented according to the crystallographic planes (111), (110) and (100). Effects of crystallographic orientation and the nature of the solution on electrolytic overvoltage of the Ag ionic exchange. (P15, 2-66, 3-72; Ag, 14-61)

530-P. (Translation.) Investigation of the Surface Properties of Germanium at Different Temperatures. Pt. 1. Amplitude Characteristics. V. G. Litovchenko and V. I. Lyashenko. Soviet Physics--Solid State, v. 3, July 1961, p. 44-52. (Translation of Fizika Tverdogo Tela, v. 3, Jan. 1961, p. 3-310.)

Temperature dependence at 170-305° K. of the field effect, zone bending, work function, field effect mobility, surface electron state energy and surface electron state concentration. 39 ref. (P-general, 2-61; Ge)

531-P. (Translation.) Investigation of the Surface Properties of Germanium at Different Temperatures. Pt. 2. Kinetics of the Processes. V. G. Litovchenko and V. I. Lyashenko. Soviet Physics--Solid State, v. 3, July 1961, p. 53-64. (Translation of Fizika Tverdogo Tela, v. 3, Jan. 1961, p. 3-310.)

Kinetics of the field effect and photoconductivity. Temperature dependence at 170-305° K. of hole and electron capture cross sections, field effect, photoconductivity relaxation times, activation energy and concentration of surface levels. 46 ref. (P-general, 2-61; Ge)

532-P. Kinetics of Adsorption of Iodide and Sulfate Ions on Copper. H. J. Arnikar and O. P. Mehta. Journal of Scientific and Industrial Research, v. 20B, May 1961, p. 209-212.

The time rate of adsorption is determined at 25° C. in KI and K_2SO_4 solutions (10^{-3}--10^{-12}M) using radioactive isotopes I^{131} and S^{35}. An alternative hypothesis based on chemisorption is also discussed. 11 ref. (P13d, 1-59; Cu, 14-68)

533-P. (German.) New Method for Measuring Thermal Conductivity of Metals at High Temperatures. Karl-Heinz Bode. Allgemeine Warmetechnik, v. 10, June 1961, p. 110-120.

Theoretical derivations for measurements above 800° C. by electrical resistance heating of metal wire. Applications to Ni, Mo, Pt. (P11h, 1-53; Ni, Mo, Pt)

534-P. Work Function Measurements of the Platinum Alloys of the Alkaline-Earth Metals. H. Batey. Institution of Electrical Engineers, Proceedings, Pt. 3, v. 108, July 1961, p. 468-469.

Measurement of thermionic emission for alloys of the alkaline-earth metals, Ba, Sr and Ca with Pt. The work

functions of the binary alloys are compared with those of the pure metals. (P15k; EG-f43)

535-P. (German.) Sensitivity and Significance of Measurements With a Small Size Calorimeter. Eberhard Schurmann and Heiner Trager. Archiv fur das Eisenhuttenwesen, v. 32, June 1961, p. 397-408.

Phase diagrams and thermodynamic properties of the systems Sn-Zn and Pb-Sb are established by calorimetric measurements using a small water calorimeter. 19 ref. (P12, M24b, X24e; Sn, Zn, Pb, Sb)

536-P. (Translation-Brutcher no. 5196.) Surface Heat Exchange Between Contacting Metal-Powder Components. V. S. Miller. Dopovidi Akademii Nauk Ukrainskoi RSR, Jan. 1961, p. 40-43.

Study of contact heat exchange between metal-powder products, on the one hand, and such products and fusion-made metals, on the other. Formulas for determining the thermal resistances between powder compacts and such compacts and cast metals. (P11k; 6)

537-P. Temperature Effects on the Remanence of Permanent Magnets. Rudolf K. Tenzer. Applied Magnetics, v. 9, 2nd quarter 1961, p. 2-9.

Reversible, irreversible and material effects on Alnico, Indox I and Cunife magnets as functions of heat treatment and temperature cycling between 25-550° C. (P16a, 2-61, 2-64, X11g; SGA-n)

538-P. Vapor Pressures of Platinum, Iridium and Rhodium. R. F. Hampson, Jr., and R. F. Walker. Journal of Research, National Bureau of Standards, Physics and Chemistry, v. 65A, July-Aug. 1961, p. 289-295.

Measurement by a microbalance technique based on the Langmuir method. Heats of sublimation at 298° K. are calculated with the aid of free energy functions. 16 ref. (P12c, 1-53; Pt, Ir, Rh)

539-P. Some Mechanical and Electronic Properties of Columbium, Hafnium and Their Alloys. D. J. Maykuth, J. B. Baker, G. S. Root and G. B. Gaines. Paper from "Advances in Electron Tube Techniques". Fifth U. S. National Conference, Proceedings (Sept. 1960). Pergamon Press Inc., New York 22, 1961, p. 10-20.

Evaluation of Cb-0.65 Zr, Cb-40 Ta and Hf alloys containing Al, Zr, Mo and Cb as materials for electron tubes using data from bend and tensile tests and electrical resistivity and secondary emission measurements. 15 ref. (P15, Q-general, T1; Cb-b, Hf-b, 17-57)

540-P. (English.) The Additional Magnetic Anisotropy Induced by Magnetic Anneal in Ferromagnetic Face-Centered Cubic Solid Solutions. Pt. 1. Mikio Yamamoto, Satoshi Taniguchi and Keizo Aoyagi. Tohoku University, Science Reports of the Research Institutes, v. 13, June 1961, p. 117-136.

Effect of temperature and duration of magnetic anneal, measuring temperature and alloy composition on induced magnetic anisotropy of fcc. Ni-Co alloys as measured by a torque magnetometer. 20 ref. (P16, 2-60, 2-61, 2-64; Ni-b, Co)

541-P. (English.) The Additional Magnetic Anisotropy Induced by Magnetic Anneal in Ferromagnetic Face-Centered Cubic Solid Solutions. Pt. 2. Keizo Aoyagi. Tohoku University, Science Reports of the Research Institutes, v. 13, June 1961, p. 137-150.

Measurement of induced uni-axial ferromagnetic anisotropy as a function of crystal orientation using a torque magnetometer with magnetically annealed disk single crystals of 12 and 20% Co-Ni and 17 and 46% Fe-Ni alloys. 12 ref. (P16, 3-72, 2-64; Ni-b, Co, Fe)

542-P. Boron Diffusion in Silicon. E. L. Williams. Electrochemical Society, Journal, v. 108, Aug. 1961, p. 795-798.

The diffusion coefficient examined from 1050-1350° C. is observed to decrease gradually as the purity of the n-type Si increases. 17 ref. (P15g, N1, 2-60, 2-62; EG-j, B, Si)

543-P. (English.) Plane Polarization of 8.5 MeV Bremsstrahlung. Katsufusa Shoda. Physical Society of Japan, Journal, v. 16, July 1961, p. 1271-1280.

The polarization produced by 8.5 MeV electrons incident on thin Al, Ag, Au and

U targets in a betatron is studied with D_2O-loaded nuclear emulsions. Polarization is measured by observing the szimuthal angular distribution of photoprotons from deuterons. 22 ref. (P18n, 2-67; Al, Ag, Au, U)

544-P. (English.) Antiferromagnetism of MnHg. Yasuaki Nakagawa and Tomiei Hori. Physical Society of Japan, Journal, v. 16, July 1961, p. 1470.

Magnetic susceptibility, electrical resistivity and crystal structure are obtained at 90-360° K. 5 ref. (P16 p, P15g, M26q, 2-63; Hg-b, Mn-b)

545-P. (English.) A Note on the Magnetoresistance of PbTe at High Magnetic Fields. Eizaburo Yamada and Kisaburo Shogenji. Physical Society of Japan, Journal, v. 16, July 1961, p. 1475.

Discussion of the oscillatory behavior of the magnetoresistance of PbTe crystals as a function of magnetic field. 5 ref. (P16, P15g; Pb-b, Te-b, 14-68)

546-P. (English.) Magnetic Annealing Effect in Cobalt. Takashi Sambongi and Tadayasu Mitui. Physical Society of Japan, Journal, v. 16, July 1961, p. 1478.

Study of the origin of the ferromagnetic anisotropy induced in Co when annealed in a magnetic field. Temperature dependence of the induced anisotropy energy is measured at 90-700° K. and compared with the crystal anisotropy energy. 4 ref. (P16, 2-61, 2-64, 3-72; Co)

547-P. (English.) Mossbauer Effect of the Intermetallic Compound UFe_2. Shigehiro Komura, Nobuhiko Kunitomi, Poh-Kun Tseng, Naomoto Shikazono and Hidekuni Takekoshi. Physical Society of Japan, Journal, v. 16, July 1961, p. 1479.

The hyperfine field at the position of the Fe 57 nuclei in UFe_2 is measured at liquid nitrogen temperature using the Mossbauer effect and compared with values determined for UFe_2, stainless steel and metallic Fe at 20° C. (P18m; Fe-b, U-b, 14-68)

548-P. (English.) Magnetic Annealing of Cobalt. C. D. Graham, Jr. Physical Society of Japan, Journal, v. 16, July 1961, p. 1481-1482.

Measurement of the uniaxial anisotropy at 20-325° C. on a polycrystalline Co disc cooled in a hydrogen atmosphere from 900-20° C. with a field of 3000 Oe applied along a diameter. 3 ref. (P16, 2-61, 2-64, 3-72; Co)

549-P. (English) Ferromagnetism of the Intermetallic Compound UFe_2. Shigehiro Komuro, Nobuhiko Kunitomi, Yoshikazu Hamaguchi and Masanobu Sakamoto. Physical Society of Japan, Journal, v. 16, July 1961, p. 1486.

Magnetic properties of UFe_2 are investigated from 100-300° K. UFe_2 shows evidence of ferromagnetism at a Curie temperature of 195° K. (P16, 2-61; Fe-b, U-b, 14-68)

550-P. Observations on the Oxygen Solubility and Magnetic Susceptibility of Body-Centered Cubic Transition Metal Alloys. R. T. Bryant and E. W. Evans. Philosophical Magazine, v. 66, June 1961, p. 805.

Effect of the electron to atom ratio on solubility and susceptibility properties of alloys of Cb with additions of 10-75% Mo, 35% Re or 25% Ru. Electronic behavior is determined as a function of composition at 20° C. (P12e, P16, M25, 2-60; Cb-b, Mo, Re, Ru, O)

551-P. Thermal Expansion at Low Temperatures. Pt. 2. Electronic Component in Metals. G. K. White. Philosophical Magazine, v. 6, June 1961, p. 815-818.

Values are given for the linear and lattice components of thermal expansion as related to electronic specific heat and for the Gruneisen constant of Cu, Al, Pd, Fe, Cr and Be specimens below 10-12° K. Electron band structures, Fermi energy and density-of-state relations are drawn for the expansion coefficient. 12 ref. (P11g, M25, 2-63; Cu, Al, Pd, Fe, Cr, Be)

552-P. (Japanese.) The Solubility of Graphite in Nickel and Cobalt and Effects of Alloying Elements. Yasushi Kojima and Kokichi Sano. Tetsu-to-Hagane (Iron and Steel Institute of Japan, Journal, v. 47, July, 1961, p. 897-902.

Solubilities and free energy relations are determined thermodynamically as a function of composition and temperature (500-1600° C.) with calculation of Wagner interaction parameters for graphite in pure Ni and Co, in Ni-Co solutions and in Ni or Co systems containing Si, Mn, Cr, V and Mo. 9 ref. (P12e, 2-60, 2-61; Co-b, Ni-b, NM-k36)

553-P. (Russian.) Surface Tension of Fe-S-C, Fe-Mn-S and Fe-Mn-C Alloys.

Van T'szin-Tan, R. A. Karasev, A. M. Samarin and A. G. Shalimov. Izvestiya Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk, Metallurgiya i Toplivo, Jan. 1961, p. 15-19.

Determination of surface tension of Fe-S-C alloys with up to 0.720% S, 3.95% C and 0.005% O, Fe-Mn-S alloy with up to 1.27% Mn, 1.38% S and 0.011% O and Fe-Mn-C alloys with up to 2.96% Mn, 2.42% C and 0.003% O from 1230-1600° C. Effect of sulphur content and activity and Mn concentration. (P13h, 2-60, 2-61; Fe-b, S, C, Mn, O)

554-P. (Russian.) Surface Energy on the Crystal Melt Interface. S. N. Zadumkin. Izvestiya Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk, Metallurgiya i Toplivo, Jan. 1961, p. 55-57.

Computation of the free surface energy of the interface polycrystal-melt from the free energy of the whole system, the free energy of the two phase-volume units, the interface area, distance of surfaces, melting heat, co-ordination number and the surface energy of the interface area in question measured with reference to a vacuum. 9 ref. (P13h, 1-54, M26)

555-P. Thermodynamic Functions for the Columbium-Hydrogen System. O. M. Katz and E. A. Gulbransen. Paper from "Columbium Metallurgy". v. 10. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 523-537.

The system is investigated between 225-513° C. and 0.01-760 mm. of Hg of H_2. Interpretation of the data is based on solid-solution behavior in this range. (P12, M24b, 2-60, 2-61; Cb-b, H)

556-P. (Translation.) The Effect of Thallium on the Thermal Conductivity of Polycrystalline Selenium. G. B. Abdullaev, M. I. Aliev and S. A. Akhundova. Soviet Physics--Solid State, v. 3, Aug. 1961, p. 234-235. (Translation of Fizika Tverdogo Tela, v. 3, Feb. 1961, p. 317-670).

Measurement of the thermal conductivity and the temperature coefficient of Se containing 0.0125-1.5% Tl at 20-90° C. A mechanism for the observed minimum is proposed in terms of phonon-scattering center formation and grain dimension increase influenced by concentration of Tl. 10 ref. (P11h, 2-59, 2-60; Se-b, Tl)

557-P. (Translation.) Vaporization of Silicon in Tellurium Vapor. V. E. Kosenko and B. A. Nesterenko. Soviet Physics--Solid State, v. 3, Aug. 1961, p. 484-485. (Translation of Fizika Tverdogo Tela, v. 3, Feb. 1961, p. 317-670).

The influence of Te vapor pressure on the vaporization rate and the heat of vaporization from 700-1150° C. (P12c, P12p, N15, 2-61; Si, Te)

558-P. Magnetic Properties of Cast Carbon Steel. Pt. 2. W. J. Jackson. Journal of Steel Castings Research, no. 21, Apr. 1961, p. 9-12.

Determination of optimum magnetic properties for minimum heat treating time. Experiments show that magnetic permeability is decreased by increasing carbon content and that annealing develops higher maximum permeability than normalizing. Optimum magnetic properties for minimum heat treatment are obtained by slowly cooling from 1380-1200° F. and then air cooling. Relationship between tensile strength and magnetic properties of steels in annealed and normalized conditions. (P16, Q27a, 2-64; CN, 5)

559-P. Magnetic Properties of Cast Carbon Steels. W. J. Jackson. Journal of Steel Castings Research, no. 20, Jan. 1961, p. 10-15.

Effect of heat treatment on magnetic permeability of cast carbon steel with 0.10-0.34% carbon. When the cast steels are slowly cooled from 1380-1200° F. and then air cooled, the permeability is higher at both low and high field strengths than that for the same steels in the fully annealed conditions. (P16q, 2-64; CN, 5)

560-P. (Translation.) Investigation of Coarse-Grained Germanium Layers Produced by Pyrolysis of Gas. G. A. Kurov, N. N. Sheftal' and N. P. Kokrish. Soviet Physics--Solid State, v. 3, Aug. 1961, p. 269-270. (Translation of Fizika Tverdogo Tela, v. 3, Feb. 1961, p. 317-670).

The influence of grain size and impurities on conduction type and electrical resistivity of Ge polycrystals. 7 ref. (P15g, 2-59, 3-69; Ge)

561-P. (Translation.) Changes in the Thermal Conductivity of Tin, Bismuth and Gallium on Melting. B. P. Pashaev. Soviet Physics--Solid State, v. 3, Aug. 1961, p. 303-305. (Translation of Fizika Tverdogo Tela, v. 3, Feb. 1961, p. 317-670).

Variations in the thermal conductivity of specimens in the solid and liquid states are measured as a function of temperature and related to changes in structure, co-ordination number and short range order. (P11h, M25, N10, 2-61, 3-73; Sn, Bi, Ga)

562-P. (Translation.) The Effect of Annealing on the Electrical and Magneto Electric Properties of Indium Antimonide. V. E. Il'in and I. E. Gorbacheva. Soviet Physics--Solid State, v. 3, Aug. 1961, p. 392-398. (Translation of Fizika Tverdogo Tela, v. 3, Feb. 1961, p. 317-670).

Influence of 300-500° C. annealing on the temperature (90-400° K.) and magnetic field dependence of the Hall constant, electrical conductivity, carrier concentration, carrier mobility, conduction type and magneto resistance. 7 ref. (P15, P16, 2-61, 2-64; In-b, Sb, 14-68)

563-P. (Italian.) Hydrogen Overvoltage on Zinc Single Crystals. Roberto Piontelli, Luisa P. Bicelli and Mariarosa Graziano. Atti della Accademie Nazionale dei Lincei, v. 30, Feb. 1961, p. 149-154.

Determination of hydrogen overvoltage on mono and polycrystalline Zn electrodes in acid bath (0.01 M $HClO_4$ and 0.01 M HCl) at 25° C. and 40° C. Effect of crystal orientation, temperature and acid concentration. (P15m, 2-61, 2-66, 3-72; Zn)

564-P. The Effects of Residual Elements on the Magnetic Properties of Carbon Steel Castings. W. J. Jackson and E. J. Ridal. Journal of Steel Castings Research, no. 21, Apr. 1961, p. 12-15.

Individual residual elements (Sn, Ni, Pb, Cu, Cr, Mo, Ti and V) slightly impair magnetic properties but combined addition of Ni, Cr and Mo slightly improves them except at low field strengths. Increasing Mn to 0.93% has only a slight effect on remanence and coercivity but lowers maximum permeability and flux density at the higher magnetizing fields. Deoxidation with 2 lb. per ton Al does not affect magnetic properties. (P16, 2-60; CN, 5)

565-P. Electrical Resistivity, Hall Effect and Superconductivity of Some b.c.c. Titanium-Molybdenum Alloys. R. R. Hake, D. H. Leslie and T. G. Berlincourt. Physics and Chemistry of Solids, v. 20, Aug. 1961, p. 177-186.

Resistivities, Hall coefficients and superconducting transition temperatures are measured between 1.1-300° K. in magnetic fields up to 30 k G and for concentrations of 7-24% Mo. The resistivities decrease with increase of Mo; the Hall coefficients are positive and are concentration and temperature dependent only below solute concentrations of 12% Mo; and the alloys are all superconducting at liquid helium temperature. 40 ref. (P15, 2-60, 2-61, 3-73; Ti-b, Mo)

566-P. The Adsorption of Chlorine on Clean Germanium Surfaces. Mino Green and K. H. Maxwell. Physics and Chemistry of Solids, v. 20, Aug. 1961, p. 274-280.

Adsorption studies at -78-20° C. in an all-glass system by crushing a single disk of Ge in the presence of the gas and following the pressure changes. Surface areas of the powders are measured by the B.E.T. method using Kr at liquid nitrogen temperature. Cl adsorbs on Ge to monolayer coverage and a slow desorption of a fraction of the adsorbed chlorine follows the rapid adsorption. 27 ref. (P13d, 2-61; Ge, Cl)

567-P. Specific Heat and Spin Susceptibility of Dilute Alloys. A. Houghton. Physics and Chemistry of Solids, v. 20, Aug. 1961, p. 289-293.

The change in the specific heat and spin susceptibility of a metal of a given valence due to the introduction of a small number of impurity atoms with added valence is calculated by the Thomas-Fermi method. In the case of Cu an exact calculation accounts approximately for the seemingly linear behavior of the change. A check on the validity of the theory is made by recalculating the properties by the techniques of many-body perturbation theory. 10 ref. (P12r, P18m, M25, 2-60, 3-69; Cu-b)

568-P. The Emittance of Iron, Nickel and Cobalt and Their Alloys. W. D. Wood, H. W. Deem and C. F. Lucks. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 119, July 25, 1961, 82 p.

Normal and total emittance and reflectance as functions of temperature and wavelength of solid and molten Fe, Fe-Ni alloys, Fe-18% W, HH and HT (molten) Fe alloys, Ni, Nichrome V, Inconel, Inconel B and X, K-Monel 5700, Haynes alloys B, C, X and 25, Nimonic 75, Co, Co-35% Ni, Co-40% Fe and Co alloy N-155. (P17a, P17d, 2-61; Fe, Ni, Co)

569-P. Some Properties of In_2Te_3 and Ga_2Te_3. J. C. Wooley and B. R. Pamplin. Electrochemical Society, Journal, v. 108, Sept. 1961, p. 874-879.

Summary of measurements of physical parameters at -190 to 600° C. for zone refined and annealed specimens. Data are given for thermal expansion and conductivity, electrical conductivity, Hall effect and lattice parameters with discussion of electron mobility, activation energy, conduction band minimum and energy gap relations to order-disorder condition. 19 ref. (P-general, P11, P15, N10, 2-61; Te-b, In, Ge, 14-68)

570-P. Influence of Surface Energy on Friction and Wear Phenomena. E. Rabinowicz. Journal of Applied Physics, v. 32, Aug. 1961, p. 1440-1444.

Friction and wear phenomena are discussed in terms of surface energy of adhesion of contacting materials. In a friction field, high friction coefficients are found for sliding materials with high surface energy/hardness ratios. An expression is derived for the size of loose wear particles and is tested by experiment with 15 different materials. 14 ref. (P13h, Q9p)

571-P. Temperature-Compensated Debye Temperature of Carbonyl Iron. C. P. Gazzara and R. M. Middleton. Journal of Applied Physics, v. 32, Aug. 1961, p. 1546-1548.

Explicit temperature function which relates the Debye temperature to a change in temperature is determined from X-ray diffraction integrated intensity measurements. The corresponding Debye temperature, corrected for temperature diffuse scattering, is calculated to be 435° K. at temperature of 310° K. 17 ref. (P12r, 2-61; Fe-a)

572-P. Electrical Resistivity of Chromium in the Vicinity of the Neel Temperature. M. J. Marcinkowski and H. A. Lipsitt. Journal of Applied Physics, v. 32, July 1961, p. 1238-1240.

Investigation of the sharply cusped minimum in the resistivity-temperature (35° C.) Plastic deformation eliminates the minimum and causes pronounced change in resistivity-temperature relationship over a wide range of temperatures centered about the Neel temperature. The behavior is analyzed and interpreted in terms of the dependence of Neel temperature on hydrostatic stresses arising from presence of dislocations in deformed material. 15 ref. (P15g, M26b, 2-61, 3-66, 3-68; Cr)

573-P. Magnetization of Nickel Single Crystals. Lambros Tterlikkis and Alvin W. Jenkins, Jr. Journal of Applied Physics, v. 32, July 1961, p. 1293-1296.

Calculation of the off-axis magnetization curves of specimen crystals made by the Lawton and Steward method for arbitrary orientation of the crystal in the magnetic field. Anisotropy coefficients are determined from experimental curves with applied field in symmetry directions. A correcting field determined from the easy axis magnetization curve is utilized to compensate for internal strain effects. 8 ref. (P16, 3-72; Ni, 14-61)

574-P. Two-Phase Permalloy for High-Speed Switching. E. A. Nesbitt and E. M. Gyorgy. Journal of Applied Physics, v. 32, July 1961, p. 1305-1308.

Addition of 2-14% Au to Permalloy for precipitating a second phase in the alloy to control the coercive force and the threshold for rotational flux reversal by appropriate heat treatments. The alloy is prepared by annealing at solution temperature of 900° C. and cooling rapidly, followed by cold rolling tape from approximately 0.014-0.00013 in. thickness for switching applications. The material is then annealed at 600-650° C. (P16a, N-general, 2-60, 2-64; Ni-b, Au)

575-P. Heats of Activation of the Cu/Cu^{++}_{aq} Electrode. Tor Hurlen. Acta Chemica Scandinavica, v. 15, Mar. 1961, p. 621-629.

Determinations of the effect of temperature (0-45° C.) on anodic polarization of Cu in H saturated sulphuric acid solution plus known temperature coefficient data make possible the determination of heats of activation. An apparent Arrhenius factor is calculated. 14 ref. (P15j, P13, 2-61, Cu)

576-P. On the Kinetics of the Cu/Cu^{++}_{aq} Electrode. Tor Hurlen. Acta Chemica Scandinavica, v. 15, Mar. 1961, p. 630-644.

Measurements on a high purity Cu electrode in a hydrogen saturated cupric sulphate-sulphuric acid solution show dependence of the reactions on the Tafel relationship. The deposition rate is proportional to the square of the cupric ion activity. 36 ref. (P13b, P15; Cu)

577-P. High Temperature X-Ray Study of the Thermal Expansion of $IrAs_3$ and $IrSb_3$. Arne Kjekshus. Acta Chemica Scandinavica, v. 15, Mar. 1961, p. 678-681.

The X-ray powder method is used at temperatures from 20-998° C. to determine both linear and volume expansion coefficients. (P11g, 1-54)

578-P. (German.) Magnetic Measurements on One and Two Phase Separation of Nitrogen in Alpha Iron During Aging. Witold Precht. Bergakademie, v. 13, Apr. 1961, p. 265-266.

Measurement of coercive force and electrical resistance with electron microscopic and fracture analysis of nitrided specimens of sintered Armco iron of varying nitrogen content and degree of deformation after aging. (P16, P15g, M-general, N7, 2-60, 2-65, 3-68; Fe-a, N)

579-P. (English.) Initial Magnetization of Nickel Under Tension and High Hydrostatic Pressure. Roman Golebiowski and Roland Wisniewski. Acta Physica Polonica, v. 20, May-June 1961, p. 391-402.

Magnetostriction is discussed as it interacts with internal stresses, deriving an expression relating initial acceptability of strained Ni to its magnetostrictive tensions and crystal isotropy. Initial magnetization of wire is measured under tension and under hydrostatic pressure. (P16b, 3-68, 3-74)

580-P. Effect of Plastic Deformation on Resistivity of Gold-Palladium Alloys. H. J. Logie, J. Jackson, J. C. Anderson and F. R. N. Nabarro. Acta Metallurgica, v. 9, Aug. 1961, p. 707-713.

Strain induced resistivity changes in wire specimens of alloys in the system 0-100% Pd are measured at 77° K. after plastic extension. Resistivity decreases at this temperature at 10-60% Pd and increases for other compositions, the effect being removed by annealing. A theoretical explanation, which depends on the local shifts of Fermi level produced by the deformation potential around a dislocation, predicts effects similar to those observed. 25 ref. (P15g, M26b, 2-60, 2-61, 2-64, 3-68; Au-b, Pd-b)

581-P. Semiconductors and Semimetals. R. W. Ure, Jr. Chapter 3 from "Thermoelectricity--Science and Engineering". Interscience Publishers, Inc., New York 1, 1961, p. 19-74.

The relationship between electrical conductivity, thermal conductivity and the Seebeck coefficient is shown qualitatively for semiconductors and semimetals. The electronic properties are determined by the electron energy levels and distribution. The theory of the transport properties of semiconductors is developed and electron scattering mechanisms discussed. 53 ref. (P15g, P11g; EG-j)

582-P. Thermal Conduction in Thermoelectric Materials. R. W. Keyes and J. E. Bauerle. Chapter 5 from "Thermoelectricity--Science and Engineering". Interscience Publishers, Inc., New York 1, 1961, p. 91-119.

The mechanisms by which heat transportation takes place through thermoelectric materials and the factors which influence it are discussed. Transportation is shown to be limited by various scattering mechanisms. Lattice conduction, electronic conduction and radiative heat conduction are discussed. 35 ref. (P11h)

583-P. (Italian.) On the Possibility of the Reaction $Si + 2CO \rightleftharpoons SiO_2 + 2C$ in the Steelmaking Process. Agostino

Bargone. Technica Italiana, v. 26, Apr-May 1961, p. 173-178.

Thermodynamic considerations during the degassing of molten steel. Results indicate that in the presence of FeO, Fe, CO, Si, SiO_2 and C for temperatures corresponding to the solidification of steel or higher, conditions do not favor the reaction. (P12q, D11)

584-P. (Translation-ConBur.) Reactions of Selenium With Aqueous Solutions of Alkali-Metal Sulphites. G. S. Klebanov and N. A. Ostapkevich. Journal of Applied Chemistry of the USSR, v. 33, Sept. 1960, p. 1938-1941.

Solubility data for Se in Na and K sulphite solutions at 0-152° C. are studied as functions of SO_3 concentration, pH and stirring rate. 5 ref. (P12; Se, EG-e41, 14-68)

585-P. (Translation-ConBur.) Cathodic Behavior of Tellurium in Electrolysis of Alkaline Solutions. O. A. Khan and L. A. Saltovskaya. Journal of Applied Chemistry of the USSR, v. 33, Sept. 1960, p. 2112-2114.

The rate of cathodic liberation of Te is studied as a function of concentration at 20-60° C. Data are given for current efficiency at various current densities and Te concentrations. 6 ref. (P15, 2-60; Te)

586-P. (Russian.) Influence of Prolonged Heating at 350-600° C. on the Viscosity of Austenitic-Ferritic Weldments. S. V. Yunger, M. P. Melnikov and V. I. Logvinov. Avtomaticheskaya Svarka, v. 14, June 1961, p. 14-20.

Investigation of weldments obtained by manual or automatic welding using different electrodes, welding rods and fluxes. Effect of isothermal heat treatment. Phase transformation, microscopy, electrolytic etching and radiography. 11 ref. (P10f, M-general, N-general, 2-64; ST, 7-51)

587-P. Some Physical Properties of Martensitic Stainless Steels. J. G. Hoag. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 68, Sept. 28, 1960, 30 p.

Summary of data for martensitic steels including AISI 403, 410, 414, 416, 420, 431, 440A, 440C, Type 422 and USS 12 MoV. Properties examined include density, specific heat and gravity, moduli of rigidity and elasticity, melting point, thermal conductivity and diffusivity, linear thermal expansion, electrical resistivity, Poisson's ratio and magnetic permeability. 24 ref. (P-general, Q21, 10-54; SS-c)

588-P. (German.) Heat of Formation of $PuBe_{13}$. V. V. Achacinskij and L. M. Kopytin. Kernenergie, v. 4, June 1961, p. 519-520.

Measurement of the heat of formation of the intermetallic compound $PuBe_{13}$ in a micro water calorimeter at 298° K. (P12q; Pu-b, Be-b, 14-68)

589-P. (German.) Direction of Magnetization in Walls of Ferromagnetic Layers. Ekkehard Fuchs. Naturwissenschaften, v. 48, June 1961, p. 450.

Electron microscopic investigation of intensity of radiation through a 400 Å-thick FeNi film and estimation of direction of magnetization. (P17c, P16, 1-54; Fe, Ni, 14-62)

590-P. The 1961 Howe Memorial Lecture--Iron and Steel Div. Role of Chemistry in Metallurgical Research. Lawrence S. Darken. Metallurgical Society of AIME, Transactions, v. 221, Aug. 1961, p. 654-670.

Review of principles of physical chemistry as applied to understanding metallurgical phenomena, particularly in the high temperature field and in areas related to Fe and steel. Consideration of thermodynamic and thermochemical relations, oxidation and diffusion kinetics, phase equilibria, reduction and transformation reactions and liquid-solid phenomena in metals, alloys and alloy systems. 22 ref. (P12, P13, A9k, D11, N-general, 2-62, 10-54)

591-P. The Heats of Solution in Liquid Tin of the Group III Elements Aluminum, Gallium, Indium and Thallium. J. B. Cohen, B. W. Howlett and M. B. Bever. Metallurgical Society of AIME, Transactions, v. 221, Aug. 1961, p. 683-686.

The partial molar heats of solution at infinite dilution in Sn of Al at 300 and 350° C. and of Ga, In and Tl at 240, 300 and 350° C. are measured by Sn solution calorimetry. Al, Ga and Tl are endothermic on solution;

In is exothermic. There is no temperature dependence of the heats of solution and only Al has a measurable change in its heat of solution with composition. 19 ref. (P12e, 2-60, 2-61; Sn-b, Al, Ga, In, Tl)

592-P. The Columbium-Oxygen Equilibrium in Liquid Iron. Michel Elle and John Chipman. Metallurgical Society of AIME, Transactions, v. 221, Aug. 1961, p. 701-703.

The equilibrium of gaseous H_2O-H_2 mixture with liquid Fe-Cb alloys containing 0.2-2.4% Cb shows that the activity coefficient of O is strongly diminished by Cb. The oxide in equilibrium with the melts is identified as CbO_2 with the equilibrium constant being determined at 1600° C. The deoxidizing power is comparable to that of vanadium. 10 ref. (P12e, D11r, 2-61; Fe-b, Cb, O)

593-P. Magnetism in a High-Carbon Stainless Steel. S. M. Purdy. Metallurgical Society of AIME, Transactions, v. 221, Aug. 1961, p. 787-788.

Under certain conditions of hot rolling and air cooling from the hot rolling temperature, bars of a high carbon (0.40% C) chrome-nickel austentic alloy show magnetism even though no ferrite or martensite can be detected by microscopic or X-ray methods. The appearance of magnetism in such alloys is attributed to Cr impoverishment of the austenite grains near the precipitated carbide particles. (P16, N7, N8, 2-64, 3-68; SS-e)

594-P. Density of Liquid Iron Silicates. John Henderson, R. G. Hudson and G. Derge. Metallurgical Society of AIME, Transactions, v. 221, Aug. 1961, p. 807-811.

Densities of melts of the FeO-SiO_2 system in contact with solid Fe are measured by the maximum bubble pressure method for 0-37% SiO_2 and 1255-1410° C. The constitution of the melts is discussed and it is postulated that the structure changes from a distribution of Fe ions in an oxygen ion network at pure "FeO" to a distribution of Fe ions in a network of silicate tetrahedra at the orthosilicate composition. 19 ref. (P10a, P12, D11n, 2-60; Fe-b, Si-b, 14-68)

595-P. Mn Vapor Pressures in the Mn-Fe System. J. H. Smith, H. W. Paxton and C. L. McCabe. Metallurgical Society of AIME, Transactions, v. 221, Aug. 1961, p. 895-896.

Solid solutions in the system containing 61.8-74.5% Mn are analyzed by the Knudsen effusion method at 1185° K. Data are given for Mn activity and vapor pressure with construction of phase equilibrium diagrams and correlation with Raoult's Law as a function of composition and temperature. 6 ref. (P12c, P12b, 2-60, 2-61; Mn-b, Fe)

596-P. Superconducting Wire Solenoids. Australasian Manufacturer, v. 46, July 22, 1961, p. 70, 72, 74-75.

Fabrication of solenoid coils of Cb_3Sn, an extremely brittle compound that becomes superconducting at 18° K. and will sustain magnetic fields of up to 100,000 gauss and can carry current densities of over 150,000 A/sq. cm. (P15g, T1c, 17-57; Cb-b, Sn)

597-P. Some Aspects of Superconductivity. William B. Gager. Battelle Technical Review, v. 10, Sept. 1961, p. 14-17.

The nature of electrical resistance at very low temperatures and the magnetic and thermal properties of superconductors are reviewed with potential applications in frictionless devices, electromagnets and switching devices. (P15g, 17-57)

598-P. Surface Tension of Refractory Metals. S. V. Radcliffe and H. Udin. Manufacturing Laboratories, Inc. Wright Air Development Div. U. S. Office of Technical Services, AD-258567, Dec. 1960, 45 p. $1.25.

The electron bombardment heating technique is shown by this research to be a valid procedure in the measurement of the surface tension of solid refractory metals having low rates of evaporation in vacuum at high temperature. Applied to the measurement of the surface tension of solid Cb, the technique gives values consistent with a theoretical estimate. (P13h, J2g; Cb, EG-d37)

599-P. Heat Transfer Between Metals in Contact. Metallurgia, v. 64 July 1961, p. 26.

Measurements of heat transfer between machined brass and Al in contact with steel and brass, all surfaces having different roughness values. Heat transfer is by surface contact and conduction

through an intervening fluid. Effect of applied pressure, surface finish and thermal conductivities of the solids. (P11k, 3-74; Cu-n, Al, ST)

600-P. (English.) The Influence of Demagnetization and Stress on the Resonance Condition of Spin Wave Resonance. D. Fraitana. Czechslovak Journal of Physics, v. 11, July 1961, p. 500-509.

Thin, monocrystalline and polycrystalline, oriented thin films of Co and Ni are vacuum deposited on cold and heated slides to study saturation demagnetization under a static magnetic field. The magnetization, spin wave resonance spectrum and isotropy constant of magnetostriction are interpreted in terms of Zeeman, dipolar and exchange interactions. 24 ref. (P16, P18m, 1-53, 14-62; Co, Ni)

601-P. Importance of Purity in Manufacturing Brazing Filler Metals for High Temperature Service Applications. Forbes M. Miller. Welding Journal, v. 40, Aug. 1961, p. 821-827.

Application recommendations, composition and physical and metallurgical properties of typical Ni-base brazing alloys for joining stainless steel and Inconel. Effects of refractory oxides and oxygen and nitrogen inclusions on flow properties and brazability of the alloys. Diffusion and erosion and testing techniques. (P-general, Q-general, 2-60; SGA-f, 9-69)

602-P. Nature of Radiation Damage Due to Fast Neutron Bombardment in Ferromagnetic Materials--Very High Permeability Pure Iron and Nickel. G. Biorci, A. Ferro and G. Montalenti. Il Nuovo Cimento, v. 20, Apr. 1961, p. 617-637.

Effects of irradiation with doses of 10^{18} nvt. on permeability, coercive force and approach to saturation. Effect of subsequent annealing at 100-200° C. Theoretical interpretations. (P16, 2-64, 2-67; Fe, Ni)

603-P. (English.) Electrochemical Studies of the Behavior of Metals in Fused Chlorides. R. Littlewood and E. J. Argent. Electrochimica Acta, v. 4, Aug. 1961, p. 155-169.

Electrode potential behavior of Ni and Fe in equimolar NaCl-KCl melts at 700° C. under argon. Effect of melt impurity content and surface area of metal volume of melt ratio on the redox potential of the melt and the Nernst potential of the metal. Effect of $NaNO_3$ additions to the melts. 10 ref. (P15, 2-66; Ni, Fe)

604-P. (German.) Thermal Conductivity of Tellurium. Hans Sussmann. Wissenschaftliche Zeitschrift der Martin-Luther-Universitat Halle-Wittenberg, v. 10, Jan. 1961, p. 33-39.

Measurement of thermal conductivity of polycrystalline plate shaped Te specimens at temperatures from 100-500° K. using a stationary absolute method. Theoretic interpretation in terms of "exciton conductivity". (P11h, 1-53; Te)

605-P. (German.) Influence of the Boundary on Remagnetizing Behavior of Thin Permalloy Films. J. Brackmann, W. Kusterer and W. Metzdorf. Zeitschrift fur Angewandte Physik, v. 13, July 1961, p. 313-321.

Investigation of hysteresis slopes in remagnetization of round and rectangular 500-2500 Å thick films, containing 79-81% Ni and 21-19% Fe, as influenced by boundary structure and film thickness. (P16a, 3-71, 3-73; Ni, Fe)

606-P. (Russian.) Reversible and Irreversible Processes in the Magnetic Reversal of Iron-Silicon Monocrystals. N. M. Salanskii, A. M. Rodichev and V. A. Buravikhin. Fizika Metallov i Metallovedenie, v. 11, June 1961, p. 843-850.

Magnetization, reversible susceptibility and Barkhausen effect in magnetic reversal in different crystallographic directions. Domain structure; micrography. 11 ref. (P16, 3-71, M21; Fe-b, Si, 14-61)

607-P. (Russian.) Influence of Sample Shape on Anisotropy of Coercive Force of Cold Rolled Iron-Silicon. V. P. Abel's and E. L. Nikolaeva. Fizika Metallov i Metallovedenie, v. 11, June 1961, p. 851-855.

Effect of width of an Fe-Si strip on coercive force. Observation of magnetic structure by using Fe powder. 7 ref. (P16a, 3-72, 3-73; Fe-b, Si, 4-53)

608-P. (Russian.) Thermodynamic Properties of Interstitial Solid Solutions With Body-Centered Cubic Lattice. N. S. Fastov. Fizika Metallov i Metallovedenie, v. 11, June 1961, p. 856-863.

Characteristics of a solid solution with unbalanced atoms after an elastic deformation. Dependence of Young's modulus and chemical potential of the dissolved particles on volume change and elongation. 7 ref. (P12, Q21a, 3-68, 3-71; 14-67)

609-P. (Russian.) "Large Drop" Method for the Determination of Surface Tension and Density of Molten Metals at High Temperatures. Yu. V. Naidich and V. N. Eremenko. Fizika Metallov i Metallovedenie, v. 11, June 1961, p. 883-888.

Measurements on the convex meniscus of Cu and Al in a 19-20 mm. diameter graphite or berylium oxide crucible. Temperature coefficient of the surface tension. 9 ref. (P13h, P10a, 1-54; Cu, Al, 14-60)

610-P. (Russian.) Surface Activity of Hydrogen in Liquid Iron. B. A. Baum, K. T. Kurochkin and P. V. Umrikhin. Fizika Metallov i Metallovedenie, v. 11, June 1961, p. 960-961.

"Large drop" method for measuring surface tension. Comparison of results with He activity. 9 ref. (P13h, 1-54, 2-60; Fe, H, 14-60)

611-P. Glassing Characteristics of Low-Alloy Steels. George J. Dormer, George R. Norton and Burton S. Payne. American Ceramic Society, Journal, v. 44, Aug. 1961, p. 375-381.

Thermal expansion, creep, hardenability and thermal shock tests on glass coated A285B, Mayari-R, A203A A225-A, A203-D and German Ti low-alloy and plain carbon steels to determine effects of residual stresses, composition and temperature on mechanical and physical properties of the steel, the coating and the composite layer. (P-general, Q-general; ST, 8-71)

612-P. (German.) Investigation of Silver-Selenium Films. Gerhard Kienel. Wissenschaftliche Zeitschrift der Martin-Luther-Universitat Halle-Wittenberg, v. 10, Jan. 1961, p. 29-32.

Measurement of electrical resistivity and thermovoltage of evaporated Se-Ag films, containing 30-75% Ag, as influenced by composition of film. Au is used as a basis for comparison. (P15g, 1-53, 2-60; Se, Ag)

613-P. (German.) Thermochemistry of Alloys. A. Schneider, H. Klotz, J. Stendel and G. Strauss. Pure and Applied Chemistry, v. 2, no. 1-2, 1961, p. 13-16.

Measurement of enthalpy of formation of InSb, $MgZn_2$, Mg_2Zn_{11} and MgZn; and of enthalpy, free enthalpy and entropy of formation of Fe_2Zr, Al_4Zr_3, Al_3Zr and Al_2Zr. Calorimetric methods are used, including the drop method and ignition by Fe-S mixture. (P12r, P12s, 1-54; In, Mg, Fe, Al, Sb, Zn, Zr)

614-P. (German.) Thermal Effects in the Investigation of the Electrical Conductivity of Germanium in Liquid Helium. E. I. Sawarizkaja. Physikalische Abhandlungen aus der Sowjetunion, v. 4, May 1961, p. 416-418.

Current-voltage measurements of Ge specimens containing small amounts of elements of the 2. and 5. group at 1.7 and 4.2° K. Stepwise and irreversible change of amperage; hysteresis effects. (P11, P15g, P16a, 2-63; Ge-b)

615-P. (German.) Experimental Evaluation of Galvanomagnetic Constants of Copper Single Crystals. H. Bross and Th. Ricker. Zeitschrift fur Physik, v. 163, June 1961, p. 489-498.

Measurement of resistance changes in Cu single crystals containing 0.003% Fe, 0.001% Bi and 0.02% alpha O given orientation in magnetic fields of varying field strength at room temperature, 77.3 and 90.2° K. (P15g, 2-60, 2-61, 3-72; Cu, 14-61)

616-P. (German.) Conductivity Characteristics of Polycrystalline Selenium. F. Eckart. Zeitschrift fur Naturforschung, v. 16a, June 1961, p. 631.

Measurement of electrical conductivity of Se at high temperatures (290-450° K.) after purging by O, N, H and air at 300° C. Conductivity as influenced by small halide impurities in Se. (P15g, 1-53, 3-69; EG-j43)

617-P. Copper-Alloy Extrusions. J. P. Lynch, C. F. DeVarney and C. J. Connors. Machine Design, v. 33, Sept. 28, 1961, p. 156-162.

Tabulation of physical, mechanical and fabricating properties and design recommendations for extruded parts of Cu-base alloys as a guide to material selection. Alloys covered include ASTM

B124, B16, B21-A, B21-C, B138, B133, B187 and B150 alloys, architectural and aluminum-silicon bronzes, free-cutting muntz and muntz metal, tellurium copper and Ni-Ag alloys. (P-general, Q-general, G17k; Cu-b, 4-58, 17-57)

618-P. (Translation-Brutcher no. 5165.) Effect of Carbon and Silicon on the Surface Tension of Pig Iron. K. I. Vashchenko and A. P. Rudoi. Izvestiya VUZ-Chernaya Metallurgiya, v. 3, Mar. 1961, p. 11-15.

Study of synthetic pig irons within fairly wide composition and temperature ranges. Effect of increasing carbon contents on surface tension of hypoeutectic, eutectic and hypereutectic pig irons. Surface tension of pig irons with 0.10-0.15% Si and with 1.13 and 1.50% Si as function of carbon additions. (P13h, 2-60; CI-a, C, Si)

619-P. (English.) Magnetic Susceptibilities of Cr and Cr-Fe Alloy. Masao Shimizu and Takeshi Takahashi. Physical Society of Japan, Journal, v. 16, Aug. 1961, p. 1544-1548.

Magnetic susceptibilities are investigated using the band picture for 3d electrons as a model in order to explain the increase of susceptibility with decreasing temperature at low temperatures. 8 ref. (P16n, P16p, 1-54; Cr, Fe)

620-P. (English.) Measurement of Seebeck Effect in Plastically Bent Germanium. Tadayoshi Yumashita and Tokio Ohta. Physical Society of Japan, Journal, v. 16, Aug. 1961, p. 1565-1569.

Changes of thermoelectric power and electrical resistivity in n and p-type Ge due to plastic bending are measured at 25-300° C. and analyzed theoretically. Value of the dislocation-acceptor level is estimated. 5 ref. (P15j, 1-54, 3-68; Ge)

621-P. (English.) Theory of Seebeck Effect in Plastically Deformed Semiconductors. Tokio Ohta. Physical Society of Japan, Journal, v. 16, Aug. 1961, p. 1561-1564.

Effect of the reduction of free electron density due to the dislocation-acceptors and the scattering due to the space charge around the dislocation on the thermoelectric power of n-type materials is theoretically investigated. Results are compared with experimental data for near intrinsic n-Ge. 10 ref. (P15j, 1-54; EG-j41)

622-P. (English.) Magnetic After Effects in Manganese Zinc Ferrites. Tsuneo Akashi and Takashi Okada. Physical Society of Japan, Journal, v. 16, Aug. 1961, p. 1641.

Influence of partial oxygen pressure during sintering at 1200° C. for 4 hr. on the Richter type after-effect and time decrease of initial permeability in Mn-Zn ferrites. 6 ref. (P16q, 1-54, 2-66, 3-74; 14-68)

623-P. (English.) Linewidth of Cyclotron Resonance of Pure Germanium. Hazimu Kawamura, Masakazu Fukai, Yoshikazu Hayashi and Tamotsu Hashimura. Physical Society of Japan, Journal, v. 16, Aug. 1961, p. 1646.

Study of the cyclotron resonance absorption of pure Ge at 1.6° K. using a 6 mm. microwave shows that the width of the resonance line increases with increased microwave power absorption because of the resulting rise of electron temperature and increased collision frequency. (P16, 1-54, 2-63; Ge)

624-P. Arc-Imaging Furnace Tests Materials in High Thermal Flux. Octave Romaine. Space/Aeronautics, v. 36, Sept. 1961, p. 71-74.

Specimens such as Cu, stainless steel and bakelite are tested for high-temperature properties, comparative performance evaluation under specified thermal flux and atmospheric conditions, determination of thermal constants and investigation of heat transfer. (P11, P12, 1-53; Cu, SS, NM-d)

625-P. (Translation-ConBur.) The Electrochemical Behavior of Titanium. L. P. Zhilina. Journal of Applied Chemistry of the USSR, v. 33, Nov. 1960, p. 2490-2494.

Determination of polarization curves for Ti in a H_2SO_4 solution containing added $K2SO_4$ and HF. Curves are measured by the potentiostatic method at 25° C. (P17g, 1-54; Ti)

626-P. (Translation-ConBur.) Influence of Alloying Additives on Hydrogen Absorption of Steels. S. A. Balezin and N. I. Narushevich. Journal of Applied

Chemistry of the USSR, v. 33, Nov. 1960, p. 2500-2505.

Hydrogen absorption of alloy steels during chemical pickling as affected by percentage contents of Cr, Ni and Cu. 13 ref. (P13d, L12g, Q26s, 2-60; ST, Cr, Ni, Cu, H)

627-P. (Translation.) Adsorption, Migration and Evaporation of Cadmium on Tungsten. Sokol'skaya. Soviet Physics--Solid State, v. 3, Sept. 1961, p. 574-579. (Translation of Fizika Tverdogo Tela, v. 3, Mar. 1961).

Study at various temperatures indicates that adsorption varies in accordance with the geometric proportions of the adsorbed atoms and the tungsten lattice. The work function of a thick layer of Cd is measured and the heat of evaporation of Cd from W is found to be 1.5 ± 0.1 ev. per atom. (P12, P13, P15, 1-54; Cd)

628-P. Non-Ferrous Metals in Missiles. P. N. Cornall. Metal Industry, v. 99, Sept. 1, 1961, p. 162-167.

Properties given for FV520 stainless steel, RR58 Al alloy, ZTY Mg alloy and D.T.D. 5053 Ti include stiffness as influenced by temperature, Young's modulus, expansion coefficient, thermal stress modulus, thermal conductivity, specific heat, density, thermal diffusivity, corrosivity, ultimate strength, proof strength and elongation. (P-general, Q-general, 2-61; T24e; SS, EG-a38, Al-b, Mg-b, Ti)

629-P. Densities of Molten Aluminum Silicon and Lead Tin Alloys. Rajendra Sharan and D. Swarup. Banaras Hindu University, Journal of Scientific Research, v. 11, Dec. 1961, p. 62-72.

Using the displacement method and the constant volume method, the density of Al-Si alloys (3.765-10.731% Si) is determined at 730° C. The influence of 50 and 100° C. of superheat on Pb-Sn alloys is studied as a function of density. (P10a, 2-61; Al-b, Si, Pb-b, Sn, 14-60)

630-P. (Russian.) Effect of Apparent Variation in Liquid Metal Specific Gravity Caused by Electromagnetic Forces. L. A. Verte. Tsvetnye Metally, June 1961, p. 61-64.

Use of electromagnetic field in molten metal to increase its specific gravity and to cause dielectric inclusions either to sink to the bottom of the hearth or to ascend to the surface of the melt. Experiment with Hg as the molten metal and W as the dielectric inclusion suggesting application for metal purification. (P10a, P16, C-general; Hg, W, 9-69)

631-P. Vacuum-Processed Alloys for Tomorrow's Automobile. A. M. Aksoy and P. Lillys. SAE Journal, v. 69, Sept. 1961, p. 60-63.

Testing of low-alloy steels, tool-steels, magnetic materials and Fe-Al alloys to determine the effects of vacuum induction melting, vacuum arc remelting and vacuum degassing processes on the physical and mechanical properties of the materials. (P-general, Q-general, D-general, 1-73, T21; SGA-n, AY, TS, Al)

632-P. Structural Materials. E. J. Zeil Berger and J. H. Lieb. Space/Aeronautics R & D Technical Handbook, v. 4, 1961-1962, p. H16-H17.

Physical and mechanical properties of refractory metals (Cb, Mo, Ta, W) and alloys, graphite, refractory oxides, carbides, nitrides and borides and plastic-glass structures. (P-general, Q-general; SGB-s)

633-P. (Ukranian.) Study of Electric Transfer in Some Alloys of High Electric Resistance. I. N. Francevich and I. I. Kovenskyj. Dopovidi Academii Nauk Ukrainskoi SSR, May 1961, p. 636-638.

Determination of charge values carried by the ions in Fe-Cr, Fe-Cr-Al and Fe-Cr-Ni alloys in the temperatures of 1100-1400° C. by radioactive isotopes. 7 ref. (P15, 1-59, 2-62; SGA-q, Fe-b, Al, Cr, Ni)

634-P. (Ukranian.) Heat Capacity of Plastically Deformed Copper. V. A. Pervakov and V. I. Khotkevych. Ukrainskyi Fizychnyi Zhurnal, v. 6, Feb. 1961, p. 240-243.

Effect of high degree (40-75%) plastic deformation of Cu on its heat capacity measured from -196° C. to 120° C.; comparison of heat capacity of annealed and deformed samples. 6 ref. (P12r, 2-64, 3-68; Cu)

635-P. (Ukranian.) Thermodynamics of Boiling Layer in Reactors for Direct Reduction of Iron From Iron Ores. O. S. Nechyporenko. Dopovidi Academii Nauk Ukrainskoi RSR, Apr. 1961, p. 495-499.

Calculation of optimal conditions for the boiling Fe ore layer in calcining and reduction reactors, as influenced by the speed of injected flame jet, the sinter diameter and the pressure. 9 ref. (P12, B15; Fe)

636-P. (Ukranian.) Heat Transfer During Reduction of Iron in a Boiling Charge Layer. O. S. Nechyporenko. Dopovidi Akademii Nauk Ukrainskoi RSR, June 1961, p. 749-752.

Heat transfer processes in the boiling charge layer during reduction from ore are evaluated by the equations of Reynolds and Grashof and formulas are developed for design of roasting and reduction equipment. 9 ref. (P11k, D-general)

637-P. (French.) Helicoidal Antiferromagnetism of $MnAu_2$, Studied by Neutron Diffraction. Andre Herpin and Pierre Meriel. Journal de Physique et le Radium, v. 22, June 1961, p. 337-348.

Determination of crystal structure and of magnetic structure from 100-403° K. with and without simultaneous exposure to a magnetic field based on neutron diffraction measurement. 9 ref. (P16p, N22j, N23a, 2-61; Mn, Au)

638-P. (Czech.) Tensimetric Measurement of Thermodynamic Functions of Silver in Silver-Copper Alloy by the Method of Isotope Exchange. J. Kucera, L. Dvorak and Z. Kudelasek. Ceskoslovensky Casopis Pro Fysiku, v. 11, no. 4, 1961, p. 277-284.

The rate of evaporation of Ag at 690-885° C. as indicated by radioactive Ag^{110} is used to determine thermodynamic functions and the phase diagram for an Ag-Cu alloy. Data are given for vapor tension, thermodynamic activity, activity coefficient, partial molar free mixing enthalpy, sublimation heat and partial molar mixing enthalpy and entropy. 10 ref. (P12, M24b, 1-59, 2-60; Cu-b, Ag)

639-P. (English.) The Influence of Plastic Deformation on the Magnetostriction Constant of Iron-Nickel Alloys. P. Suda and J. Paces. Czechoslovak Journal of Physics, v. 11, Aug. 1961, p. 602-608.

The magnetostriction constant and volume magnetostriction of wire specimens containing 28.16-76.60% Ni and 22.95-63.35% Fe, with an alloy containing 17.42% Co, are determined by tensometric measurement after annealing and plastic elongation. The influence of crystallographic texture is examined by X-ray diffraction. Phenomena observed in the decrease of magnetostriction are explained in terms of a stress-induced mechanism, assuming the influence of lattice deformation on spin-orbital interaction. 13 ref. (P16b, M26, 3-66, 3-68; Fe-b, Ni-b, Co)

640-P. (English.) Studies on the Nickel Matte. Pt. 1. Nickel-Iron-Sulphur System. Kiyokado Nishihara and Yoshio Kondo. Kyoto University, Faculty of Engineering, Memoirs, v. 23, Apr. 1961, p. 242-263.

Thermomagnetic analyses, X-ray studies and magnetization intensity measurements to determine magnetic properties of smelted specimens of the binary system Ni-S and of the ternary system Ni-Fe-S. 25 ref. (P-general, 1-53; Ni)

641-P. The Chemistry of the Rare Earths. Therald Moeller. Chapter 2 from "The Rare Earths". John Wiley & Sons, Inc., New York 16, 1961, p. 9-28.

Rare-earth metal chemistry is discussed in terms of electron configuration and related properties. Review of oxidation states, magnetic characteristics, light absorption properties, size relationship and stabilities of polyamine and polycarboxylic acid chelates. 75 ref. (P-general, R1h; EG-g45)

642-P. Physical Properties of the Rare Earth Metals. A. H. Daane. Chapter 13 from "The Rare Earths". John Wiley & Sons, Inc., New York 16, 1961, p. 177-189.

Review of melting points, transition temperatures, vapor pressures, crystal structures, densities, electrical resistivities, heat capacities, magnetic properties, thermal expansion coefficients, corrosion resistance, thermal conductivity and Hall coefficient for each rare-earth metal. 52 ref. (P-general, M26, R1, 10-54; EG-g45)

643-P. Rare-Earth Metals in Magnesium Technology. T. E. Leontis. Chapter 19 from "The Rare Earths". John Wiley & Sons, Inc., New York 16, 1961, p. 455-498.

Mg-rare earth alloys of high strength and creep resistance are prepared for jet engine parts in the form of sand and permanent mold

castings. Physical, mechanical and electrical properties are presented with special reference to the effects of other metals at 90-700° F. 44 ref. (P-general, Q-general, 2-60, 3-69, T24b; Mg, EG-g45, 5-60, 5-63)

644-P. An Approach to Extreme Temperature Alloys for Liquid Metal Space Power Applications. B. E. Farwell, R. S. Carey and D. E. Deutsch. Society of Automotive Engineers, 417A, 1961, 5 p.

Outline of presently available alloys and refractory metals for use in jet engines, steam power plants and other space power systems. W, Ta, Mo, Cb, Cr, Fe, Co and Ni are alloyed, fabricated and tested at 900-2500° F. with tabulation of physical and mechanical properties. 5 ref. (P-general, Q-general, T24e; SGA-h, Cb, Co, Cr, Fe, Mo, Ni, Ta, W, 14-60)

645-P. (German.) Viscosity of Pure Liquid Ferric Oxide (FeO) at Temperatures Between 1380 and 1490° C. Hermann Schenck, Martin G. Frohberg and Walter Rohde. Archiv fur das Eisenhuttenwesen, v. 32, Aug. 1961, p. 521-523.

Measurement of viscosity of FeO in a pure Fe crucible using a rotation viscosimeter with a rotating body of pure iron. (P10f, 1-54; Fe, 14-60, 14-68)

646-P. General Development in Ceramics for Marine Engineering. F. H. Aldred and N. W. Hinchliffe. American Society of Naval Engineers Inc., Journal, v. 73, Aug. 1961, p. 453-462.

Physical and mechanical properties are given for various metallurgical applications including the use of refractories in furnaces and of ceramics in welding and sand blast nozzles, heat engines in boiler plants, gas turbines and nuclear power plants and electronic equipment. 19 ref. (P-general, Q-general, T22; NM-f, 17-57)

647-P. (Russian.) Investigation of the Electric Resistance of Ce, La and Nd at Pressures Up to 250 Atm. L. F. Vereshchagin, A. A. Semerchan and S. V. Popova. Doklady Akademii Nauk SSSR, v. 138, May 1961, p. 1059-1061.

Maximum and minimum resistance are determined as functions of polymorphous transformations. (P15g, N-general, 3-74; Ce, La, Nd)

648-P. (Ukranian.) Study of the Influence of Plastic Deformation on Electric Resistance of Alloys. I. Y. Dikhtyar, S. H. Lytovchenko, R. H. Fedchenko. Ukrainskyi Fizychnii Zhurnal, v. 6, Feb. 1961, p. 233-237.

Dislocations and vacancies in Fe-Mo alloys are studied as they affect resistance. 4 ref. (P15g, M26b, 3-71; Fe, Mo)

649-P. (Russian.) Surface Tension of Certain Intermetallic Alloys. V. N. Eremenko, V. I. Nyzhenko and Y. V. Naidych. Izvestiya Akademii Nauk SSSR--Metallurgiya i Toplivo, Mar. 1961, p. 150-154.

Isothermic curves are established for surface tension and density of Cu-Al, Ni-Al and Ni-Be alloy systems at 1640° C. by the falling drop method. 20 ref. (P10a, P13h; Al, Be, Cu, Ni)

650-P. (Russian.) Viscosity of Liquid Nickel-Aluminum Alloys. A. A. Vertman and A. M. Samarin. Izvestiya Akademii Nauk SSSR--Metallurgiya i Toplivo, Mar. 1961, p. 159-160.

Study of kinematic viscosity at 1600-1700° C. with special reference to the effect of Ni_3Al on viscosity. (P10f, 2-60, 2-62; Ni, Al, 14-60)

651-P. (French.) Effect of Nonmagnetic Substitution Impurities on the Interatomic Magnetic Points in a Metal. Y. A. Rocher. Journal de Physique et le Radium, v. 22, June 1961, p. 367-376.

To explain the change of electrical and magnetic properties of a magnetic metal in the presence of Al, Cu, Zn, Ga and other nonmagnetic impurities, the case is studied when the spins of two magnetic atoms are coupled through an intermediate impurity atom. Effect of impurities on Curie point and electrical resistivity. 11 ref. (P16, P15, 2-60, 3-69; Al, Cu, Ga, Zn)

652-P. Pole Figures for Randomly Oriented Sheets of Silicon Steel and Aluminum. K. D. Maji and E. G. Ramachandran. NML (National Metallurgical Laboratory) Technical Journal, v. 3, May 1961, p. 28-35.

Calculation of the intensities of emergent X-rays after passage over an entire Debye cone through sheets of silicon and Al tilted at various angles. Tables showing emergent X-ray intensities versus

azimuth angle for angles of tilt from 10-67.5°. (P17c, M22f, 1-54; ST, Al)

653-P. (Translation-AIP.) Photoelectric Yield for Soft X-Rays. A. S. Ganeev and I. M. Izrailev. Soviet Physics--Technical Physics, v. 31, Sept. 1961, p. 270-274.

Cathodes made of Al, Ag, Ta and W are irradiated with X-rays with energies from 4-9 kev. to determine the dependence of photoelectric yield on energy and incidence angle. 7 ref. (P15k, 1-54; Al, Ag, Ta, W)

654-P. Cathodic Behavior of Iron Single Crystals and the Oxides Fe_3O_4, Gamma-Fe_2O_3 and Alpha-Fe_2O_3. C. D. Stockbridge, P. B. Sewell and M. Cohen. Electrochemical Society, Journal, v. 108, Oct. 1961, p. 928-933.

Potential current time relations are studied for Fe and Fe oxide surfaces during cathodic reduction in borate/HCl solution at 7.6 pH. Effect of crystallographic orientation and changes in surface microstructure on hydrogen overpotential. Comparison with reactions occurring on surfaces exposed to air. 10 ref. (P15, R1h; Fe-b, 14-61, 14-68)

655-P. Composition and Thickness Effects on Magnetic Properties of Electrodeposited Nickel-Iron Thin Films. Irving W. Wolf. Electrochemical Society, Journal, v. 108, Oct. 1961, p. 959-964.

A magnetic field is used during deposition to align the magnetic axes in films in one direction so that the film exhibits a single "easy" axis of magnetization, establishing an "induced" anisotropy. Effect of thickness (500-6000 Å) and composition (60% Ni-100% Ni) on the anisotropy field, H_k, as well as on wall coercive force, H_c and easy direction disturb, H_{cd}, are presented with evidence for stress interaction with magnetization and effects on substrate roughness. 10 ref. (P16, L17, 2-60, 3-72, 3-73; Ni-b, Fe, 14-62)

656-P. (English.) Swelling in Alpha Uranium Due to Irradiation. S. F. Pugh. Journal of Nuclear Materials, v. 4, July 1961, p. 177-199.

Review of phenomena causing volume expansion in specimens irradiated to about 1/2% burn-up at 400-650° C. in Na with and without thermal cycling as determined by metallography and mechanical testing. Relation to structural variations, properties of the specimen and irradiation variables with special attention to grain boundary cracking, distortion and embrittlement and nucleation and growth of fission product gas bubbles causing void formation. 34 ref. (P10d, M27, M28n, Q-general, 2-67; U)

657-P. The Calculation of Metallic Hall Constants--Topological Aspects and Applications to Copper. John R. Klauder. Bell System Technical Journal, v. 40, Sept. 1961, p. 1349-1367.

A numerical method for calculating the Hall constant which requires a topological investigation to be carried out on a two-dimensional plane. Each of several parallel two-dimensional planes in crystal-momentum space are analyzed to find, on a single sheet of Fermi surface, the number of non-intersecting closed contours that surround an arbitrary point. Application of this technique for the Pippard model for copper. 11 ref. (P15p, 1-54; Cu)

658-P. Properties of High-Resistivity Gallium Arsenide Compensated With Diffused Copper. J. Blanc, R. H. Bube and H. E. MacDonald. Journal of Applied Physics, v. 32, Sept. 1961, p. 1666-1679.

Hall effect and photocurrent are measured from low temperatures to 300° K. The temperature and wavelength dependence of photosensitivity is determined and donor and acceptor energies are discussed. Spectral response, optical quenching and the compensation process. 17 ref. (P15p; EG-j)

659-P. Flash Method of Determining Thermal Diffusivity, Heat Capacity and Thermal Conductivity. W. J. Parker, R. J. Jenkins, C. P. Butler and G. L. Abbott. Journal of Applied Physics, v. 32, Sept. 1961, p. 1679-1684.

A high intensity light pulse and thermocouple and oscilloscope and used to measure samples of Cu, Ag, Fe, Ni, Al, Sn, Zn, 1020 steel, 4340 steel, HK31 Mg alloy and 6Al-4V Ti alloy. 6 ref. (P11, 1-54; Ag, Al, Cu, Fe, Ni, Zn ST, Mg-a, Ti-a)

660-P. Cross-Section Ratios of Sensitizing Centers in Photoconductors. R. H. Bube. Journal of Applied Physics, v. 32, Sept. 1961, p. 1707-1709.

CdS, CdSe, ZnSe, GaAs, InP, GaSe and ZnTe photoconductors doped with Cu, Br, Ag, As, Si, Sn, Cl and In are investigated and the ratio of capture cross section to free electron cross section is determined from measurements of thermal quenching as a function of excitation intensity. Doubly charged centers are detected. 10 ref. (P18j, 1-54)

661-P. Effect of Temperature on the Exoemission of Electrons From Abraded Aluminum Surfaces. W. T. Pimbley and E. E. Francis. Journal of Applied Physics, v. 32, Sept. 1961, p. 1729-1733.

Exoemission of a surface abraded to produce vacancies is measured with a Geiger counter and found to depend upon the vacancy diffusion and temperature (9.9-44.4° C.). Activation energies are measured. 11 ref. (P17, P13a, 2-61, 3-71; Al)

662-P. Characteristics of the Annealing Kinetics of Tin Films Deposited at 88° K. J. Priest, C. Chior and H. L. Caswell. Journal of Applied Physics, v. 32, Sept. 1961, p. 1772-1776.

The electrical resistance of high-purity films is measured to 180° K. and the annealing behavior is found to depend upon the oxygen content of the atmosphere and on film thickness. Defect resistivity and annealing peak activation energies are determined. 17 ref. (P15g, P13a, N7d, 2-60, 3-73; Sn, 14-62)

663-P. Thermionic Emission of UC-Nb. R. H. Abrams, Jr., and F. E. Jamerson. Journal of Applied Physics, v. 32, Sept. 1961, p. 1783-1784.

A cathode is prepared from 80 vol.% UC and 20 vol.% Cb by pressure bonding at 1700° K. under He pressure of 680 atm. The thermionic emission and work function are measured by vacuum heating to 1960° K. using electric fields to 23,000 v. per cm. The saturation current is determined. (P15k, 1-54)

664-P. Angular Dependence of Torque in Anisotropic Permalloy Films. W. D. Doyle, J. E. Rudisell and S. Shtriknam. Journal of Applied Physics, v. 32, Sept. 1961, p. 1785-1787.

Thin films of 77% Ni are vacuum deposited in a magnetic field and the torque is measured with a torque magnetometer. The angular dependence is determined as well as the anisotropy and the rotational hysteresis. 10 ref. (P16, 1-54; Ni-b, 14-62)

665-P. Photovoltaic Effects in Cs_3Sb Films. Frederick Wooten. Journal of Applied Physics, v. 32, Sept. 1961, p. 1789-1790.

Thin films are vapor deposited on glass substrates using Al electrodes. Electrical resistivity, thermoelectric power and Seebeck coefficient are measured. The photovoltaic effect is determined and the influence of band bending on the photoemission is discussed. 4 ref. (P15j, N15g, 1-54; Cs, Sb)

666-P. Voids in Resolidified Drops of Molten Metal. J. C. Kelley. Journal of Applied Physics, v. 32, Sept. 1961, p. 1797-1798.

Metal rods of spectroscopically pure Ni, Cb and W are suspended in glass tubing and melted with an electron gun to form a molten drop, then resolidified. Voids in the drops are indicated as introducing errors in the measurement of surface tensions. 4 ref. (P13h, 1-54; Cb, Ni, W)

667-P. Thermal Conductivity in Two-Phase Alloys. J. B. Schroeder. Journal of Applied Physics, v. 32, Sept. 1961, p. 1798-1799.

A mechanism is proposed for thermal conductivity in two-phase bismuth telluride which involves circulating currents, the Seebeck emf. and the Peltier effect. Grain structure is shown to affect conductivity. 4 ref. (P11h, P15j, 1-54)

668-P. Angular Dependence of Magnetoresistance in HgSe. T. C. Harman. Journal of Applied Physics, v. 32, Sept. 1961, p. 1800-1801.

Crystals are grown and samples are cut, lapped, annealed and etched. Electrodes are attached and the magnetoresistance is measured as a function of magnetic field orientation. Conduction band anisotropy is detected. 5 ref. (P15, P16, 1-54)

669-P. Thermoelastic Equations and Grueneisen's Relation. A. M. Freudenthal. Journal of Applied Physics, v. 32, Sept. 1961, p. 1801-1802.

Thermoelastic and thermoinelastic equations are derived by a stress analysis invoking the Gureneisen relation, thermal expansion, bulk modulus and specific heat. Thermal wave propagation is discussed. 5 ref. (P11, 1-54)

670-P. Thermionic Emission From a Tantalum Crystal in Cesium or Rubidium Vapor. H. F. Webster. Journal of Applied Physics, v. 32, Sept. 1961, p. 1802-1803.

The thermionic emission patterns are obtained using a phosphor screen and hemispherical cathode technique. Emission is found to depend upon crystallographic orientation. Vapor deposition changes the work function as well as the pattern form. (P15k, N15g, 1-54)

671-P. Theory and Use of Thermostatic Bimetals. P. Martin and N. Yarworth. Engineering, v. 192, Sept. 22, 1961, p. 366-367.

Thermostatic bimetals tested are Fe-base alloys containing 14-50% Ni with small additions of Cr and Mn. Determination of the effect on thermal activity of varying and low expansion component in combination with a common high expansion alloy at -70 to 500° C. Application of thermostatic bimetals for industrial and domestic use (thermostat, voltage regualtor). (P11, 1-54; SGA-a, Fe, Ni, Cr, Mn)

672-P. (German.) Electron Diffraction Technique for Thermomagnetic Analysis. S. Yamaguchi. Zeitschrift fur Instrumentenkunde, v. 69, Aug. 1961, p. 224-226.

Measurement of magnetic induction of Invar (64% Fe, 36% Ni) powder and investigation of magnetic anisotropy of Co crystals by double electron diffraction exposures at low (40° C.) and high (300° C.) temperatures. (P16, 1-54, 2-61; Co, Fe, Ni)

673-P. Some Electrical Resistivity Measurements on a Series of Iron-Chromium Alloys. R. W. Powell, R. P. Type and Margaret J. Woodman. Philosophical Magazine, v. 6, July 1961, p. 857-862.

Electrical resistivities of Fe and five 1.2-5.58% Cr-Fe alloys measured at -269 to 910° C. Both the temperature of alpha to gamma transformation and the consequent decrease in apparent electrical resistivity (neglecting dimensional changes) are approximately linear functions of the Cr content. Hysteresis is observed on cooling. 5 ref. (P15g, 2-60, 2-61, 2-64; Fe-b, Cr)

674-P. Reinterpretation of Discordant X-Ray Results for the Debye Temperature of Silver. F. H. Herbstein. Philosophical Magazine, v. 6, July 1961, p. 863-869.

Values given in the literature for the Debye temperature of Ag as a function of temperature are derived from measurements of elastic constants and from the temperature variation of Bragg intensities and are not in good agreement. Reinterpretation of the X-ray measurements, by a method due to Chipman (1960), gives new values which agree satisfactorily with the elastic-constant values. 15 ref. (P12r, M22g, Q21, 2-61; Ag)

675-P. The Interfacial Energy of Coherent Twin Boundaries in Copper. M. C. Inman and A. R. Khan. Philosophical Magazine, v. 6, July 1961, p. 937-938.

Electron transmission microscopy study of thin films of OFHC Cu annealed at 950° C. Coherent twin boundary-grain boundary intersections are observed and correlated with data for the inclination of the twin plane to the surface for computing the true dihedral angles of intersections. 4 ref. (P13h, M27e, 2-64; Cu-a)

676-P. The Solubility of Krypton in Liquid Cadmium and Indium. G. W. Johnson. Philosophical Magazine, v. 6, July 1961, p. 943-946.

Measurements at 1000-1300° C. on liquid In and at 1150° C. for Cd, with thermodynamic calculation of the solubility of Kr as a function of temperature, using the Ostwald solubility coefficient. Surface energy and vibrational entropy relations are derived with comparison made to Pb and Sn. 7 ref. (P12e, 2-61; In, Cd, Kr)

677-P. The Effect of Various Gases and Vapors on the Surface Tension of Mercury. M. E. Nicholas, P. A. Joyner, B. M. Tessem and M. D. Olson. Journal of Physical Chemistry, v. 65, Aug. 1961, p. 1373-1375.

The effects of He, H_2, N_2, O_2, CO_2, H_2O, CH_4, C_3H_8, stopcock grease and pump oil on surface tension of purified Hg is determined in vacuo at 25°. Na, Mg, Zn, Cd, Ph, Sn, Tl, Ni, Al, Cr, Cu, Au, Pt and Ag are removed by HNO_3, amalgams and vacuum distillation. 16 ref. (P13h, 1-54; Hg)

678-P. Rare Earths. Pt. 2. A Mass Spectrometric Determination of the Heats of Sublimation (or Vaporization) of Neodymium, Praseodymium, Gadolinium, Terbium, Dysprosium, Holmium, Erbium and Lutetium. David White, Patrick Walsh, Harold W. Goldstein and David F. Dever. Journal of Physical Chemistry, v. 65, Aug. 1961, p. 1404-1409.

A mass spectrometer is adapted for thermodynamic investigations at elevated temperatures. Chemical reactions and effusion are observed. Heats of transition, sublimation and vaporization are determined. 13 ref. (P12, 1-54; EG-g45)

679-P. Rare Earths. Pt. 3. A Mass Spectrometric Investigation of the Isomolecular Oxygen-Exchange Reactions of Lanthanum, Cerium, Praseodymium and Neodymium With Their Monoxides. Patrick N. Walsh, David F. Dever and David White. Journal of Physical Chemistry, v. 65, Aug. 1961, p. 1410-1413.

Equilibrium constants, heat of reaction and dissociation energies are determined for the exchange reactions at 1900° K. The electronic contributions to the entropy of the gaseous monoxides are discussed. 13 ref. (P12, 1-54; EG-g45)

680-P. Correction of the Potassium Vapor Pressure Equation by Use of the Second Virial Coefficient. R. J. Thorn and G. H. Winslow. Journal of Physical Chemistry, v. 65, Aug. 1961, p. 1297-1302.

Absolute vaporization energy, dissociation energy, heat of vaporization and free energy are determined at high temperatures. 21 ref. (P12, 1-66; K)

681-P. (German.) Use of Modern Statistical Methods in Production Control of Light Metal Die Casting. Metall, v. 15, Sept. 1961, p. 863-869.

Electromagnetic induction measurements of electrical conductivity in quality control of homogenized and warm aged AlSiMg alloy die casting. (P15g, P16, 1-53, 17-54; Al-b, Si, Mg, 5-61)

682-P. Magnetic Materials. Edgar Allen News, v. 40, Sept. 1961, p. 196-198.

Magnetic properties of hot worked W, Cr and Co steel magnets after annealing, solution treatment and quenching. Determination of the demagnetization curves and the effects of the alloy composition, heat treatment, quenching, section thickness and the manufacturing method on remanence, coercivity and maximum energy product. (P16, 2-60, 2-64, 3-73; ST, SGA-n)

683-P. (German.) Electrochemical Properties of Various Electrolytic Nickel Types. Pt. 1. E. Raub and A. Disam. Metalloberflache, v. 15, July 1961, p. 193-197.

Measurement of electric potential and anode potential versus current density curves for various types of electrolytic Ni and for rolled Ni in NaCl and 0.1 n H_2SO_4 solution at room temperature in the presence of air and emf. measurements in chloride, sulphate and sulphite containing solutions using electrodes of electrolytic Ni or NiCr alloys. (P15, L17c, 2-61, 2-66; Ni, Cr)

684-P. (German.) Electrochemical Properties of Various Electrolytic Nickel Types. Pt. 2. E. Raub and A. Disam. Metalloberflache, v. 15, Aug. 1961, p. 229-233.

Investigation of corrosion and contact corrosion of various electrolytic Ni and NiCr electrodes by emf. measurements of the investigated metals. (P15, L17c, R-general, 1-54; Ni, Cr)

685-P. (Russian.) Magnetic Properties of a Polycrystalline Alloy, Cu + 22.8 at.% Manganese. I. G. Fakidov and B. V. Znamenskii. Zhurnal Eksperimental'noi i Teoreticheskoi Fiziki, v. 40, May 1961, p. 1522-1523.

Detailed investigation of physical properties in an unregulated condition including magnetocalorific effect. Magnetization curves. 9 ref. (P16; Cu, Mn)

686-P. (Russian.) Paramagnetic Resonance in Metallic Al. A. A. Galkin and V. P. Naberezhnykh. Zhurnal Eksperimental' noi i Teoreticheskoi Fiziki, v. 40, June 1961, p. 1876-1877.

Observation of electronic paramagnetic absorbtion on an Al monocrystal of a residual resistance of 6.7×10^{-5}, corresponding to the length of the free path of an electron, $2. \times 10^{-2}$ cm. 8 ref. (P16p; Al, 14-61)

687-P. (German.) Magnetic Investigation of Gold-Chromium Alloys. Ernst

Wachtel and Ursula Vetter. Zeitschrift fur Metallkunde, v. 52, Aug. 1961, p. 525-529.

Measurement of magnetic susceptibility of specimens (7.5-29.2 at.% Cr) homogenized at 1000° C., at temperatures from 173-1000° K., using a magnetic balance. Magnetic properties are studied as influenced by temperature and composition. Charge of Cr atoms in Au lattice. (P16n, P16p, M26, 2-60, 2-61; Au, Cr)

688-P. (Translation.) Electric Transport in Interstitial Solid Solutions. D. F. Kalinovich. Soviet Physics--Solid State, v. 3, Oct. 1961, p. 812-815. (Translation from Fizika Tverdogo Tela, v. 3, Apr. 1961.)

Forces acting on the ions of elements (C, Fe, Ni, Ti, N, O, Pd, H, Cu, Al, Ag, Au, Cd, Zn and Cr) interstitially embedded in various systems under the influence of an electrical field are discussed in terms of the theory of electric transference. 26 ref. (P15, 1-54; 14-67)

689-P. (Translation.) Electrical and Galvanomagnetic Properties of n-Type Indium Antimony at Low Temperatures. Lien Chih Ch'ao and D. N. Nasledov. Soviet Physics--Solid State, v. 3, Oct. 1961, p. 861-864. (Translation from Fizika Tverdogo Tela, v. 3, Apr. 1961.)

Investigation of the impurity band and magnetoresistance oscillations in InSb (10^{12} to 10^{15} cm^{-3}) in the temperature range 4-77° K. (P15, P16, 1-67, 3-69; In, Sb)

690-P. The Physical and Mechanical Properties of Metals and Alloys. Precision Metal Molding, v. 19, Oct. 1961, p. 60-67.

Properties of metals are tabulated for applications in plaster mold, die, permanent mold and investment castings and extrusions. (P-general, Q-general, E-general, F24, 17-57)

691-P. Basic Studies of the Metallic State. A. I. Schindler. Report of the NRL (Naval Research Laboratory) Progress, Sept. 1961, p. 40-41. (Available as PB 171322 from U. S. Office of Technical Services, Washington 25, D.C.) $1.25.

Effects of neutron irradiation on the magnetic characteristics of metal alloys and ferrites including coercive force, remanence, shape of the hysteresis loop, Curie temperature and magnetic moment. Radiation sensitivity appears to be related primarily to the dependence of magnetic properties on the ease of short-range ordering of the atoms along certain crystallographic directions. (P16, N10, 2-67)

692-P. (Czech.) Quality of Pole Shoes Manufactured by Powder Metallurgical Methods. Zdenek Ministr. Electrotechnicky Obzor, v. 50, no. 4, 1961, p. 210-214.

Testing of the magnetic properties of sintered iron samples. Effects of composition, deformation, heat treatment, density and the direction of pressing on magnetic induction and permeability. (P16, 2-60, 2-64, 3-68, 3-72, 3-74; Fe, 6-71)

693-P. (English.) Internal Magnetic Field in Rare Earth Metals. Jun Kondo. Physical Society of Japan, Journal, v. 16, Sept. 1961, p. 1690-1691.

Calculation of the effective magnetic field, taking into account the contribution from the orbital angular momentum of 4 f-electrons. 10 ref. (P16, 1-54; EG-g45)

694-P. (German.) Investigation of Heat Treatment of Magnetically Soft Iron-Aluminum Alloys. G. W. Krassnoperow and N. I. Lapkin. Physikalische Abhandlungen aus der Sowjetunion, v. 4, no. 6, 1961, p. 442-446.

Measurement of ultimate and initial magnetic permeability, coercive force and electric resistivity of hot rolled sheet specimens of a FeAl alloy containing 15.7% Al after various heat treatments such as annealing at 800-1200° C., controlled cooling and quenching in NaOH solution (20%). (P15g, P16a, P16q, 2-64, 1-54; Fe-b, Al)

695-P. (Ukranian.) Concentration Dependence of Electric Transfer of Nickel-Chromium Alloy Components. I. M. Franzevich and M. D. Smolin. Dopovidi Akademii Nauk Ukrainskoi RSR, July 1961, p. 908-910.

Ni-Cr alloys with Cr content from 4.76-31.01 at.% are investigated to derive formulas for calculation of composition with reference to transfer at 1250° C. 6 ref. (P15, 2-60; Ni, Cr)

696-P. (German.) Measurement of Electromotive Forces on Liquid Cadmium-Arsenic and Cadmium-Antimony Alloys. Erich Scheil and Arno Kalkuhl. Zeitschrift fur Metallkunde, v. 52, Sept. 1961, p. 557-564.

Emf. measurements on binary Cd-As and Cd-Sb alloys in the concentration ranges 0-70 at.% As and 0-100% Sb at temperatures from 400-800° C. and evaluation of thermodynamic activities and partial molal energy properties using a UCl-LiCl-$CdCl_2$ mixture as electrolyte. Density measurements and investigation of undercooling effects to explain abnormal activity behavior. (P10a, P15g, 2-60, 2-61, 1-54; Cd-b, As, Sb)

697-P. (German.) Surface Changes in Reactions of Solids. Georg Maria Schwab and Reinhard von Ammon. Zeitschrift fur Metallkunde, v. 52, Sept. 1961, p. 583-587.

Investigation of specific surface area and reaction mechanism as a function of temperature (0-1000° C.), during sintering of metal powders, reduction of oxides by less noble elements and decomposition of oxides, formiates and oxalates. Binary systems include Fe-Co, Co-Ni, Fe-Ni, Fe-W, Co-W, Ni-W and Co-Cr; oxide systems include CuO-Fe, WO_3-Fe and Fe_2O_3-C; single compounds include Ni $(CO_2)_2$, Ni $(HCO_2)_2$, Co $(HCO_2)_2$, AgO and $KMnO_4$. (P10, P13, H15, C26, 1-54)

698-P. (English.) X-Ray Studies on Solid Solutions of Oxygen in Alpha Zirconium. Bo Holmberg and Tore Dagerhamn. Acta Chemica Scandinavica, v. 15, Apr. 1961, p. 919-925.

Effect of temperature (400-800° C.) and increasing oxygen content on solubility . Tabular data on sample composition, density, lattice parameter, unit cell volume, powder pattern and superstructure reflection intensity. 9 ref. (P12e, 2-60, 2-61; Zr, EG-q)

699-P. (French.) Properties and Applications of Austenitic "Ni-Resist" S. G. Cast Irons. J. Grilliat. Revue du Nickel, v. 27, July-Aug. 1961, p. 87-96.

Cast specimens containing various amounts of Ni, Cu, Cr or Si are tested with regard to density, melting point, thermal expansion and conductivity, electrical resistivity, magnetic permeability, tensile and creep properties at 20-760° C., hardness, modulus of elasticity, shear strength, compressive strength and resilience at room temperature. Wear and corrosion resistance, weldability and machinability are also considered, along with types of heat treatment. (P-general, Q-general, K9s, G17k, 10-54; CI-r)

700-P. Vapor Pressure of Antimony by the Torsion Effusion Method. Gerd. M. Rosenblatt and C. Ernest Birchenall. Journal of Chemical Physics, v. 35, Sept. 1961, p. 788-794.

Simultaneous measurement of pressures and mean molecular weights of the vapors over solid Sb (420-550° C.) and solid Zn (250-335° C.) by torsion momentum and Knudsen weight loss methods. Calculation from data of entropy and enthalpy of vaporization and standard heats of reaction. 14 ref. (P12c, P12r, P12s, 1-54; Sb, Zn)

701-P. Cohesive Energies of Europium, Gadolinium, Holmium and Erbium. O. Conrad Trulson, Donald E. Hudson and Frank H. Spedding. Journal of Chemical Physics, v. 35, Sept. 1961, p. 1018-1026.

Calculation of enthalpy and heat of sublimation of metallic and gaseous states from the study of solid-gas phase changes by the mass spectrometric method down to 298° K. Summary of cohesion in the rare earth series. 19 ref. (P12q, P12r, 1-54; EG-g45)

702-P. Low Temperature Specific Heat of Molybdenum. C. A. Bryant and P. H. Keesom. Journal of Chemical Physics, v. 35, Sept. 1961, p. 1149-1150.

One specimen is a pellet prepared by melting Mo powder of 99.8% purity in a helium arc furnace and quenching on a water-cooled copper hearth; the other is a sintered and ground rod of nominal 99.99% purity and a density nearer that of a perfect crystal. Data are taken between 1 and 4.5° K. 6 ref. (P12r, 1-54, 1-67; Mo)

703-P. (French.) New Aeronautic Materials. H. Buckle. Technique Moderne, v. 53, July 1961, p. 53-64.

W, Re, Ta, Os, Mo, Cb, Ir, Ru, Hf, Rh, Cr, V, Zr, Pt, Ti, Be, graphite, binary Mo-Re and W-Re alloys, Ni-Cr alloys, $MoSi_2$, B_4C, WC, TiN,

TaB_2, TiC, CbC and HfC are mechanically tested at -160 to 2900° C. and corrosion tested in various solutions. Tabulation of physical and mechanical properties. 11 ref. (P-general, Q-general, R-general, T24, 1-53, 17-57)

704-P. (Russian.) Thermochemical Characteristics of PbO-SiO_2-Na_2O Melts. H. A. Toporishchev, O. A. Esin and S. H. Bratchikov. Izvestiya VUZ--Tsvetnaya Metallurgiya, Mar. 1961, p. 37-43.

Determination of heat capacity and enthalpy of PbO-SiO_2-Na_2O systems at 400-1200° C. with variable SiO_2 content; graphs; formulas. 18 ref. (P12r, 1-54, 2-60; Pb, Si, EG-g40, 14-68)

705-P. Some Thermal and Magnetic Properties of Tantalum, Niobium, and Vanadium at Helium Temperatures. A. Calverley, K. Mendelssohn and P. M. Rowell. Cryogenics, v. 2, Sept. 1961, p. 26-33.

Properties determined include thermal conductivity, thermal resistance in the intermediate state and critical field behavior. Results obtained by zone refining are compared with results of similar measurements on Pb. 34 ref. (P11, P16, 1-54, 2-63; Cb, Ta, V)

706-P. An Apparatus for Studying Ultrasonic Absorption in Metals at Low Temperatures. A. A. Galkin and A. P. Korolyuk. Cryogenics, v. 2, Sept. 1961, p. 48-52.

The sound intensity of a signal transmitted through a small crystal specimen of Sn is automatically recorded as a function of magnetic field. Resultant data enable determination of the Fermi surface. 8 ref. (P15, P17c, 1-53; Sn)

707-P. The Ferromagnetic-Antiferromagnetic Properties of Copper-Manganese and Silver-Manganese Alloys. J. S. Kouvel. Physics and Chemistry of Solids, v. 21, Oct. 1961, p. 57-70.

Magnetic hysteresis loops displaced from their symmetrical positions about the origin are observed in alloys of 5-30% Mn in Cu and 10-25% Mn in Ag cooled to 1.8° K. in a magnetic field. Remanent magnetizations are related to a ferromagnetic alignment of Mn atomic moments. The hysteresis loop displacement and hysteresis losses, magnetic susceptibility electrical resistivity and magnetic transition are determined as a function of temperature and alloy composition and are consistent with a microscopic exchange anistropy model based on the coexistence of antiferromagnetic and ferromagnetic interactions between Mn atoms. 16 ref. (P16, 2-60, 2-61, 3-72; Cu-b, Ag-b, Mn)

708-P. Electronic Specific Heat of Mn-Cu Alloys. J. E. Zimmerman and H. Sato. Physics and Chemistry of Solids, v. 21, Oct. 1961, p. 71-75.

The specific heats of f-c-c. Mn-Cu alloys containing 3 1/2-90% Cu are measured at 4.2% K. The major specific heat component is electronic which varies with Cu concentration according to gamma, beta and alpha phase state. Implications of the specific heat data on the electronic density of states curve and on the magnetic properties of Mn-Cu alloys are discussed. The lattice component of the heat capacity varies only moderately with concentration. 26 ref. (P12r, P15g, P16, M25, 2-60, 2-63; Cu-b, Mn)

709-P. Surface Magnetoconductivity Experiments on Silicon. R. E. Coovert. Physics and Chemistry of Solids, v. 21, Oct. 1961, p. 87-98.

Measurements of the Hall coefficient and magnetoconductivity of holes and electrons trapped in the space charge region adjacent to a thermally oxidized surface on high resistivity p-type and n-type samples at 90° C. as a function of field induced surface conductance. The results are compared with theories for random and specular surface scattering as influenced by ionized impurities. 31 ref. (P15g, P16, 3-69; Si)

710-P. The Van Vleck Temperature-Independent Magnetism of Metals. L. E. Orgel. Physics and Chemistry in Solids, v. 21, Oct. 1961, p. 123-124.

Calculations are made suggesting that the van Vleck paramagnetism due to induced orbital motion makes an important contribution to the susceptibility, magnetic shielding, Knight shift and relaxation time of body centered transition metals, examples being given for Co and V. 5 ref. (P16; Co, V)

711-P. Theory of the Resistance Minimum in Dilute Paramagnetic Alloys. A.

D. Brailsford and A. W. Overhauser. Physics and Chemistry of Solids, v. 21, Oct. 1961, p. 127-128.

Calculations indicating that the s-d. exchange scattering of conduction electrons by ferromagnetically coupled ion pairs constitutes a mechanism for the occurrence of a resistivity minimum in dilute paramagnetic alloys at low temperatures. 11 ref. (P15g, M25, 2-63; SGA-n)

712-P. (English.) Anomalous Electrical Resistivity of Ordered Cu_2NiZn at Low Temperatures. V. A. Phillips. Acta Metallurgica, v. 9, Oct. 1961, p. 976-978.

Resistivity measurements at 4.2-298° K. on polycrystalline wire specimens ordered by heating in air to 900° K. and slow cooling to room temperature, the residual resistivity being determined as higher in the ordered than disordered state. The anomaly for long range order induced resistivity is analyzed in terms of Brillouin zone splitting and the presence of antiphase boundaries. 7 ref. (P15g, N10, 2-61; Cu-b, Ni, Zn)

713-P. (English.) A Note on the Freezing Range of the Equiatomic Ag-Au Alloy. C. J. Coake and W. Hume-Rothery. Acta Metallurgica, v. 9, Oct. 1961, p. 982.

The liquidus point is determined at 1032.5° C. for specimen ingots by a cooling curve. After solidification, the ingots are annealed for 1/2 hr. with the solidus point being established from a heating curve. The freezing range is calculated at 1.7° C. and compared with values in the Hansen equilibrium diagram and with those calculated by Wagner. (P12n, N12, 2-60, 2-61; Ag-b, Au-b)

714-P. (Russian.) Effect of Atom Thermal Vibrations on the Process of Melting the Thin Structure of X-Ray Absorption Spectra. Pt. 1. Investigation of the Solid Solution Copper-Platinum. I. B. Borovskii and G. N. Ronami. Izvestiya Akademii Nauk SSSR--Seriya Fizicheskaya, v. 25, Aug. 1961, p. 999-1001.

Investigation of absorption spectrum of Cu and Pt in pure Cu, pure Pt and an alloy of CuPt stoichiometric composition. Effect of temperature and thermal fluctuations of atoms on the disappearance of the fine absorption spectrum. 7 ref. (P17c, M25h; Cu-b, Pt-b)

715-P. Thermal Conductance of Machined Metal Contacts. L. C. Laming. Paper from "International Developments in Heat Transfer Conference", Aug-Sept. 1961, American Society of Mechanical Engineers, New York 18, Pt. 1, p. 65-76.

Determination of the total thermal conductance per unit area on machined plates of mild steel, brass and Al using interface fluids of air, glycerol and water. Measurements of conductance versus load are made. The effects of fluid film conductance, metallic a-spot conductance and hardness on the total thermal conductance. 9 ref. (P11h, 1-54; CN, Cu-n, Al, 4-53)

716-P. The Thermal and Electrical Conductivity of Liquid Mercury. R. W. Powell and R. P. Tye. Paper from "International Development in Heat Transfer Conference", Aug-Sept. 1961, American Society of Mechanical Engineers, New York 18, Pt. 4, p. 856-862.

A comparative longitudinal heat flow method is used to determine the thermal conductivity, electrical resistivity and Lorenz function of Hg at 30-200° K. A description of the heat flow apparatus is given. 25 ref. (P11h, P15g, P16, 1-54; Hg, 14-60)

717-P. The Density of Liquid Plutonium Metal. C. Z. Serpan, Jr., and L. J. Wittenberg. Metallurgical Society of AIME, Transactions, v. 221, Oct. 1961, p. 1017-1020.

The density of liquid Pu was determined by a pycnometric technique at 664-788° C. and exhibits a temperature dependence which is expressed by an equation. These density values compare favorably with the values previously obtained by a technique utilizing Archimedes' principle. The apparatus and method were evaluated when the densities of molten Sn and Bi were measured. 7 ref. (P10a, 2-61; Pu, 14-60)

718-P. Thermodynamics of Silicon Monoxide. H. F. Ramstad and F. D. Richardson. Metallurgical Society of AIME, Transactions, v. 221, Oct. 1961, p. 1021-1028.

The equilibria $SiO_2 + H_2 = SiO + H_2O$ and $Si + SiO_2 = 2SiO$ are studied at 1425-1600° C. and 1310-1485° C. respectively by measuring the amounts of silica which could be condensed

from streams of H_2 or H_2 + H_2O brought into equilibrium with silica or by measuring the material that could be condensed from streams of H_2 or Ar brought into equilibrium with mixtures of Si and silica. The standard free energy changes for the reactions are given by equations which remove certain anomalies in existing high-temperature data for equilibria involving SiO_2 and Si in Fe. 21 ref. (P12a, P12d, 2-60, 2-61; Si-b, 14-68)

719-P. Axial Thermal Expansion of Rhenium. R. J. Wasilewski. Metallurgical Society of AIME, Transactions, v. 221, Oct. 1961, p. 1081-1082.

Discontinuities along the a and c lattice parameters are observed in vacuum annealed Re specimens as a function of temperature at 25-1288° C. by X-ray diffraction examination and least squares method calculations. 8 ref. (P11g, M26, 2-61; Re)

720-P. Hydrogen From a Hydrocarbon Lubricant Absorbed by Ball Bearings. D. E. Swets and R. C. Frank. Metallurgical Society of AIME, Transactions, v. 221, Oct. 1961, p. 1082-1083.

Steel bearings are fatigue tested for varying times in mineral oil lubricants, containing deuteroparaffin as a source for radioactive H_2 with subsequent hot extraction and isotope measurement techniques used to determine hydrogen pickup by the bearings as caused by decomposition of the hydrocarbon lubricant. 6 ref. (P13d, T7d, 1-59, 18-73; ST, 17-57, H)

721-P. (French.) Properties of High-Purity Aluminum. Georges Chaudron. Revue de l'Aluminium, no. 288, June 1961, p. 755-762.

Aluminum of 99.7-99.999% purity is held at 400° C. for four days with measurement of the variation of electrical conductivity and residual resistance with the degree of purity. Recrystallization velocity after 97% deformation and subsequent treatment at 79° C. is determined as a function of purity. (P15g, N5, 2-60, 2-64; Al-a)

722-P. (Russian.) Thermodynamic Properties of Silver-Antimony Alloys. A. A. Vecher and Ya. I. Gerasimov. Doklady Akademii Nauk SSSR, v. 139, Apr. 1961, p. 863-865.

Cell potential measurements of molten Ag-Sb alloys (10.3-79.5% Ag) at 630-830° C. providing activity, enthalpy and enthropy values as functions of composition. 9 ref. (P12, 2-60, 2-61; Ag-b, Sb)

723-P. (Russian.) Heat of Dissociation of the Kurnakov Compounds Ni_3Fe, Ni_3Mn, Ni_3Cr and Ni_3V. I. I. Kornilov and N. M. Matreev. Doklady Akademii Nauk SSSR, v. 139, Apr. 1961, p. 880-883.

Thermal analysis used to determine enthalpies of transformation into solid solutions of Ni_3V, Ni_3Fe, Ni_3Mn and Ni_3Cr compounds. Effect of previous annealing time and temperatures and location in the periodic table on enthalpy. 13 ref. (P12r, P12e, 2-64; Ni-b, 14-67)

724-P. (Russian.) Magnetic and Magnetoelastic Properties of Dyprosium and Gadolinium. K. P. Belov, R. Z. Levitin, S. A. Nikitin and A. V. Ped'ko. Zhurnal Eksperimental'noi i Teoreticheskoi Fiziki, v. 40, June 1961, p. 1562-1569.

Investigation of magnetic transformations, temperature dependences of magnetization; elasticity modulus and internal friction at 80-178° K. 12 ref. (P16, Q22, 2-63; Dy, Gd, EG-g31)

725-P. (German.) Contribution to the Problem of Heat Transfer on Metal-Liquid Interfaces. P. Csokan. Harterei-Technische Mitteilungen, v. 16, July 1961, p. 75-79.

Measurement of heat transfer on metal/liquid interface during quenching of Cu specimens from 850° C. in water and various oils of given physical properties as influenced by temperature of specimen and initial temperature of quenching liquid. (P11k, J26, 2-61; Cu)

726-P. (German.) Thermoelectric Measurements on Unalloyed Toolsteel. P. Fischer. Harterei-Technische Mitteilungen, v. 16, July 1961, p. 110-112.

Investigation of alpha-gamma transitions by thermovoltage measurements on annealed C 100 W 1 steel and austenitic 18/8 steel wire specimens; and measurement of thermovoltage as influenced by annealing temperature of oil-hardened (790-830° C.) C 100 W 1 steel. (P15j, N-general, 2-61, 2-64; TS, SS-e)

727-P. (German.) Effect of Bath Nitriding on Several Physical Properties of Low-Carbon Steels. A. Kettmann and W. Stuhlmann. Harterei-Technische Mitteilungen, v. 16, July 1961, p. 112-114.

Investigation of magnetic properties, with emphasis on coercive force, and of technological properties such as wear and corrosion resistance of bath nitrided low-carbon steels including MK 3 steel, St 3 steel, AISI 8620, X 10 Cr 13, X 8 Cr 17 and X 12 CrNi 18 8 steel. 4 ref. (P16, P-general, J28, Q-general; ST)

728-P. Magnetic Materials. Edgar Allen News, v. 40, Aug. 1961, p. 169-172.

Review of principles of magnetism and characteristics of permanent magnets including magnetizing and demagnetizing relations and maximum energy product, design of magnets and properties of magnetic materials such as Alcomax, Alnice, Alni, Nial, lodestone and Cr, W and C steels. (P16; SGA-n, 10-54)

729-P. Transfer of Heat Below 0.15° K. A. C. Anderson, G. L. Salinger and J. C. Wheatley. Review of Scientific Instruments, v. 32, Oct. 1961, p. 1110-1113.

Heat transfer from a Cu thermal link into single crystal slabs of chromium potassium alum ($KCr(SO_4)_2 \cdot 12H_2O$) are measured at 0.03-0.15° K. The temperature differences produced by heating are less than 6% of the average temperature and the heat flow rates are proportional to the contact area with the thermal link. (P11h, 2-63; Cu)

730-P. High-Temperature Colorimeter for the Determination of Heats of Formation of Refractory Compounds. C. E. Lowell and Wendell S. Williams. Review of Scientific Instruments, v. 32, Oct. 1961, p. 1120-1123.

Technique and equipment for measuring heat of formation of Ti with boron and carbon using a high-temperature colorimeter which includes a carbon crucible, pump for evacuation and heating chamber. The experiment is made by direct reaction of the elements at low pressure (1×10^{-5} mm. Hg) and at temperatures in excess of 1000° C. Determination of heat of formation of TiB_2 and TiC. (P11, P12, 1-52)

731-P. (German.) Radioactivation of Steels for Reactor Construction. K. Fink and N. Riehl. Atomwirtschaft, v. 6, July-Aug. 1961, p. 392-398.

Computation of gamma-saturation activities for 17 Mn4, 15 Mo 3, 19 Mn 5 Mo, X 10 CrNiTi 18 9 and X 10 CrNiCb 18 9 steels and experimental measurement of activity for 19 Mn 5 Mo steel specimens to prove significance of estimated results. Computation of radioactivity on external surface of reactor vessels of 19 Mn 5 Mo steel. (P18, T11, 1-59; ST, 17-59)

732-P. Surface Properties of Liquid Sodium and Sodium-Potassium Alloys in Contact With Metal Oxide Surfaces. D. H. Bradhurst and A. S. Buchanan. Australian Journal of Chemistry, v. 14, Aug. 1961, p. 397-408.

Measurement of the surface tension and contact angles of molten Pb and Na-K alloys in contact with oxides of U, Ca, Mg and Ba as determined by modifications of the sessile drop technique. Demonstration of the importance of the O_2 concentration of the wetting liquid. 16 ref. (P13h, 2-60; Na-b, EG-e41, 14-60)

733-P. Surface Properties of Molten Bismuth-Bismuth Chloride in Contact With Uranium Dioxide. D. H. Bradhurst and A. S. Buchanan. Australian Journal of Chemistry, v. 14, Aug. 1961, p. 409-416.

Measurement of the surface tension and contact angles of 0-100% solutions of $BiCl_3$ solutions in molten Bi placed on samples of UO_2. Low concentrations of $BiCl_3$ were found to improve the wettability of UO_2 by Bi. 22 ref. (P13h; U, 14-68, Bi, 14-60)

734-P. Surface Properties of Liquid Metals: Bismuth, Lead-Bismuth, Tin. D. H. Bradhurst and A. S. Buchanan. Australian Journal of Chemistry, v. 14, Aug. 1961, p. 417-419.

Surface activity of O_2, S, Se and Te in molten Bi, Pb-Bi eutectic mixture and Sn as shown by surface tension and contact angle with solid UO_2. Measurements by the sessile drop technique. 5 ref. (P13h, 2-60; Bi-b, Pb-b, O, S, Se, Te, 14-60)

SECTION Q

MECHANICAL PROPERTIES and TEST METHODS; DEFORMATION

1-Q. Weldable Steels for Strength or Abrasion Resistance. Materials in Design Engineering, v. 52, Nov. 1960, p. 9.

Physical and mechanical properties, weldability and workability of two new series of steels, three weldable, high strength grades and two weldable abrasion resistant grades. (K9s, Q-general, P-general; ST)

2-Q. Short-Time, Rapid-Heating Tests for Aerospace Materials. Ward F. Simmons. Materials in Design Engineering, v. 52, Nov. 1960, p. 125-129.

Test methods for determining creep, tensile strength and stress-strain relationships at 2000° F. on stainless steels, Al alloys and Ni alloys. (Q3, Q27, Q25n, 2-62; Al-b, Ni-b, SS)

3-Q. (French.) Tensile Properties of Sintered Aluminum With Iron and Nitrogen Additions. P. Lelong, J. Moisan and J. Herenguel. Memoires Scientifiques de la Revue de Metallurgie, v. 57, Sept. 1960, p. 683-688.

Cylindrical bars are extruded from mixtures of powdered Al, 0-2% Fe and 0-1% Ni (with or without Al_2O_3), rolled at 500° C. and annealed at 460° C. for 1 hr. Effects of composition and rolling on tensile strength are determined at 25 and 350° C. testing temperatures. 9 ref. (Q27, 2-60, 2-64, 3-68; Al-b, Fe, Ni, 6-72)

4-Q. (French.) Deformation of SG Cast Iron and Mild Steel. A. Vetiska. Memoires Scientifiques de la Revue de Metallurgie, v. 57, Sept. 1960, p. 689-698.

SG iron containing 3.24% C, 2.7% Si, 0.75% Mn, 0.099% P, 0.007% S and 0.043% Mg and a ferritic mild steel with traces of pearlite containing 0.08-0.10% C are subjected to static or dynamic compressive deformation. Elastic and plastic deformations as functions of load. Effects of deformation on microhardness, microstructure and crystal structure. 6 ref. (Q24, Q21, Q29q, M27, M26; CI-r, CN)

5-Q. Embrittlement of High Purity Nickel. K. M. Olsen, C. F. Larkin and P. H. Schmitt, Jr. American Society for Metals, Transactions, Preprint no. 203, v. 53, 1961, p. 349-358.

Grain boundary embrittlement by a segregated nickel sulphide phase can be produced in a high purity Ni containing as little as 0.0009% sulphur by weight. The embrittlement can only be produced if the Ni is first cold worked and then heat treated in the 450-600° C. range to induce recrystallization and grain growth. It is postulated that the sulphide phase is precipitated early in the recrystallization stage and is carried along in the grain boundaries with further grain growth. 7 ref. (Q26s, N5, 2-64; Ni-a, S)

6-Q. Metal Wear by Scoring. J. H. Olson and R. D. Chapman. American Society for Metals, Transactions, Preprint no. 204, v. 53, 1961, p. 359-379.

Score loads have been determined for a variety of ferrous-ferrous and ferrous-nonferrous combinations by progressively loading lubricated reciprocating samples until scoring occurs. Higher score loads can be attained and score damage minimized by utilizing an Al base, rather than steel, under hard plated surfaces to enhance the thermal conductivity and prevent loss of the oil film. 25 ref. (Q9)

7-Q. Dynamic Stress-Strain Phenomena and Plastic Wave Propagation in Metals. Ralph Papirno and George Gerard. American Society for Metals, Transactions, Preprint no. 205, v. 53, 1961, p. 381-406.

Experimental results show that the magnitude and velocity of the elastic portion of a mixed elastic-plastic wave were correctly predicted by theory. 25 ref. (Q24j)

8-Q. The Effect of Microstructure on the Fatigue Strength of a High Carbon Steel. F. Borik and R. D. Chapman. American Society for Metals, Transactions, Preprint no. 209, v. 53, 1961, p. 447-463.

Endurance limits in reversed bending were determined for austempered and quenched and tempered microstructures of SAE 51100 steel within a hardness range to 36 to 61 Rc. The fatigue specimens were prepared in such a way as to minimize the influence of residual surface stresses. The influence of residual surface stresses. The influence of microstrains existing in the matrix of bainite and tempered martensite and the effect of carbide morphology on the fatigue strength of the high carbon steel were evaluated. 22 ref. (Q7a, M27; CN-r)

9-Q. Hydrogen Embrittlement in Vanadium-Columbium Alloys. A. L. Eustice and O. N. Carlson. American Society for Metals, Transactions, Preprint no. 212, v. 53, 1961, p. 501-510.

Hydrogen embrittlement investigated as a function of alloy composition and hydrogen content. Bend and tension tests were carried out in the temperature range of -196 to 52° C. 4 ref. (Q26s; V-b, Cb, H)

10-Q. A New Series of Nickel-Base Alloys for Advanced-Temperature Applications. John C. Freche, William J. Waters and Thomas J. Riley. American Society for Metals, Transactions, Preprint no. 214, v. 53, 1961, p. 523-537.

Series of Ni-base alloys that do not require vacuum melting techniques and that provide good stress-rupture and impact properties. One alloy provided rupture lives (as-cast) of 380 and 107 hr. at 15,000 psi. and temperatures of 1800 and 1850° F. The strongest alloy demonstrated lives of 768, 301 and 101 hr. under the same stress at 1800, 1850 and 1900° F., respectively. 6 ref. (Q3q, 2-62; Ni-b)

11-Q. Precipitation of Phosphorus From Alpha Iron and Its Effect on Plastic Deformation. E. Hornbogen. American Society for Metals, Transactions, Preprint no. 217, v. 53, 1961, p. 569-589.

Phosphorus is in substitutional solution in alpha Fe. High phosphorus contents cause grain boundary brittleness, probably by segregation of phosphorus to the alpha Fe grain boundaries. Precipitation is found in alloys with more than 1% phosphorus and at temperatures higher than 400° C. Precipitation hardening occurs on aging at temperatures up to 700° C. 18 ref. (Q24; Fe)

12-Q. The Tensile Properties of Type 410 Stainless Steel Deformed Before and After Martensite Transformation. Yuzo Hosoi and Kenneth E. Pennow. American Society for Metals, Transactions, Preprint no. 218, v. 53, 1961, p. 591-602.

Significant improvements in tensile strength were realized with some sacrifice of ductility. Deformation of the metastable austenite to the extent of 57% reduction of area by swaging at 800° F. increased the yield strength from 178,000 to 206,000 psi. and the tensile strength from 212,000 to 245,000 psi. in the untempered condition without producing a marked decrease in elongation. (Q27a, N8p, 3-68; SS)

13-Q. Yield Point Phenomena in a Number of Commercial Copper Alloys and One Nickel Base Alloy. R. B. Jones and V. A. Phillips. American Society for Metals, Transactions, v. 53, Preprint no. 219, 1961, p. 603-620.

Tensile tests to survey the occurrence of yield point phenomena in phosphor bronze, manganic nickel, chromium copper and beryllium copper. Yield points can be produced by suitable strain-aging treatments in all the alloys. The large initial yield points are attributed to equilibrium segregation of solute to grain boundaries. (Q24c; Cu-b, Ni-b)

14-Q. High-Strength Martensitic Steels for Elevated-Temperature Use. A. Kasak, V. K. Chandhok and E. J. Dulis. American Society for Metals, Transactions, v. 53, Preprint no. 220, p. 621-636.

Martensitic steels with a nominal base composition of 0.38% C, 7% Cr,

1% V, 5.8% Mo and 5% Co were investigated. Several of the steels exhibited an outstanding combination of room and elevated-temperature mechanical properties; tensile strengths up to 332,000 and 201,000 psi. were obtained at room temperature and 1100° F., respectively. (Q-general, 2-62; SS-c, SGB-a)

15-Q. Low Temperature Flow and Fracture Tension Properties of Heat-Treated SAE 4340 Steel. Frank R. Larson and John Nunes. American Society for Metals, Transactions, Preprint no. 223, v. 53, 1961, p. 663-682.

A variety of microstructures, martensite, bainite and pearlite were studied at several strength levels. The flow stress, strain hardening, fracture stress and fracture strain were determined. The flow stress at a constant true strain is closely described by a reciprocal absolute temperature function. 35 ref. (Q23, Q25, 2-63; AY)

16-Q. Improvement of the Ductility of Vanadium by Alloying. C. E. Lundin, Jr., and D. T. Klodt. American Society for Metals, Transactions, Preprint no. 227, v. 53, 1961, p. 735-742.

Commercial-grade vanadium was alloyed with yttrium metal and a series of representative rare-earth metals. The yttrium and rare-earth metals act as scavenging agents to remove the oxygen, and probably nitrogen, impurity content from the vanadium. Optimum ductility is attained with additions of only 1 wt.% Y or rare-earth metal. 8 ref. (Q23p, 2-60; V, Y, EG-g)

17-Q. The Determination of Hardness in Steels From the Breadth of X-Ray Diffraction Lines. R. E. Marburger and D. P. Koistinen. American Society for Metals, Transactions, Preprint no. 228, v. 53, 1961, p. 743-752.

The broad asymmetrical nature of martensite diffraction lines has in the past been the source of great difficulty in X-ray diffraction studies of hardened steel. By utilizing the increase of martensite line breadth with hardness, it is possible to make rapid nondestructive surface hardness measurements by X-ray methods. 5 ref. (Q29, M22g; ST)

18-Q. Effect of Induction on 500° Embrittlement. A. Nakashima and J. F. Libsch. American Society for Metals, Transactions, Preprint no. 229, v. 53, 1961, p. 753-764.

Influence of rapid heating upon 500° F. embrittlement of 3140 steel in an effort to find a means to minimize the loss of notch toughness and obtain further information for an understanding of the embrittling mechanism. 14 ref. (Q26s; AY)

19-Q. Yield Point and Order-Hardening Phenomena in Some Commercial "Nickel Silver" Alloys. Victor A. Phillips and R. B. Jones. American Society for Metals, Transactions, Preprint no. 231, v. 53, 1961, p. 775-791.

The nature of the initial yield point, which is known to give rise to stretcher-strain markings in the fine grained annealed alpha Cu-Ni-Zn alloys, has been investigated by tensile tests. An alloy close to the Cu_2Zn Ni composition was found to show a new hardening phenomenon interpreted as order-hardening. 20 ref. (Q24c, N7e; Cu-b)

20-Q. Mechanical Properties of Tantalum-Base Alloys. F. F. Schmidt, F. C. Holden, H. R. Ogden and R. I. Jaffee. American Society for Metals, Transactions, Preprint no. 233, v. 53, 1961, p. 805-816.

Effects of alloying on the mechanical properties of Ta were studied at room temperature and at 1200° C. Hf, Mo, W, V and Zr were found to be effective strengtheners. Several binary and ternary alloys with excellent fabricability and strengths at elevated temperatures have been evaluated. (Q-general, 2-60; Ta-b, Hf, Mo, W, V, Zr)

21-Q. The Effect of Cold Work and Temperature on Strength and Structure of Steel. P. Shahinian, M. R. Achter and W. A. Pennington. American Society for Metals, Transactions, Preprint no. 234, v. 53, 1960, p. 817-836.

Influence of cold work determined by measurements of hardness, tensile and creep-rupture properties and its effect on microstructure. 12 ref. (Q-general, 3-68; AY)

22-Q. Temperature and Microstructure Dependence of Size Effects in Notched Bend Tests of Some Alloy Steels. S. Yukawa. American Society for Metals, Transactions, Preprint no. 238, v. 53, 1961, p. 871-881.

Increasing the specimen size in notched bend tests of alloy steels results in increased propensity to sudden, brittle

fracturing and in decreased nominal strength; the first effect occurs at higher temperatures relative to the second. The V-notch Charpy 50% fibrous transition temperature appears to be a useful index to the size effect sensitivity of the steels investigated. 16 ref. (Q26s, 3-73; ST)

23-Q. (German.) Inspection of Wire Ropes Used in Lifting and Haulage Equipment. Ernst Franke. Industrie-Anzeiger, v. 82, Oct. 18, 1960, p. 23-25.

Soft Pb strips are pressed around wire rope and the resulting replica formed on the metal surface is studied microscopically to determine rope wear. (Q9; 4-61)

24-Q. (Russian.) Fatigue Strength of Chemically Heat Treated Machine Parts. D. S. Elenevskii and L. M. Shneerson. Vestnik Mashinostoroeniya, Oct. 1960, p. 17-22.

Bend and torsion tests with asymmetric cyclic loading of 40KhNMA and 12Kh2H4A steel samples that have been subjected to cementation or nitriding. Distribution of stresses in the surface layer and core. Electropolishing increases fatigue strength of cemented parts. 5 ref. (Q7, 2-64, T7; ST)

25-Q. (German.) Properties of Cold Drawn Wire. E. Forstner. Industrie-Anzeiger, v. 82, Nov. 1, 1960, p. 1475-1477.

Stress-strain curves of wire and wire rope composed of ferritic, martensitic, austenitic and heat resistant alloy steels. Corrosion protection by galvanizing. (Q25n, L16; AY, SS, SGA-h, 4-61)

26-Q. Tool Failures. Pt. 9. Toughness. Atlas Steel News, v. 14, Oct. 1960, p. 7-8.

Composition and mechanical properties of toolsteels. Relation of ductility, bend strength and carbide size and distribution to toughness. Tool applications. (Q23r, Q-general, 2-60; TS)

27-Q. (Italian.) Properties of Aluminum-Base Bearing Alloys. E. Di Russo and L. Mori. Alluminio, v. 29, Sept. 1960, p. 393-402.

Brinell hardness, tensile and compressive strength, wear resistance and microstructure of Al alloys containing 6% Si-5% Sn, 20% Sn-1% Cu, 6.5% Sn-1% Cu or 6.5% Sn and 1% Cu-0.5% Ni-2.5% Si in the as-cast and hardened and tempered contitions. 7 ref. (Q-general, M27, 2-64; Al-b, Si, Sn, Cu, Ni)

28-Q. Research Digs Deeper Into Annealed Nodular Iron. R. C. Bates. Iron Age, v. 186, Nov. 17, 1960, p. 144-145.

Hardness of annealed and as-cast nodular iron after quenching, tempering and normalizing heat treatments. Effect of austenitizing time prior to quenching on microstructure and hardness. (Q29n, M27, 2-64; CI-r)

29-Q. Some Properties of Chromium and Chromium-Tungsten Alloys. Pt. 2. Fabrication and Ductility. S. T. M. Johnstone, F. Henderson and H. L. Wain. Institute of Metals, Journal, v. 89, Nov. 1960, p. 101-104.

Arc-melted ingots (1 1/2 in. in diameter) of Cr-W alloys containing up to 10% tungsten are fabricated to strip by extrusion and rolling to investigate the effect of tungsten on the workability and ductility of Cr. 16 ref. (Q23p, Q23q, F-general, 2-60; Cr-b, W)

30-Q. The Effects of Creep Testing on the Hydrogen Embrittlement of a Titanium Alloy Containing 2% Aluminum and 2% Manganese. A. I. Smith, M. F. Day, M. F. Grimwade and L. M. T. Hopkins. Institute of Metals, Journal, v. 89, Nov. 1960, p. 105-110.

Alloy samples are impregnated with various amounts of hydrogen and a study is made of the effects of creep deformation on brittle behavior in tensile and notched bar impact tests. 7 ref. (Q26s, Q3, 3-68; Ti-b, Al, Mg)

31-Q. The Effect of Composition on the Intercrystalline Cracking of Sand-Cast, Complex Beta-Brasses Under Constant Tensile Load. A. R. Bailey. Institute of Metals, Journal, v. 89, Nov. 1960, p. 110-111.

Effects of alloying elements Al, Fe and Mn and of Ni and Co additions on cracking in ordinary atmosphere, provided that moisture is present and in sea water or 3% NaCl solution under sustained tensile stress. 5 ref. (Q26q, R1h, 2-60, 3-66; Cu-n)

32-Q. The Fatigue Curves of Copper. J. Porter and J. C. Levy. Institute of

Metals, Journal, v. 89, Nov. 1960, p. 86-89.

Fatigue tests using a rotating cantilever machine on specimens of electrolytic tough-pitch Cu, annealed for 1 hr. at 500° C. in vacuum. The S/N curve shows a hitherto unsuspected discontinuity at a stress amplitude of 21,500 psi. 13 ref. (Q7b, Q7c; Cu)

33-Q. Some Properties of Chromium and Chromium-Tungsten Alloys. Pt. 1. Compression Creep Tests. A. R. Edwards, C. S. Landau and H. T. Greenaway. Institute of Metals, Journal, v. 89, Nov. 1960, p. 97-101.

Compression creep curves determined at 750-950° C. on pure Cr and at 900-1000° C. on Cr-W alloys. For pure Cr, the logarithm of the minimum creep rate shows an approximately linear relationship with the applied stress at a given temperature and there is evidence that the onset of tertiary creep is associated with recrystallization. 13 ref. (Q3, Q28, 2-62, N5; Cr-b, W)

34-Q. Resistance to Deformation of Super-Pure Aluminum at High Temperatures and Strain Rates. Determination From High-Temperature Torsion Data. H. Ormerod and W. J. McG. Tegart. Institute of Metals, Journal, v. 89, Nov. 1960, p. 94-96.

Super-pure Al is deformed in torsion at 195-55° C. and shear strain rates from 0.86 to 7.1 per sec. The data are used to calculate true-stress, true-strain curves. 12 ref. (Q1e, 2-62, 3-68; Al-a)

35-Q. These Forgeable Refractories Have Micrograin Structure. Metalworking Production, v. 104, Oct. 26, 1960, p. 79-81.

Improved ductility and workability of 90% Ta-10% W alloys as a result of electron seam processing and critical composition control. (Q23p, Q23q; Ta-b, W)

36-Q. Heat-Affected Zone of Arc-Welded Ductile Iron. E. F. Nippes, W. F. Savage and W. A. Owczarski. Welding Journal, v. 39, Nov. 1960, p. 465s-472s.

Use of synthetic specimen technique to duplicate weld thermal cycles and determine their effect on metallographic structure and hardness of ductile iron specimens. (Q7j, Q29n, M27; CI-r, 7-51)

37-Q. Comparison and Analysis of Notch-Toughness Tests for Welded Steel. H. H. Johnson and R. D. Stout. Welding Journal, v. 39, Nov. 1960, p. 492s-501s.

Survey of literature on notch toughness. Influence of chemical composition, steelmaking practice, welding, plate thickness and heat treatment on brittle fracture. 33 ref. (Q23s, Q26s, 2-60, 2-64, 3-73; ST, 7-51)

38-Q. Metallurgy of 13% Chromium Steel Castings. J. Beech. Foundry Trade Journal, v. 109, Nov. 3, 1960, p. 569-575.

Phase relationships in the Fe-C-Cr system. Effect of steelmaking and casting conditions, ferrite distribution, heat treatment, gas content and nonmetallic inclusions on mechanical properties, weldability and corrosion resistance of castings. (Q-general, 2-64, 3-69, M24c, R-general; ST, Cr, 5)

39-Q. (German.) Tensile Strength Measurements on Copper Whiskers. F. X. Eder and V. Meyer. Naturwissenschaften, v. 47, no. 15, 1960, p. 352-353.

Mechanical force and microscopic strain measurements with photographic registration correlating tensile strength data and whisker diameter. (Q27, 3-73; Cu, 14-61)

40-Q. Hydrogen Embrittlement of Cadmium Plated Spring Steel. J. A. Gurklis, L. D. McGraw and C. L. Faust. Plating, v. 47, Oct. 1960, p. 1146-1154.

Effects of etching, pickling, aging, baking and plating variables on the ductility of Cd-plated SAE 1095 spring steel. Recommendations for avoiding or relieving hydrogen embrittlement. (Q26s, Q23p, L17; ST, Cd)

41-Q. Low-Temperature Metals: a Roundup. George H. Zenner. Chemical Engineering, v. 67, Oct. 31, 1960, p. 117-120.

Low temperature mechanical properties of carbon steel, alloy steel, stainless steel, Ni alloys, Al and Cu. Design of cryogenic insulation systems, piping, storage and shipping vessels and high-pressure pumps. (Q-general, 2-63, 1-52; Al, Cu, Ni-b, AY, CN, SS)

42-Q. For a Stronger Metal Surface. A. J. Schwarzkoff. Product Engineering, v. 47, Nov. 14, 1960, p. 70-74.

Improvement of wear resistance of steel by carburizing, nitriding, flame spraying and hardfacing. (Q9n, J28g, J28k, L23, L24; ST)

43-Q. 55% Thread Depth Will Make Beryllium Bolts Practical. Nicholas P. Chironis. Product Engineering, v. 31, Nov. 14, 1960, p. 75-77.

Use of a new thread form, with a large root radius and a thread depth only 55% of the theoretical, to increase fatigue strength of Be bolts. Tensile, shear and fatigue strength of Be, Ti, and steel bolts. (Q-general, T7f; Be, Ti, ST)

44-Q. (French.) Theoretical Study of Work Hardening Using a Dislocation Model. Pt. 2. G. Saada. Metaux, Corrosion, Industries, v. 35, Sept. 1960, p. 317-335.

Effect of recombinations between dislocations on the work hardening of f-c-c. monocrystals. Effect of temperature and size of dislocation network on the strains between dislocations. Production of vacancies during cold working. 57 ref. (Q23a, M26b; 14-61)

45-Q. Properties of Chromium-Steel Weld Metal. J. Heuschkel. Welding Journal, v. 39, Nov. 1960, p. 502s-508s.

Effect of temperatures from -320 to 2000° F. on tensile properties, hardness and microstructure of 0-25% Cr steel welds. 5 ref. (Q27a, Q29n, M27, 2-61; ST, Cr, 7-51)

46-Q. The Dynamic Frictional Characteristics of Molded Friction Materials. M. J. Rabins. American Society of Mechanical Engineers, Paper no. 60-WA-35, 1960, 8 p. $1.

Frictional behavior of steel, cast iron and Al drums determined under various conditions of loading and slipping velocity. Normal load, relative velocity, temperature and surface conditions are controlled. 17 ref. (Q9p, 3-74; ST, CI, Al)

47-Q. (German.) Creep Strength of Wrought Copper-Nickel Alloys--Literature Review. H. Vosskuhler. Metall, v. 14, Nov. 1960, p. 1081-1084.

Creep testing of alloys with 5-70% Ni for 1000 hr. at 149-663° C. Creep strength and velocity as a function of temperature and composition. 9 ref. (Q3, 2-60, 2-61; Cu-b, Ni-b)

48-Q. (Czech.) Standards for New Boron Steels. K. Novak. Strojirenstvi, v. 10, Sept. 1960, p. 688-689.

Hardening depth, tensile strength, yield strength, elongation, impact strength and reduction of area of CSN 12042, 13240, 14230 and 14240 steels, two of which contain boron and are used as materials for high-strength screws and automotive parts. (Q-general, S22; ST, B)

49-Q. (Italian.) Stainless Steel Marine Screw Propellers. Acciaio Inossidabile, v. 27, July-Aug. 1960, p. 481-483.

Corrosion fatigue resistance and general fatigue properties of propellers composed of Avesta 739S, 832 and 832H steels. Repair of damaged propellers by welding. (Q7, K-general, T22h; SS, 17-57)

50-Q. Structures and Materials. George Gerard. Astronautics, v. 5, Nov. 1960, p. 47.

Tensile and creep strength and temperature resistance of space vehicle structures composed of Cb, V, W, Mo, Pb and Ti alloys, high strength steels and pyrolytic graphic. 15 ref. (Q-general, T24e; Cb-b, Mo-b, Pb-b, Ti-b, V-b, W-b, ST, NM-h36, 17-57)

51-Q. Cu-Zr Alloy for High Temperature Devices. Electronics, Sept. 9, 1960, p. 96-98.

Mechanical and electrical properties of a Cu-Zr alloy, "Amzirc", at prolonged temperatures to 750° F. (Q-general, P15, 2-62, Cu-b, Zr)

52-Q. (Japanese.) Impact Properties of Induction-Hardened Steels. Miyato Miyairi and Tadashi Matsumoto. Railway Engineering Research, Journal, v. 17, Aug. 1960, p. 320-324.

Impact strength, strain, hardness and fatigue limit of prestressed or notched steel specimens. (Q6, Q7, J2g, N7e; ST)

53-Q. (German.) Electron Microscope Studies on Temperature Dependent Transition From Ductile to Cleavage Fracture of Notched Impact Test Specimens. Wolfgang Dienst. Materialprufung, v. 2, Oct. 20, 1960, p. 382-392.

Notched impact testing of aged and unaged unalloyed 0.05-0.23% carbon

structural steel at low temperature and electron microscopic investigation of fracture surface by carbon replica. Influence of aging and shape of specimen. 10 ref. (Q26n, Q6, M21e, 2-63, 2-65; ST, SGB-s)

54-Q. (German.) Effect of Testing Temperature on Notch-Toughness of Unalloyed Steels. Karl Wellinger and Hans-Joachim Wittwer. Materialprufung, v. 2, Oct. 20, 1960, p. 373-381.

Notch toughness of heat treated 0.09-1.32% carbon steels of given microstructure and mechanical properties measured at -196 to 20° C. Influence of heat treatment and carbon content on transition temperature. 8 ref. (Q23s, 2-60, 2-61, 2-64; CN)

55-Q. Testing Elevated Temperature Structures. S. L. Shaw and C. H. Stevenson. SAE Journal, v. 68, Dec. 1960, p. 56-58.

High temperature testing of airframes to determine thermal properties at 3000° F. by heating with electrical resistance elements or quartz heat lamps. (Q3, Q25p, T24a)

56-Q. Wear Tests Spot Best Mating Materials. L. E. Fuller. SAE Journal, v. 68, Dec. 1960, p. 60-65.

Unlubricated, high-load low-speed wear tests on coated stainless steel and Ni alloys to determine wear rates and friction coefficients. (Q9; Ni-b, SS)

57-Q. (German.) Total Intensity of X-Ray Interferences for Deformed and Recovered Aluminum Specimens. Manfred V. Heimendahl and Hermann Weyerer. Zeitschrift fur Metallkunde, v. 51, Oct. 1960, p. 573-579.

Sheets of cold rolled 99.00% Al (90% deformed) are heat treated at 80-300° C. to study recovery and recrystallization. Influence of cold working on line intensities of the X-ray interferences measured in the as-deformed state and after heat treatment. (Q22n, 2-64, M22g; Al, 4-53)

58-Q. The Effect of Surface Preparation on the Tensile Strength, Hardness and Adhesion of Electrodeposited Nickel. P. A. Brook. Plating, v. 47, Nov. 1960, p. 1269-1273.

Tensile testing of Ni deposits on degreased and scratch brushed, etched or polished Cu to determine effect of surface preparation on adhesion and mechanical properties. 32 ref. (Q27, L10, L12, L17; Cu, Ni, 8-62)

59-Q. Tensile and Short-Time Creep Properties of N-155 Alloy Sheet. Eugene C. Bernett. Journal of Engineering for Industry, Series B (American Society of Mechanical Engineers, Transactions), v. 82, Nov. 1960, p. 283-302.

Evaluation of the tensile, yield and ultimate strengths, tensile elongation, Young's Modulus, creep rates and plastic deformation of annealed Haynes N-155 alloy sheet (20% Cr, 20% Ni, 20% Co, 40% Fe) at 75-2100° F. 4 ref. (Q27, Q3; Fe-b, Cr, Ni, Co)

60-Q. Correlation of Bendability of Materials With Their Tensile Properties. J. Datsko and C. T. Yang. Journal of Engineering for Industry, Series B (American Society of Mechanical Engineers, Transactions), v. 82, Nov. 1960, p. 309-314.

Flat tensile specimens cut from Mg, Al, brass, 1018 steel, Ti, cast iron and plastic bar stock polystyrene are tested for bendability. Round tensile specimens of the same materials are tested for per cent reduction of area, the data being correlated with minimum bend radius. (Q5g, Q27; Mg, Al, Cu-n, ST, Ti, CI)

61-Q. Comparisons Between the Shearing Properties of Alpha-Brass as Derived From the Cutting Process and From Static and Impact Torsion Tests. S. S. Chang and W. B. Heginbotham. Journal of Engineering for Industry, Series B (American Society of Mechanical Engineers, Transactions), v. 82, Nov. 1960, p. 315-323.

Orthogonal cutting tests on tubular specimens with direct comparisons of results of static compression and impact torsion tests. Shearing strains are produced from both the static and the dynamic Tests. 11 ref. (Q2, G17, Q1; Cu-n)

62-Q. Hardness Test Shows Decarburization. Steel, v. 147, Nov. 28, 1960, p. 118-120.

Measurement of decarburization depth in steel using a nondestructive test method and a standard Rockwell hardness tester. Accuracy is compared with results obtained from destructive microhardness traverse examination. (Q29; ST)

63-Q. Cracking in Welded Joints of Austenitic Steel in C. E. G. B. Power Stations. F. E. Asbury, B. Mitchell and H. L. Toft. British Welding Journal, v. 7, Nov. 1960, p. 667-678.

Cracking in the heat affected zones of austenitic steel welds (18% Cr, 12% Ni, 1% Cb). Effect of columbium carbide precipitation on weld ductility. (Q26q, Q23p, N8r; SS-e, 7-51)

64-Q. "Operation Cryogenics". Inco, v. 27, Fall 1960, p. 2-4.

Destruction impact testing at -452° F. of 9% Ni steel vessels for storage and transportation of low temperature liquids under high pressure. (Q6, T26q, 2-63; ST, Ni, 17-57)

65-Q. (Russian.) Scale Factor in Cyclic Loading. I. A. Oding. Zavodskaya Laboratoriya, v. 26, Sept. 1960, p. 1106-1107.

Effect of sample dimensions, heat treatment, grain size and stress heterogeneity on the strength of specimens during impact, tensile and bend testing under cyclic loading. (Q5, Q6, Q27, 2-59, 2-64, 3-66)

66-Q. (Russian.) General Theory on the Scale Effect in Cyclic Loading. P. D. Vagapov. Zavodskaya Laboratoriya, v. 26, Sept. 1960, p. 1108-1116.

Effect of size and shape of steel samples on the uniformity of surface loading, stress distribution and rate of crack propagation during bend, tensile and compression tests under cyclic loading. (Q-general, 3-66, 3-73; ST)

67-Q. (Russian.) Size Factors in Creep Rupture Testing. N. D. Sobolev. Zavodskaya Laboratoriya, v. 26, Sept. 1960, p. 1118-1122.

Effect of sample size on corrosion and fatigue cracking and rupture of metals subjected to long-time static loading. 17 ref. (Q3q, R1e, 3-73)

68-Q. Cause and Effect of Work Hardening in Austenitic Stainless Steels. Howard E. Tomlinson, Jr. Paper presented at Philadelphia Regional Technical Meeting of American Iron and Steel Institute, Oct. 13, 1960, 9 p.

Plastic deformation of 18-8 Cr-Ni austenitic stainless steel and the AISI 300 series. Effect of temperature on work hardening and effect of work hardening on magnetic permeability and Brinell hardness. Mechanical properties of a 304 stainless steel flanged and dished head. (Q-general, Q23a; SS)

69-Q. Current Nickel-Base High-Temperature Alloys. C. H. Lund. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 73, Nov. 17, 1960, 10 p. (Available as PB 161223 from U. S. Office of Technical Services, Washington 25, D. C.)

Composition, ultimate tensile strength and rupture strength of representative British, Soviet and United States Ni-base superalloys. 12 ref. (Q27a, Q3m) Ni-b, SGA-h, SGB-a)

70-Q. Creep, Mechanical and Metallurgical Properties of an Experimental Molybdenum-Vanadium Steel Rotor Forging. A. I. Smith, E. A. Jenkinson, D. J. Armstrong and L. M. T. Hopkin. Iron and Steel Institute, Journal, v. 196, pt. 2, Oct. 1960, p. 117-130.

Effect of air cooling and tempering and oil quenching and tempering treatment on creep, tensile and impact properties and the microstructure of 1/2% Mo, 1/4% V steel rotor forgings. 10 ref. (Q3, Q-general, M27, 2-64; AY, 4-51)

71-Q. Mechanical Properties of Some Tempered Alloy Martensites. J. M. Capus and G. Mayer. Iron and Steel Institute, Journal, v. 196, pt. 2, Oct. 1960, p. 149-158.

Tensile, impact, notched tensile, fatigue and notched fatigue properties of high purity martensitic Ni-Cr-Mo-V steels heat treated to high strength levels. Comparison with properties of similarly treated steels of commercial purity. 17 ref. (Q-general, 2-64; SS-c)

72-Q. Effect of Heat-Treatment and Microstructure on the High-Temperature Ductility of 18% Cr-12% Ni-1% Nb Steel. K. J. Irvin, J. D. Murray and F. B. Pickering. Iron and Steel Institute, Journal, v. 196, pt. 2, Oct. 1960, p. 166-179.

Effect of heat treatment and strain on the carbide precipitation processes of austenitic stainless steel containing Cb. Correlation of microstructure with high temperature ductility. 7 ref. (Q23p, M27, N8r, 2-62, 2-64, 3-68; SS-e)

73-Q. Some Ductility Aspects of 18-12-1 Nb Steel. R. J. R. Truman and H. W. Kirkby. Iron and Steel Institute, Journal, v. 196, pt. 2, Oct. 1960, p. 180-188.

Creep-rupture properties of weldments. Short time tensile properties at 600-1250° C. of 18% Cr, 12% Ni, 1% Cb austenitic steel, heat treated at high solution temperatures to simulate thermal treatment obtained in weld-heat affected zone. 14 ref. (Q23p, Q3, Q27, 2-62; SS-e, 7-51)

74-Q. Heat-Affected Zone Cracking in Welded High-Temperature Austenitic Steels. R. N. Younger and R. G. Baker. Iron and Steel Institute, Journal, v. 196, pt. 2, Oct. 1960, p. 188-194.

Heat affected zone cracking during welding and post-weld heat treatment in 18% Cr-12% Ni-1% Cb, 18% Cr-10% Ni-3% Mo and 18% Cr-3% Ni type steels. Metallurgical investigation by electron microscopy and electron diffraction. Cracking mechanisms. 19 ref. (Q26, K-general, M-general, 2-62, 2-64; SS-e, 7-51)

75-Q. High-Strength Steel Sheet (300 M). J. C. Chang, F. J. Herr and J. W. Sweet. Metal Progress, v. 78, Dec. 1960, p. 101-104.

Heat treated to 270,000 psi. tensile strength, it retains 7% elongation at subzero temperatures and 230,000 psi. ultimate at 600° F. Proper welding techniques are necessary to achieve these properties in the joints of missile cases. (Q-general, 3-70; AY, 4-53)

76-Q. (German.) Wear of Cast Materials. R. Weber. Industrie-Anzeiger, v. 82, Nov. 15, 1960, p. 1585-1587.

Samples of cast steels are wear tested by rotating in a mixture of quartz sand, drilling emulsion and water with subsequent weighing for metal loss. Relative wear as a function of composition. (Q9, 2-60; ST, 5)

77-Q. (Russian.) Irreversible Temper Brittleness. V. I. Sarrak and R. I. Entin. Metallovedenie i Termicheskaya Obrabotka Metallov, Oct. 1960, p. 14-19.

Low temperature tempering of 20KHG, 35S2G3, 50KHG and 37KHN4SV steels to produce irreversible temper brittleness by decomposition of martensite. Effect of alloying with Al and boron and tempering at higher temperatures on irreversible brittleness. 16 ref. (Q26s, J29, 1-67, N8p; ST)

78-Q. (Russian.) The Nature of Toughened Metals. G. V. Kurdyumov. Metallovedenie i Termicheskaya Obrabotka Metallov, Oct. 1960, p. 22-30.

Effect of fine crystalline structure, degree of cold plastic deformation, heat treatment, lattice distortion and microstress on the toughness of carbon steel. (Q23r, 2-59, 2-64, 3-66, 3-68; CN)

79-Q. (Russian.) Effect of Electroplating on the Mechanical Properties of Steels. N. T. Kudryavtsev and I. I. Moroz. Metallovedenie i Termicheskaya Obrabotka Metallov, Oct. 1960, p. 36-40.

Mechanical properties of 30KHGSA and U9 steels coated with Zn, Cu, Cr, Pb and Sn platings deposited from cyanide and noncyanide electrolytes. Measurement of hydrogen absorption by steel during electroplating. 4 ref. (Q-general; ST, Cr, Cu, Pb, Sn, Zn, 8-62)

80-Q. (Russian.) Notch Sensitivity of High Strength Steels. M. P. Markovets. Metallovedenie i Termicheskaya Obrabotka Metallov, Oct. 1960, p. 41-46.

Relationship between notch sensitivity, hardness and tensile strength of high and medium strength steels under cyclic loading in the bent condition. Effect of residual austenite content on notch sensitivity. 5 ref. (Q23s, Q29n, Q27a; ST, SGB-a)

81-Q. A Model for Repeated Residual Deformation Under Repeated Loading of Equal Direction. A. Zaslavsky. Research Council of Israel, Bulletin, Section C, Technology, v. 8C, June 1960, p. 59-62.

Residual stresses in steel structures under a critical collapse load more than double the maximum elastic load are predicted from a triangular structural model. (Q21, Q25h; ST, 4-57)

82-Q. Tensile Straining and Deformation Bands of Single Crystal of Pure Iron. Shoso Dohi. Hiroshima University, Journal of Science, Series A, v. 24, July 1960, p. 97-106.

The shear stress-strain curve obtained from the crystal deformed by the single

slip differs from that obtained from deformation by double slip up to about 0.5 of shear strain. Deformation bands appear only when the crystal is deformed by the mechanism of single slip. (Q24a; Fe-a, 14-61)

83-Q. (Spanish.) Bainitic Cast Irons With Cu, Mo and Cr Additions. Mario Pujol Roig. Instituto del Hierro y del Acero, v. 13, July-Sept. 1960, p. 745-759.

Microstructure, tensile strength and Brinell hardness of as-cast, tempered, hardened, normalized or bainitized cast iron alloys. (Q27a, Q29n, M27, 2-64; CI, Cr, Cu, Mo)

84-Q. (Spanish.) Statistical Study of the Influence of the Casting Method on the Tensile Properties of Individually Cast Test Pieces in Copper Alloys. Z. Gorny and A. Fijal. Instituto del Hierro y del Acero, v. 13, July-Sept. 1960, p. 729-744.

Tensile strength, elongation at rupture, Brinell hardness and contraction of cast Cu alloys as affected by casting method and pouring temperature. (Q27a, Q23p, Q29n, P10d; Cu-b, 5)

85-Q. (Spanish.) Influence of Sulphur on the Mechanical Properties of High-Grade Gray Iron. Jeronimo Vazquez White. Instituto del Hierro y del Acero, v. 13, July-Sept. 1960, p. 760-768.

Tensile strength, Brinell hardness, machinability and microstructure of integrally cast test bars containing GG 26 iron in which sulphur content is only variable in an extensive series. Measurement of optimum sulphur content. 7 ref. (Q27a, Q29n, G17k, M27, 2-60; CI-n, S)

86-Q. (Spanish.) Hardness of Metals. Francisco Sole Puig. Instituto del Hierro y del Acero, v. 13, July-Sept. 1960, p. 769-777.

Brinell, Rockwell, Vickers and Shore hardness testing procedures; factors affecting accuracy of tests; equivalences between hardness number systems. (Q29)

87-Q. (English.) An Investigation Into Sliding Bearings Suitable for a CO_2 Cooled Nuclear Reactor. H. H. Heath and K. F. Phillips. Wear, v. 3, Sept-Oct. 1960, p. 358-373.

Friction and wear behavior of nitrided, stainless, mild and toolsteels, Fe and Ti at 400° C. under intense radiation fluxes. Suitability of these materials for use in sliding bearings in reactors. 5 ref. (Q9, 2-62, 2-67, T7d; CN, Fe, SS, Ti, TS, 17-57)

88-Q. (French.) Problem of Quality in Large Steel Forgings. Paul Bastien. Revue de Metallurgie, v. 57, Sept. 1960, p. 815-826.

Heterogeneity and discontinuities in large steel ingots are correlated with the susceptibility of the metal to failure by embrittlement. Ultrasonic detection of flaws in large steel parts by combining systematic photographic recording of ultrasonic sounding with results of destructive tests on rejects and used parts. 21 ref. (Q26s, S13e; ST, 4-51)

89-Q. (French.) Actual Deformation During Wire Drawing. J. Buffet and B. Jaoul. Revue de Metallurgie, v. 57, Sept. 1960, p. 827-833.

Effect of lubrication on deformation due to tool friction during extrusion of mild steel and stainless steel wire. (Q21, Q24, F24; CN, SS, 4-61, 18-73)

90-Q. (German.) Results and Conclusions From Comparative Testing of Structural Steel Specimens for Brittle Fracture and Notch Toughness. Walter Dick. Stahl und Eisen, v. 80, Oct. 27, 1960, p. 1588-1602.

Evaluation of toughness-temperature curves for test bars of aged and nonaged, killed and unkilled, hearth and air refined plates of varying thickness. Bead bend and notched-bar tensile-bend tests at -20 to 100° C. Effect of killing and deoxidizing on brittle fracture. (Q5, Q26s, Q23s, 2-61, 3-70; ST)

91-Q. How Can We Prevent Brittle Fracture? Harry H. Thomasson. Canadian Metalworking, v. 23, Nov. 1960, p. 38-39, 64.

Effect of residual stress, notch or weld defects or temperatures below the brittle transition range on the brittle fracture of steel. (Q26s, 2-61, 3-66; ST)

92-Q. 300,000 Psi. Case Yield Strength May Be Practical. A. T. Letsinger. Missiles and Rockets, v. 7, Nov. 28, 1960, p. 40-41.

Techniques for increasing tensile strength of steel parts for rocket motors through control of composition and heat treatment; joining and forming of high strength materials. (Q27a, K-general, G-general, 2-60, 2-64, T2p; ST, SGB-a, 17-57)

93-Q. Dyna-Soar Demands Exotic Materials. M. A. Nelson. Missiles and Rockets, v. 7, Nov. 28, 1960, p. 50, 54.

High temperature mechanical properties of superalloys, refractory metals, cermets, ceramics and composites for missile applications. (Q-general, 2-62, T24e; SGA-h, EG-d37)

94-Q. (Japanese.) The Influence of Bainite on the Ductility of Alloy-Structural Steels. Kazuo Tsuya. Japan Institute of Metals, Journal, v. 24, July 1960, p. 440-444.

Charpy impact, Jominy hardness and Vickers microhardness tests at -80 to 98° C. on Cr-Mo and Ni-Cr-Mo steel specimens with bainitic structures transformed isothermally during slack and full quenching at 350-500° C. Data are given for ductility, toughness, hardness and transition curves. 5 ref. (Q23p, Q-general, N8m, 2-64; AY)

95-Q. (Japanese.) Internal Friction in Martensite and Tempered Martensite. Tadashi Ichiyama, Masayuki Kawasaki and Kikuo Takashina. Japan Institute of Metals, Journal, v. 24, July 1960, p. 456-460.

Internal friction in quench-hardened plain carbon steels containing 0.68-1.14% carbon measured by torsion pendulum at 2 cps. Effect of stress-induced ordering of carbon atoms, dislocation interaction, ferrite formation and temperature on relaxation peaks. 13 ref. (Q22, N-general, 2-64; CN)

96-Q. (French-German.) Zirconium Alloyed Copper. H. Bovet. Pro-Metal, v. 13, Oct. 1960, p. 375-380.

Alloys with 0.05-0.15% Zr are solution treated at 980° C., quenched and artificially aged at 400° C. Effect of Zr content on tensile strength, electrical conductivity and fusion point. Effect of tempering at 100-600° C. on mechanical properties. (Q27a, P12n, P15g, Q-general, 2-60, 2-64; Cu-b, Zr)

97-Q. Creep-Stress Analysis of Thin-Walled Structures. S. A. Patel, K. A. V. Pandalai and B. Venkatraman. Royal Aeronautical Society, Journal, v. 64, Nov. 1960, p. 673-682.

Stress analysis of thin-walled aircraft and missile components subject to creep. Derivation of equations for determining creep strain values, shear flow distribution, shear stress distribution, dimensionless shear and bending stress, assuming that the structures are at a uniform temperature and are composed of nonlinear elastic materials. 11 ref. (Q3, Q25, T24; 4-57)

98-Q. Study of Mechanical and Magnetic Characteristics of Ferromagnetic Materials by Ultrasonic Technique. W. J. Bratina and D. Mills. Canadian Mining and Metallurgical Bulletin, v. 53, Oct. 1960, p. 788-791.

Effect of elastic stress, plastic deformation, relaxation, aging and varying ultrasonic test frequencies on the attenuation of annealed and cold worked Armco iron, 1020 steel, 4340 steel and 420 stainless steel. 12 ref. (Q-general, P16, 1-74, 2-65, 3-66, 3-68; Fe-a, SS, ST)

99-Q. (Czech.) Testing of Patented Spring Wire. A. Klimes. Strojirenstvi, Oct. 1960, p. 755-759.

Steel wire of various diameters containing 0.81-0.85% C, 0.23-0.37% Mn, 0.21-0.30% Si, 0.007-0.021% P, 0.01-0.033% S and 0.11-0.13% Cr is tested for mechanical properties by tension, alternate bending, torsion, winding about cores of varying diameter and subsequent expanding and by the knot test. 9 ref. (Q-general; ST, SGA-b, 4-61)

100-Q. Joint Effect of Sulphur and Rare Earth Metals on Mechanical Properties of Cast Complex Low-Alloy Electric Furnace Steel. R. D. Engquist. Paper from "Electric Furnace Proceedings, 1959", v. 17. American Institute of Mining, Metallurgical and Petroleum Engineers, Inc., New York, 1960, p. 125-147.

Tensile and impact testing of induction furnace heats composed of ultra high-strength cast steel containing 0.005-0.045% sulphur to determine the effect of sulphur and rare earth content on elongation, yield strength, impact strength and hardness. (Q-general, 2-60; AY, Si, 5)

101-Q. Effects of Inhibitors on H_2 Embrittlement. Carl Meyer. Iron & Steel, v. 33, Nov. 1960, p. 536-539.

Protection against hydrogen embrittlement during pickling of iron and steel by addition of various inhibitors to the pickling bath. Effect of temperature, steel composition, bath contamination and inhibitor composition on embrittlement. 7 ref. (Q26s, L12g, 2-60, 2-61; Fe, ST)

102-Q. Heat Treatment Discovery. Iron & Steel, v. 33, Nov. 1960, p. 560.

Effect of uniformity of crystal distribution and grain rearrangement during heat treatment on mechanical properties and oxidation/corrosion resistance of stainless steels and Ti. (Q-general, R-general, 2-64; SS, Ti)

103-Q. (Russian.) Physico-Chemical Properties of Ti-V-Cb Ternary Alloys. I. I. Kornilov and V. S. Vlasov. Zhurnal Neorganicheskoi Khimii, v. 5, Sept. 1960, p. 2017-2024.

Sintered samples are tested for hardness and thermal expansion during rapid vacuum cooling and after various heat treatments. Electic resistivity is measured at 20-100° C. Effect of phase chemical composition on the above properties. 10 ref. (Q29n, P11g, P15g, 2-60, 2-61, 2-64; Ti-b, V, Cb)

104-Q. Effect of Neutron Irradiation on the Relaxation of Elastic Stresses. S. T. Konebeevsky. Atomnaya Energiya, v. 9, March 1960, p. 194-200.

U-Mo alloy springs are annealed at 570° C. in the bent state, then exposed to neutron irradiation for 19-48 min. Creep resistance and bend strength as influenced by neutron irradiation. Relaxation as a function of vacancy concentration. 7 ref. (Q3, Q5g, 2-67, T7c; Mo-b, U-b)

105-Q. (Japanese.) Stainless Steel Containing Boron Manufactured on Trial. Eiji Miyoshi and Tesuo Yakitoshi. Sumitomo Metals, v. 12, Apr. 1960, p. 415-427.

Stainless steels containing 0.78-6.10% boron are melted, forged and rolled to determine influence of boron content on forgeability, deformation resistance, toughness and brittleness. Specimens containing up to 2% boron are tested for weldability, radiation damage, corrosion resistance, mechanical properties and metallurgical characteristics. Test fabrications are made in bar, plate, sheet, tube and rod form. 11 ref. (Q-general, F-general, G-general, K-general; SS, B)

106-Q. (Japanese.) Tensile Properties of Austenitic Stainless Steels at Elevated Temperature. Shoji Terai and Takashi Abe. Sumitomo Metals, v. 12, Apr. 1960, p. 428-437.

Tensile properties at 0-800° C. and hot shortness at above 650° C. are investigated for 18-8, 18-8 Ti, 18-8 Cb, 16-13 Mo and extra low carbon 18-8 stainless steels by tests and microfractography. 4 ref. (Q27, 2-62; SS-e)

107-Q. (Russian.) Characteristics of Brittle Fracture in Metallic Crystals. E. D. Shchukin, L. A. Kochanova and V. I. Likhtman. Doklady Akademii Nauk SSSR, Fizika, v. 133, May 1960, p. 1064-1066.

Microscopic study of tensile rupture in Zn amalgam single crystals produced at 20-70° C. Kinetics of the edge and screw dislocations in relation to the temperature and deformation rate. 11 ref. (Q26s, 2-61, 3-68, M21; Zn, 14-61)

108-Q. Fatigue Damage Under Varying Stress Amplitudes. H. W. Liu and H. T. Corten. NASA Technical Note D-647, Nov. 1960. 68p. (Available from National Aeronautics and Space Administration, Washington, D. C.) $1.75.

Influence of various fluctuating stress-amplitude histories on the fatigue life of 5000 wires composed of 7075-T6 and 2024-T4 Al alloy, hard-drawn-steel and high strength steel using statistical analysis to determine mean fatigue life and scatter. 8 ref. (Q7b, 3-66; Al-b, ST, SGB-a)

109-Q. (Italian.) High Velocity Impact Testing. A. Bartocci. Metallurgia Italiana, v. 52, Sept. 1960, p. 587-600.

Notched samples of carbon and alloy steel are impact tested by shooting a spherical bullet of ball bearing steel against the smooth surface behind the notch. Impact energy can be modified by varying the powder charge. (Q6q; AY, CN)

110-Q. (German.) Toughness at Low Temperatures of Low-Alloy Chromium-Molybdenum, Chromium-Nickel and Chromium-Nickel-Molybdenum Cast Steel After Various Heat Treatments.

Hans Zeuner and Karl-Eugen Horner. Giesserei, v. 47, Nov. 3, 1960, p. 623-633.

Dilatometric investigation during heating and cooling comprising water and oil hardening (920-1100° C.) and subsequent annealing (520-930° C.) microstructure investigation and notch impact tests at -180 to 20° C. on GS-25 CrMo4, GS-27 NiCr73, GS-27 $NiCrMo_{64}$ and GS-30 NiCrMo 87 cast steel. (Q23r, Q23s, M-general; AY)

111-Q. (German.) Strength Properties of Cast Iron With Nodular Graphite. Horst Muhlberger. Giesserei, v. 47, Nov. 3, 1960, p. 614-622.

Analysis of mechanical properties of nodular cast iron by various melting processes including basic arc furnace, cold and hot blast cupola furnace and induction furnace. Comparison between ferritic and pearlitic nodular cast iron. Influence of mode of melting and composition. (Q27, Q-general, 2-60, E10; CI-r)

112-Q. (German.) Influence of Mode of Melting and of Overheating on Some Defects and on Mechanical Properties of Cast Iron. Kurt Orths. Giesserei, v. 47, Nov. 3, 1960, p. 595-608.

Statistical evaluation of production tests in melting of cast iron in acid reverberatory and cupola furnaces. Measurement of tapping temperature, reflection coefficient (ratio of true and black temperature), and degree of carbon saturation to assess quality of cast iron. (Q-general, E10, 9-68; CI)

113-Q. (Italian.) Ultrasonics and Fatigue Failures. Spartaco Cardona. Rivista di Meccanica, v. 11, Sept. 26, 1960, p. 19-23.

Causes of crack formation in steel crank, drive and railroad car axles. Ultrasonic methods of crack detection before failure. (Q7, S13q, 9-72, T23; ST)

114-Q. A Method for Analyzing Primary Creep Data. K. R. Merckx. 3rd. U. S. National Congress of Applied Mechanics, Proceedings, 1958, p. 605-610.

A general method for analyzing the strain rate during primary creep as a function of creep stress, testing temperature and strain is presented in a form suitable for a graphical analysis. Analysis of uranium creep data between 100-600° C. Material model is generalized for use in problems where the stress condition is triaxial and stresses vary with time. 7 ref. (Q3, 2-61, 3-66, 3-68; U)

115-Q. Determination of the Plastic Stress-Strain Relations in Tension of Nittany No. 2 Brass Under Hydrostatic Pressure. L. W. Hu. 3rd. U. S. National Congress of Applied Mechanics, 1958, p. 557-562.

Effects of hydrostatic compression on strain-hardening coefficient, strength coefficient, average true stress at rupture and reduction in cross sectional area at rupture are measured using a new triaxial stress testing method for studying plastic behavior of metals. (Q25n, Q-general, N7e; Cu-n)

116-Q. (Japanese.) Extrusion Properties of Lead Alloys With Antimony and Silicon Additions. Masao Terazawa and Hideji Yoshida. Japan Institute of Metals, Journal, v. 24, Aug. 1960, p. 487-490.

Age-hardening and age-softening effects, tensile strength and extrusion pressure of Pb alloy rods containing 0.3-5.0% Si and 0.014% Sb after extrusion at 20-300° C. and subsequent aging. Effect of composition and process temperature. 8 ref. (Q-general, N7a, 65, a-60, 2-64; Pb-b, Si, Sb)

117-Q. (Japanese.) Influence of Carbon Concentration on the Torsion Creep of Hardened Steels. Hiroshi-Muro. Japan Institute of Metals, Journal, v. 24, Aug. 1960, p. 490-493.

Torsion creep tests on carbon steel specimens containing 0.23-1.05% carbon at 20-300° C. after annealing, tempering and various quenching treatments. Influence of carbon content of quenched martensite on strain increment. 6 ref. (Q3b, 2-60, 2-64; CN)

118-Q. (Japanese.) Studies of Cr-Be Copper. Masataka Sugiyama, Noboru Makino and Hitoshi Shidara. Japan Institute of Metals, Journal, v. 24, Aug. 1960, p. 496-500.

Effect of Be on the hardness, tensile strength and electrical conductivity of Cu-Cr alloys is studied for ternary Cu-Cr-Be alloys containing 0.05-0.1% Be, 0.6-0.9% Cr, with various additions of Ni, Ti, Ag, Al and P. Effect of heat treatment at 300-1000° C. and cold working. 4 ref. (Q29n, Q27, P15g, 2-60, 2-64, 3-68; Cu-b, Be, Cr)

119-Q. (Japanese.) Properties of Nitrided Titanium. Koichi Nakano, Shunji Yamamoto, Hiroshi Kobayashi and Akira Takamura. Japan Institute of Metals, Journal, v. 24, Aug. 1960, p. 500-504.

Wear and corrosion resistance and mechanical properties of Ti nitrided in a nitrogen stream at 850° C. for 16-80 hr. 4 ref. (Q9n, Q-general, J28K, R-general; Ti)

120-Q. (Pamphlet.) Adaptaloy. Bulletin no. 201, 1960, 2 p. American Smelting and Refining Co., 120 Broadway, New York 5, N. Y.

Performance of a highly ductile Al alloy for use in castings which must be bent or cold formed during processing, assembly or installation. Data for mechanical properties, workability, weldability and foundry characteristics. (Q-general, E-general, K9s; Al-b, 5)

121-Q. (Pamphlet.) Tradenames "Thermotem-13" and "Thermoneal-13" Heppenstall Grade H720. Data Sheet No. 7, 4 p., Heppenstall Co., Pittsburgh, Pa.

Chemical composition, tensile properties at elevated temperatures and hardness of a 5% Cr hot work toolsteel containing V. Forging, annealing, hardening, tempering and surface protection of the steel. (Q27a, Q29n, 2-62, J-general; TS)

122-Q. (Translation-PERA.) Effect of Residual Stresses on the Dynamic Strength of Steel Bushes. D. D. Papshev. Machines and Tooling, v. 31, Apr. 1960, p. 32-34.

Bend tests are made on medium carbon steel workpieces to measure the effect of cutting speed, feed depth and cutting tool angle on the residual stress developed during turning. 3 ref. (Q25h, G17a; CN-p)

123-Q. (Translation-Brutcher no. 4854.) Effect of Low Temperatures Upon Fracture and Toughness of Medium Alloy Steel. M. P. Braun. Izvestiya Akademii Nauk SSSR, OTN, Metallurgiya i Toplivo, Feb. 1960, p. 104-109.

Changes in notch toughness and appearance of fracture of medium-alloy Ni-Cr-Mn steels in the initially "tough" and "brittle" conditions within 100 and -100° C. range, with special reference to effect of high quenching temperatures and various fourth alloying elements. (Q23s, Q26s, 2-63; AY)

124-Q. (Translation-Brutcher no. 4445.) Residual Stresses Set Up in Surface Hardening. V. V. Abramov. Metallovedenie i Obrabotka Metallov, Dec. 1958, p. 21-28.

Method of approximate calculation of quenching stresses in plates with allowance for transformations and plastic deformations. Effect of original stress state before quenching on the ultimate residual stress state. Importance of temperature of interior of components during the quench; improved theory of formation of stresses in surface-quenched steel. (Q25h, J26; ST)

125-Q. (Translation-Brutcher no. 4922.) An Electromagnetic Method of Testing Hardened Surfaces for Quality. B. A. Kuznetsov. Stanki i Instrument, v. 29, Dec. 1958, p. 27-29.

Method of nondestructive testing of surface hardened components for quality (structure and depth of the hardened surface layer). Combination of variable-field (eddy-current) and constant-field (residual magnetic) methods. (Q29, J28)

126-Q. (German.) Influence of Distance Between Supports on Bend Test Results for Cast Iron. St. Nadasan and E. Iovitiu. Freiberger Forschungshefte, B 45, 1960, p. 80-85.

Results of bending tests on round Ge 12, Ge 14, Ge 18, Ge 21, Ge 24, Ge 28 and Ge 32 cast iron bars with 600 and 300 mm. distance between supports. Influence of amount and structure of graphite in Fe on bending strength. (Q5, 2-60; CI, 4-55)

127-Q. Loads and Deformations of Buckled Rectangular Plates. Manuel Stein. National Aeronautics and Space Administration, NASA TR R-40, 1959, 27 p.

The postbuckling behavior of simply supported rectangular plates composed of 2024-T3 Al alloy and subjected to longitudinal compression and a uniform temperature rise is studied on a hydraulic testing machine. 17 ref. (Q28; Al-b, 4-53)

128-Q. Predicted Behavior of Rapidly Heated Metals in Compression. Elbridge Z. Stowell and George J. Heimerl, National Aeronautics and Space Administration, NASA TR R-59, 1960, 7 p.

A phenomenological relation developed for metals in tension at elevated temperatures is applied to compression under

rapid-heating conditions. Solutions are presented for cases in which the metal is unrestrained and the stress is constant and in which the metal is completely restrained and thermal stresses develop. The behavior of 7075-T6 Al alloy in compression is predicted for these cases at 0.1-100° F. per sec. 8 ref. (Q-28, 2-62, Q25p; Al-b)

129-Q. (German.) Use of Welded Joints in Construction. Hans H. Reinsch. Schweisstechnik, v. 14, Oct. 1960, p. 115-117.

Changes in mechanical properties of joints caused by temperature influences during welding (strain hardening, aging). Spot welding techniques for steel and nonferrous metals. Examples of proper and improper design for welding joints. (Q-general, 2-61, 2-65, 3-68; ST, 4-57, 7-51)

130-Q. (Italian.) The Fatigue Strength of Metals. Cornelio Gianola. Rivista di Meccanica, v. 11, Aug. 29, 1960, p. 55-63.

Fatigue strength under rotary bending of carbon, structural, stainless and alloy steels and of Cu, Ni, Mg and Al alloys in a variety of heat treat conditions as reported in the literature. 4 ref. (Q7, 10-54; ST, Al-b, Cu-b, Ni-b, Mg-b)

131-Q. (German.) Wear Tests Under Sliding and Sandblasting Conditions on Surface Weldings. K. Wellinger and H. Uetz. Schweissen und Schneiden, v. 12, Nov. 1960, p. 465.

Surface welds composed of low-alloyed (2% Mn, 1% Cr + Ti) and high-alloyed (3.5-3.8% Cr) materials are tested at 0-600° C. using quartz sand and gas coke to evaluate wear resistance to gliding and blasting. (Q9n, 2-61, L10c; AY, SS, 7-51)

132-Q. Analytical Investigation of Residual Stresses and Distortions Due to Welding. Koichi Masubuchi. Welding Journal, v. 39, Dec. 1960, p. 525-s to 537-s.

Mathematical expressions are developed to describe the distribution of residual stress and distortions. Analytical investigation of the following: transverse shrinkage and residual stress in a butt joint, distortion of a structure caused by angular change occurring in a butt joint, distortion of a structure caused by angular change occurring in a fillet joint and longitudinal distortion of a welded beam. 33 ref. (Q25h; 7-51, 9-74)

133-Q. A Reversed-Bend Test to Study Ductile and Brittle Transition. J. H. Ludley and D. C. Drucker. Welding Journal, v. 39, Dec. 1960, p. 543-s to 546-s.

A sharply bent beam is used to study the influence of temperature, tensile stress and surface conditions on the borderline between ductile and brittle behavior of structural steel. Results are given for project E, A-7 and T-1 steels. 6 ref. (Q23r, Q5, 2-61, 3-66; ST, 4-57)

134-Q. Spheroidal Graphite Cast Iron. G. Fitzgerald-Lee. Mine and Quarry Engineering, v. 26, Nov. 1960, p. 487-491.

Mechanical properties and microstructure of pearlitic ductile cast iron. Heat treatments and their effects. Casting requirements. Applications in mining equipment. (Q-general, M27, 2-64, T28; CI, 17-57)

135-Q. Accelerated Fatigue Testing of Steel. Research & Industry, v. 4, June 1959, p. 133-134.

Design and operation of an attachment for a fatigue testing machine which shortens the testing time for carbon and high-tensile steels to 24 hr. attachment provides continuous recording of the stress-deflection curve; the load which causes sudden rise in deflection is taken as the fatigue limit. (Q7, 1-52; ST)

136-Q. The Influence of Bismuth, Iron, Arsenic and Antimony in Sand-Cast Gunmetals. J. E. Stolarczyk, D. A. Hudson and D. Ashbolt. British Foundryman, v. 53, pt. 2, Nov. 1960, p. 482-499.

Influence of up to 0.1% Bi, 0.3% Fe, 0.6% As and 0.6% Sb on the tensile properties, porosity, pressure-tightness, hot tearing resistance, castability and fluidity of 85-5-5-5 and 88-10-2 gunmetals. None of these impurities has any effect on casting characteristics except that iron over 0.15% gives rise to small oxide inclusions. (Q-general, 2-60; Cu-s, Fe, As, Bi, Sb)

137-Q. (Russian.) Nickel Base Alloys for Stationary Gas Turbines. E. E. Levin, E. M. Pivnik, V. S. Kultygin and B. E. Lynbinskii. Energo-Mashinostronie, Aug. 1960, p. 30-35.

Effect of various alloying elements on the high temperature creep strength of materials used in gas turbine parts for operation at 700-750° C. for 10,000-100,000 hr. Data for linear expansion coefficient, heat resistance, creep

strength, flow limit, heat conductivity, elasticity modulus and other mechanical properties. 5 ref. (Q3m, Q-general, P-general, 2-60, 2-61, W11m; Ni-b, 17-57)

138-Q. (Russian.) Fatigue Strength of Austenitic Steel Pipe Welds. I. V. Kudryautsev and T. V. Naumova. Energo-Mashinostronie, Aug. 1960, p. 35-42.

Effect of welding conditions and heat treatment on crack formation in Ei257 steel pipe welds. Fatigue strength of welds during cyclic loading at 20 and 580° C. 4 ref. (Q7, Q26, 2-64; SS-e, 4-60, 7-51)

139-Q. (Russian.) Long Time Aging and Tensile Testing of Ei 481 Steel. L. B. Getsov and M. G. Taubina. Energo-Mashinostronie, April 1960, p. 32-35.

Mechanical properties of gas turbine parts composed of heat resistant Ni alloy steel during aging at 550-700° C. for 100-10,000 hr. Data for hardness, plasticity, creep and corrosion resistance, structure and flow limit. (Q-general, Q27, R-general, 2-65, W11m; AY, Ni, SGA-h)

140-Q. (German.) Influence of Pre-Heat Treatments on Torsional Creep of Aluminum Containing Traces of Iron. F. Erdmann-Jesnitzer, W. Bernhardt, W. Steinmuller and G. Muller. Aluminium, v. 36, Dec. 1960, p. 709-714.

Creep tests on Al with Fe content between 0.001 and 0.058% after various preliminary heat treatments using an analytical balance and a "torsion coil". Coil is attached by one end to the bare board of the balance and other end is fastened to balance arm. Extension is calculated by deflection of beam of the balance. (Q3b, 2-60, 2-64; Al-a, Fe)

141-Q. (German.) Influence of Material and Form of Joint on Static and Dynamic Tensile Strength of Bonded Joints in Sheet Metal. E. A. Cornelius and W. Mehl. Aluminium, v. 36, Dec. 1960, p. 699-708.

Influence of Araldite IN and Redux resins; Al alloy AlZnMgCu 1.5 and special deep drawn steel sheet; simple lap joint, single and double strap joints, scarfed joint and various types of preformed joints. Results indicate that for high strength sheet materials the bonded joint is superior to all other types of nondetachable joints. 7 ref. (Q27, 2-60; Al-b, ST, 7-58, 17-51)

142-Q. (German.) Impact Tests on Aluminum. W. Spath. Aluminium, v. 36, Dec. 1960, p. 715-719.

Impact apparatus allows simultaneous measurement of impact energy and maximum force during test. Tests with G-AlSi12CuNi alloy to demonstrate insignificance of impact energy measurements for evaluation of toughness of Al. (Q6, 1-53; Al-b)

143-Q. (Japanese.) Abrasion Tests on Electrolytically Hardened SKS-7 Steel. Toshinori Kuroda and Haruki Kondo. Japan Institute of Metals, Journal, v. 24, Sept. 1960, p. 553-555.

Comparison of hacksaw blades of SKS-7 and SK-3 steel for cutting ability after electrolytic and high frequency induction hardening with quenching. Effect of heat treatment on microstructure and hardness distribution. 2 ref. (Q9, Q29, J2g, M27, T6p; TS)

144-Q. (Japanese.) High Temperature Properties of the Ni-Base Ni-Cr-Co Austenitic Alloys. Katsuro Suenaga. Japan Institute of Metals, Journal, v. 24, Sept. 1960, p. 578-580.

Alloys containing 0-4% Co and 20% Cr examined at temperatures to 1200° C. after various heat treatment and cold rolling. Data are given for hardness, recrystallization temperature, oxidation resistance, ductility, creep rupture strength and age hardening as a function of Co content and temperature. 4 ref. (Q-general, N-general, R1h, 2-60, 2-62; Ni-b, Cr, Co)

145-Q. (Japanese.) Studies of Load-Time Relations by Charpy Impact Tests. Pt. 2. Seita Sakui, Tadahisa Nakamura and Masanobu Ohmori. Tetsu-to-Hagane (Iron and Steel Institute of Japan, Journal), v. 46, Nov. 1960, p. 1538-1543.

Transition temperatures and fracture modes of specimens of low carbon killed steel containing 0.17% carbon, after vacuum annealing at 920° C. and strain aging at 20, 100 and 200° C. are investigated using a miniature Charpy impact test at -100 to 100° C. Local measurements using piezoelectric crystal and oscillograph. (Q6, Q23r, Q26s, 2-63, 2-64; CN)

146-Q. (Japanese.) Function of Nitrogen as an Alloying Element in Heat Resisting Material. Pt. 8. Masazo Okamoto, Ryohei

Tanaka, Akira Sato and Shigeru Aoki. Tetsu-to-Hagane (Iron and Steel Institute of Japan, Journal), v. 46, Nov. 1960, p. 1559-1563.

Effect of cold working and "hot-cold" working on thermal stability of 316 L 17 Cr-12Ni-2Mo steels and low-Ni Timken 16Cr-15Ni-6Mo alloys containing 0.2-0.3% N studied at 20-950° C. Data for microstructure and mechanical properties. 3 ref. (Q-general, M27, 2-62, 3-68; SS, N)

147-Q. (Russian.) Study of Creep in Ei 696 Steel. B. M. Rakhman, A. Ya. Madorskii and V. V. Obukhovskii. Fizika Metallov i Metallovednie, v. 10, Apr. 1960, p. 617-621.

Creep test of alloy steel samples at 400-750° C. for 20-100 hr. Creep curves and lattice parameters at various temperatures. Factors influencing electrical resistivity, brittle fracture, creep strength and reduction in area upon deformation at high temperature. (Q3, 2-61, 3-67, P15g, Q26s, Q23p, 3-68; AY)

148-Q. (Russian.) Damping Properties of Two Phase Materials. M. A. Krivoglaz. Fizika Metallov i Metallovedenie, v. 10, Apr. 1960, p. 497-512.

Theory of damping of elastic vibrations in metal systems in connection with phase equilibrium. Derivation of formulas showing values for the rate and absorption coefficient of the sound wave, scattering energy and internal friction in relation to composition, temperature and phase transformation kinetics. 10 ref. (Q8)

149-Q. (German.) Radiographic Elasticity Constants for Tensile Lattice Deformation in the (400) Plane of Pure Copper. Carl-Otto Leiber and Eckard Macherarich. Zeitschrift fur Metallkunde, v. 51, Nov. 1960, p. 621-625.

Samples of 99.98% purity Cu are electrolytically polished and stress relieved by vacuum heating for 4 hr. at 400° C. and for 2 hr. at 450° C. with subsequent furnace cooling. X-ray testing with simultaneous tensile loading. 11 ref. (Q21, J1a, L13p; Cu-a)

150-Q. (German.) Recovery of Spectroscopically Pure Silver. Eva Bode. Zeitschrift fur Metallkunde, v. 51, Nov. 1960, p. 632-636.

A wire of 0.7 mm. diameter is heat treated to obtain an average grain size equal to this diameter. Recovery of elongation and internal friction is measured by making the wire a component of a torsional pendulum suspended in a vacuum and measuring its amplitudes and velocities. 15 ref. (Q22n, Q23p, 1-73; Ag-a, 4-60)

151-Q. (German.) Effect of Sound Waves on the Plastic Behavior of Metals. Friedrich Blaha, Bertwin Langenecker, Dietrich Oelschlagel. Zeitschrift fur Metallkunde, v. 51, Nov. 1960, p. 636-638.

Effect of an ultrasonic field of 800 kc./s. frequency and 2 W./sq.cm. intensity on the stress-strain ratio, yield strength, slip and shearing stress of Zn single crystals. 9 ref. (Q23, Q24, Q25n; Zn, 14-61)

152-Q. Creep in Steel. J. D. Murray. Metal Treatment and Drop Forging, v. 27, Nov. 1960, p. 461-467.

Technological, engineering and metallurgical aspects of creep in various steels. Stress-to-rupture data. Influence of structure and various alloying elements. (Q3, 3-71, 2-60; ST)

153-Q. (Dutch.) Cast Light Metals. L. J. G. Van Ewijk. Ingenieur, v. 72, Sept. 30, 1960, p. 197-205.

Al alloys containing 0-12% Si, 0-12% Mg, 0-0.5% Mn, 0-10% Cu, 0-2.5% Ni and 0-1.1% Fe and Mg alloys containing 0-9.5% Al, 0-5.5% Zn, 0-0.3% Mn, 0-0.7% Zr and 0-3% Th are cast in sand or permanent molds. Tensile yield, compression fatigue, impact strength, hardness and elongation from -100 to 100° C. (Q-general, 2-61, E-general; Al-b, EG-a39)

154-Q. Study of Mold-Iron Compositions. J. R. Kattus. American Iron and Steel Institute. Paper presented at Birmingham Technical Meeting, Nov. 30, 1960, 36 p.

Testing of various gray irons and Mg treated ductile irons used in ingot molds to determine thermal fatigue and service life. 29 ref. (Q7k; CI)

155-Q. (German.) Magnesium-Base Casting Alloys. E. F. Emley. Giesserei, v. 47, Nov. 17, 1960, p. 663-671.

Samples of alloys containing 0-9.5% Al, 0.3-5.5% Zn, 0-0.3% Mn, 0-0.7% Zr, 0-3% rare earth and 0-3% Th are cast and mechanically tested from 20-400° C. to determine creep strength, tensile strength and elongation as functions of composition and testing temperature and effect of rare earths on microporosity and cracking tendency. 51 ref. (Q-general, 2-60, 2-61; Mg-b, 5)

156-Q. Notch Sensitivity in Steel. Erik Agerman. ASEA Research, no. 4, 1960, p. 5-46.

Theories for determining notch effect for cast iron, cast steel, austenitic steel, spring steel and hardened and nonhardened steel. Notch sensitivity as influenced by the shaping of a part and its surface finish. (Q23s, 3-73; CI, SS-e, ST)

157-Q. New Steels Are Developed Which Save on Weight, Maintain Strength. Steel Facts, Dec. 1960, p. 7.

Use of low-alloy steels with minimum yield points of 45,000-50,000 psi. and heat treated constructional alloy steels with minimum yield points of 65,000-110,000 psi. in products subjected to hard wear. Comparison of strength-weight ratio, formability, toughness and corrosion resistance with conventional carbon steel. (Q23, Q9, T-general; AY-n, 17-57)

158-Q. Fatigue Problems Associated With Structural Materials for Current and Future Aircraft. J. Y. Mann. Australian Defence Scientific Service, Dept. of Supply, Report ARL/SM. 270, Sept. 1959, 54 p.

Fatigue properties of Al, Mg and Ti alloys and plastics with reference to stress concentrations, subzero temperatures and corrosive conditions. (Q7; Al-b, Mg-b, Ti-b)

159-Q. Nickel-Free High Temperature Alloy. D. J. Schmatz. Materials in Design Engineering, v. 51, Dec. 1960, p. 18.

Tests at room temperature and 1200° F. on a new group of austentic Fe-base alloys containing 9% Al, 30% Mn, 1% Si and 1% C. Mechanical properties are considerably higher than those of 304 stainless steel. (Q-general; Ni-b, SGA-h)

160-Q. Automatic Horizontal Continuous-Casting Machine. Castings, v. 6, Oct. 1960, p. 36-37.

Effect of the continuous casting process using a water-cooled mold on the mechanical properties, quality and machinability of cast iron bars. Comparison with properties of sand cast bars. (Q-general, G17k; CI, 5)

161-Q. (Russian.) Use of Antimony Cast Iron in Place of Bronze in Production of Ball Bearings. A. I. Smirnov and B. V. Chellanov. Stanki i Instrument, v. 31, Oct. 1960, p. 29-31.

Optimum composition of antifriction cast iron is obtained by introducing 0.3-0.65% Sb to the liquid metal jet in the ladle. Hardness, frictional wear resistance and corrosion resistance in sea water, acids and alkali media of Sb cast iron bearings. (Q29n, Q9n, R-general, T7d; CI, Sb, 17-57)

162-Q. (Italian.) Influence of Extended Aging at Ordinary Temperature on the Mechanical Properties of Some Light Alloys. L. Mori. Alluminio, v. 29, July-Aug. 1960, p. 351-357.

Specimens of cold worked and annealed commercial Al and a number of Al alloys are held at 20° C. for periods to 40,000 hr. (about 4 1/2 years) before tensile testing. Al-Mg alloys exhibit a decrease in tensile strength and yield point and an increase in elongation comparable to changes produced by a 5 hr. anneal at 90-100° C. and proportional to Mg content and degree of cold work. Lesser variations occur in 99-99.99% Al; in a 1.21% Mn-Al alloy, tensile strength increases and yield point decreases. X-ray analysis of Mg-Al alloys show evidence of recovery. 12 ref. (Q-general, 2-65; Al-b, Mg, Mn)

163-Q. (French.) Contribution to the Study of Ferro-Aluminum Alloys. E. Hugony and C. Garino. Alluminio, v. 29, July-Aug. 1960, p. 339-350.

Pearlitic (to 4% Al) and ferritic (4-22% Al) Fe alloys are prepared in the laboratory and tested for mechanical properties and corrosion and oxidation resistance at temperatures to 920° C. to find suitable material for use as retorts in the distillation of sulphur. Experimental melts are also made of an electric furnace steel with additions of Al to 6%. 43 ref. (Q-general, R-general; Fe-b, ST, Al)

164-Q. A Study of Some Peculiarities in the Shape of Hardness Curves of End-Quenched and Tempered Steels. H. R. S. Rao and V. G. Paranipe. Indian Institute of Metals, Transactions, v. 13, Sept. 1960, p. 205-240.

An anomalous dip is observed in the hardness curve even when the hardenability curve is smooth. The influence of austenitizing conditions and the time and temperature of tempering were determined to clarify the principles involved in the formation of the dip. (Q29n, J29; ST)

165-Q. Mechanics of Plastic Deformation in Polycrystalline Metals. R. C. Deshpande. Indian Institute of Metals, Transactions, v. 13, Sept. 1960, p. 241-248.

Effects of grain boundaries with special reference to the constraints imposed on the flow of the grain by neighboring grains. The interaction of the adjacent grains is evidenced in slip interference and "forced slip" on some unusual slip system near the grain boundary. 35 ref. (Q24)

166-Q. (German.) Use of Cast Iron in Machine Construction. G. Quapil. Technik, v. 15, Nov. 1960, p. 757-762.

Effect of graphite shapes on tensile strength. Damping properties of cast iron as compared with steel. Mechanical properties as a function of wall thickness. Wear resistance, machinability, corrosion resistance of highly alloyed corrosion and heat resistant irons. 9 ref. (Q-general, R-general, G17k; CI, SGA-h)

167-Q. (German.) Overrated Importance of the Notch Impact Strength. St. Kronmarck. Technik, v. 15, Nov. 1960, p. 751-756.

Structural steel containing 0.09-0.21% C, 0.01-0.63% Si, 0.39-1.35% Mn, 0.007-0.058% P, 0.017-0.093% S, 0.003-0.016% N, 0-0.083% Al and 0-0.21% Ti is notch impact tested at 0-90° C. after a 10% deformation followed by holding at 250° C. for 30 min. Strength behavior as a function of residual stress, deformation velocity and temperature. 25 ref. (Q6, 2-61, 3-66, 3-68; ST, SGB-s)

168-Q. (Japanese.) Wear of Titanium Cast Iron With Eutectic Graphite Structure. Eiichi Takeuchi. Imono (Japan Foundrymen's Society, Journal), v. 32, Sept. 1960, p. 635-641.

Resistance of cast iron containing 0.23% Ti and 3.36-3.85% C to sliding friction wear under lubrication is studied by electron microscopy. Effect of contact pressure, frictional velocity and eutectic graphite structure on wear phenomena. 5 ref. (Q9, 2-60, 3-71, 18-73; CI, C, Ti)

169-Q. Temperature Dependence of Flow Stress in Quenched Aluminum Crystals. L. E. Tanner. Acta Metallurgica, v. 8, Oct. 1960, p. 730-732.

Cyclic strain and tensile tests on specimen at 78-293° K. Relation of temperature dependence of work softening phenomenon and flow stress ratio to dislocation configuration as affected by quenching (in comparison to previous findings in annealed specimens.) 9 ref. (Q24, Q25, M26b, 2-61, 2-64; Al, 14-61)

170-Q. Mechanical Twinning in Thin Evaporated Gold Films. A. Catlin, W. P. Walker and K. R. Lawless. Acta Metallurgica, v. 8, Oct. 1960, p. 734-735.

Single crystal Au thin films, vacuum deposited onto NaCl substrates, are subjected to bulging and stretching tests at 20-200° C. Mechanical twinning as a result of shear stress is observed by optical and electron microscopy and X-ray diffraction and transmission techniques. (Q24b, M-general, 3-66; Au, 14-62)

171-Q. The Low Temperature Tensile Properties of Niobium. A. A. Johnson. Acta Metallurgica, v. 8, Oct. 1960, p. 737-740.

The grain size dependence of tensile properties of vacuum annealed specimens studied at 20-293° K. to determine the temperature dependence of the lattice friction stress and dislocation unlocking stress as factors determining the brittle transition temperature. 5 ref. (Q27, Q23r, M26, 2-59, 2-63; Cb)

172-Q. Observations on the Work-Hardening of Zinc Crystals in Alternating Tension and Compression. D. S. Kemsley. Acta Metallurgica, v. 8, Oct. 1960, p. 740-743.

Hardening behavior of Zn single crystals at varying strain amplitudes in tension and compression at room temperature for comparison with similar studies on Cu. Workhardening curves, slip mechanisms and orientation as a function of stress. 6 ref. (Q23a, Q24, 3-66; Zn, 14-61)

173-Q. Creep in Steel: Technological Aspects of the Subject. J. D. Murray. Iron & Coal Trades Review, v. 181, Nov. 4, 1960, p. 1007-1013.

Metallurgical investigation of high temperature (above 350° C.) steels for gas turbine applications to determine factors in creep deformation. Stress to rupture data and ductility are given for carbon steels, boron-containing steels and Cu alloys. (Q3, Q23p; CN, Cu-b, ST, B, SGA-h)

174-Q. High-Speed Impact. A. C. Charters. Scientific American, v. 203, Oct. 1960, p. 128-140.

Effect of high velocity on the process of impact when steel, tungsten carbide or nylon projectiles are fired into Pb, Cu, Al, duralumin, granite or epoxy resin target blocks at velocities up to 20,000 ft. per sec. Measurement of depth of penetration, impact crater characteristics and velocity at which the projectile and the target impact zone become fluid. (Q6; Al, Cu, Pb, NM-d)

175-Q. Composite Construction Using High Tensile Steel H-Beams. Engineer, v. 210, Dec. 2, 1960, p. 944.

Stress is induced in high tensile steel H beams by subjecting a broad flanged beam to a bending moment then casting a concrete casing around the tension flange of the beam. (Q25; ST, 4-57)

176-Q. Analytical Study of Creep Deflection of Structural Beams. Leonard Mordfin. NASA Technical Note D-661, Dec. 1960, 31 p.

Methods of analyzing creep deflection in I-beams of aircraft structures using Popov's elastic followup technique, time hardening principles, elementary beam theory and tensile and compressive creep curves. Derivation of equations for stress and strain distribution in beams having unequal creep properties in tension and compression, for deflection and pure and nonuniform bending. Development of corrections required by riveted connections for creep and transverse shear. Application to 2024-T4 Al alloy. 28 ref. (Q3, T24a; Al-b, 4-57)

177-Q. Experimental Investigation of Creep Deflection of Extruded and Riveted I-Beams. Leonard Mordfin and Nixon Halsey. NASA Technical Note D-662, Dec. 1960, 26 p.

Creep testing of riveted and extruded I beams of 2024-T4 Al alloy during bending at 450° F. Comparison of experimental creep deflections with calculated theoretical values. Effect of rivet creep on stress distribution and deflection. 5 ref. (Q3; Al-b, 4-57)

178-Q. Fatigue Properties of Zinc Single Crystals and Polycrystals. Mikio Yamamoto and Jiro Watanabe. Physical Society of Japan, Journal, v. 15, Nov. 1960, p. 2099.

Zn crystals are subjected to cantilever rotating fatigue tests at 20° C. to determine alternating bending stress as a function of number of cycles to fracture. (Q7; Zn, 14-61)

179-Q. (Japanese.) Chromium Base Heat Resisting Alloys. Pt. 1. Effect of the Addition of Ti and Al on the High Temperature Properties of 60% Cr-25% Fe-15% Mo Type Alloys. Tetsutaro Mitsuhashi, Renpei Yoda and Masao Yokushiyi. Japan Institute of Metals, Journal, v. 24, Oct. 1960, p. 615-618.

Creep, oxidation and deformation resistance, microstructure and hardness at 1150-1250° C. after various heat treatments for specimens containing to 2% Al and Ti. (Q-general, M27, 2-60, 2-62; Cr-b, Mo, Fe, Al, Ti)

180-Q. (Japanese.) Brittleness of Recrystallized Molybdenum. Kazuo Tsuya and Hideyuki Sasaki. Japan Institute of Metals, Journal, v. 24, Oct. 1960, p. 629-633.

The recrystallization brittleness of arc-cast and sintered Mo studied by metallographic and microfractographic techniques after annealing at 800-1300° C. Ductility is evaluated by bend testing at -70 to 0° C. 4 ref. (Q26s, Q23, N5, 2-61; Mo)

181-Q. (Japanese.) Fatigue Strength of Austenitic Stainless Steel at Elevated Temperatures. Gunji Shinoda, Tadakazu Sakurai, Tadao Sano, Tadashi Kawasaki and Hisashi Izumi. Japan Institute of Metals, Journal, v. 24, Oct. 1960, p. 645-649.

Rotating beam fatigue tests on plain and notched austenitic stainless steel specimens, including 304, 316, 347 and 321 stainless at 460-700° C. Fatigue strength at high temperatures is determined as a function of endurance limit and enhancement by carbon content and carbide precipitation. 15 ref. (Q7, N7, N8r, 2-60, 2-62; SS-e)

182-Q. (Japanese.) Tensile Strength Characteristics of Austenitic Stainless Steel at Elevated Temperature. Sunji Shinoda, Tadao Saro, Tadakeza Sakurai, Tadashi Kawasaki and Hisashi Izumi. Japan Institute of Metals, Journal, v. 24, Oct. 1960, p. 650-654.

Tensile tests on 304, 321 and another austenitic stainless notched specimen at -68 to 800° C. after various heat treatments and deformation. High temperature tensile properties are determined in terms of structural change, carbide precipitation and prior deformation. 8 ref. (Q27a, N8r, 2-61, 3-68; SS-e)

183-Q. (Dutch.) Testing of Weldments. Lastechniek, v. 26, Nov. 1960, p. 215-224.

The shear strength of welded assemblies is determined by testing a series of specially prepared samples under different welding conditions. Effects of material, electrode type, weld design and welding process. (Q2g, 4-57, 7-51)

184-Q. Cooperative Study of Brittle Fracture in Service. Lastechniek, v. 26, Nov. 1960, p. 228-230.

Facts to be considered when investigating the brittle fracture of steel during service are type of construction, temperature and weather conditions, appearance and character of fracture, material, design of assemblies and welding procedures. (Q26s; ST, 4-57)

185-Q. Rupture of Silicon-Iron Sheets and Related Creep Phenomena. C. W. Chen. Iron and Steel Institute, Journal, v. 196, Dec. 1960, p. 385-389.

Stress rupture tests at 550-875° C. revealing three modes of rupture associated with necking, void formation and the development of edge cracks paired at opposite sides. Structural changes occurring during creep, including migration and serration of grain boundaries, polygonization, recrystallization and grain coarsening, according to temperature. Effect of MgO surface coating on creep resistance and void formation susceptibility. 15 ref. (Q3, Q26, M27, N-general, 2-61; Fe-b, Si)

186-Q. Estimation of Hydrogen in Pickled Steel by Vacuum Extraction at 700° C. K. Sachs and M. Odgers. Iron and Steel Institute, Journal, v. 196, Dec. 1960, p. 406-414.

Mild steel, EN 1a, cyanided and silver steel are tested at various temperatures for ductility and hydrogen content, after pickling in cold HCl. Effects of sulphide inclusions, moisture adsorption, plastic deformation and storage temperature on results of analysis. 34 ref. (Q26s, S11f, 1-73; ST)

187-Q. The Bearing Properties of 1% C-Cr Steel as Influenced by Steelmaking. R. F. Johnson and J. F. Sewell. Iron and Steel Institute, Journal, v. 196, Dec. 1960, p. 414-444.

Use of a fatigue testing rig to examine bearings made from various kinds of 1% C-Cr steel. Effects of basic electric arc openhearth and vacuum melting and nonmetallic inclusions on bearing endurance. 13 ref. (Q7, D-general, 9-69; SGA-c, AY)

188-Q. Magnesium Cladding. Metal Industry, v. 97, Nov. 18, 1960, p. 422-424.

Creep ductility and fatigue behavior of Magnox A12, an Mg alloy used in fuel element cans. Data obtained from creep rupture and constant strain rate, tensile tests and by cyclic stressing. 4 ref. (Q3, Q7, Q27, T11q; Mg-b)

189-Q. Determining Decarburization Depth Nondestructively. Frank Phillips. Tool and Manufacturing Engineer, v. 45, Oct. 1960, p. 119-120.

Surface and core hardness values for steel parts, determined by an intolerance Rockwell tester, are converted to decarburization depth readings by a nomograph. Method permits consistent and nondestructive measurements which can be made by a Rockwell operator. (Q29; ST)

190-Q. (Russian.) Hardness of Deformed Steel as a Criterion of Strain Hardening During Secondary Loading. M. S. Orozd. Zavodskaya Laboratoriya, v. 26, Oct. 1960, p. 1139-1143.

Computation of relationship between hardness and degree of tensile, torsion and compression deformation. Effectiveness of strain hardening is evaluated by comparison of hardness before and after preliminary plastic deformation. Hardness value determines elastic limit during secondary loading. 9 ref. (Q29, 3-68, Q21; ST)

191-Q. (Russian.) Hardness Measurements by Spherical Indentor (Meyer's Method). S. S. Stepanov. Zavodskaya Laboratoriya, v. 26, Oct. 1960, p. 1144-1145.

New method for hardness measurement based on determination of the specific work of plastic deformation. Method requires not more than one indentation and does not depend on the load or ball diameter. Device is used to determine the hardness of U8 steel. (Q29; ST)

192-Q. (Russian.) Comparison of Brinell and Meyer Hardness Measurement Methods.

B. I. Pilipchuk. Zavodskaya Laboratoriya, v. 26, Oct. 1960, p. 1145-1147.

Principle difference between both methods is revealed by comparing measurement results obtained using same degree of loading and same indenter point diameter on Fe and Ni alloys, gray cast iron and Cu. Brinell and Meyer hardness. 3 ref. (Q29; CI-n, Cu, Fe-b, Ni-b)

193-Q. (Russian.) Evaluation of Gripping Friction Wear. G. A. Preis. Zavodskaya Laboratoriya, v. 26, Oct. 1960, p. 1148-1149.

Wear testing of bronze, steel and high strength cast iron samples in pure Ar under dry sliding friction conditions. Determination of friction gripping coefficients for various metal pairs. (Q9; CI, Cu-s, ST, SGB-a)

194-Q. (Russian.) Application of Varnish Coating to Study of Strain Conditions in Structures. A. G. Panasyants and V. N. Zaritov. Zavodskaya Laboratoriya, v. 26, Oct. 1960, p. 1150-1151.

Distribution and direction of deformation may be determined by coating the part with amylacetate varnish and tar powder. Results are varified by electrotensometric methods. 3 ref. (Q25; 4-57)

195-Q. Feasibility Studies of Stresses in Ligaments. M. M. Lemcoe. Welding Research Council, Bulletin Series, no. 65, Nov. 1960, 27 p.

Exploratory study of experimental techniques, including Photostress, bonded electric strain gages, photoelasticity (three-dimensional) and Stresscoat, for feasibility, accuracy and economy in measuring thick Al specimen and results compared with classical theoretical solutions. (Q25, F2, G25, S13k; Al, 4-53)

196-Q. (German.) Plastic Versus Metals. W. Heinrich. Maschinenbau, v. 9, Oct. 1960, p. 292-293.

Comparison of physical, chemical and mechanical properties of metals including Cu alloys, Al, cast iron, alloyed and unalloyed steel with plastics such as glass fiber reinforced polyester resin, polyvinylchloride and polyethylene, glass, asbestos or polyamid fiber reinforced phenol resins. Use of plastics in structures (tubes and sheets), for household goods, in missile construction and for machine parts (gear wheels). (Q-general, P-general; Al, Cu-b, CI, ST, NM-d)

197-Q. Modified Charpy V-Notch Impact Test for Alloy Steels. D. L. Newhouse and B. M. Wundt. Iron & Coal Trades Review, v. 181, Dec. 9, 1960, p. 1265.

Standard Charpy-V impact specimens of Ni-Mo-V steel are nitrided at 525° C. and then tested at 24° C. for brittle fracture and energy absorption. Brittle-boundary impact energy data are used for evaluation of fracture toughness and temperature of fracture and for selection of fracture-resistant alloys. (Q26, J28k; AY)

198-Q. (German.) Deformation Stresses in Drawn Material Leaving the Drawing Die. A. Peiter. Draht, v. 11, Nov. 1960, p. 695-702.

Investigation of deformation mechanisms in steel wire by applying a grid to surface, by macro-etching of sections to evaluate course of segregation lines, by measurement of hardness and by average grain size and by stress analysis. Selection of dies. (Q24; ST, 4-61)

199-Q. Problems Involved in the Development of Programmed Fatigue Testing. T. R. G. Williams. Engineer, v. 210, Oct. 28, 1960, p. 703-705.

Comparison of the relationship between random fatigue loading and recommended program loading patterns to show that, for Al alloys, the program test is a conservative estimation of fatigue life in variable loading. Results are compared with those for mild steel. (Q7; Al-b, CN)

200-Q. Effect of Roll Wear on Spalling. J. D. Keller. Iron and Steel Engineer, v. 37, Dec. 1960, p. 171-178.

Nonuniform wear of working and backup rolls in hot strip mills produces pressure up to and exceeding the shearing stress of the roll due to radial deformation. Fatigue cracking caused by stress produces spalling. 6 ref. (Q9, W23k)

201-Q. Properties of Some Copper Alloys at Elevated Temperatures. C. H. Crowe. ASTM Bulletin, Dec. 1960, p. 30-31.

Tensile and yield strength and electrical resistivity of various Cu alloy

bars at temperatures to 500° C. after annealing at 550° C. for 1 hr. (Q27, Q23b, P15g, 2-61, 2-64; Cu-b, 4-55)

202-Q. A Relation Between the Critical Alternating Propagation Stress and Crack Length for Mild Steel. N. E. Frost. Institution of Mechanical Engineers, Proceedings, v. 173, no. 35, 1959, p. 811-836.

Fatigue tests on mild steel specimens containing edge cracks of various lengths to determine the alternating stress necessary to cause crack growth. Relation between stress and crack length is used to correlate notch fatigue data. 25 ref. (Q7, Q26q, 3-66; CN)

203-Q. (Book.) 1960 Supplement to Book of ASTM Standards Including Tentatives. Pt. 3. Methods of Testing Metals. American Society for Testing Materials, 1916 Race St., Philadelphia 3, Pa.

Methods of testing for cast iron, notch toughness of steel forgings, torque rate of thermostat metal and conductivity, resistivity and permeability of magnetic and electrical conductor materials. Methods of liquid penetrant inspection, radiographic inspection of Al and Mg castings, ultrasonic contact inspection of weldments and sampling of metal powders. (Q-general, S-general, 1-54; Al, CI, Mg, ST)

204-Q. (Japanese.) True Stress Strain Curves for Various Tube Metals. Shigehiko Yazawa. Journal of Mechanical Laboratory (Japan), v. 14, Sept. 1960, p. 141-145.

Stress strain curves obtained from tension tests on tubular specimens are used to determine work hardening characteristics. 4 ref. (Q25n, Q27, Q23a; 4-60)

205-Q. Some Experiments on the Effect of Time at Temperature on the Room Temperature Reversed Bending Fatigue Characteristics and on the Tensile Strength of 24S-T Al-Clad Aluminum Alloy. J. A. Dunsby. National Research Council of Canada, Mechanical Engineering Report MS-102, Aug. 8, 1960 (NRC no. 5927), 24 p.

Alloy is held at 300-400° F. from 1 1/2-100 hr. prior to conducting room temperature reversed bending fatigue or tensile tests. Physical properties change radically with such treatments; these changes can be correlated for varying times and temperatures by the use of the Larson-Miller parameter. (Q7, Q27a; Al-b)

206-Q. (Japanese.) Study of High Strength Low-Alloy Steel. Effect of Boron and Boron Plus Molybdenum Additions in Manganese-Silicon Steel. University of Tokyo, Engineering Research Institute, Annual Report, v. 19, Sept. 1960, p. 96-101.

Addition of B and B with 0.5% Mo improves tensile and yield strength as well as hardness. Addition of both B and Mo improves hardenability whereas B alone has no effect. (Q27a, Q29n; AY, B, AD-q40)

207-Q. The Work Hardening of Metals. N. F. Molt. Metallurgical Society of AIME, Transactions, v. 218, Dec. 1960, p. 962-968.

Survey of the theory of work hardening with attention to face centered cubic metals. Evaluation of mechanisms responsible for stopping the movement of dislocations and causing hardening, including slip, dislocation network, jog and forest formation and annihilation; vacancy formation; and source locking and unlocking. 28 ref. (Q23a, M26b)

208-Q. The Effect of Phosphorus on the Deformation and Fracture Characteristics of Iron From 1600-2200° F. Rolf Nordheim, Thomas B. King and Nicholas J. Grant. Metallurgical Society of AIME, Transactions, v. 218, Dec. 1960, p. 1029-1032.

Constant-load creep-rupture tests conducted in an argon atmosphere at 1600-2200° F. on two heats of Fe containing about 0.06 and 0.09% P in solid solution in the As-cast condition. Stresses are selected to give strain rates approaching those encountered in the hot working of steel. 6 ref. (Q3, Q23, Q26, 2-62, 3-66; Fe-b, P)

209-Q. (French.) Practical Interest of the Great Oscillation Damping Capacity of Irons. Elizabeth Plenard. Fonderie, Oct. 1960, p. 419-431.

Principles of the property of amortisment and test methods for measurement. Influence of physical factors such as temperature, frequency, amplitude of constraint, nature of vibrations and

number of cycles. Correlation between amortisement and certain mechanical properties such as fatigue limit, shock resistance, shearing sensitivity and static strength. Discussion of oscillation systems. (Q8, Q-general; Fe)

210-Q. The Effect of Sulphur on the Notch Toughness of Heat Treated Steels. J. M. Hodge, R. H. Frazier and F. W. Boulger. Metal Treating, v. 11, Dec-Jan. 1961, p. 14-15.

Effect of sulphur content on V notch Charpy impact resistance in wrought, heat treated alloy steels at hardness levels of Rc. 25-40. Testing conducted at -40 to 300° F. (Q6, 2-60, 2-61; AY)

211-Q. Fractures Caused by Explosions and Impacts. John S. Rinehart. Colorado School of Mines, Quarterly, v. 55, Oct. 1960, 155 p.

A discussion of fracture occurring under impulsive loads such as explosions or impacts and of propogation of transient disturbances through metals such as 4130 steel, Cu, brass and 1020 steel. Effect of changes in physical properties on transient disturbance movement. (Q26; Cu-b, ST)

212-Q. Temperature Effects on Tensile Modulus of Elasticity. Magnesium Products, Nov. 1960, Insert.

Tensile modulus of elasticity of HM21A-T8, HM31A-F, HK31A-T6, HK31A-H24, AZ31B-0 and AZ31B-H24 Mg alloys, 2024-T4 and 7075-T6 Al alloys, 155A and 140A Ti alloys, Inconel X, AISI 301 steel, 17-7pH steel, Ti 13V-11Cr-3Al aged, Ti 6Al-4V and Ti 8Mn alloys. (Q21b, 2-61; Al-b, Mg-b, Ni-b, ST, SS, Ti-b)

213-Q. The Metallurgical Aspects of Hydrogen Embrittlement in Metal Finishing. Harold J. Read. Paper from "American Electroplaters' Society, Technical Proceedings", 1960, p. 110-115.

Stress and strain relationships in flow and fracture and the manner in which occluded hydrogen can affect the normal relationship. Problems of removing or avoiding hydrogen embrittlement during finishing; solid solubility and diffusion phenomena. 5 ref. (Q26s, L-general)

214-Q. The Behavior of Hydrogen in Iron and Steel. M. L. Hill. Paper from "American Electroplaters' Society, Technical Proceedings", 1960, p. 124-134.

Extensive review of the mechanism of hydrogen embrittlement. Comparison of the several theories advanced to explain embrittlement phenomena. 58 ref. (Q26s)

215-Q. Measurements Pertaining to Hydrogen Embrittlement. Cloyd A. Snavely. Paper from "American Electroplaters' Society, Technical Proceedings", 1960, p. 138-142.

Hydrogen charging methods, stressing techniques, analytical problems, surface effects and related phenomena. Feasibility of a standard embrittlement test. 24 ref. (Q26s)

216-Q. A New Look at the Hydrogen Embrittlement of Cadmium Coated High Strength Steels. Norman M. Geyer, G. William Lawless and Bennie Cohen. Paper from "American Electroplaters' Society, Technical Proceedings", 1960, p. 143-151.

Cd electroplating processes for coating high strength steel, 280,000 psi. UTS, without detrimental hydrogen embrittlement. Detrimental embrittlement is dependent on the steel alloy, the current efficiency of the Cd plating bath and the physical structure of the Cd coating obtained. A reliable and sensitive test procedure is outlined for ascertaining detrimental embrittlement as a result of Cd plating. 12 ref. (Q26s, L17; AY, Cd, SGB-a)

217-Q. The Effectiveness of Metallic Undercoats in Minimizing Plating Embrittlement of Ultra High Strength Steel. Walter Beck and Edward J. Jankowsky. Paper from "American Electroplaters' Society, Technical Proceedings", 1960, p. 152-159.

Embrittlement caused by Cr and cyanide Cd electroplating is substantially reduced by using undercoats of pyrophosphate Cu and Watts type Ni or by replacement of the cyanide Cd plating solution with the fluoborate bath. 25 ref. (Q26s; AY, Cr, Cd)

218-Q. Control of Hydrogen Embrittlement by Plating From Cadmium Cyanide Baths Containing Nitrate. William F. Hamilton and Myron Levine. Paper from "American Electroplaters' Society, Technical Proceedings", 1960, p. 160-165.

Addition of sodium nitrate and a throwing power additive to a high Cd, low free-cyanide electrolyte produces satisfactory operating characteristics without visible cathodic gassing. The need for post plate baking is eliminated. (Q26s, L17; Cd)

219-Q. Fatigue Breakdowns in Carbon Steels. Mirko Klesnil. Metal Treatment and Drop Forging, v. 27, Dec. 1960, p. 503-510.

Use of tensometers to measure the amplitude of deformation and stress. Changes in structure are studied by X-ray diffractography. In the elastically plastic zone hardening is pronounced; in the phenomenologically elastic zone, which covers almost the whole course of the Wohler cruve, no hardening is established. 10 ref. (Q7; CN)

220-Q. (Russian.) Effect of Elastic Vibrations on Internal Friction in Aluminum Alloy With 2% Manganese at Low Temperatures. V. P. Ketova and V. A. Pavlov. Fizika Metallov i Metallovedenie, v. 10, Mar. 1960, p. 445-452.

Temperature and internal friction relations studied in samples exposed to transverse vibrations of 10^{-5} amplitude between 200-300° K. Internal friction peak observed at 250° K. is in direct proportion with the number of vibrations and is thought to be caused by crystalline lattice defects, such as vacancy coagulations, formed during vibrations. (Q22, Q8, M26s, 2-63; Al-b, Mg)

221-Q. (Russian.) Effect of Additions in Metals on Tensile Strength in Relation to Time and Temperature. V. I. Betekhtin, S. N. Zhurrov and A. V. Savitskii. Fizika Metallov i Metallovedenie, v. 10, Mar. 1960, p. 481-486.

Al, Ag and solid solutions of Al with Cu, Mg and Ag are exposed to monoaxial tensile stress at 18-450° C. It is shown that the structure dependent coefficient (lattice parameters) in the equation determining the time elapsing between the start of loading and rupture depends on the concentration of alloying additions. 10 ref. (Q27, 2-60; Al-b, Ag-b)

222-Q. (Russian.) Effect of Composition on the Slip Traces of Magnesium Alpha-Solid Solution in Aluminum. V. I. Syutkina and E. S. Yakovleva. Fizika Metallov i Metallovedenie, v. 10, Mar. 1960, p. 481-486.

Electron-microscopic observation of slip trace distribution in 4-14% tensile deformed samples (0.01-0.92% Mg) showing marked influence by Mg. The phenomenon is explained by the interaction between Mg atoms and dislocations in the beginning of deformation when strain hardening takes place and during softening at high deformation degree. 9 ref. (Q24a, M21e, M26, N7a, 2-60; Al-b, Mg)

223-Q. Toughness of Tempered Martensite. D. Hardwick and K. R. Pirt. Iron and Steel Institute, Journal, v. 196, Nov. 1960, p. 301-308.

Influence of tensile strength on the transition temperature of three low-alloy steels. En. 21, En. 25 and En. 40 B in the tempered martensitic condition and at a constant prior austenitic grain size. Results are rationalized in terms of the tempering characteristics of martensite. (Q23r, Q27, N8a; N8p, 2-59; AY)

224-Q. Research on the Mechanical Properties of Metals. Australian Machinery and Production Engineering, v. 13, Oct. 1960, p. 23-27.

Use of X-ray diffraction and electron microscopy to determine the relation of metallurgical structure to fatigue cracking and the effect of the notch geometry on tensile strength and ductility of Al, low alloy steels, high strength steels and Ti and its alloys. Effect of temperatures of -196 and 1200° F. on tensile strength. (Q7, Q27a, Q23p, M22g, M21e; Al, AY, Ti-b, SGB-a)

225-Q. How Arvo Beat a Metal Fatigue Problem. Richard Smallman-Tew. Canadian Metalworking, v. 24, Jan. 1961, p. 31-35.

Stress relief of Alcoa X7079 alloy hand forgings by compressive deformation. Causes of residual stress in high strength Al alloys; measurements of stress pattern and magnitude. (Q7; Al, 4-51)

226-Q. Availability and Mechanical Properties of High Strength Steel Extrusions. Defense Metals Information Center, Battelle Memorial Institute, DMIC Report 138, Oct. 26, 1960, 60 p. (Available as PB 151097

from U. S. Office of Technical Services, Washington 25, D. C.)

Ultimate tensile strength, elongation, yield strength and area reduction are given for high strength steel extrusions such as low alloy hardenable, martensitic, martensitic precipitation hardenable, austenitic and semiaustenitic precipitation hardenable steels. (Q27a, Q23; AY, SS, 4-58)

227-Q. (French.) Comparison of the Values of the Modulus of Elasticity of Gray Irons Obtained by a Static Method and a Dynamic Method. J. Dilewijns. Fonderie Belge, v. 30, Nov. 1960, p. 293-297.

Methods of determining modulus of elasticity, including dynamic method using Forster Elastomat, with statistical analysis of results. Dispersion of results on gray irons as reported in the literature and of tests on 20 mm. diameter cylinders of lamellar graphite iron by means of the Elastomat and by flexure tests on conventional tensile testing machine. 7 ref. (Q21a, Q21b, 1-54; CI-n)

228-Q. (Translation-AIP.) Physics of the Strength of Crystalline Materials. R. I. Garber and I. A. Gindin. Soviet Physics, v. 3, July-Aug. 1960, p. 41-77.

Effect of microscopic cracks, strength and size of fiber crystals, temperature, stress, brittleness and structure on strength of crystalline materials including high strength alloys. Fatigue and rupture mechanisms. 223 ref. (Q-general, M26; SGB-a)

229-Q. (Book.) Determination of the Mechanical and Technological Properties of Metals. B. M. Gliner. 158 p. 1960. Pergamon Press, 122 E. 55th St., New York 22, N. Y.

Covers all types of tests used in the Soviet Union. In all cases the principal terms are accurately defined, the testing variables such as specimen dimensions, loading rate and time, testing temperature are laid down in accordance with Soviet specifications. Brief descriptions are given of the principal types of testing equipment. (Q-general)

230-Q. Checking Tensile Strength of Bolts. Mill and Factory, v. 68, Jan. 1961, p. 93.

Measurement of torsion tensile strength of bolts by portable testers to determine the torque giving maximum holding power without exceeding the bolt's tensile strength. Applications in aircraft wheels. (Q27, Q1, T7f, T24)

231-Q. (French.) Study of Steels With and Without Vanadium for Forgings. G. Delbart, M. Jaspart, A. Clerc and A. Constant. Revue de Metallurgie, v. 57, Oct. 1960, p. 885-909.

Influence of addition of 0.03-0.29% vanadium on mechanical properties of 50-200 mm. diameter bars of carbon steel and a group of Cr-Mo and Cr-Ni-Mo steels. Marked improvement of tensile and impact properties obtained by addition of vanadium in some cases permits substitution of a normalizing treatment for quenching and raising of tempering temperatures. 3 ref. (Q-general, 2-60, 2-64; AY, V)

232-Q. (Slovakian.) Effect of Hydrogen on Welded Cast and Formed Steel. Paul Bastien. Zvaracsky Sbornik, v. 9, Mar. 1960, p. 345-366.

Literature review. Effect of hydrogen on the flaking of forged or rolled steel. Brittleness of welds containing hydrogen. Internal friction, elastic and plastic deformation and tensile properties as functions of the hydrogen present and its distribution in the metal in the form of protones, atoms or molecules. 36 ref. (Q26s, 9-70, Q-general; ST, 4-51, 4-53)

233-Q. A Basic Guide to Specifying Heat Treatment of Steels. Lester F. Spencer. Machine Design, v. 32, Dec. 22, 1960, p. 120-125.

Mechanical properties of carbon and alloy steels as a function of type of heat treatment, chemical composition and grain size. (Q-general, 2-59, 2-60, 2-64; AY, CN)

234-Q. Zircaloy Cladding Performs Well in PWR. B. Lustman, M. L. Bleiberg, E. S. Byron, J. N. Chirigos, J. G. Goodwin and G. J. Salvaggio. Nucleonics, v. 19, Jan. 1961, p. 58-63.

Effect of exposure to an integrated neutron flux of $5.5\text{-}6.0 \times 10^{21}$ NVT on dimensions, mechanical properties, microstructure and hydrogen content of Zircaloy fuel element cladding. Mechanisms of cladding failure due to hydriding and water logging. (Q-general, M27, 2-67, T11; Zr-b)

235-Q. Glass Helps Metals to Raise High Temperature Barriers. Iron Age, v. 187, Jan. 12, 1961, p. 57-59.

Effect of glass additions on the high temperature strength, elastic moduli and stress rupture and creep properties of low melting point metals such as Al, Pb and Zn alloys. (Q-general, 2-60; Al, Pb, Zn, SGA-d, NM-f42)

236-Q. Effect of Radiation on Ductile-Brittle Transition Temperature. Power Reactor Technology, v. 3, Sept. 1960, p. 38-57.

Effect of fast neutron irradiation on the mechanical properties and ductile-brittle transition temperatures of various ferritic steels of varying grain size, impurity content and composition. (Q-general, Q23r, 2-67; SS-d)

237-Q. Nickel Coatings--Adherence on Aluminium and Alloys. Corrosion Technology, v. 7, Nov. 1960, p. 369.

A quantitative determination of the strength of adhesion of a Ni coating to Al and its alloys based on the force required to strip the coating from the surface. Optimum pretreatment conditions can also be determined from this test. (Q10c; Al-b, Ni, 8)

238-Q. Steel Tubing. Its Weight? Its Annular Area? F. Kaplan. Product Engineering, v. 31, Dec. 26, 1960, p. 59.

Calculation of tubing weight per foot, annular area and shear strength from a nomograph. (Q2g; ST, 4-53)

239-Q. (German.) Observations Concerning Radiation Hardening in Copper and Nickel. I. G. Greenfield and H. G. F. Wilsdorf. Naturwissenschaften, v. 47, no. 17, 1960, p. 395-396.

Neutron irradiation of Cu single crystals (99.999%, 2.5 x 2.5 x 60 mm. in size) in a pile to a dose of 2×10^{19} nvt. (integrated flux) at 70° C. and subsequent deformation by various amounts in tension. Electron microscopic examination after electrolytical polishing of crystals to a thickness of 1000 Å. The reaction mechanism of radiation hardening is compared with the behavior of Ni. (Q29n, M-general, 2-67; Cu, Ni, 14-61)

240-Q. Movement of Point Defects During Fatigue of Aluminum Crystals. E. Roberts and R. W. K. Honeycombe. Philosophical Magazine, v. 5, Nov. 1960, p. 1147-1149.

Dynamic stress-strain behavior of Al crystals fatigued in a push-pull machine at 13 CPS. Room temperature interruptions to test at -196 and -78° C. result in a transitory hardening which is attributed to the movement of point defects to dislocations. (Q7, Q25n, M26b; Al, 14-61)

241-Q. (French.) Austenitic Grain Size of Cast Steel. M. Pierre Detrez. Fonderie, Sept. 1960, p. 383-391.

Influences of austenitic grain size on workability, impact resistance and tensile strength of martensitic tempered steels. Comparison of results obtained by vacuum thermal and picric acid methods. (Q23q, Q6, Q27, 2-59; SS-c)

242-Q. (Russian.) Deformation and Stresses During Elongation. I. Ya. Tarnovskiy, A. A. Pozdeev and S. H. Puchkov. Kuznechno Shtampovochnoe Proizvodstvo, June 1960, p. 6-10.

Distribution of tensile and compression stresses in a Pb blank of rectangular and cylindrical shape during elongation by drop-forging with round, rhombic and rectangular dies. Relationship between degree of reduction and emergence of cracks and pores. Influence of contact-surface of the die on stress distribution in the blank. 7 ref. (Q28k, Q27, F22n; Pb)

243-Q. (Russian.) Determination of the Plasticity of Steel Sheet by Hydrostatic Device. L. A. Rubenkova. Kuznechno Shtampovochnoe Proizvodstvo, June 1960, p. 12-13.

Determination of tensile strength of cold rolled steel sheets under various degrees of plastic deformation by a special hydraulic punching device which simultaneously measures the pressure developed in cylinder and the height and diameter of the reduced and elongated sample. 5 ref. (Q27a, 3-68; ST, 4-53)

244-Q. (German.) Theoretical Buckling Stresses of Aluminum Structural Elements. Karl Sutter. VDI-Zeitschrift, v. 102, Dec. 11, 1960, p. 1715-1729.

Classification of Al alloys into three strength categories in terms of their 0.1 and 0.2 yield strength ratio. Computation of theoretical buckling strength under

compression and shear stress as dependent on yield strength and slenderness ratio. (Q28, Q23b; Al-b)

245-Q. (German.) Joints in Aluminum Constructions for Structural Engineering Applications. Otto Steinhardt. VDI-Zeitschrift, v. 102, Dec. 11, 1960, p. 1729-1742.

Tensile, shear and fatigue testing of as-cast and warm aged specimens of AlMg5, AlMgSi1, AlZnMg1 and AlZnMg3 having riveted and welded joints. (Q27, Q2, Q7; Al-b, Mg, 7-51, 7-53)

246-Q. (Russian.) Theory for Experimentation With Sheet Metal at High Rate of Deformation. A. D. Tomlenov. Kuznecho Shtampovochnoe Proizvodstvo, July 1960, p. 5-6.

Determination of resistance to deformation of sheet metal at various deformation rates by a high-speed hydraulic punching machine. Results are calculated from data on the amount of liquid in the hydraulic cylinder, its density and compression modulus on the velocity of the impact wave. 8 ref. (Q23q; 4-53)

247-Q. (Italian.) Fatigue Strength of Metals. Pt. 3. Cornelio Gianola. Rivista di Meccanica, v. 11, Oct. 1960, p. 27-33.

Form and notch factors and notch sensitivity in ferrous and nonferrous metals under static or dynamic tensile, flexural and torsional stress. (Q7, Q23s)

248-Q. (Japanese.) Study of Al-Mg-Si-Cu Strong Alloy Sheets for Bright Anodizing. First Report. Influence of Si and Cu on Brightness and Mechanical Properties. Namio Kawashima and Noboru Fukuchi. Light Metals, v. 10, Sept. 1960, p. 337-340.

Corrosion hardness and tensile test data for specimens tempered in the T6 condition. (Q-general, L19, 2-64; Al-b, Cu, Si)

249-Q. (Japanese.) Relation of Cold Work to Aging Characteristics of High Strength Aluminum Alloys for Aircraft. Eici Ikono. Light Metals, v. 10, Sept. 1960, p. 341-347.

Electrical conductivity measurement and tensile and corrosion tests on 2024, 7075 and 6061 Al clad Al alloy sheet after natural and artificial aging at 20-190° C. for various times, solution treatment and cold working. Response of mechanical properties to heat treatment and deformation as a function of composition. 8 ref. (Q-general, P16g, R-general, 2-60, 2-65, 3-68; Al-b)

250-Q. Studies of Hot Cracking in High-Strength Weld Metals. H. W. Mishler, R. E. Monroe and P. J. Rieppel. Welding Journal, v. 40, Jan. 1961, p. 1s-7s.

Effect of sulphur and phosphorus content on the hot tensile properties and hot ductility of 4340 weld metals is determined using a freezing cycle hot tension machine. 5 ref. (Q27, Q23p, 2-60, 9-72; ST, 7-51)

251-Q. Application of 2219 Aluminum Alloy to Missile Pressure-Vessel Fabrication. Clayton H. Crane and Whitney G. Smith. Welding Journal, v. 40, Jan. 1961, p. 33s-40s.

Corrosion resistance, heat treatment characteristics, mechanical properties as affected by temperature and weldability of 2014, 2219 and 6061 Al alloys are compared to determine the feasibility of using Cu-bearing alloys in fusion welded and heat treated pressure vessels. (Q-general, 2-61, R-general, K9s, T26q; Al-b, Cu, 17-57)

252-Q. Brittle Fracture Characteristics of a Reactor Pressure-Vessel Steel. E. T. Wessel and W. H. Pryle. Welding Journal, v. 40, Jan. 1961, p. 41s-48s.

Notch sensitivity, yield strength, transition temperature and impact strength are measured for A302B steel plates in the as received normalized condition or after a heat treatment similar to that encountered during fabrication into reactor pressure vessels. (Q26s, Q23, Q23b, 2-64, T26q; ST, 4-53, 17-57)

253-Q. (Russian.) Effect of Aging on Tensile Strength of V95 Type Alloys at Low and Elevated Temperatures. K. M. Pogooina-Alekseeva and E. I. Timofeev. Tsvetnye Metally, Oct. 1960, p. 68-71.

Aging of Al alloy samples at 20-150° C. for 2-128 hr. with subsequent tensile testing at -40 to 150° C. Increase in tensile strength as a function of aging at higher temperatures than the service temperature. (Q27, 2-61, 2-65; Al-b)

254-Q. (Russian.) Drawing Die Wear is Studied by Radioactive Isotopes. P. F.

Groshev. Tsvetnye Metally, Oct. 1960, p. 71-76.

Cu wire is drawn using a hard alloy die containing W-C and made radioactive by slow neutron irradiation to produce W^{187} isotope. Determination of die wear as a function of drawing velocity by testing and recording the resulting W^{187} irradiation. 3 ref. (Q9, 1-59, T6r)

255-Q. Creep Testing Machine Meets British Emergency. H. Robson. Metal Progress, v. 79, Jan. 1961, p. 76-78.

Faced with the urgent task of checking the creep properties of numerous forgings of doubtful quality, engineers at D. Napier & Son, Ltd., in London, designed and built a creep tester in only five weeks rather than cut jet engine production and wait for replacements. Simple in design and fabrication, the tester can handle up to six creep specimens at one time. (Q3, 1-53)

256-Q. (Japanese.) Properties of 2S Slabs Made by Continuous Casting. Takashi Ikeno, Shigeo Zoima and Kizo Shibata. Light Metals, v. 10, Nov. 1960, p. 397-404.

Comparison of structure and mechanical properties of specimens taken from different sections of an Al alloy casting. Data are given for tensile and shear strength, elongation, hardness, Knoop ratio, earing and micro and macrostructure. 5 ref. (Q-general, M-general; Al-b, 5)

257-Q. (French.) Problems Connected With Creep Tests. W. Siegfried. Metallurgia Italiana, v. 52, Oct. 1960, p. 640-646.

Determination of the Larson-Miller constant from the stress applied, temperature and time elapsed until rupture. Stress strain curves for creep are given for a steel containing 0.5% Mn, pure Ni, Ni with 0.05% Ti and an austenitic steel. Range of testing temperatures: 550-750° C.; range of load: 0.5-35 kg. per sq. mm. 9 ref. (Q3, 2-61, 3-66; Ni-b, Ti, SS-e, ST, Mn)

258-Q. (Italian.) Creep Properties of Various Steels Loaded at Higher Temperature. G. Paravicini. Metallurgia Italiana, v. 52, Oct. 1960, p. 647-650.

Literature review on evaluating creep test results. Testing of alloy steels 131D containing Mo and 223D containing Cr and Mo, 227D, 235D and 234D at 500-600° C. while loaded with 3.5-18 kg. per sq. mm. (Q3, 2-61; AY)

259-Q. (Italian.) Effect of Temperature and Load Variations in Creep Testing. M. Alberghina. Metallurgia Italiana, v. 52, Oct. 1960, p. 651-655.

Heat resistant AISI 310 steel containing 19.8% Ni, 25.8% Cr, 0.14% C, 0.76% Mn and 1.09% Si is loaded with 15-22.5 kg. per sq. mm. at 600-650° C. and creep tested. Evaluation of accuracy of results. (Q3, 2-61, 3-66; ST, SGA-h)

260-Q. (Italian.) Short Time Creep Tests. A. Erra. Metallurgia Italiana, v. 52, Oct. 1960, p. 656-658.

Ag 42 steel is loaded with 2-33 kg. per sq. mm. at 370-450° C. for 45 hr. to determine creep strength as a function of temperature. 5 ref. (Q3, 2-61; ST)

261-Q. (Italian.) Extrapolation of Creep Rupture Data. P. Brozzo. Metallurgia Italiana, v. 52, Oct. 1960, p. 659-660.

Discussion of extrapolation methods for creep data in general and according to the theories of Larson-Miller, Dorn and Manson-Haferd. (Q3)

262-Q. (Italian.) Steels Used in High Temperature Tubing Systems. A. Feroci. Metallurgia Italiana, v. 52, Oct. 1960, p. 661-668.

Pressure maxima, sizes, admissible thermal stress, yield strength, creep strength, thermal expansion, modulus of elasticity, thermal conductivity, density and specific heat of tubing manufactured from 33, 35 and 45D carbon steels, austenitic steels 913, 991, 971, 942 and 912D and ferritic or martensitic stainless steels 921, 923, 925 and 927D at -50 to 900° C. (Q-general, P-general, 2-61; AY, CN, SS, 4-60)

263-Q. (Italian.) Effect of Structure and Heat Treatment on the Creep Behavior of Steel. A. Myallonnier. Metallurgia Italiana, v. 52, Oct. 1960, p. 669-673.

Carbon steel containing 0.10-0.22% C and various Cr, Mo and Ni alloy steels are subjected to isothermal heat treatments at 920-1100° C., rapid cooling to 700-720° C. and slow cooling to room

temperature, then creep tested at 475-700° C. Effect of composition and grain size on creep strength. 19 ref. (Q3, 2-59, 2-64; CN)

264-Q. (Czech.) Hard Facing Co-Cr-Mo-W Alloys for Service Temperatures in the 700° C. Range. Karel Löbl. Zvaranie, v. 9, Nov. 1960, p. 320-326.

Alloys containing 26.85-31.62% Cr, 3.79-14.08% Mo, 1.14-13.15% W and 40.98-55.65% Co and used for hard facing of extrusion dies and forging hammers, are tested for mechanical properties at 20-700° C. and for oxidation resistance at 800-1000° C. 8 ref. (Q-general, R1h; Co-b, Cr-b, Mo, W)

265-Q. (German.) Investigation of Anelastic Behavior of Silver in Stattc Torsion Testing. Werner Schilling, Georg Alefeld and Gerd Buschhorn. Zeitschrift fur Metallkunde, v. 51, Dec. 1960, p. 685-693.

Measurements of the torsional elastic after-effect at temperatures from 0-350° C. of pure (99.99%) cold rolled and annealed silver wire. Interpretation of mechanism of after-effect in terms of a dislocation model. (Q22, Q1, M26b, 2-61; Ag, 4-61)

266-Q. (German.) Investigation of Slip in Individual Crystallites of Multicrystallite Copper Specimens. Randolf J. Hartmann and Eckard Macherauch. Zeitschrift fur Metallkunde, v. 51, Dec. 1960, p. 694-699.

Combined X-ray and microscopic investigation of slip planes from slip band direction and crystallite orientation during tensile deformation (up to 7.5%) of annealed and etched 99.98% Cu specimens with crystallites of 0.1-0.4 mm. diameter. (Q24a, M-general, 3-68; Cu)

267-Q. (German.) Work Hardening and Staple Fault Energy of Copper Alloy Crystals. Peter Haasen and Alwyn King. Zeitschrift fur Metallkunde, v. 51, Dec. 1960, p. 722-736.

Plastic deformation of alpha (fcc.) solid solution single crystals of Cu with 2.15-9.66% Ga or 1.47-6.62% Ge between 80 and 500° K. for varying deformation rates to investigate work hardening as a function of concentration, temperature and strain rate. Computation of staple fault energy from stress at beginning of cross slip. Examination of deformation-twinning at temperatures below 200° C. (Q23a, Q24, 3-66; Cu-b, 14-61)

268-Q. Science for Electroplaters. Pt. 62. L. Serota. Metal Finishing, v. 59, Jan. 1961, p. 49-51.

Adhesion of Ni castings on cast iron, nickel brass and extruded and cast brass is determined by the Jacquet method and the nodule test. The first is a method of quantitatively determining the bond strength and the second a method of adhesion testing in which an electroformed projection serves as a grip and the force required to dislodge it from the base metal is measured. (Q10c; CI, Cu-n, Ni, 8)

269-Q. (Japanese.) Study of Al-Mg-Si Alloy Systems. Shigio Muromachi and Yamazaki Hiroshi. Light Metals, July 1960, p. 33-38.

Melting, casting, rolling and heat treatment of Al-Mg-Si alloys as they affect the mechanical properties. Data for optimum casting temperature, cooling speed and quenching and tempering temperature. 6 ref. (Q-general, 2-64, 3-68, C5; Al-b, Mg-b, Si)

270-Q. The Effects of "As Forged" Surfaces and Notches on the Fatigue Strength of S.A.E. 4140 Steel (U.T.S. 140,000 Psi.) J. Y. Mann. Australian Defense Scientific Service, Aeronautical Research Laboratories, Structures and Materials Note no. 256. 15 p.

Rotating cantilever fatigue tests are conducted on S.A.E. 4140 steel specimens (U.T.S. 140,000 psi.) with "as forged" surfaces and with V-notches. Graphs show effect of "as forged" or decarburized surface on the fatigue limit and fatigue strength reduction factor. 16 ref. (Q7c, 2-64; ST)

271-Q. (English.) Hot Workability of Carbon Steels. T. Koinumaru, S. Sasaki and T. Ichikawa. Railway Technical Research Institute (Japan), Quarterly Report, v. 1, June 1960, p. 32-33.

Torsion tests at temperature above 950° C. on Swedish carbon steel (0.04-1.29% C) and Japanese carbon steel (0.10-0.89% C) to determine hot workability for application in railway forging. Hot deformability as a function

of C, O and Cu content and temperature with test failures occurring because of hot shortness. (Q23q, Q26s, 2-62; CN)

272-Q. Stress Analysis of Aluminum V-8 Diesel Cylinder Block. H. W. Van Camp. Preprint no. 255A, Society of Automotive Engineers, 485 Lexington Ave., New York 17, N. Y. 1960, 12 p.

Role of experimental stress analysis in product design. Criteria for evaluating Al alloy 355 castings for fatigue is described in the case history of a cast Al wet line type cylinder block for which stress measurements are correlated with fatigue fracture. (Q23b, Q7k, T3n; Al)

273-Q. Wrought Titanium Alloy Has Better Creep Resistance. Materials in Design Engineering, v. 53, Jan. 1961, p. 17.

Data given for creep resistance, forgeability and tensile properties of a new 8Al-1Mo-1V-Ti alloy as compared with 6Al-4V-Ti alloy. Duplex annealing is suggested as a method of increasing rupture life. (Q3m, F22, 17-52, Q27a, J23; Ti-b, Al, Mo, V)

274-Q. Heat Treatable Copper Alloys. Materials in Design Engineering, v. 53, Jan. 1961, p. 84-88.

Effect of thermal and mechanical treatments on the mechanical properties and electrical conductivity of beryllium copper, chromium copper, zirconium copper, nickel tin bronze and aluminum bronze. (Q-general, P15g, 2-64, 3-68; Cu-b)

275-Q. What You Should Know About Creep Rupture. F. J. Clauss. Materials in Design Engineering, v. 53, Jan. 1961, p. 89-100.

Effect of stress, temperature and time on the creep rupture of ferritic, martensitic and austenitic steels, 1100 Al alloy, W, Ta, Mo, Li, Fe, Pt, Au, Ag, Cu, Al, Mg, Zn, Cd, Pb and Sn with emphasis on experimental techniques. Effect of structure on the creep rupture of solid solution, precipitation hardened and dispersion hardened alloys. (Q3, 2-61, 3-66, 3-71)

276-Q. How to Make Simple Bend Tests. Iron Age, v. 187, Jan. 26, 1961, p. 82.

Ductility of sheet metal is determined without the aid of testing devices by a practical method in which the metal is bent 180°, a piece of the same metal is inserted between bent sections and compound bends are made. The appearance of the metal in the folding zone is indicative of its properties. (Q5; 4-53)

277-Q. The Effect of Lubricants on the Growth of Surface-Contact Area During Plastic Deformation of Metals. L. H. Butler. Institute of Metals, Journal, v. 89, Dec. 1960, p. 116-122.

Compression tests on small annealed Al sheet specimens with a flat, highly polished contact die, the interfaces being either unlubricated or lubricated with pure paraffinic-base lubricants of varying viscosity, with deformation to approximately 40% compression. Correlation with surface-contact conditions in metal-forming processes to explain the low value of coefficient of friction and the surface texture changes in cold rolling and wire drawing. (Q9, Q28, M26c, S15, 3-68, 18-73; Al, 4-53)

278-Q. A Low-Temperature Inflection in the Temperature-Dependence of Hardness of Pure Metals. E. R. Petty. Institute of Metals, Journal, v. 89, Dec. 1960, p. 123-124.

Hardness, temperature relationships for Al, Ag, Au, Cr, Fe, Mo, Ni, Pb, Pt, Ta, V, W, Zr, alpha brass and steel at -183 to 800° C. Relation to low temperature deformation and creep mechanism is examined by tensile and compression tests, correlated with test data from the literature. 13 ref. (Q29n, Q-general, 2-63, 3-68)

279-Q. The Microhardness of Copper Bombarded With Alpha Particles. T. K. Ghosh, C. J. Beevers and R. S. Barnes. Institute of Metals, Journal, v. 89, Dec. 1960, p. 125-127.

The hardness induced in Cu after bombardment with 38-MeV alpha particles at 150° C. is investigated together with its annealing characteristics after vacuum treatments at 200-1000° C. The hardening is separated into two parts: that caused by atomic displacements, produced by the passage of the energetic alpha particles and that at the end of the alpha particles track caused by the deposition of the He atoms. 4 ref. (Q29q, 2-64, 2-67; Cu)

280-Q. (Japanese.) Fatigue Bauschinger Effect. Minoru Kawamoto, Hiromi Takai and Hidehiro Kisimato. Japan Society of Mechanical Engineers, Transactions, v. 26, Oct. 1960, p. 1333-1339.

Deformation behavior of 0.34% carbon steel under cyclic loading pulsating torsional stress applied in one direction and successively in the reverse direction. A "Fatigue Bauschinger Effect" is observed at stress slightly below the yield stress, corresponding to the conventional Bauschinger Effect observed in static loading. (Q7h, Q24k; CN)

281-Q. (Japanese.) Plain Bending Fatigue Strength of Welded Joints. Comparison of High Tension Steel With Mild Steel in Joint-Models of Rolling Stock. Pt. 2. Hiroshi Nakamura and Shiro Veda. Japan Society of Mechanical Engineers, Transactions, v. 26, Oct. 1960, p. 1361-1368.

Bending fatigue tests on model weldments used in the design and manufacture of truck frames, axles and wheels. Effect of postweld operations such as shot-peening, grinding and annealing on fatigue strength and crack propagation. Relation of notch sensitivity to weldment surface defects. 6 ref. (Q7, Q5m, Q26, K9q; CN-g, 7-51, 9-71)

282-Q. (Japanese.) The Prediction of Fatigue Fracture Under Combined Stresses at Stress Concentration. George Sines. Japan Society of Mechanical Engineers, Transactions, v. 26, Oct. 1960, p. 1340-1347.

Fatigue failure criteria for unnotched specimens under a combination of alternating and static stress are proposed and examined in fatigue tests to obtain a general failure criterion, especially applicable to notched specimens with stress concentations. Data are reviewed for various carbon and alloy steels, malleable iron and Cu and Al alloys, after heat treatment and working. 24 ref. (Q7f, Q25k; Al-b, CI-s, Cu-b, ST)

283-Q. (Japanese.) Dynamic Creep and Fatigue of 13 Cr Steel at Elevated Temperature. Shiyi Taira and Ryoichi Koterazawa. Japan Society of Mechanical Engineers, Transactions, v. 20, Oct. 1960, p. 1356-1360.

Data for dynamic creep and fatigue tests at 450° C. are correlated with static creep rupture and reversed stress fatigue test data to predict high temperature strength. 8 ref. (Q3m, Q7, 2-62; AY, Cr)

284-Q. (Japanese.) Strain Ratio Relationship in Plastic Deformation. Fujio Nakanishi and Yosuo Sato. Japan Society of Mechanical Engineers, Transactions, v. 26, Oct. 1960, p. 1327-1332.

A theory on plasticity is advanced in terms of strain ratio relationships accounting for relation between plastic stresses, forms of hysteresis curves, anisotropic deformation mechanisms and yielding as a function of plastic deformation. 5 ref. (Q24g, Q24h; CN, Cu-n)

285-Q. (Japanese.) Analysis of Ball-Indentation Hardness. Koshino Kuroki. Japan Society of Mechanical Engineers, Transactions, v. 26, Oct. 1960, p. 1435-1443.

Spherical indentation hardness is evaluated in terms of balance between indenting load and stresses at the contact surface, assuming constant contact pressures. Theoretical relations between the indenting load, ball diameter, specimen yield stress and depth or diameter of the indentation are checked for specimens of different hardness. Conversions are made for Vickers, Rockwell and Brinell hardness, with some attention to Meyer's analysis. 11 ref. (Q29b, Q29e, Q29s)

286-Q. (Japanese.) Fatigue Tests of Metals at Ultrasonic Frequency. John Awatani. Japan Society of Mechanical Engineers, Transactions, v. 26, Oct. 1960, p. 1382-1386.

S-N curves are obtained for bearing steel and Cu specimens as a function of ultrasonically induced stress concentration at the midportion, which is contracted. Analysis is made of the vibration of the contracted test piece at resonance conditions. (Q7f, Q25k, 1-74; Cu-b, AY)

287-Q. (Swedish.) Blue Brittleness. A. Josefsson. Jernkontorets Annaler, v. 144, Nov. 1960, p. 834-846.

Effect of plastic deformation at 200-300° C. as compared to deformation at room temperature on the mechanical properties of low carbon steels with varying nitrogen content. (Q26s, Q-general, 2-60, 3-68; CN-g)

288-Q. Why You Should Braze Small Diameter Piping. Alden W. Swift. Welding Engineer, Jan. 1961, p. 44-46.

Tensile, compression and crush testing of brazed and threaded joints to compare shear strength, soundness and weight. (Q27, Q28; 4-60, 7-52, 7-55)

289-Q. An Approximate Method of Calculating Shear and Bending in Free-Beam Structures Subjected to Suddenly Applied Forces. M. S. Smith. Machine Design, v. 33, Jan. 19, 1961, p. 127-131.

Calculation of the dynamic response of beam structures subjected to sudden loads by a mode acceleration method applied in steps to find the components of local accelerations, which are then summed according to the principles of superposition. (Q2, Q5; 4-57)

290-Q. Fracture Specimen of Notched Tensile Specimens of Titanium and a Titanium Alloy. G. W. Geil and N. I. Carwile. Materials Research and Standards, v. 1, Jan. 1961, p. 16-21.

Effects of notch geometry, temperature and prior strain-temperature history on the initiation and propagation of fracture in tensile specimens tested at -196 to 100° C. Initiation of fracture is correlated with embrittlement factors associated with the notch geometry. (Q26q, Q26s, Q23s; Ti-b)

291-Q. (Italian.) Manganese Bronzes. A. Azzolini and G. Cogito. Fonderia Italiana, Oct. 1960, p. 407-413.

Preparation of bronzes containing 57-70% Cu, various amounts of Zn, 0.5-6.5% Al, 0.5-3% Fe, 0.5-5% Mn and 0-0.50 Pb, Sn or Ni. Constitutional diagrams. Effects of Al, Sn, Fe, Mn and Ni on mechanical properties. 3 ref. (Q-general, M24d, 2-60; Cu-s)

292-Q. Testing of Wire Rope. E. Franke. Wire, Dec. 1960, p. 242-244.

Importance of fatigue testing of wire rope. Design of fatigue testing equipment capable of subjecting wire rope and individual wires in the rope to tensile, bending, wear and vibration stresses. (Q7; 4-61)

293-Q. The Application of Steel Extrusions. R. D. Jones. Welding and Metal Fabrication, v. 28, Dec. 1960, p. 495-498.

Extrusion of high tensile alloy and stainless steels in complicated rollable bar, unrollable solid and hollow sections. Data are given for tensile strength and elongation of the extrusions as a function of carbon content and for tolerances and surface finishes. (Q27a, Q23p, 2-60; AY, SS, 4-58)

294-Q. Piping Failures. Mechanical World and Engineering Record, v. 141, Jan. 1961, p. 17-18.

Failure in carbon, alloy and stainless steel boiler tubes under high pressure as caused by corrosion, erosion, scaling, creep and temper embrittlement as a function of stress and temperature. (Q26, Q3, R1d, 2-62, 3-66; ST, 4-60)

295-Q. Radiation Hardening of Copper Single Crystals. T. H. Blewitt, R. R. Coltman, R. E. Jamison and J. K. Redman. Journal of Nuclear Materials, v. 2, Dec. 1960, p. 277-298.

Effect of nuclear radiation on the mechanical properties of Cu. Annealing kinetics of the radiation hardness are studied in the temperature range from 25-700° K. Little or no annealing is observed in the region below 80° K. From 80-300° K., approximately 20% of the yield stress is recovered with the remainder annealing in the range from 600-700° K. Data support a dislocation locking mechanism. 23 ref. (Q-general, 2-67; Cu, 14-61)

296-Q. The Plastic Deformation of Monoclinic Alpha Plutonium. S. E. Bronisz and A. E. Gorum. Journal of Nuclear Materials, v. 2, Dec. 1960, p. 353-355.

Evidence shows that alpha Pu deforms primarily by slip, but that twinning and possibly grain boundary sliding contribute to the deformation. Grain boundary sliding at room temperature and an increase in the ease of twinning with an increase of temperature are contradictory to the observed behavior of other materials. 3 ref. (Q24; Pu)

297-Q. (Russian.) Determination of Notch Sensitivity in Plastic Metals. O. A. Timoshenko. Zavodskaya Laboratoriya, Nov. 1960, p. 1293-1297.

Armco iron and 10, 20, 45, U8 and Yait steel samples are heat treated, notched and exposed to tensile loading. Axial and radial deformation distribution in the minimum cross section area and effect of carbon content on the notch sensitivity are determined. 4 ref. (Q23s; Fe, ST)

298-Q. Bi-Metallic Interlock Bonds Cast Iron Inserts to Die Cast Parts. A. F. Bauer and J. S. Mikus. Current Engineering Practice, v. 3, Oct. 1960, p. 18-21.

High tensile and shear strength and stress resistance of mechanical bond formed between centrifugally cast gray iron and die cast Al. Application in light weight, wear resistant engine blocks and brake drums with good heat transfer properties. (Q-general, T21b, 17-57; Al-b, 5-61, CI-n, 8-66)

299-Q. "Operation Cyrogenics" Demonstrates Toughness of 9% Nickel Steel. Inco Nickel Topics, v. 14, Jan. 1961, p. 2-3.

Rectangular and cylindrical pressure vessels of quenched and tempered or double-normalized and tempered 9% Ni steel are subjected to drop impact and burst tests at -320° F. and at 100 and 2160 psi. without stress relieving to investigate low temperature strength. (Q23r, Q6p, Q10, 2-63, T26q; SS, Ni, 17-57)

300-Q. How to Select the Right Superalloy Spring. Steel, v. 148, Jan. 30, 1961, p. 96-98.

Suggested temperature ranges for 17-7 PH, NS-A286, Inconel X, NS-25, Rene 41 and S816 superalloys. Correlation of the temperature at which the alloy is precipitation hardened with the stability of high temperature properties. (Q-general, J27, 2-61, T7c; SGA-h)

301-Q. Spalling Causes Are Sought by Mill Rollmakers, Users. J. D. Keller. Steel, v. 148, Jan. 30, 1960, p. 104, 108, 111.

Measurement of wear and its distribution along the roll length, work rolls and backup rolls and of contour changes caused by thermal expansion. Results are used to determine load distribution and stress along the roll length. (Q9, W23p)

302-Q. (French.) Proof of a Peak of Internal Friction Due to the Interactions Between the Carbon and Molybdenum Atoms in Several Fe-Mo-C Alloys. Gaston Collette. Comptes Rendus, v. 251, Nov. 7, 1960, p. 2017-2019.

Curves representing coefficient of internal friction as a function of temperature in Fe-Mo-C alloys containing 1.02-3.53 wt.% Mo reveal a normal peak of internal friction of carbon in Fe and a second peak at lower temperatures, which is attributed to interactions between carbon and Mo atoms. Temperatures at which these peaks appear are 26 and 18° C., respectively. (Q22; Fe-b, Mo, C)

303-Q. The Elastic Modulus and Internal Friction of Electrodeposited Copper. Harold J. Read and Arthur H. Graham. Electrochemical Society, Journal, v. 108, Jan. 1961, p. 73-78.

Determination of elastic modulus and internal friction from sonic measurements on thin-walled Cu tubes prepared by electrodeposition. Effect of plating variables on microstructure and elastic properties. 10 ref. (Q21, Q22, N12d; Cu, 4-60)

304-Q. (Swedish.) Use of Castings in Machine Construction. Bertil Thyberg. Teknisk Tidskrift, v. 90, Nov. 18, 1960, p. 1149-1154.

Tensile strength, yield strength and area reduction of gray cast iron, steel containing 0.15-0.45% carbon, malleable iron and cast steel. Comparison of torsion and bend strengths of gray iron and malleable iron. Machinability. Cast parts used include crankshafts, cylinder blocks and sewing machine arms. 12 ref. (Q-general, G17k, T21; CI, CN, 5)

305-Q. Effect of Sodium Exposure on the Mechanical Properties of Zirconium. J. C. Bokros. Corrosion, v. 17, Jan. 1961, p. 103-106.

Surface oxide developing on Zr in impure sodium significantly lowers the fatigue life at elevated temperatures. Hydrogen absorption, on the other hand, has little effect on fatigue life at elevated temperatures but lowers it at room temperature. Tensile properties are not affected. (Q7b; Zr)

306-Q. (Dutch.) Working Processes With Stainless Steel. Th. J. M. van der Pas. Ingenieur, v. 72, Oct. 28, 1960, p. 227-234.

Cold and hot deformation, mechanical properties, machinability and structure after various heat treatments of austenitic, ferritic and martensitic stainless steels. (Q-general, G17k, M27, 2-64; SS)

307-Q. Metallurgy in Large Turbo-Generator Design. J. M. Robertson. Electrical Review, v. 167, Oct. 14, 1960, p. 649-657.

Mechanical properties of high temperature steels and alloys for application in steam turbo-generators. Review of metallurgical developments which have contributed to increases in size and steam temperatures and pressures of turbo-generators from 1949 to 1960. (Q-general, 2-62, W11k; ST)

308-Q. Strength and Rigidity Requirements for the Automobile Structure. M. Yamamoto. Preprint no. 298B, Society of Automotive Engineers, 485 Lexington Ave., New York 17, N. Y. Jan. 1961, 17 p.

Calculation of the fatigue strength of automobile structural components using the frequency distribution curve of acceleration or stress which may be either anticipated or obtained in actual run of the vehicle. Recommended fatigue, rupture and yield safety factors for various load distributions. 19 ref. (Q7a, T21a)

309-Q. Some Aspects of Steel Testing Prior to Enamelling. D. Moul. Canadian Ceramic Society, Journal, v. 29, 1960, p. 35-38.

Industrial testing of sheet steel with hardness tester, ductility and sag test equipment. Tests are designed to reduce rejects due to distortion, stress relief and strain occurring in the drawing and porcelaining processes. (Q29, Q23p, L26n; ST, 4-53)

310-Q. Wear and Friction Under Rolling With Slip. B. N. Das, R. Choubey and K. C. Goswami. NML Technical Journal (National Metallurgical Laboratory, India), v. 2, Nov. 1960, p. 15-21.

Rail and tire steel containing C, Mn, Si, S and P are tested for the effects of wear fragments and relative slip upon metallic luster, subsurface flow, wear rate and frictional torque. (Q9, F23; ST)

311-Q. Continuously Cast Aluminum-Tin Bearings. D. A. Robins. Tin and Its Uses, no. 50, 1960, p. 3-6.

Use of 80% Al-20% Sn and 91% Al-6% Sn, 3% Cu alloys in bearings. Data are given for fatigue loading at 4000 rpm. up to 3 tsi. for over 100 hr. (Q7, T7d; Al-b, Sn, Cu, 17-57)

312-Q. Titanium-Alloy Forgings. H. J. Henning and P. D. Frost. Defense Metals Information Center, Battelle Memorial Institute, DMIC Rept. 141, Dec. 19, 1960, 90 p. (Available as PB 151100 from U. S. Office of Technical Services, Washington 25, D. C.)

Forging of alpha-beta alloys, all-alpha alloys and all-beta alloys at 1000-1830° F. for 1-4 hr. Determination of yield strength, ultimate tensile strength, area reduction, elongation and forgeability of Ti-alloy forgings. (Q27a, Q23, F22, 17-52; Ti-b)

313-Q. Preliminary Design Information on Recrystallized Mo-0.5 Ti Alloy for Aircraft and Missiles. W. P. Achbach and R. J. Favor. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 79, Jan. 16, 1961, 11 p. (Available as PB 161229 from U. S. Office of Technical Services, Washington 25, D. C.)

Effect of temperature on the ultimate tensile strength, tensile yield strength, compressive yield strength, tensile modulus and compressive modulus of W-2 coated and uncoated Mo-0.5 Ti alloys after recrystallization at 2450° F. for 1 hr. (Q27, Q28, 2-61, N5f; Mo-b, Ti)

314-Q. Study of Mold-Iron Compositions. J. R. Kattus. Blast Furnace and Steel Plant, v. 49, Jan. 1961, p. 66-67, 72-73, 80-84.

Thermal fatigue tensile tests are conducted with thermal cycling at 300-1500° F. on standard ingot mold Fe, high phosphorus ingot mold Fe, C1018 steel bar stock, low alloy gray Fe, pearlite ductile Fe and ferritic ductile Fe to determine effect of composition on service life of the resulting molds. (Q7j, Q27, 2-60, W19c; Fe, ST, 17-57)

315-Q. (Dutch.) Effect of Zirconium Additions on the Quality of Iron Castings. Gieterij-Centrum Berichten, v. 8, Nov-Dec. 1960, p. 70-71.

Manufacture of castings from Fe melts containing 5-7% Zr. Effect of Zr on graphitization, machinability, casting properties, tensile strength and hardness depth. (Q27a, Q29n, G17k, E25p, 2-60; Fe, Zr, 5)

316-Q. Steels for Reactor Pressure Circuits. G. E. Darwin. Nuclear Power, v. 6, Jan. 1961, p. 93-94.

Review of the high temperature properties of low alloy and carbon steels as

they relate to their application in reactor pressure circuits. Effect of irradiation on the ductile to brittle transition temperature. (Q-general, Q23r, 2-67, T11; AY, CN)

317-Q. Weld Metal Has Excellent Properties! Are You Using Them? Welding Design & Fabrication, v. 34, Jan. 1961, p. 34-35.

Comparison of the tensile strength, yield point, elongation, toughness and ductility of ASTM-ASME A-7 mild steel and commercial steels such as Manten, Corten and Triten, with weld metal deposited by a E-60 XX electrode. (Q23, Q27, Q-general; CN, 7-51)

318-Q. (German.) Wear Testing of Metallic (Blast Cleaning) Shot Materials. Peter Ulrich Schmithals and Hans-Gunter Labisch. Stahl und Eisen, v. 80, Dec. 22, 1960, p. 1939-1944.

Significance of "short-time" test methods in which the number of cycles required to split half the material to a defined mesh size is measured. Comparison with total wear test methods. Measurement of wear resistance in terms of a newly defined splitting value which eliminates screen analyses in wear testing. (Q9n; 6-67)

319-Q. (German.) Wear Testing of Metallic (Blast Cleaning) Shot Materials. Erich Bickel. Stahl und Eisen, v. 80, Dec. 22, 1960, p. 1944-1948.

Apparatus and method for semi-automatic wear testing based on measurement of weight reduction rather than screen analysis. Theoretical and experimental investigation of testing variables such as projection velocity, direction of jet and coefficient of friction. (Q9n; 6-67)

320-Q. (German.) Influence of Testing Conditions on Results in (Blast Cleaning) Shot Wear Testing. H. Krautmacher. Stahl und Eisen, v. 80, Dec. 22, 1960, p. 1949-1952.

Wear testing of shot using rebounding plates with varying shape and direction and a testing machine with differently worn blades. Influence of these variables on wear resistance. (Q9n; 6-67)

321-Q. (Japanese.) Effect of Mo and W on Properties of 18 Cr-12 Ni Stainless Steel. Ryuichi Nakagawa and Yasuo Otogura. Tetsu-to-Hagane (Journal of the Iron & Steel Institute of Japan), v. 46, Dec. 1960, p. 28-34.

Hardness attained during aging, microstructure, precipitation rate, tensile properties at various temperatures and creep rupture strength of stainless steels with varying Mo and W contents. (Q29n, J27d, M27, N7, Q27a, Q3m, 2-60; SS, Mo, W)

322-Q. Effect of P on Properties of 19-9 DL Type Heat Resisting Steel. Naomichi Yamanaka, Kunio Kusaka and Akira Tonooka. Tetsu-to-Hagane (Journal of the Iron & Steel Institute of Japan), v. 46, Dec. 1960, p. 34-41.

Effect of phosphorus content on hardness attained during aging, rupture strength at 700° C., rupture elongation, impact value and ductility of heat resisting steels with or without boron and rare earth element additions. 9 ref. (Q29n, Q3m, J27d, Q23p, Q6n, 2-60; SS, SGA-h)

323-Q. Effect of V on Properties of High C-5 Cr-W-Mo, High C-8 Cr-W-Mo and High C-12 Cr-Mo Steel for Punching Dies. Sadao Koshiba and Asao Inata. Tetsu-to-Hagane (Journal of the Iron & Steel Institute of Japan), v. 46, Dec. 1960, p. 42-46.

Effect of vanadium additions on the ductile-brittle transition temperature, quenching temperature range, dimensional change, toughness and wear resistance of high carbon steels. 5 ref. (Q23r, Q9n, P10d, 2-60, T6r; TS-g)

324-Q. (German.) Steels for Low Temperature Stressing. E. Krainer and K. Posch. Berg- und Huttenmannische Monatshefte, v. 105, Nov. 1960, p. 268-280.

Measurement of mechanical properties between 20 and -180° C. of unalloyed cold tough steels, ferritic heat treatable Ni, Cr and Mo alloyed steel and austenitic Mn, Cr, Ni and Si alloyed steels. Interpretation of results in terms of dislocation theory. (Q-general, 2-61, M26b; SS, ST)

325-Q. London Transports Axle Fatigue Tester. Metalworking Production, v. 105, Jan. 4, 1961, p. 59-60.

Strength of axle steel when subjected to a rotating bending stress is determined on a specially designed resonant machine. (Q7c, Q5, T7j; ST)

326-Q. What Can We Do With Whiskers? George A. Hoffman. New Scientist, v. 9, Jan. 5, 1961, p. 40-42.

Thin crystalline filaments made from C, B4C, Be, SiC, B, Al_2O_3 and others have tensile strengths approaching the theoretical limit when diameter is of the order of one micron. Whiskers may be produced by extrusion, electrolytic deposition, condensation, reduction of salts or precipitation. Behavior at elevated temperatures and weight advantage. (Q27a, F24, L17, N16p; Al, B, Be, 14-61, 14-68)

327-Q. Strength of Thick Cylinders Subjected to Repeated Internal Pressure. J. L. M. Morrison, B. Crossland, and J. S. C. Parry. Institution of Mechanical Engineers, Proceedings, v. 174, Feb. 1960, p. 95-117.

Triaxial stress testing of 3% Cr steel, Ni-Cr-Mo steel, mild and stainless steels, D. T. D. 364 Al alloy and commercially pure Ti cylinders. Static tensile and shear properties, both longitudinal and transverse; fatigue limits in tension, compression and torsion are determined as a function of cycling. Effect of surface treatments, autofrettage and nitriding. 7 ref. (Q-general, 3-74; Al-b, CN, SS, Ti, 4-60)

328-Q. The Strength of Rails With Particular Reference to Rail Joints. S. Wise, D. Lindsay and I. G. T. Duncan. Institution of Mechanical Engineers, Proceedings, v. 174, Sept. 1960, p. 371-407.

Rails are tested by strain gages. Stresses and failure due to fishbolt holes, wheel slip, packing, atmospheric corrosion and fatigue are analyzed graphically. 9 ref. (Q5g, Q7, T23q)

329-Q. (Russian.) Effect of Arsenic, Phosphorus and Carbon on Steel Properties. K. F. Starodubov and V. V. Kalmykov. Stal', Nov. 1960, p. 1034-1037.

Impact and tensile tests on normalized rail steel samples at -60 to 260° C. Flow limit, resilience, embrittlement, tensile strength, hardness, elongation and reduction in area as a function of C, As and P concentrations in steel. (Q-general, 2-60; ST)

330-Q. (Czech.) Effect of Forging Temperature. V. Hasek. Strojirenstvi, v. 10, Nov. 1960, p. 835-837.

Carbon and low alloy steels are forged at 1050-1300° C. Some of the forgings are heat treated at 840-880° C. for 60 sec. Effect of forging temperature and heat treatment on impact strength and hardness. 3 ref. (Q6n, Q29n, 2-61, 2-64; AY, CN)

331-Q. (Czech.) Effect of Sulphur Present in Furnace Fuels on Heat Treated Steels. Frantisek Wiesner and Eva Tichopadova. Hutnicke Listy, v. 15, Dec. 1960, p. 923-929.

A deep drawing steel, transformer steel and Ni-Cr-Mo alloy steel are held for 1-3.5 hr. at 1110-1300° C. in oxidizing and reducing atmospheres of heat treatment furnaces fired with crude oil containing 0.5-3% sulphur. Effect of sulphur on structure and surface after bend testing. 17 ref. (Q5, M27, 2-64; AY, SS)

332-Q. (Czech.) Arsenic and Phosphorus in Chromium Steel and Cr-Ni Low Alloy Steel. Frantisek Benes and Dagmar Tlusta. Hutnicke Listy, v. 15, Dec. 1960, p. 929-936.

A ferritic heat resistant Cr steel with 0.035-0.109% P and 0-0.182% As and an 18/8 stainless steel with 0.020-0.117% P and 0-0.197% As are mechanically tested at -180 to 800° C and corrosion tested in boiling 65% HNO_3, 10% HCl and 10% H_2SO_4 at 20° C. Effect of P and As on tensile strength, yield point, elongation, area reduction, heat and corrosion resistances. 4 ref. (Q-general, R6g, 2-60; AY, SS, As, P)

333-Q. (Czech.) Problems in Aluminum Foil Manufacture. Miroslav Brzobohaty. Hutnicke Listy, v. 15, Dec. 1960, p. 936-945.

Effect of surface cleanliness, dimensional precision and grain size of starting strip, composition of lubricant used in cold rolling and rolling in one or two steps on the quality and mechanical strength of foil. 19 ref. (Q27, 2-59, 3-68; Al, 4-56)

334-Q. (Czech.) Steel and Cast Iron With a High Boron Content. Jaroslav Vrtel. Hutnicke Listy, v. 15, Dec. 1960, p. 945-950.

Various cast irons with 1.86-3.75% C, 0.12-0.19% Mn, 0.22-0.85% Si and 1.16-1.90% B and steels with 0.05-0.20% Cr, 0-2.7% Al and 1.19-5.54% B are mechanically and structurally tested.

Effect of boron and heat treatments at 650-1050° C. on tensile, yield and impact strengths, hardness, phase composition, magnetic properties and microstructure. 16 ref. (Q-general, P16, M27, 2-60, 2-64; CI, ST, B)

335-Q. (Czech.) Steels Containing More Than 1% Boron. Zdenek Eminger. Hutnicke Listy, v. 15, Dec. 1960, p. 955-961.

Various steels containing 0-4.17% boron are manufactured to determine effect of boron on porosity and surface of ingots, casting properties, homogeneity, microstructure, hardness, tensile properties at -10 to 300° C., impact strength, transformation points, thermal expansion, density, weldability and machinability. 14 ref. (Q-general, M27, E25p, K9s, G17k, 2-60; ST, B)

336-Q. (English.) Detection Range of Strain Figures and Their Characteristics. Motoichi Kodama and Masanosuke Sakamoto. Bulletin of JSME, v. 3, Nov. 1960, p. 415-418.

Strain figures caused by mechanical or thermal stress are detected in Fe and steel with carbon content from 0.05-3% by etching and micrography. (Q25; Fe, ST)

337-Q. (English.) Fatigue of Metals Under Repeated Finite Strain. Yukihiko Takenaka. Bulletin of JSME, v. 3, Nov. 1960, p. 419-424.

Measurement of the fatigue characteristics and tensile strength of mild steel and brass tubes subjected to repeated plastic strain in a combined tension-compression and torsion testing machine. Observations on strain hardening, strain softening and the relations between saturated stresses, strain amplitudes and the number of cycles required for fracture. 6 ref. (Q7, Q27a, N7e, Q25; CN, Cu-n, 4-60)

338-Q. (English.) Fatigue Strength Under Multiple Repeated Stress. Minoru Kawamoto, Takno Nakagawa and Hiroyuki Kohama. Bulletin of JSME, v. 3, Nov. 1960, p. 425-431.

Testing of medium carbon steel (0.34% C) for fatigue strength by superimposing higher stress levels on repeated lower ones. Investigation of the influence of the cycle ratios of the primary stress and the secondary (higher) stress level. Interpretation of the results by cycle ratio-damage (D-R) curves. 5 ref. (Q7, 3-66; CN)

339-Q. (English.) Characteristics of Bearing Alloys (4th Report, Properties of the Oilless Cast Iron Bearing.) Tokuzo Matsuyama and Takao Kayabo. Bulletin of JSME, v. 3, Nov. 1960, p. 566-571.

Friction and wear properties for bearings of gray cast iron, expanded by repeated heating and cooling and then oil-saturated. (Q9, T7d; CI-n, 17-57)

340-Q. (Japanese.) Effect of Difference in Grain Structure on the Fatigue Properties of Aluminum Alloys. Seikiti Kukai and Katsuzi Takeuchi. Sumitomo Light Metals, Technical Reports, v. 1, Oct. 1960, p. 235-245.

Notch and unnotched fatigue strengths of coarse and fine grain structures of extruded 61S, 17S and 75S and forged 14S Al alloys are examined through rotating beam tests. Crack initiation under cyclic stressing and static tensile and plastic properties are also studied as a function of grain size, structure and direction. 9 ref. (Q7c, Q26, 2-59; Al-b)

341-Q. (Japanese.) High Temperature Strengths of Ti-2%Al-2% Mn Alloys and Some Commercially Pure Titaniums. Seikiti Hukai, Katsuzi Takeuchi and Eiji Tanaka. Sumitomo Light Metals, Technical Reports, v. 1, Oct. 1960, p. 284-301.

Static tensile properties, hardness and impact values and fatigue and creep strengths of Ti-2% Al-2% Mn alloys and commercially pure Ti at room and high temperatures to 600° C. 24 ref. (Q-general, 2-62; Ti-b)

342-Q. Some Effects of Heat Treatment Upon the Impact-Fatigue Life of Nickel Hard Grinding Balls. R. H. T. Dixon. Iron and Steel Institute, Journal, v. 197, Jan. 1961, p. 40-49.

Effects of heat treatment at -196 to 850° C. on the life to fracture, under conditions of repeated impact, of a white cast iron containing 4.5% Ni and 1.5% Cr. Field tests are made to determine wear resistance of the grinding balls. (Q6, 2-61, 2-64, Q9n; CI-p, Ni, Cr)

343-Q. New Application of a Copper Alloy. Copper, no. 10, Winter 1960, p. 6-8.

Maximum stress, proof stress, elongation and corrosion resistance of an aluminum bronze for marine applications. (Q23p, S21, R-general, T21; Cu-s, Al)

344-Q. Welded Nickel Steel Vessels Withstand Pressure, Impact Without Stress Relief. Welding Engineer, v. 45, Dec. 1960, p. 38-40.

Impact and burst testing of pressure vessels composed of quenched and tempered 9% Ni steel at -320° C. to show that mechanical properties are adequate without stress relieving. (Q6, Q10b, 1-67, T26q; ST, Ni)

345-Q. Mechanical Properties of Solid and Porous Stainless Steel Sheet Metal at Elevated Temperatures. J. B. Lord. College of Aeronautics, Cranfield, Note no. 107, Oct. 1960, p. 1-9.

Tensile tests are performed at 20-1000° C. on three stainless steel sheet materials including a woven porous material called Rigimesh to determine Young's modulus, secant modulus, proof stress, ultimate stress and Poisson's ratio. (Q27, Q-general, 2-61; SS, 4-53, 6-71)

346-Q. The Creep Rupture Properties of 80Ni-20Cr Alloys. Robert Widmer and Nicholas J. Grant. Journal of Basic Engineering (ASME Transactions, Series D), v. 82, Dec. 1960, p. 829-838.

Effect of stress and temperature on the creep and ductility of 80% Ni-20% Cr alloys at 1200-1800° F. 6 ref. (Q3q, Q23p, 2-61, 3-66; Ni-b, Cr)

347-Q. The Extrapolation of Families of Curves by Recurrence Relations, With Application to Creep-Rupture Data. A. Mendelson and S. S. Manson. Journal of Basic Engineering (ASME Transactions, Series D), v. 82, Dec. 1960, p. 839-847.

Determination of creep-rupture properties for 18-8 stainless steel, 422 crucible steel, carbon steel, Nimonic 80-A, S-590 alloy and A-286 alloy at 1000-1500° F. A method using finite difference recurrence relations and direct extrapolation is applied to creep-rupture data to obtain results without using parameter concepts. (Q3q; CN, Ni-b, SS, SGA-h)

348-Q. Some Observations on the Extrapolation of High Temperature Ferritic Steel Data. Robert M. Goldhoff. Journal of Basic Engineering (ASME Transactions, Series D), v. 82, Dec. 1960, p. 848-854.

Determination of the rupture time for forged and cast Cr-Mo-V steel alloys as function of minimum creep rate and stress at 850-2010° F. 10 ref. (Q3q, 3-66; SS-d, 4-51, 5)

349-Q. Survey of Various Special Tests Used to Determine Elastic, Plastic and Rupture Properties of Metal at Elevated Temperature. F. Garofalo. Journal of Basic Engineering (ASME Transactions, Series D), v. 82, Dec. 1960, p. 867-881.

Determination of elastic moduli for 410, 430, 446, 304, 316, 321, 347, 309, 370 and 301 stainless steels and Mg, Ti and Al alloys at 70-1500° F. Review of static and dynamic testing techniques. Effect of high strain rates on plastic and rupture behavior of Cu, Al, Ti, Mg, Ni and Co and variation of hardness with temperature. 39 ref. (Q-general, 2-61; Al-b, Co, Cu, Mg-b, Ni, SS, Ti-b)

350-Q. The Role of Atmosphere in the Creep-Rupture Behavior of 80Ni-20Cr Alloy. Robert Widmer and Nicholas J. Grant. Journal of Basic Engineering (ASME Transactions, Series D), v. 82, Dec. 1960, p. 882-886.

Study of microstructure of 80Ni-20Cr alloys after creep at 1500-1800° F. in argon and air atmospheres. Effect of melting process, Si content and Mn/S ratio on crack propagation. 5 ref. (Q3q, M27, Q26q, 2-60; Ni-b, Cr)

351-Q. (Swedish.) Testing Cast Iron for Steel Ingot Molds With Regard to Crazing Tendency. A. Josefsson and B. Backstron. Jernkontorets Annaler, v. 144, Oct. 1960, p. 739-756.

Development of crazing on inner surface of cast iron molds in simulated teeming conditions for steel ingots by heating rapidly to a surface temperature of 850-900° C. and by accelerated cooling. Microcrack formation is determined as a function of structural heterogeneity. (Q26, W19c; CI)

352-Q. Contribution of Dislocation Line Tension and the Density of the Solute Atmosphere to the Yield Point in Strain Aged Ingot Iron. T. Mura and J. O. Brittain.

Acta Metallurgica, v. 8, Nov. 1960, p. 767-772.

Investigation of the 77° K. yielding behavior of ingot iron specimens after prestraining and aging under stress at 303° K. Effect of aging time, temperature and stress on yield point are discussed in terms of the dislocation line tension and solute atmosphere density along the dislocation. 11 ref. (Q24c, M26b, 2-61, 2-65, 3-66; Fe-a)

353-Q. The Effective Surface Energy Involved in the Brittle Fracture of 70/30 Brass. H. Nichols and W. Rostoker. Acta Metallurgica, v. 8, Nov. 1960, p. 788-790.

Brittle fracture originating at about engineering yield stress at the interface of a 70/30 brass specimen wetted with Hg is shown to be temperature dependent at 20° K. and basically the same as encountered in brittle ductile transitions in body centered cubic metals, with true surface energy as the dominating factor. 6 ref. (Q23, Q26s, P13h, 2-61, Cu-n)

354-Q. Cattrell Locking and the Flow Stress in Iron. H. Conrad and G. Schoeck. Acta Metallurgica, v. 8, Nov. 1960, p. 791-796.

The effect of temperature and grain size on the yield and flow stress of electrolytic iron at a constant structure is investigated at 90-300° K. The equivalence of the temperature and grain size dependence of the lower yield and the flow stress suggests that the lower yield represents the movement of dislocation and does not include a thermally activated locking term while the upper yield stress represents the tearing of dislocations from their Cottrell atmospheres. 24 ref. (Q24c, M26b, 2-59, 2-61; Fe-a)

355-Q. Twinning in Iron. E. Bull Simonsen. Acta Metallurgica, v. 8, Nov. 1960, p. 809-810.

Effect of increased purity or increase in the ease of twinning is investigated in room temperature rolling and 1400° C. annealing of zone melted Fe specimen bars with annealing and mechanical twinning occurring across subgrain boundaries. 10 ref. (Q24b, M27q, 2-64, 3-68, 3-69; Fe-a)

356-Q. The Structure of Slip Band Extrusion Revealed by Transmission Electron Microscopy. P. J. E. Forsyth and C. A. Stubbington. Acta Metallurgica, v. 8, Nov. 1960, p. 811-814.

Electron transmission and diffraction studies, using replica techniques, of slip band extrusion phenomena in solution treated Al-4% Cu alloy fatigued at room temperature. Striation phenomena are observed as a function of stress cycles. 7 ref. (Q24c, 3-66, M21e, M22k, 3-66, 3-69; Al-b, Cu)

357-Q. Thermal Cycling Creep of Alpha-Uranium. A. C. Roberts. Acta Metallurgica, v. 8, Nov. 1960, p. 817-819.

The effect of intergranular stress shakedown or redistribution on the ability of uranium specimens to support thermal strains without giving way plastically is investigated by thermal cycling creep tests at 125-650° C. under 186-1697 psi. loads. 3 ref. (Q3, Q7j, Q24, 3-66; U-a)

358-Q. Physical and Mechanical Properties of Some High-Strength Fine Wires. D. A. Roberts. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 80, Jan. 20, 1961, 20 p. (Available as PB 161230 from U. S. Office of Technical Services, Washington 25, D. C.)

Tensile and physical properties of high strength fine wire produced from various types of high carbon steels, stainless steels, nickel base alloys, tungsten and molybdenum. Effects of wire size, production methods, temperature and aging treatments on these properties. (Q27, P-general, 2-61, 2-65; CN, Mo, Ni-b, SS, W, 4-61)

359-Q. (German.) Mechanical Testing and Fatigue Investigation to Evaluate Dimensions of Flat Sheets in Orthotropic Plates. K. Kloppel and E. Roos. Stahlbau, v. 29, Dec. 1960, p. 361-373.

Tests to evaluate maximum carrying load, deflection and fatigue strength of 4.26 mm. thick ST37 steel plates under varying load distributions and degrees of prestressing. (Q7, 3-66; ST, 4-53)

360-Q. A New High-Temperature Alloy. John Maxson. Metal Progress, v. 79, Feb. 1961, p. 97-99.

Devised for service above 1800° F., this new Ni-base alloy, termed RA-333, contains 25% Cr and 3% each of Mo, Co and W. Its excellent creep-rupture properties, low coefficient of expansion and good oxidation resistance

have made it useful for critical parts in heat treating furnaces. (Q-general, 2-62, W27p; Ni-b, SGA-h)

361-Q. Effect of Thermal Cycling on the Creep of Uranium. W. S. Blackburn, G. Harnby and J. J. Stobo. Journal of Nuclear Energy, Pt. A, v. 12, Aug. 1960, p. 162-171.

Effect of thermal cycles of up to 40° above and below 500° C. on the creep rate of uranium specimens. Development of theory predicting the effect of thermal cycling on creep. Comparison of predictions of theories with experimental results. (Q3n, Q7j; U)

362-Q. The Mystery of the Hollow Ball Bearing. Western Metalworking, v. 19, Jan. 1961, p. 28-29.

Microhardness and microstructural investigations made on 52100 steel ball bearings show high temperatures to be the cause of internal rupture. (Q3, Q29, M27, T7d; ST)

363-Q. The High-Strength Steels--What They Offer. Herbert L. Kee. Product Engineering, v. 32, Jan. 23, 1961, p. 54-61.

Tensile properties, corrosion resistance and workability of high-strength constructional alloy and stainless steels at 70 and 1000° F. (G27, R-general, Q23q; AY, SS, SGB-s)

364-Q. Investigational Techniques. D. A. Ryder. Metal Industry, v. 98, Jan. 20, 1961, p. 43-44, 52.

Investigation of fatigue failures in aircraft structures to determine type and origin of fluctuating stress which has produced failure. Consideration of torsional and fretting fatigue. (Q7, T24a)

365-Q. Improved Niobium Alloys. Metal Industry, v. 98, Jan. 20, 1961, p. 52.

Effect of Ti, W and Mo on the tensile strength and oxidation resistance and fabricability of Cb alloys. (Q27a, R1h, 2-60; Cb, Mo, Ti, W)

366-Q. (Russian.) Influence of the Heat Treating Conditions on Properties of Large Forgings. M. P. Brown, B. B. Vinokur, E. I. Mirovskiy, A. L. Heller and L. H. Maryushkin. Kuznechno-Shatampovochnoe Proizvodstvo, Apr. 1960, p. 8-11.

Effect of heating large steel forgings to 30-40° C. over normal forging temperature of 1230° C. on plasticity and tensile strength. Mechanical properties as affected by soaking time. (Q23p, Q27a, 2-64, F21; ST, 4-51)

367-Q. (Russian.) Influence of the Soaking Time at Forging Temperature on Plasticity of EI-437B Alloy. M. Ya. Dzuhutov and B. F. Bakhtanov. Kuznechno-Shtampovochnoe Proizvodstvo, Apr. 1960, p. 17-19.

Plasticity of EI-437B high speed steel is affected by soaking for 2 hr. after temperature homogenization at 900-1200° C. Effect of increasing grain size on plasticity of a sample soaked at 1050-1200° C. for 2, 10 and 50 hr. (Q23p, 2-59, F21b; TS-m)

368-Q. The Mechanical Properties of Some Tempered Alloy Martensites. J. M. Capus and G. Mayer. Iron & Steel, v. 33, Dec. 19, 1960, p. 665-668.

Ultimate tensile strength, notch sensitivity, Charpy V-notch impact value, notched tensile strength and fatigue properties of high-purity high-strength martensite alloys as affected by heat treatment, porosity and Si content. (Q-general, N8p, 2-60, 2-64; AY)

369-Q. The Toughness of Tempered Martensite. D. Hardwick and K. R. Pirt. Iron & Steel, v. 33, Dec. 19, 1960, p. 668-670.

Transition temperatures of tempered martensite structures as affected by tensile strength and ferrite grain size, which are dependent on prior austenite grain size and steel composition. (Q23r, N8p, 2-59, 2-60; ST)

370-Q. Cryogenic Materials. Space Aeronautics, v. 35, Jan. 1961, p. 72-73.

Tensile strength, elongation, area reduction, impact energy and elasticity modulus of 347 and 301 stainless, 17-4 PH stainless, 6061 Al and Berylco 25 as a function of temperature after annealing, quenching, cold rolling and precipitation hardening. (Q-general, 1-67, 2-64; Al-b, Be-b, SS)

371-Q. Ferritic Alloy Steels for Power Plant. M. G. Gemmill. Alloy Metals Review, v. 9, Dec. 1960, p. 1-8.

Properties of creep strength, ductility, weldability and corrosion resistance as they affect applicability of stainless steels in power plant turbines,

superheaters and generators. (Q3m, Q23p, K9s, R4, W11g; SS, 17-57)

372-Q. (Ukrainian.) Appearance of Recrystallization Centers. V. N. Danilov. Dopovidi Akademii Nauk Ukrains'koi SSR, Sept. 1960, p. 1236-1240.

Experimental attampt to prove that recrystallization centers caused by deformation of Ag and steel samples appear in the areas of screw dislocations and in the areas of heterogeneous tension gradients. 33 ref. (Q24; Ag, ST)

373-Q. (Ukrainian.) Effect of the Galvanic Coatings on the Strength of Press Joints. H. I. Lukashevich. Dopovidi Akademii Nauk Ukrains'koi SSR, Sept. 1960, p. 1198-1201.

Determination of the strength, corrosion resistance and deformation resistance of the surfaces of 45 steel press joints galvanized with a coat of Cr, Ni, Cu, Zn or Sn. Comparison of the friction surface before and after galvanizing. 7 ref. (Q27a, R-general; ST, 7, 8-65)

374-Q. (Japanese.) Ceramic Coating. Yorihiro Murata. Metal Finishing Society of Japan, Journal, v. 11, Oct. 1960, p. 609-612.

Adhesion and chemical heat and weather resistance of ceramic coatings as affected by frit composition, firing temperature and thermal stress. (Q10c, R6, R7, R3, 2-60, 3-66; 8-71)

375-Q. (Japanese.) Physical Properties of Metallic Surfaces. Masahisa Matsunaga. Metal Finishing Society of Japan, Journal, v. 11, Oct. 1960, p. 385-388.

Electron microscopy, electron diffraction, potential and hardness measurements used to determine surface properties of Armco iron, stainless steel, Ni alloys, Au, Al, Mg and other metals. (Q9, Q29, M21e, M22h; Al, Au, Fe-a, Mg, Ni-b, SS)

376-Q. The Nature of the Brittleness of Chromium. N. V. Ageev, V. N. Bykov and V. A. Trapeznikov. Paper from "Contemporary Problems of Metallurgy" Consultants Bureau, Inc., New York, 1960, p. 462-467.

Effect of spin ordering, atomic and crystalline structure, impurities, dislocation interaction and temperatures above and below the Neel point on brittleness. Neutron diffraction and thermal differential analysis data are correlated with brittleness determination for crystal specimens deformed in compression at -43 to 200° C. 15 ref. (Q23r, Q26s, M-general, 2-61, 3-68, 3-71; Cr)

377-Q. The Structural Theory of Creep in Metals. I. A. Oding. Paper from "Contemporary Problems of Metallurgy". Consultants Bureau, Inc., New York, 1960, p. 468-474.

Equations for creep at high temperatures as a two part process involving grain boundary and intergranular creep are derived in terms of dislocation movement and blocking as a function of critical stresses and crystal lattice structural factors such as imperfections, vacancies and Frank-Reed sources. 11 ref. (Q3, M26b)

378-Q. Characterization of the Properties of Structural Steels by the Energy Absorbed Under Maximum Deformation. L. Zhil'mo. Paper from "Contemporary Problems of Metallurgy". Consultants Bureau, Inc., New York, 1960, p. 475-483.

Theoretical and experimental investigation of the energy necessary to rupture an elementary volume of metal in the area of minimum cross section as in a single index characterizing specimen. Tests on carbon, stainless and structural steels after various heat treatment for correlation with conventional indexes and to establish a plasticity index for use in calculating structures. 7 ref. (Q23, Q24, Q-general, 1-54; ST)

379-Q. Raising the Strength and Toughness of Low-Carbon Steel by Heat Treatment. K. F. Starodubov and Yu. Z. Borkovskii. Paper from "Contemporary Problems of Metallurgy". Consultants Bureau, Inc., New York, 1960, p. 491-495.

Changes in mechanical properties of steel 15 (Gost 1050-57) after water quenching from 900° C. and tempering at 100-700° C. are investigated by tensile, impact and bend tests at -196 to 200° C. (Q27, Q26s, Q6, 2-61, 2-64; CN-g)

380-Q. Fatigue Resistance of Rails Containing Arsenic. L. L. Pinkhusovich and Z. G. Fridman. Paper from "Contemporary Problems of Metallurgy". Consultants Bureau, Inc., New York, 1960, p. 496-500.

Effect of 0.123-0.225% As concentration with 0.67-0.81% carbon on fatigue resistance and cracking susceptibility of normalized and nonheat-treated rail steel specimens. 3 ref. (Q7, T23q, 2-60, 2-64; ST)

381-Q. (Pamphlet.) Influence of Hot-Rolling Conditions on Brittle Fracture in Steel Plate. F. de Kazinczy and W. A. Backofen. Ship Structure Committee, Report SSC-126, National Academy of Sciences--National Research Council, Washington, D. C. Nov. 10, 1960, 26 p.

Testing steel plate specimens processed by conventional rolling methods and by controlled rolling to determine the reasons for superior notch toughness in the controlled-rolled product. Effects of grain size and heat treatment on the Charpy V-notch transition temperature. Effects of temperature, flaw structure and grain size on microfissuring and fracturing anisotropy. 28 ref. (Q26, 2-59, 2-61, 2-64, 3-68; ST, 4-53)

382-Q. (Translation.) Rare Elements As Alloying Additives to Heat-Resistant Steels. U. S. Dept. of Commerce, Office of Technical Services, June 2, 1960, 18 p. (From Izvestiya Akademii nauk Latviyskov SSR, no. 11, 1959.) (Available as 60-31,226 from U. S. Office of Technical Services, Washington 25, D. C. $.50)

Investigation of the effect of Ti, V and Cb additives on the structure and mechanical properties of heat resistant 5-15-8 Cr-Ni-Mn steel by phase and X-ray structural analysis. Mechanical properties are determined from steel samples hardened at a temperature of 1200-1300° C. and aged for 20 hr. at a temperature of 680-700° C. (Q-general, M27, J27, 2-60; SS, SGA-h, Cb, Ti, V)

383-Q. (Translation-ConBur.) The Effect of Neutron Irradiation on the Structure and Properties of Ferrito-Pearlitic Steels. V. S. Lyashenko and Sh. Sh. Ibragimov. Soviet Journal of Atomic Energy, v. 6, Nov. 1960, p. 165-169.

Variation in ultimate tensile strength, yield strength, elongation, microhardness and electrical resistivity as a result of fast neutron irradiation are explained on the basis of microstructure. (Q-general, P15g, 2-67; ST)

384-Q. (Translation-ConBur.) The Plasticity of the High Temperature Modifications of Polymorphic Metals. E. M. Savitskii and Ch. V. Kopetskii. Academy of Sciences of the USSR., Proceedings, Physical Chemistry Section, v. 112, Mar-Apr. 1960, p. 353-355.

Discussion of variations in crystal structure of Ca, Sr, Sc, Ti, Fe, Sn, Rh, etc. with temperature to determine possibility of a relationship between the polymorphism and the change in the electronic structure of the metal atoms. (Q23p, M27, 2-61; Ca, Fe, Sc, Sn, Sr, Ti)

385-Q. (Translation-ConBur.) Hydrogen Embrittlement of Steel During Cathodic Polarization in Sulphuric Acid. S. M. Beloglazov and M. I. Polukarov. Journal of Applied Chemistry of the USSR., v. 33, Feb. 1960, p. 385-391.

Effect of hydrogen absorption on the mechanical properties of carbon spring steel wire after hydrogenation in pure H_2SO_4 and H_2SO_4 containing hydrogenation catalysts at different current densities, temperatures and concentrations of the acid. 9 ref. (Q26s, R6g; CN, SGA-b, 4-60)

386-Q. (Translation-ConBur.) Internal Stresses in Electrolytic Deposits of Zinc, Obtained From Sulphate Electrolytes. N. P. Fedot'ev and A. A. Khonikevich. Journal of Applied Chemistry of the USSR., v. 33, Feb. 1960, p. 352-357.

Internal stresses in galvanic Zn deposits are measured on a flexible cathode composed of B-67 brass. Microhardness is determined by the static extrusion method. Data are given for the dependence of the internal stresses, microhardness, cathode potential and cathodic current efficiency or current density. 13 ref. (Q25, Q29n; Cu-n, Zn, 8-62)

387-Q. (Translation.) "Aftereffect" in Metal Specimens Subjected to Diffusion Creep at High Temperatures. B. Ya. Pines and I. G. Ivanov. Soviet Physics--Solid State, v. 2, Nov. 1960, p. 872-877.

Reverse deformation is observed upon removal of applied stress in Cu specimens subjected to diffusion creep at high temperatures. Qualitative interpretation of "aftereffect" laws in terms of appearance during creep of nuclei for new atomic planes. 4 ref. (Q3, 3-66; Cu)

388-Q. (Translation-ConBur.) The Effects of Irradiation on Solids. Yu. N. Sokurskii. Soviet Journal of Atomic Energy, v. 6, Nov. 1960, p. 271-291.

Quantitative estimates of the effect of radiation on the fissionable materials U and Pu and their alloys, the effect of very high burnups on the size and shape of units made of U and its alloys and the effect of temperature and radiation dosage on the mechanical properties of steel, other construction materials and nonmetallic materials such as BeO, UO_2-BeO and UO_2-ThO_2 mixtures and graphite. (Q-general, P10d, 2-67; Pu-b, ST, U-b, SGB-s)

389-Q. Quicker Diagrams Analyze Steel Fatigue. M. D. Creech. Product Engineering, v. 32, Feb. 13, 1961, p. 54-56.

Approximate endurance diagrams, constructed from data on ultimate and yield strength of the steel, may be used to determine endurance limits for ductile steels. (Q7a; ST)

390-Q. Size Effects on Fatigue Crack, Initiation and Propagation in Aluminum Sheet Specimens Subjected to Stresses of Nearly Constant Amplitude. Waloddi Weibull. Aeronautical Research Institute of Sweden, June 1960, p. 5-29.

Effect of specimen width on crack growth rate during fatigue testing of 24S-T and 75S-T Al sheet. (Q26, Q7, 3-73; Al-b, 4-53)

391-Q. Stainless Mild Steel Proves Its Mettle. Machine Design, v. 33, Feb. 16, 1961, p. 32.

Oxidation, corrosion and wear resistance similar to those of stainless steel and magnetic properties similar to those of annealed magnetic ingot iron are imparted to mild steel by alphatizing, a process in which Cr is diffused into the surface to produce a true metallurgical alloy. (Q9n, R-general, P16, N1; CN, Cr)

392-Q. Fatigue--The Problem in Relation to Welded Structures. R. P. Newman. Welder, v. 29, July-Sept. 1960, p. 54-60.

Linear stress-endurance and stress-log endurance curves for mild steel plate under alternating axial stress or axial repeated tension stress are compared with fatigue test results on mild steel butt welds. (Q7d; CN, 4-53, 7-51)

393-Q. (German.) Tests on Steel Joints Made With Adhesives. H. Winter and H. Meckelburg. Stahlbau, v. 30, Jan. 1961, p. 16-23.

Tensile shear tests to evaluate static adhesive strength of overlapped joints of St 00.23 steel, aircraft steel 27 MnCr V4, stainless steel V-2A and X5CrNi 18 9 joined with warm and cold hardening adhesives. Pretreatment and dimensioning of joints. (Q10c, K12; ST)

394-Q. Guard Against Fatigue Failures. J. B. Barriage. Iron Age, v. 187, Feb. 16, 1961, p. 111-113.

Application to maintenance of aircraft of the foil-safe method, in which fatigue cracks are recognized as practically unavoidable but the danger of failure is minimized by redesign and frequent inspection. (Q7, T24)

395-Q. (Russian.) Properties of Two Phase Metal-Ceramic Hard Alloys of TiC-WC-Co Type. G. S. Kreimer, M. P. Vakhovskaya and A. I. Baranov. Fizika Metallov i Metallovedenie, v. 10, May 1960, p. 698-709.

Bend strength, impact strength, porosity and plasticity of samples containing 4-25% Co at 20-1000° C. as affected by Co concentration, temperature and carbide grain size on the properties tested. 15 ref. (Q5, Q6, Q23p, P10m; Co-b, 6-70)

396-Q. (Russian.) Ultrasonic Wave Velocity in Eutectic Binary System Melts. Z. L. Khodov. Fizika Metallov i Metallovedenie, v. 10, May 1960, p. 772-779.

Velocity of ultrasonic waves is determined at 243-386° C. in liquid Sn, Pb, Cd and Bi binary systems by an impulse device. Elasticity modulus and adiabatic coefficient of compression are computed using values for ultrasonic rate. 27 ref. (Q21; Bi, Cd, Pb, Sn, 14-60)

397-Q. Reactor--Materials Properties. Stan J. Paprocki and Ronald F. Dickerson. Nucleonics, v. 18, Nov. 1960, p. 154-161.

Review of mechanical, physical and creep rupture properties of reactor fuel materials and structural materials such as stainless steel, Mg and Ni alloys, Be and Cr. Irradiation parameters for fuel materials. Compatability of fuel materaials with structural materials and of the latter with various coolants.

Suitability of clad fuels for use in various coolants. 157 ref. (Q-general, P-general, Q3, T11q; Be, Cr, Mg-b, Ni-b, SS, 17-57)

398-Q. (French.) Influence of the Distribution and Nature of Small Slag Inclusions on the Strength of Cast Steel. Bernhard Matuschka. Revue de Metallurgie, v. 57, Nov. 1960, p. 999-1001.

Production of cast steel in high frequency furnaces. Effect of material of furnace lining on accumulation of slag inclusions at the primary grain boundaries and indirectly on resistance to elongation. (Q27, D6, M26q, 9-69; ST)

399-Q. The Influence of Water Vapor Upon the Adherence Reactions Between Ground Coat and Sheet Iron. L. Merker. Institute of Vitreous Enamellers Bulletin, v. 11, Jan. 1961, p. 55-58.

Adherence between ground coat enamel and sheet iron as affected by firing in various controlled furnace atmospheres composed of N_2, $H_2O + N_2$, H_2O and dry air. (Q10c, L27; Fe, 4-53)

400-Q. Fatigue Characteristics of EC and 5005 Alloy Aluminum Wire. C. E. Burley. Power Apparatus and Systems, Dec. 1960, p. 789-792.

Fatigue testing of Al-0.8% Mg alloy cable using a rotating buckling machine to determine stress-lifetime curves. Fatigue strength, fatigue limit and ratio of fatigue limit to tensile strength are compared for the two types of wire. (Q7, T7g; Al-b, Mg)

401-Q. Mobile Mauler Launcher Made of High Strength Aluminum. Space Aeronautics, v. 35, Feb. 1961, p. 65-66, 68, 72, 74, 78.

Minimum tensile properties for 5083 and 5456 Al alloy sheet used in missile launching vehicle weighing 9 1/2 tons produced by Mig and Tig welding. Composition of 5083 alloy and 5183 welding wire. (Q27a, K1, T24e; Al, 17-57)

402-Q. (Czech.) Effect of Size on Stresses Developing in Castings. J. Pribyl. Sbornik, v. 6, Mar-Apr. 1960, p. 303-313.

Theory of stresses developing in cast rings of various sizes and cross sections. Internal stress as a function of design and absolute size. (Q25, 3-73; 5)

403-Q. (Czech.) Stress in Castings Caused by Gamma-Alpha Transformations. J. Pribyl. Sbornik, v. 6, Mar-Apr. 1960, p. 315-325.

Development of tensile stresses and compression stresses in small and large cross sections, respectively, of the same casting. Characteristics of transformation cracks. Crack elimination by molding practices providing for an adequate flow of heat and by an appropriate design of castings. (Q25m; 5)

404-Q. The Double-Notched (V-V) Bar Torsion-Bending Test. T. W. Wlodek. Canadian Mining and Metallurgical Bulletin, v. 54, Jan. 1961, p. 72-86.

Effect of surface treatment, surface imperfections, locked-in residual stresses and metallurgical and geometrical notches upon tension-bending characteristics, ductility, fracture resistance and impact sensitivity of various steels, Al and Mg alloys, bronze, brass and Cu. (Q5, Q26, Q6, 3-66; Al-b, Cu-b, Mg-b, ST)

405-Q. Titanium to Slash Weight of Cases in Minuteman 2nd Stage. Missiles and Rockets, v. 8, Feb. 20, 1961, p. 22-23.

Comparison of mechanical and physical properties of Ti alloys containing Al, Cr, Sn and V with D-6AC steel as to applicability for use in rocket motor cases. Outline of spin forging, heat treatment and welding techniques for fabrication of the cases. (Q-general, P-general, T2p; Ti-b, 17-57)

406-Q. Beryllium. M. K. McQuillan and T. W. Farthing. Endeavour, v. 22, Jan. 1961, p. 11-18.

Preparation of Be from beryl. Review of physical, chemical and mechanical properties of Be. Effect of temperature on the ductility of polycrystalline Be at 25-1050° C. (Q-general, Q23p, 2-61, P-general; Be)

407-Q. Light Armor Materials. H. P. George. Journal of Metals, v. 13, Feb. 1961, p. 131-134.

Evaluation of Al, Ti, Mg, steel and plastic as to suitability as armor materials. Data are given for density, elongation, yield and tensile strength and ballistic merit. (Q23, Q27a, P10a, T2; Al, Mg, ST, Ti, NM-d30, NM-d31)

408-Q. Preventing Hydrogen Embrittlement of Tantalum. C. R. Bishop and Milton Stern. Journal of Metals, v. 13, Feb. 1961, p. 144-145.

Influence of contact with noble metals on the hydrogen embrittlement of Ta in concentrated HCl at 190° C. Contact is made by riveting, welding, electrodeposition or merely rubbing. 17 ref. (Q26s; Ta)

409-Q. Effect of Impurities on Mechanical Properties of Electrolytic Titanium. J. D. Ramsdell and D. R. Mathews. U. S. Bureau of Mines, Report of Investigations 5701, 1960, 12 p.

Investigation of effects of the impurities O, N, C and Fe (in low percentages) on strength and hardness of electrolytic Ti. Mechanical properties of binary Ti-O, Ti-N and Ti-C alloys are linear functions of alloy content in the composition range investigated. 11 ref. (Q27a, Q29n, 2-60; Ti)

410-Q. Metals at High Temperature. T. C. Reuther, P. Shahinian and M. R. Achter. Report of N. R. L. (Naval Research Laboratory) Progress, Dec. 1960, p. 25-26. $1.25. (Available as PB 161288 from U. S. Office of Technical Services, Washington 25, D. C.)

Investigation of size effect on oxidation strengthening of smaller section of tapered specimens during creep-rupture testing. Metallographic analysis of crack pattern and character in fractured and interrupted specimens pulled in tension at 1500° F. for 350 hr. in vacuum and in air. (Q3, Q26, R2s, 2-61, 3-73; Ni)

411-Q. Design With High Strength Cold Rolled Austenitic Stainless Sheet. D. B. Roach and A. M. Hall. Materials in Design Engineering, v. 53, Feb. 1961, p. 108-110.

Compressive, stress-rupture and tensile properties of 301, 201, Tenelon and 17-5 MnV stainless sheet. (Q27, Q28, Q3m; SS-e, 4-53)

412-Q. (Japanese.) Embrittlement of Steel in Contact With Molten Copper-Zinc-Tin Alloys and Molten Sulphide. Morio Nakajima. Tetsu-to-Hagane (Iron and Steel Institute of Japan, Journal), v. 47, Jan. 1961, p. 22-27.

Embrittling temperature range of mild steel specimens as a function of Sn and Zn content. Effect of contact with molten iron sulphide. 9 ref. (Q26s, 2-60; ST)

413-Q. (Japanese.) Microscopic Segregation in High-Carbon Chromium Ball-Bearing Steel Tubes. Eiji Miyoshi and Nobuo Matsura. Tetsu-to-Hagane (Iron and Steel Institute of Japan, Journal), v. 47, Jan. 1961, p. 33-38.

Compressive strength and lifetime of ball-bearing steel tubing as affected by carbide segregation. 3 ref. (Q28g, N8r, 9-69; ST, SGA-c, 4-60)

414-Q. (Japanese.) Influence of Phosphorous on Properties of 13 Cr Stainless Steels. Naomichi Yamanaka, Kunio Kusaka and Masanobu Kitahara. Tetsu-to-Hagane (Iron and Steel Institute of Japan, Journal), v. 47, Jan. 1961, p. 38-43.

Transformation temperature, hardness, mechanical properties at room and elevated temperatures and corrosion resistance to nitric and acetic acids of 13% Cr stainless steels with phosphorous additions. 5 ref. (Q23r, Q29n, Q-general, R6g; SS, Cr)

415-Q. The Penetration of Hard-Steel Spheres Into Plane Metal Surfaces. Werner Goldsmith and Peter T. Lyman. Journal of Applied Mechanics (ASME, Transactions), Series E, v. 27, Dec. 1960, p. 717-725.

Determination of the force-indentation relations governing the contact of hard-steel ball and plane surfaces of toolsteel, Al 2024-T4 alloy and commercially pure Pb and Al sheets. Static and dynamic conditional measurements made by Hopkinson-bar technique. 36 ref. (Q29b; Al-b, Pb-a, TS)

416-Q. Effect of Structure and Purity on the Mechanical Properties of Columbium. A. L. Mincher and W. F. Sheely. Metallurgical Society of AIME, Transactions, v. 221, Feb. 1961, p. 19-25.

Mechanical properties of Cb studied at -196 to 1093° C. The decreased strengthening influence of cold work at temperatures below ambient is interpreted in terms of the Peierls-Nabarro effect. Maxima in the rate of strain hardening observed during tensile testing at 250-600° C. are correlated with interstitial impurities to indicate the temperature range at which C, O and N are responsible for strain aging. 12 ref. (Q-general, M26b, N7e, 2-61, 3-69; Cb)

417-Q. Effect of Explosive Shock Waves on a Gold-Silver Alloy. A. S. Appleton, G. E. Dieter and M. B. Bever. Metallurgical Society of AIME, Transactions, v. 221, Feb. 1961, p. 90-94.

The stored energy, microhardness and microstructural changes of Au-17.4% Ag alloy deformed by explosive loading are investigated at several shock pressures up to 510 kilobars. Deformation twinning and other phenomena are interpreted in terms of the probable imperfections introduced and are compared with changes induced by conventional deformation processes. 12 ref. (Q24, Q-general, M27; Au-b, Ag, NM-k34)

418-Q. Dispersion Strengthening of Copper by Internal Oxidation. Oliver Preston and Nicholas J. Grant. Metallurgical Society of AIME, Transactions, v. 221, Feb. 1961, p. 164-173.

A series of dilute solid solutions of Al and Si in Cu, in powder form, are internally oxidized, compacted and extruded to produce Cu-Al_2O_3 and CuSiO_2 alloys with 0.1 to 12% oxide. Room temperature tensile tests, creep-rupture tests at 450-859° C., conductivity measurements and recrystallization studies are made with oxide particle, size and interparticle spacings being determined to relate the structure to measured strength value using known dispersion strengthening theories. 36 ref. (Q-general, N7a, R2s, 3-71; Cu-b, Al, Si, 6-72, 14-68)

419-Q. Internal Friction Behavior of an Aluminum-Aluminum Oxide SAP-Type. G. S. Ansell and P. E. Arnold. Metallurgical Society of AIME, Transactions, v. 221, Feb. 1961, p. 206-207.

Activation energy for the relaxation process and temperature of the relaxation peak are determined with the internal friction constant and damping characteristics of fine-grained as-extruded and recrystallized coarse grain dispersion alloy specimens at 343-923° K. and frequencies of 0.9-1.8 cycles per sec. 6 ref. (Q22, P13a, 2-61; Al-b, 6-72, 14-68)

420-Q. Embrittlement of Ultra-High Tensile Steels in Relation to Surface Coatings. R. L. Samuel and N. A. Lockington. Institute of Metal Finishing, Transactions, v. 36, 1958-1959, p. 135-141.

Effect of Cd, Zn, Ni, Al and hard silicone stoving lacquer corrosion resistant coatings on hydrogen embrittlement of notched specimens under steady load. Influence of stress corrosion mechanism, rather than extent of corrosion, on fracture. 4 ref. (Q26s,^{4}R1d; ST, Cd, Zn, Ni, Al, 8-62)

421-Q. Hydrogen Embrittlement of Steel by Cathode Charging, Pickling and Cadium Plating. K. Sachs and S. H. Melbourne. Institute of Metal Finishing, Transactions, v. 36, 1958-1959, p. 142-152.

The effects of electrolytic cathode charging and subsequent aging at various temperatures on ductility and the embrittlement resulting from hydrogen absorption in routine plating operations are studied on mild steel screw wire and on carbon steel coil springs. The operations considered are pickling, storage in cyanide solution, cadium plating, hot air centrifuge drying and baking. 5 ref. (Q26s, 2-66, L12g; CN, Cd, 8-62)

422-Q. Short-Time Annealing Characteristics of Capped, Rimmed and Semi-Killed Wide Strip. P. N. Richards. Paper from "Production of Wide Steel Strip". Iron and Steel Institute, London, England. May 1960, p. 118-127.

Influence of annealing at 980-1540° C. on Brinell hardness, spring back and reverse bend properties, crack susceptibility, yield point, ultimate tensile strength and microstructure. Results are also obtained after hot dip galvanizing and roller levelling. (Q-general, 2-64; ST, 4-53, 8-65)

423-Q. (German.) Tensile Tests on Low-Phosphorus Basic Bessemer Openhearth and Electro Steels at 250° C. F. Erdmann-Jesnitzer, W. Precht and W. Scholz. Bergakademie, v. 12, Dec. 1960, p. 679-684.

Establishment of stress-strain curves by tensile testing at 250° C. for unalloyed, low-carbon (0.05-0.14% C) and low-phosphorus (0.023-0.175% P) steels to investigate influence of phosphorus on stress oscillation. (Q27, Q25, 2-60; ST)

424-Q. (German.) Some Peculiarities of the Temperature Dependence in Damping Unalloyed Titanium. H. Scholl and W. Knorr. Technische Mitteilungen Krupp, v. 18, Dec. 1960, p. 115-118.

Forged Ti rods are annealed at 50-850° C. to obtain 1700-10,000 micron grain size and subsequently subjected to bending oscillations at frequencies of 800-6220 Hz and temperatures from 20-600° C. Damping is then measured as a function of temperature, amount of plastic deformation and vanadium content. (Q22h, 2-60, 2-61, 3-68; Ti, 4-55)

425-Q. (German.) Mechanical Testing of Nodular Cast Iron. Georg Sille, Waldemar Lewerenz and Rudolf Wahren. Giesserei-Technik, v. 6, Dec. 1960, p. 358-362.

Results of notch-impact and shock-bending tests on ferritic, pearlitic and heat treated nodular cast iron (3.25% C, 2.33% Si, 0.34% Mn, 0.084% P, 0.006% S, 0.08% Mg, 0.08% Cr, 0.05% Ti) of given tensile strength. Investigation of fracture mechanism. Suggestions for standardizing test methods. (Q6, Q5; CI-r)

426-Q. (German.) Use of Zr to Compensate for Effect of Residual Elements in Production of Nodular Cast Iron. Hans Grossman. Giesserei-Technik, v. 6, Dec. 1960, p. 370-375.

Specimens of nodular cast iron with 0.04-0.084% Mg, 0.02-0.15% Ti, 0.03-0.09% Cr and 0-0.11% Zr are melted in a basic arc furnace and subsequently investigated to determine microstructure and mechanical properties in the as-cast state and after ferritic annealing at 950° C. and controlled cooling. Zr additions are found to compensate for Ti content. (Q-general, M27, 2-60, 2-64; CI-r)

427-Q. Practical Implications of Trace Additions of Silver to Commercial Aluminum-Zinc-Magnesium Alloys. I. J. Polmear. Australian Defense Scientific Service, Aeronautical Research Laboratories, Metallurgy Rept. 39, 1960, 23 p.

Effects of a 0.3% addition of Ag to Al-Zn (4.36-6.65%)-Mg (2.38-2.95%) alloys on their tensile, aging and fatigue properties, microstructure and stress corrosion resistance. (Q27a, N7a, Q7, M27, R1d, 2-60; Al-b, Mg, Zn, Ag)

428-Q. (Translation.) The Problem of Conditions Necessary for Formation and Development of Cracks in Crystals. V. N. Rozhanskii. Soviet Physics, Solid State, v. 2, Dec. 1960, p. 978-983. (Translation of Fizika Tverdogo Tela, v. 2, June 1960, p. 1033-1360.)

Reduction in strength of Zn whiskers when coated with mercury is attributed to cracks and dislocations induced by the surface active impurity. 30 ref. (Q27a, Q26q; Zn, 14-61)

429-Q. (Translation.) Slip at the Boundaries of Twins During Forward and Reverse Twinning of Iron. I. A. Gindin and Ya. D. Starodubov. Soviet Physics, Solid State, v. 2, Dec. 1960, p. 968-977. (Translation of Fizika Tverdogo Tela, v. 2, June 1960, p. 1033-1360.)

Compressive and tensile loading of high-purity iron at 77° K. cause formation and removal of twinning layers. Slip mechanism affects magnitude of forces required. 7 ref. (Q24; Fe-a)

430-Q. (Translation.) The Calculated and Empirical Values of the Lifetime of Metals and Alloys Under a Load. B. Ya. Pines and A. F. Sirenko. Soviet Physics, Solid State, v. 2, Dec. 1960, p. 942-949. (Translation of Fizika Tverdogo Tela, v. 2, June 1960, p. 1033-1360.)

Stress-rupture values for pure Sn, Pb, Al, Pt, Ag, Cu and Ag-Al (95-5) alloy as influenced by self-diffusion coefficient, modulus of elasticity, Boltzmann's constant, linear atomic dimension and lattice vacancies at temperatures up to 800° C. and tensile stress up to 87,500 psi. 13 ref. (Q3q, 2-61; Ag, Al, Cu, Pb, Pt, Sn)

431-Q. (Translation.) A Study of the Time and Temperature Dependences of Mechanical Strength. S. N. Zhurkov and T. P. Sanfirova. Soviet Physics, Solid State, v. 2, Dec. 1960, p. 933-938. (Translation of Fizika Tverdogo Tela, v. 2, June 1960, p. 1033-1360.)

Investigations of the mechanical strength of amorphous and crystalline solids as influenced by time and temperature are used to establish a relationship between lifetime of a material under load, tensile stress and temperature. Results are illustrated by measurements on pure Al and Al-2% Mg alloys. 12 ref. (Q27, 2-61, 3-66; Al-b, Mg)

432-Q. The Low Temperature Properties of Stainless Steels. J. R. Hunter. Steel Horizons, v. 23, no. 1, 1961, p. 14.

After annealing, sensitizing and cold working processes, 300 series steels are tested at -423 to 68° F. to determine low temperature embrittlement effects. Data are given for impact, yield and tensile ratio and elongation. (Q-general, 2-61; SS)

433-Q. Residual Stress Distribution in and Around Spot Welds. W. Bolton. British Welding Journal, v. 8, Feb. 1961, p. 57-60.

Determination of three-dimensional stress distribution of spot in FV520 stainless steel using a method involving the drilling of a hole at the center of a system of electrical strain gages. Residual stress distribution is found for spot welds in the fully precipitated, hardened condition and also after a low temperature treatment. (Q25h; SS, 7-51)

434-Q. Effect of Oxygen and Nitrogen on Properties of Welds in Unalloyed Titanium. J. C. Borland. British Welding Journal, v. 8, Feb. 1961, p. 61-67.

Effect of O_2, N_2 and air on weld joint properties such as bend ductility and bead hardness in unalloyed Ti containing 0.17% Fe and 0.05% C. Permissible levels of contamination. 12 ref. (Q5g, Q29n, 3-69; Ti, 7-51)

435-Q. (English.) Notch Sensitivity in Steel. Erik Agerman. Acta Polytechnica Scandinavica, no. 8, 1960, p. 3-44.

Values for the notch effect in steel observed experimentally and calculated by various formulae are analyzed statistically to determine the theory which best fits the experimental data. A calculating method is also proposed in which the safety factor is associated with the probability of fracture. 81 ref. (Q23s, Q7a; ST)

436-Q. (Japanese.) Brittle Fracture of Welded Structures. Yoshio Akita. Japan Society of Mechanical Engineers, Journal, v. 63, Dec. 1960, p. 1632-1640.

High tensile steels and their weldments are tested by brittle cracking, notch sensitivity, tensile and rupture tests to determine crack propagation rate, arresting temperature, allowable stress, low temperature limits, weldability and effects of preheating and prestressing. (Q-general, K9s; ST, 4-57)

437-Q. (Japanese.) Structure and Strength of Cast Iron. Masatoshi Morita. Japan Society of Mechanical Engineers, Journal, v. 63, Dec. 1960, p. 1656-1661.

Mechanical strength of cast iron discussed in relation to its structure, carbon equivalent and globularity. (Q27, 2-60, 3-71; CI)

438-Q. Stress Rupture Tests at 1350° F. on Type 304 Stainless Steel. W. D. Jenkins, W. A. Willard and W. J. Youden. Materials Research & Standards, v. 1, Feb. 1961, p. 104-108.

Stress rupture testing of bar specimens at a stress of 13,500 psi. to determine the suitability of a heat of this stainless steel as a source of calibration specimens for future tests. (Q3q; SS)

439-Q. The Evolution of Nickel-Base Precipitation-Hardening Superalloys. J. S. Hoag. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 84, Feb. 6, 1961, 10 p.

Addition of Cr, Al, Ti, Co and Mo as they affect creep, rupture, oxidation resistance, forgeability and strength in the 1200-1800° F. range. Effect of Cr-carbide precipitation on hardness and of B and Zr on grain boundary stability, microcracking and ductility. 18 ref. (Q-general, 2-60, 2-61; Ni-b)

440-Q. (Japanese.) Some Observations on the Fracture of Cermets. Masataka Sugiyama, Hisashi Suzuki and Akio Hara. Japan Institute of Metals, Journal, v. 24, Nov. 1960, p. 740-743.

Microscopy studies of brittle fracture mechanisms in WC-Co-cemented carbides and TiC base alloys containing Co, Ni and Cr metal binders after impact and bending tests. Crack initiation and growth, fracture modes and fracture patterns, flake graphite precipitation and chrome carbide aggregation are correlated with strain rate and temperature. 8 ref. (Q26; Ti, W, 6-69, 6-70, 14-68)

441-Q. (Japanese.) Study of Zone-Refined High Purity Copper. Pt. 2. Tensile Tests and Room Temperature Recrystallization of Zone-Melted Copper. Tomisaburo Nara and Yoshito Yamada. Japan Institute of Metals, Journal, v. 24, Nov. 1960, p. 744-748.

Tensile properties, hardness and recrystallized microstructure of cold

worked Cu wires prepared from zone refined ingots are examined as a function of purity and time and temperature of heat treatment. Comparisons are made with OFHC and vacuum melted Cu. 14 ref. (Q27, C28k, N5, Q29; 2-60, 2-64; Cu-a)

442-Q. Deoxidation of Reactive and Refractory Metals With Selected Reducing Agents (Deoxidation of Molybdenum). I. R. Lane, Jr., and E. J. Chapin. Report of NRL (Naval Research Laboratory) Progress, Jan. 1961, p. 25-26.

As-cast specimen ingots of pure Mo and Mo containing small amounts of Er, Gd, Th and Y as potential deoxidants are examined by tensile test and fractography methods to determine effect of addition on chemical analysis, microstructure and room temperature tensile ductility. Transgranular and intergranular fracture and intergranular embrittlement occurring in the specimens are attributed to failure of the deoxidants to remove oxygen from solid solution and to precipitation of carbon as grain boundary and matrix carbides. (Q23p, Q26, M26, M27, 2-60; Mo, AD-r31, Er, Gd, Th, Y)

443-Q. Radiation Damage of Metals (Effect of Irradiation Temperature on the Transition-Temperature Characteristics of Pressure Vessel Steels). J. R. Hawthorne and L. E. Steele. Report of NRL (Naval Research Laboratory) Progress, Jan. 1961, p. 30-31.

Charpy V-notch test specimens from a 4 in. thick ferritic A212B plate steel is exposed to fast neutron flux reactor irradiation at 260-550° F. Notch ductility is measured before and after irradiation at -100 to 300° F. A low shift in brittle transition temperature is attributed to self-annealing of radiation induced charges. (Q23r, Q23s, 2-67; ST)

444-Q. (Translation.) Microstructure and Physiomechanical Properties of Rare Earth Metals and Their Alloys. E. M. Savitskii and V. F. Terekhova. Rare Earth Elements, 1959, p. 325-332.

Mechanical and physical properties of rare earth elements La, Ce and Pr with other metals and alloys (Fe, Ti, Cr, Al, Co, Si, Ni, Ag, Th and Mg alloys) tested at 20-800° C. 12 ref. (Q-general, P-general, 2-60; Eg-g45)

445-Q. (Translation.) Use of Rare Earth Metals for Alloying Magnesium Cast Alloys. N. M. Tikhova and V. A. Blokhina. Rare Earth Elements, 1959, p. 350-356.

Measurement of mechanical properties of Mg alloys with rare earth metal additions at 20-350° C. show properties are improved by alloying with metals from La to Nd. (Q-general, 2-60; Mg-b, EG-g45)

446-Q. Design Properties as Affected by Cryogenic Temperatures. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 81, Jan. 24, 1961, 18 p.

Tensile testing of 6Al-4V-Ti alloy, 4340 steel and 7079-T6 Al alloy at 70 to -423° F. Data are given for the ultimate tensile strength, notch strength, yield strength and stress-strain curve. 5 ref. (Q27, 2-63; Al-b, ST, Ti-b)

447-Q. Dust Injection Tests Reveal Relative Merits of Ring-Liner Combinations. Glenn F. Hyde, Fred A. Robbins and Paul R. Shipler. SAE Journal, v. 69, Mar. 1961, p. 68.

Wear tests of Cr-plated or unplated Fe ring liner combinations to determine minimum end clearance change obtainable when tested over a period of 48 hr. (Q9; Fe)

448-Q. Prediction of Unstable Crack Length in Aluminum Alloys. R. H. Ryder. College of Aeronautics, Cranfield, Oct. 1960, 4 p.

Theoretical calculation of the unstable length of a crack in Al alloy sheet subjected to steady tensile stress. (Q26; Al-b, 4-53)

449-Q. (Russian.) Low Carbon Unalloyed Steels Replace Some High Strength Alloy Steels. M. E. Blanter, K. P. Koryagin and O. V. Martishin. Metallovedenie i Obrabotka Metallov, Dec. 1960, p. 2-7.

Quenching of 10 and 15 steels in 10% NaOH solution at 800-950° C. followed by comparative mechanical testing at -50 to 500° C. Effect of temperature and quenching conditions on plasticity, impact and tensile strength, elongation, yield point and reduction in area. Properties are compared to 30KHGSA structural steel. 5 ref. (Q-general, 2-64; CN-g, AY)

450-Q. (Russian.) Nickel-Free Steel for Large Forgings. M. P. Baun, K. F. Gurzhienko, A. I. Kondrashev, B. V. Vinokur and A. L. Geller. Metallovedenie i Obrabotka Metallov, Dec. 1960, p. 16-17.

Heat treatment and mechanical testing of newly developed 30KHGVT structural steel. The steel exhibits satisfactory hardenability, tensile strength, plasticity and viscosity and is recommended for forgings of up to 700 mm. cross sections in place of Cr-Ni 40KHN and 40KHNM steels. 7 ref. (Q-general, F22, 17-52, J-general; ST, SGB-s)

451-Q. (Russian.) Oxygen-Converter Steel. A. A. Mitrofanov. Metallovedenie i Obrabotka Metallov, Dec. 1960, p. 18-21.

Improvement in quality of rimming steel by top oxygen blowing during the converter process. Cold shortness, mechanical aging tendency, weldability, corrosion resistance, gas, sulphur and phosphorus content and mechanical properties of such steel are found to be analogous to these of the openhearth steel. 10 ref. (Q-general, D3; ST-g)

452-Q. (Russian.) Effect of Copper and Graphite on the Properties of Iron-Base Powder Alloys. V. K. Sorokin. Metallovedenie i Obrabotka Metallov, Dec. 1960, p. 42-43.

Selection of optimum amount of Cu and graphite additions to the powders to produce pearlitic structure sintered parts with high tensile properties and hardness. (Q27, Q29, N8h, 2-60; Fe-b, C, Cu, 6-72)

453-Q. (Italian.) Influence of Heat Treatment on the Fatigue Failure Curve Under Rotary Bending Load. C. Panseri and L. Mori. Alluminio, v. 29, Dec. 1960, p. 563-566.

Curves obtained during bending fatigue tests on Avional 22 in a tempered and age hardened state (TN) and in a tempered and artificially aged state (TA). Hypotheses concerning the anomaly observed in the curve, a "knee" occurring in the TN curve but not observed in the TA curve. 11 ref. (Q7c, 2-64; Al-b)

454-Q. (French.) Transitory Increase of Internal Friction in the Course of Isothermal Precipitation of Carbon in a Ferro-Carbon Alloy. Gaston Collette. Comptes Rendus, v. 251, Dec. 19, 1960, p. 2930-2932.

Development of internal friction as a function of time in a ferrous alloy of 0.0092% C, 0.024% Si, 0.003% P, 0.005% S, 0.003% O and 0.0004% Mn during isothermal precipitation of the carbon, after producing a solid solution in the alpha range and water quenching. (Q22, N7, 2-64, 3-67; Fe-b, C)

455-Q. (French.) Influence of Small Quantities of Impurities on the Restoration of Mechanical Properties of Highly Worked Iron. Paul Morgand and Christian Messager. Comptes Rendus, v. 251, Dec. 19, 1960, p. 2936-2937.

Role of impurities on deformation hardening and restoration of hardness before recrystallization investigated in cold rolled specimens of Armco iron, Armco iron purified in a hydrogen atmosphere, electrolytic iron and purified by molten zone. 3 ref. (Q23a, 3-69; Fe-a)

456-Q. (Italian.) Lead Steels. R. Roja and E. Massa. Macchine, v. 15, Dec. 1960, p. 1119-1124.

Influence of the addition of Pb to steel on its fatigue limit and machinability. (Q7a, G17k, 2-60; ST, Pb)

457-Q. (Italian.) Spheroidal Cast Iron in the Machine Tool Industry. R. M. Bronson. Macchine, v. 15, Dec. 1960, p. 1153-1160.

Rigidity, machinability, wear resistance and elasticity of spheroidal gray castings containing 3-4% C, 2-3% Si, 0.2-1% Mn, up to 0.08% P, up to 0.02% S and up to 3% Ni used in machine tools. (Q9, Q21, G17k, 2-60; CI-r)

458-Q. How to Choose the Right Soft Solder Alloy. Howard H. Manko. Product Engineering, v. 32, Mar. 6, 1961, p. 39-46.

Comparison of the following properties of 28 basic soft solder alloys: tensile strength, shear strength, elongation, Brinell hardness, electrical conductivity, electrical resistivity, expansion coefficient and specific gravity. Solderability of base metals. Review of iron, torch, resistance, induction and wave soldering techniques. 6 ref. (Q-general, P-general, K7; SGA-f)

459-Q. New Answer for Brittle Failure Problem. J. G. Parr. Canadian Metalworking, v. 24, Feb. 1961, p. 37-40.

Discussion of the dislocation theory as an aid in predicting brittle failure. (Q26s)

460-Q. Magnetic Relaxation at High Temperatures Due to Grain Boundary Slip and to Dislocations. G. Biorci, G. Montalenti and A. Ferro. Solid State Physics in Electronics and Telecommunications, Proceedings of the International Conference, Brussels, Belgium, June 2-7, 1958, v. 3. Magnetic and Optical Properties. Pt. 1. 1960, p. 235-244.

Magnetic relaxation and diffusion viscosity field of polycrystalline iron at 150-500° C. are interpreted in terms of grain boundary slip. (Q3, M27f, M26b, 2-61; Fe)

461-Q. Mechanical Damping of Germanium and Silicon Containing Impurity Oxygen. P. D. Southgate. Solid State Physics in Electronics and Telecommunications, Proceedings of the International Conference, Brussels, Belgium, June 2-7, 1958, v. 1. Semiconductors. Pt. 1. 1960, p. 240-250.

Measurements on Ge and Si single crystals at 100-300 kc. per sec. and 100-1300° C. Determining internal friction as a function of temperature. 17 ref. (Q22, 2-61, 3-69; Ge, Si, 14-61)

462-Q. (Japanese.) An Abnormal Hardening Phenomenon in Kovar Caused by Transformation During Cold Working. Satoru Mito. Japan Institute of Metals, Journal, v. 24, Dec. 1960, p. 790-794.

Work hardening occurring during gamma to alpha phase transformation as a function of temperature, heat treatment and Ni content is examined in Fe-base Kovar alloy specimens by measuring the change in hardness in cold rolling and the stress strain curve in tensile tests and by X-ray diffraction analysis. Rolling and test temperature are -183 to 400° C., with annealing at 200-1000° C. and Ni composition at 25.1-31.4%. 7 ref. (Q23a, N-general, 2-60, 2-61, 2-64; Fe-b, Ni)

463-Q. (Japanese.) The Rigidity Modulus and Internal Friction in Quench-Hardened Steel Wires. Seita Sakui and Hideo Takei. Japan Institute of Metals, Journal, v. 24, Dec. 1960, p. 810-813.

The rigidity modulus, the electrical resistivity, the microhardness and the internal friction in quench-hardened steel wires containing 0.08% and 0.12% of carbon are measured as a function of reduction in area and tempering and annealing temperature at 20-920° C. 6 ref. (Q1g, Q22, Q29q, P15g, 2-64, 3-68; ST, 4-61)

464-Q. (Japanese.) Creep Rupture Strength and Changes in Microstructure of Austenitic Stainless Steels. Gunji Shinoda, Tadao Sano, Tadakazu Sakurai, Tadashi Kawasaki and Hisashi Izumi. Japan Institute of Metals, Journal, v. 24, Dec. 1960, p. 818-822.

Creep rupture tests at 600° C. on plain and V and U-notched specimens of 304, 304L and a high Cr (19.58%), high Ni (20.86%) stainless, with metallographic examination of microstructures after testing. The microstructure of specimens having short rupture life show a large number of slip bands in each grain with drastic individual grain deformation, while specimens with longer life show grain boundary voids and twin bands, suggesting different fracture mechanism. Data are given for creep rupture strength, notch factor and tensile properties. 8 ref. (Q3, Q24, M27, 2-62; SS-e)

465-Q. (Japanese.) The Relation Between Impact Stress and Impact Energy Stress of Beams by Impact Load. Koichi Akizono. Japan Institute of Metals, Journal, v. 24, Dec. 1960, p. 822-825.

Test pieces of 0.8% carbon steel of various shapes and sizes are tested under different impact conditions using a Matsumura's impact fatigue testing machine with strain gage measurement of stresses. The value of the impact stress and the ratio of energy absorbed by the test pieces and the impact energy are correlated with size effects for application to study of impact fatigue. (Q6, Q7, 3-66; CN)

466-Q. (Japanese.) Formation and Propagation of Fatigue Cracks. S-N Curves of Impact Fatigue. Koichi Akizono. Japan Institute of Metals, Journal, v. 24, Dec. 1960, p. 826-829.

Tests on annealed 0.2-0.3% carbon steel specimens using Matsumura's impact fatigue testing machine. Correlation of crack length and propagation velocity with number of blows for fracture and tensile, compressive and tensile-compressive stresses in the specimen notch. 7 ref. (Q6, Q7, Q26, 3-66; CN-g)

467-Q. (Japanese.) The Cause of Banded Structures (Role of P, Mn, Cr and Ni). Koichi Furusawa. Japan Institute of Metals, Journal, v. 24, Dec. 1960, p. 833-836.

Pearlite and ferrite banded structures observed in the welded segregation region of a steel specimen after various heat treatments at 600-1000° C. Correlation of ferrite nucleation with high phosphorous segregation and with retained austenite and carbon atom migration as a function of composition, cooling rate and heat treatment time and temperature. 6 ref. (Q24c, N2, N8n, 2-60, 2-64; ST, Cr, Mn, Ni, P)

468-Q. (Russian.) Effect of Nuclear Irradiation on Properties of Fe-C Systems. I. M. Pronman. Metallovedenie i Termicheskaya Obrabotka Metallov, Jan. 1961, p. 36-47.

Study of hardness, tensile and impact strength, plasticity, yield point, electrical resistivity and phase transformation as affected by neutron irradiation in various steels. (Q-general, P15g, N-general, 2-67; ST)

469-Q. (Russian.) Effect of Heat Treatment Parameters on the Hardness and Wear Resistance of High Speed Tool Steel. E. P. Nadeinskaya and A. A. Badaeva. Metallovedenie i Termicheskaya Obrabotka Metallov, Jan. 1961, p. 36-47.

R18 and R9 steel tools are quenched from 1100-1270° C., tempered at 100-600° C. and tested for wear during turning of 45 steel at widely varying cutting and feeding rates. (Q29n, Q9n, 2-64; TS-in)

470-Q. Ductile Molybdenum. J. A. Belk. New Scientist, v. 9, Jan. 12, 1961, p. 79-81.

Ductility and other mechanical properties of Mo in applications at high temperatures or in corrosive atmospheres. Effect of annealing and rolling temperature on the tensile strength and elongation of Mo. Description of a 50% Mo-50% Rh alloy which is ductile work hardens slowly and retains high strength at high temperatures. (Q23, Q-general; Mo-b, Rh)

471-Q. The Relation Between the Plastic Deformation of Aluminum Single Crystals and Polycrystals. S. Howe and C. Elbaum. Philosophical Magazine, v. 6, Jan. 1961, p. 37-48.

Shear stress-shear strain curves for Al single crystals of (100), (111) and (110) axial orientation as a function of temperature from 27-600° C. Mode of deformation as affected by orientation. Evaluation of the Taylor criterion for comparison of stress-strain curves of mono and polycrystals. (Q24, 2-61; Al)

472-Q. Dieselmaker Improves Technique for Wear Study. Steel, v. 148, Mar. 6, 1961, p. 76.

Radioactive wear testing of diesel engine cylinders by a technique in which the cylinder liner is partially shielded externally with Cd, placed in a watertight Al capsule and irradiated in a reactor for four weeks. Wear products are then recovered from lubricating oil and exhaust gas streams. (Q9, 1-59, W11j)

473-Q. New Plastic Clad Steel Plates, Steel, v. 148, Mar. 6, 1961, p. 95.

Development of rolled steel plates clad with vinyl plastic which can be bent, twisted, cut and shaped and which withstand heat up to 150° F. or subfreezing temperatures. (Q23q; ST, 4-53, 8-65)

474-Q. Which Instrument-Gear Materials Wear Least? R. J. Benson. Product Engineering, v. 32, Feb. 27, 1961, p. 37-41.

Relative wear tests are conducted on spur gears hobbed from untreated, anodized, electrolized and chrome-plated Al; untreated and electrolized stainless; Rulon B; Nylon 3001, Nylasint and Sinite D105. Gears are meshed in various combinations and operated under different conditions of lubrication and temperature. (Q9, T7a, 17-52; Al-b, ST, NM-d31, 17-57)

475-Q. Ductile-Brittle Transition in Alpha Brass. H. Nichols and W. Rostoker. Acta Metallurgica, v. 8, Dec. 1960, p. 848-850.

Tensile test data for annealed 70-30 brass is correlated with analysis of theoretical models to show that embrittlement of alpha brass by liquid mercury is temperature dependent and that the functional relationship is a transition from ductile to brittle behavior in the same manner as experienced by iron and other b-c-c. metals tested in their normal recyrstallized state. The transition temperature is governed by the

recrystallized grain size. The significance of this dependency is discussed in terms of current dislocation theory of the transition effect. 8 ref. (Q23r, M26b, N5, 2-59; Cu-n)

476-Q. The Growth of Twins in Tin Single Crystals as Observed by Transmission Electron Microscopy. J. T. Fourie, F. Weinberg and F. W. C. Boswell. Acta Metallurgica, v. 8, Dec. 1960, p. 851-863.

The nucleation and growth of twins in melt-grown Sn single crystals are examined by transmission electron microscopy and electron diffraction after several minutes exposure in the electron beam. Twins are observed to nucleate at the edge of the crystal foil, etch pits, other twin boundaries, defects and areas relatively free from dislocations. Twin propagation is attributed to stresses present at a lower level than necessary for nucleation, with growth rate being a function of time in the electron beam. 14 ref. (Q24b, M21e, N2, 3-66; Sn, 14-61)

477-Q. Stress Inducing Ordering in Gold-Silver Alloys. T. J. Turner and G. P. Williams, Jr. Acta Metallurgica, v. 8, Dec. 1960, p. 891-892.

An inverted torsion pendulum and an elastic after-effect apparatus are used for relaxation measurement of the order of 1 sec. and 1000 sec., respectively, on 42-68% Ag-Au specimens in vacuum at 200-550° C. to determine atomic and grain size and valency effects on stress induced ordering. Values for internal friction and relaxation time and activation energy are determined as a function of temperature and composition. Ordering theories are reviewed, with an effective size resulting from compressibility difference being suggested as the most important criterion for stress induced ordering. 8 ref. (Q3, Q22, N10, 2-60, 2-61; Ag-b, Au-b)

478-Q. Effect of Zone-Refining and Orientation on the Hardness of High Purity Rhenium. A. Lawley and R. Maddin. Acta Metallurgica, v. 8, Dec. 1960, p. 896-897.

A singel crystal of rhenium (close packed hexagonal) 0.23 cm. diameter x 15 cm. long is grown from sintered round bar using the electron bombardment floating zone technique. The extremely anisotropic single crystal occupies the central portion of the 25 cm. long bar, with a recrystallized matrix adjacent to the first and last zones to freeze. The orientation and longitudinal and circumferential Knoop hardness are determined after two, four and six passes along the original 15 cm. long single crystal. (Q29n, J28k, 3-72; Re, 14-61)

479-Q. Twinning in Vanadium. C. J. McHargue. Acta Metallurgica, v. 8, Dec. 1960, p. 900.

Electron beam melted vanadium single crystals are deformed in slow compression at liquid nitrogen temperature. Twins are observed comparable to those found in other b-c-c. metals--thin, with serrated boundaries and (112) twin planes. Comparison is made with Ta and Cb and it is suggested that all group Va b-c-c. metals twin with relative ease below room temperature if very pure and with large grain size. 4 ref. (Q24b, 2-59, 2-63, 3-68; V, 14-61)

480-Q. Can Copper Alloys Hold the Line at Ultralow Temperatures. C. L. Bulow. Iron Age, v. 187, Mar. 9, 1961, p. 92-93.

Comparison of mechanical and electrical properties of Cu alloys at room temperature and -180° C. (Q-general, P15, 2-61; Cu-b)

481-Q. Predicting Very Short-Time Creep Behavior for Missiles. S. F. Frederick. Metal Progress, v. 79, Mar. 1961, p. 88-90.

Conventional time-temperature parameters may be applied to very-short-time creep data. (Q3, 1-54)

482-Q. Effect of Grip Constraints on the Tensile Deformation of F.C.C. Single Crystals. J. J. Hauser and K. A. Jackson. Acta Metallurgica, v. 9, Jan. 1961, p. 1-13.

Theoretical analysis of geometrical grip effects and their relation to easy glide regions during deformation, establishing the orientation dependence of both. Correlation with tensile, compressive and shear stresses and strain, lattice rotation, dislocation interactions in various slip systems, Cottrell-Lomer locking and specimen size and shape effects to determine deformation mechanisms and geometry. 12 ref. (Q24, Q25, M26, 3-72, 3-73; 14-61)

483-Q. Low-Temperature Elastic Constants of Magnesium Alloys. S. Eros and C. S. Smith. Acta Metallurgica, v. 9, Jan. 1961, p. 14-22.

The elastic constants of a series of Mg alloy single crystals, containing Ag, Sn or In and with an electron-atom range of 1.996-2.020 are measured at 4-298° K. to look for effects which are predicted to be associated with the initiation of a new electronic overlap and which can only be observed at low temperatures. 18 ref. (Q21, M25, 2-63; Mg-b, Ag, Sn, In, 14-61)

484-Q. Magnitude of the Zener Relaxation Effect. Pt. 1. Survey of Alloy Systems. A. S. Nowick and D. P. Seraphim. Acta Metallurgica, v. 9, Jan. 1961, p. 40-48.

Stress-induced ordering phenomenon in substitutional solid solutions. A brief review of the two proposed mechanisms for this phenomenon, the pair reorientation theory of Zener and the directional short-range order theory of Le Claire and Lomer, is presented with data for the relaxation strength of polycrystalline samples from 19 alloy systems, with information from lattice-parameter data. For solid solutions of the noble metals, it is shown that there is no relation between relaxation strength and the size factor, but that there is rough correlation between relaxation strength and the magnitude of the deviation from Vegard's law. 29 ref. (Q3, Q22, M26, N10, 10-54; 14-67)

485-Q. Temperature Dependence of the Relaxation Strength in Alpha Ag-Zn Magnitude of the Zener Relaxation Effect. Pt. 2. C. Y. Li and A. S. Nowick. Acta Metallurgica, v. 9, Jan. 1961, p. 49-58.

The dependence of the magnitude of stress-induced ordering on temperature is measured by static, internal friction and dynamic modulus methods at 32-297° C. on polycrystalline samples of alpha Ag-Zn alloys of three compositions. The relaxation strength is found to follow the equation derived by Zener (rederived here under more general assumptions). The critical temperature for self-induced ordering is found to be equal to 175, 140 and 97° K. for alloys containing 33.5, 30.2 and 24.2 at.% Zn, respectively. 10 ref. (Q3, Q22, N10, 2-61; Ag-b, Zn)

486-Q. Microcreep Relaxation of Pinned Dislocations in Gold. R. Kamel. Acta Metallurgica, v. 9, Jan. 1961, p. 65-68.

Internal friction and elastic modulus measurements on quenched and annealed Au wire specimens at 0-1000° C. to determine dislocation line-vacancy interaction and the resulting effect on dislocation climb, phase lag between stress and dislocation motion and related microcreep phenomena. Relaxation curves are obtained as a function of time and temperature, with vacancy or divacancy diffusion being attributed as the rate controlling process. 4 ref. (Q3, Q22, M26, 2-61, 3-67; Au)

487-Q. Void Formation in Ductile Fracture of a Cobalt-Iron Alloy. C. W. Chen. Acta Metallurgica, v. 9, Jan. 1961, p. 68-71.

Room temperature tensile tests on a 49% Fe-49% Co-2% V alloy, after martensitic conversion of the gamma phase by heat treatment, with metallographic analysis of the resultant cup-and-cone fracture surface. Void initiation sites and formation and growth mechanism in ductile fracture are related to plastic deformation and hydrostatic tension processes and dislocation pile-up and stress concentration mechanisms. 7 ref. (Q26, M23p, M26p, 3-66, 3-68; Fe-b, Co-b, V)

488-Q. On the Fine Structure in Twins. H. Kiho and S. Maruyama. Acta Metallurgica, v. 9, Jan. 1961, p. 82-83.

Electron micrographic and sterographic projection examination of markings across the twin bands in zone melted Zn single crystal after cleaving in liquid nitrogen. The markings are identified as kink-bands produced by local slip in twinning. (Q24b, Q24c, M21e; Zn, 14-61)

489-Q. Materials for Astronautic Vehicles. A. J. Murphy. College of Aeronautics, Cranfield, England, Nov. 1960, 21 p.

Alloys based on Fe, Ni and Co, refractory metals, particularly Mo, Cb and W, nonmetallics such as carbon and ceramic oxides, synthetic resins and cermets are evaluated for application in space ships operating at high speeds in the extreme conditions of outer space, with special attention to heat ablation and dissipation. Data are compiled for thermal, thermodynamic and kinetic properties; reactivity, irradiation sensitivity; creep, fatigue stress and oxidation resistance at high

temperatures and mechanical properties at low temperatures. (Q-general, P-general, T24e; SGA-h, EG-d37, Fe-b, Co-b, Mo-b, Ni-b, W-b, Cb-b, NM, 17-52, 17-57)

490-Q. (French.) Effect of Remelting on the Properties of A-U5GT and A-G3 Alloys. Claude Mascre and Michel Drouzy. Fonderie, Nov. 1960, p. 469-472.

A charge of A-U5-GT containing 0.24-0.29% Mg and 0.17-0.35% Ti and a charge of A-G3 containing 2.90-3.07% Mg, 0.38-0.40% Mn and 0.08-0.09% Ti are melted in a foundry furnace, cast and twice remelted, to study changes of the composition, tensile strength, elongation and grain size. (Q27a, Q23p, M27c; Al-b)

491-Q. (German.) Attenuation of Ultrasonic Waves in Austenitic Cr-Ni-Steels. Paul Midecke. Materialprufung, v. 3, Jan. 1961, p. 1-4.

Measurement of ultrasonic reflection by reflectograms and hardness tests on austenitic forged, rolled and cast CrNi steel (18-25% Cr, 8.5-21.3% Ni, 0.1-0.49% C). Ultrasonic penetration depth as influenced by microstructure precipitations, carbon content and mode of shaping. (Q8g, 1-74; SS, 4-51, 5)

492-Q. (German.) Fatigue Testing of Titanium. Dieter Haffer and Wilhelm Hofmann. Materialprufung, v. 3, Jan. 1961, p. 5-14.

Tensile and fatigue testing of notched and notchless cold drawn (10-40% deformation) 650-800° C. annealed and nonannealed round Ti specimens of varying grain size and tensile strength at temperatures from 20-300° C. Comparison of fatigue strength of Ti and steel. (Q7, Q27, 2-59, 2-61, 2-64; Ti)

493-Q. (German.) Novel Nickel Materials. H. A. Hocking. Radex Rundschau, Dec. 1960, p. 353-364.

Mechanical properties of a novel 9% stainless and case hardenable Ni steel at temperatures down to -190° C.; mechanical properties and heat treatment of a 5% Ni, 2% Al steel with good age hardening and nitriding properties. Properties of gas-turbine materials, high-temperature alloys and vacuum cast alloys on Cr-Ni basis. Review of world production of Ni. (Q-general, J-general; Ni-b, ST, Ni, 17-57)

494-Q. (Russian.) Wear Resistance of Worm Gears. G. I. Kornilov and A. N. Tynnyi. Vestnik Mashinostroeniya, Dec. 1960, p. 26-29.

Wear resistance of Ti-Cu cast iron reducer gears is tested at various contact pressures and sliding rates and compared to that of five steel and cast iron gears. (Q9n, T7; CI)

495-Q. (Russian.) Investigation of Steel--High Tin Aluminum Alloy Bimetal. N. M. Rudnitskii, A. D. Kuritsyna, F. V. Korolev and K. N. Korsunskaya. Vestnik Mashinostroeniya, Dec. 1960, p. 33-37.

Developments in production of antifrictional bimetal sheets having AMS intermediate layers for use in manufacture of ball bearings. Method provides increased adherence between layers, improved galling resistance and high fatigue strength. (Q10c, Q7a, T7d; Al-b, ST, 7-59, 17-57)

496-Q. (French.) Developments and Applications of Stainless Steels. L. Guitton. Metallurgie et la Construction Mecanique, v. 92, Nov. 1960, p. 881-898.

Stainless steel with 17% Cr and 18-10 steels with 7-12% Ni are mechanically tested, deep drawn, descaled in a solution containing nitric acid, hydrofluoric acid and sodium fluoride and corrosion tested in oxalic acid and NaCl. Tensile strength, elastic limit, elongation, deep drawing properties, modulus of elasticity, structure, electrolytic potential. (Q-general, R6; SS)

497-Q. (French.) Special Steels Containing Cobalt. Metallurgie et la Construction Mecanique, v. 92, Nov. 1960, p. 901-912.

Low-alloy steels are subjected to austenitization heating for 2 hr., air cooled and mechanically tested. Tensile strength, elastic limit, hardness, fracture and heat resistance as functions of the Co content. Use of Co in superalloys, permanent magnet materials, high-speed toolsteels, hard materials and low thermal expansion, elasticity and electrical resistor materials. (Q-general, 2-60; AY, Co)

498-Q. (French.) Use of Stainless Steels in Architecture and Civil Engineering. H. Waisblat. Metallurgie et la Construction Mecanique, v. 92, Nov. 1960, p. 961-969.

Density, thermal expansion, elastic limit, tensile strength, elongation and Young's modulus of steels containing 16-19% Cr, 0-13% Ni and 0-2.5% Mo. Corrosion resistance in air. Electrode potential in very diluted acids. (Q-general, R3; SS)

499-Q. Materials--Metallic and Non-Metallic. N. J. L. Megson. Royal Aeronautical Society, Journal, v. 65, Feb. 1961, p. 83-85.

Paper presented at Supersonic Transport Aircraft discussion in Dec. 1960. Mechanical properties, potential applications and means for improving or modifying Al alloys, steels, Ti alloys, transparencies, radomes and elastomers for high temperature use. (Q-general, T24; Al-b, ST, Ti-b, EG-j, 17-57)

500-Q. The Principles and Practice of Torque Loading. J. M. Sharman. Production Engineer, v. 40, Feb. 1961, p. 139-154.

Improving fatigue life of steel and light alloy bolts through tensioning with torque wrenches. 4 ref. (Q7b, T7f; ST, 17-57)

501-Q. (French.) General Tendencies in the Development of Steel and Special Alloys in the Tube Industry. Jacques Dedieu. Societe des Engenieurs Civil de France, v. 113, Dec. 1960, p. 17-30.

Special heat, stress and corrosion resistance requirements placed on tubes in the petroleum, aeronautical, mechanical, nuclear and other industries concerned with problems of fluid materials. Evaluation of carbon and special steel and Ni and Zr alloys developed for these demands. (Q-general, R-general, 2-61; ST, Ni-b, Zr-b, 4-61, 17-57)

502-Q. (French.) Copper-Aluminum Alloys--Their Characteristics and Properties With Respect to Application in the Petroleum Industry. P. Weill-Couly. Association Francaise des Techniciens du Petrole, Bulletin, Nov. 30, 1960, p. 1041-1064.

Copper alloys containing 4-12% Al and 4-5% of Mn, Fe and Ni are evaluated in terms of corrosion and cavitation resistance, influence of temperature on mechanical properties and weldability. Application as containers for corrosive liquids. (Q-general, K9s, R-general, T29n; Cu-b, Al, Mn, Fe, Ni, 17-57)

503-Q. (French.) Reversion, Cause for a Transitory Weakening of Some Aluminum Alloys Under the Effect of Heat. J. Calvet and H. Martinod. Recherche Aeronautique, Nov-Dec. 1960, p. 27-34.

Conditions under which the reversion of structural strength occurs. Effects of reversion on the Brinell hardness of AU4G, AU4G1, AU4SG, AZ5GU (French), AZ5GU (English) and AU2GN alloys under short-time heating to 250° C. Mechanical properties of the alloys at the state of reversion. 21 ref. (Q-general, Q3, Q29n, 2-62; Al-b)

504-Q. (German.) Investigation of Roll Wear With Particular Reference to Drag Rolling in Finish Rolling of Hot Strip. Hans Altmeyer, Herbert Sedlaczek and Fritz Fischer. Stahl und Eisen, v. 81, Feb. 2, 1961, p. 184-194.

Measurement of wear on chill cast and nodular cast iron rolls by a surface feeler with automatic recording during finish rolling of unkilled unalloyed mild openhearth and basic Bessemer steels and of Cr-alloyed razor blade steel. (Q9, W23k; CI, 17-57)

505-Q. Ductile Iron in Steel Mills. C. R. Isleib. Iron and Steel Engineer, v. 38, Feb. 1961, p. 83-90.

Wear, corrosion, creep and impact resistance, castability, weldability, tensile properties and microstructure of ductile cast iron. Applications in metal-working rolls, gears, furnace doors, coke cars, crankshafts and blast furnaces. (Q-general, R-general, K9s; CI-r, 17-57)

506-Q. Effect of Tin on the Mechanical Properties of Pearlitic Nodular Iron. J. C. Prytherch and G. N. J. Gilbert. Foundry, v. 110, Feb. 16, 1961, p. 197-206.

Use of Sn in pearlitic nodular cast iron to suppress the formation of free ferrite without introducing massive cementite. Hardness, proof stress at ductile-to-brittle transition temperature and impact toughness of the irons at all Si levels as affected by Sn. 7 ref. (Q-general, E25q, 2-60; CI-r, Sn)

507-Q. Superalloy Forgings. H. J. Henning and F. W. Boulger. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 86, Feb. 10, 1961,

44 p. (Available as PB 161236 from U. S. Office of Technical Services, Washington 25, D. C.)

Tensile and stress-rupture-properties of disks composed of Waspaloy, U-500, Rene 41; Astroloy and V-57 as dependent on melting practice, heat treatment, alloy composition and forging practice. 19 ref. (Q27, Q3m, 2-60, 2-64; SGA-h, 4-51)

508-Q. Iron in Aluminum-Magnesium-Silicon Alloys. M. Paganelli and F. Sacchi. Metal Industry, v. 98, Feb. 10, 1961, p. 109-110, 112.

Microstructure, mechanical properties and corrosion resistance of Al-0.65 Mg-0.4 Si alloy as affected by Fe content. (Q-general, M27, R-general, 2-60; Al-b, Fe, Mg, Si)

509-Q. Wear Resistance of High Phosphorus Cast Iron Brake Shoes. Minonu Nakai, Seizo Saito and Kunio O. Kabayashi. Imono (Japan Foundrymen's Society, Journal), v. 32, Nov. 1960, p. 765-772.

Laboratory and car wheel tests on brake shoes composed of cast iron containing 0.7-1% phosphorous and with Brinell hardness of 250. Wear resistance is determined to be a function of hardness and phosphorous content. 3 ref. (Q9n, Q29n, T23s, 2-60; CI, P, 17-52, 17-57)

510-Q. Mechanical Properties of Centrifugally Cast Alloy of Complicated Form. Mitsuo Ochiai. Imono (Japan Foundrymen's Society, Journal), v. 32, Nov. 1960, p. 789-793.

Mechanical properties of test piece cut from a centrifugally cast rock cylinder are determined in the as-cast condition and after 850° C. annealing for 3 hr. Data are given for tensile strength, elongation impact value and reduction in area as a function of revolving rate and segregation occurring in centrifugal casting process. 9 ref. (Q-general, E14; AY)

511-Q. A Note on Brittle Fracture Initiation in Mild Steel by Prior Compressive Pre-Strain. C. E. Turner. Iron and Steel Institute, Journal, v. 197, Feb. 1961, p. 131-135.

Brittle fractures of a 3 in. wide notched tensile test piece of a relatively notch ductile 1 in. thick plate steel after aging and precompression. Testing is at -63 to 1° C. to determine crystalline appearance, reduction in mid-plate thickness and nominal stress at fracture as a function of temperature. (Q26s, Q27d, 2-63, 3-68; ST)

512-Q. The Hardness of Iron, Low-Carbon Steels and Cast Iron Roll Materials at Various Temperatures. E. R. Petty and Hugh O'Neill. Iron and Steel Institute, Journal, v. 197, Feb. 1961, p. 141-145.

Investigation of blue hardening in low-carbon steels and pure iron at 20-900° C. Comparison with spheroidal graphite iron. Relationships between blue hardening and strain hardening capacity and tensile strength. Softening characteristics of hot roll irons. (Q29, N7e; Fe-b)

513-Q. The Factors Influencing the Fracture Characteristics of High-Strength Steel. C. W. Marshall. Defense Metals Information Center, Battelle Memorial Institute, DMIC Rept. 147, Feb. 6, 1961, 40 p. (Available as PB 151106 from U. S. Office of Technical Services, Washington 25, D. C.)

External and metallurgical factors affecting the ductile-brittle transition of high-strength steel include temperature, stress concentration and notches, strain rate, stress state, specimen size, nature of carbide dispersion and ferrite matrix, retained austenite and nonmetallic inclusions. 30 ref. (Q26r, Q23r; ST, SGB-a)

514-Q. Present Status of Guaranteeing the Quality of Titanium Sponge. Pt. 1. Determination of Brinell Hardness Number. Toshio Noda, Masaki Kitamura, Kameji Shimasaki and Shinichi Nakamura. Union of Japanese Scientist and Engineers, Statistical Application Research, Reports, v. 7, Sept. 1960, p. 30-40.

Determination of the Brinell hardness number of small Ti sponge ingots (20 x 40 x 45 mm.) prepared in an arc melting furnace with argon gas at 30-40 mm. Hg of pressure, then dried at 95-105° C. for one hr. in an electric oven. Discussion of test's reliability in predicting the quality of sponge. 3 ref. (Q29n, C5h; Ti, 6-74)

515-Q. (Italian.) Metallurgical Production: Common and Special Steels. Pt. 4. Classification of Steel. Angelo Bellini. Rivista di Meccanica, v. 11, Dec. 7, 1960, p. 65-69.

Composition of Co, W and Mo high-speed steels; hot working temperatures and application in cutting tools. (To be continued.) (Q23q, 1-66, T6n, 2-60; TS-m, Co, W, Mo, 17-57)

516-Q. (Italian.) Impact Test on Gray Castings. D. Fortino. Fonderia Italiana, v. 9, Nov. 1960, p. 433-445.

Relation between rupture and the chemical, physical and mechanical characteristics of gray iron castings. 4 ref. (Q6, Q-general, P-general, 2-60; CI-n)

517-Q. (French.) Annealing of 70/30 Brass. D. Whitwham, R. Leguet and J. Herenguel. Memoires Scientifiques de la Revue de Metallurgie, v. 57, Nov. 1960, p. 809-828.

Changes in mechanical properties and microstructure of cold rolled 70/30 brass after isothermal annealing as a function of cold rolling reduction and annealing temperature. Recrystallization accompanying various degrees of reduction. 23 ref. (Q-general, M27, N5, 2-64, 3-68; Cu-n)

518-Q. (Japanese.) Influences of Defects in Steel Castings on Safe Operation. Tsuguyoshi Matsuura. Japan Society of Mechanical Engineers, Journal, v. 63, Dec. 1960, p. 1622-1631.

Mechanical strength of high-tensile steel castings as influenced by concentration and type of defects. Gamma-ray nondestructive testing of cast machine parts to determine defects. (Q27, 9, S13e, T7; ST, 5)

519-Q. Ductile Molybdenum. J. A. Belk. New Scientist, v. 9, Jan. 12, 1961, p. 79-81.

Mechanical and thermal properties of Mo. Methods of sintering, arc melting, zone refining, rolling and annealing to improve ductility. (Q23p, Q-general, P11; Mo)

520-Q. (German.) Microhardness Measurements on Age-Hardenable Aluminum Alloys at Room Temperature and at Elevated Temperatures. K. L. Maurer. Radex Rundschau, Dec. 1960, p. 395-399.

Method and apparatus for microhardness measurements during 20-160° C. aging of 530° C. annealed Al-5.18% Cu cylindrical specimens. Study of structure changes in aging. Comparison of hardness-time curves with values for macrohardness. (Q29q, N7a, 2-61; Al-b, Cu)

521-Q. (Russian.) Strength of Butt Joints of EI659 Steel Under Variable Loads. I. I. Markov. Svarochnoe Proizvodstvo, Nov. 1960, p. 8-11.

Numerous weld joints of various shapes and thicknesses are tensile and bend tested under vibration. Effect of reinforcement height on the fatigue strength and sensitivity to concentrated stresses of welded structural joints. 3 ref. (Q27, Q5, Q7a; ST, 7-51)

522-Q. (Russian.) Wear Resistance of Hard Facing Materials. V. G. Kolesov. Svarochnoe Proizvodstvo, Nov. 1960, p. 20-24.

Numerous materials are tested for abrasive wear under impact loading. Methods for determination of wear resistance by weight, volume or linear measurements as applied to various machine parts. Relationship of hardness to the wear resistance of hard facing materials. (Q9, Q29n; SGA-m)

523-Q. A. O. Smith Develops Lighter Truck Frame. Steel, v. 148, Mar. 13, 1961, p. 125.

Development of a modified 1027 steel containing 0.22-0.30% C and 1-1.35% Mn which achieves the hardness of enriched steels upon quenching in a die quench press. Application in manufacture of lighter weight truck components. (Q29n, T21e; ST, 17-57)

524-Q. Here's a Simple Test for Open Face Honeycomb. Steel, v. 148, Mar. 13, 1961, p. 132.

Testing of bonds on brazed, open-faced honeycomb by filling the cells with a light liquid of low surface tension. Unbonded areas fail to hold the liquid. (Q10c; 4-57)

525-Q. Most Magnesium Alloys Can Be Investment Cast. Kenneth Herrick and Harry Matthieson. Precision Metal Molding, v. 19, Mar. 1961, p. 53-55.

Mechanical and physical properties of AZ92A, AZ91C, HK31A and other Mg alloys as they affect investment casting applications at room and elevated temperatures. (Q-general, P-general; Mg-b, 5-62)

526-Q. Heat Treatment of Cast Stainless Steels. W. P. James. Precision Metal Molding, v. 19, Mar. 1961, p. 56-57.

Effect of annealing, hardening and tempering on the tensile strength, yield strength, elongation and reduction in area of AM-355 stainless steel casting alloy. (Q27, Q23, 2-64; SS, 5)

527-Q. (French.) Brinell Hardness of Cast Alloys. Journal d'Information Techniques des Industries de la Fonderie, Jan. 1961, p. 21-24.

Directions for sampling. Effect of sphere diameter on measuring result. Correlation between Brinell hardness and tensile strength. (Q29, Q27; 5)

528-Q. Magnesium as a Tooling Material. Metalworking Production, v. 105, Feb. 8, 1961, p. 65-66.

Advantages of Mg, in contrast to Al or steel, as a tooling plate material in the aircraft industry in terms of superior machinability, wear resistance, minimum deflection and a coefficient of thermal expansion nearly equal to that of the aircraft. (Q-general, G17k, T6; Mg, 17-57)

529-Q. (Croatian.) Improvement of the Mechanical Properties of Nickel Steels by the Addition of Small Amounts of Boron. Dorde Blagojevic. Saopstenja, v. 6, Nov. 1958, p. 79-89.

Effects of boron with Ti on the mechanical properties of Ni-Cr-Mo alloy steel determined by laboratory and steel-mill controlled testing. The strength, toughness and hardenability of treated samples are significantly higher than similar properties in untreated samples. (Q23r, Q27, J5, 2-60; AY, Ni, Cr, Mo, B)

530-Q. (German-French.) Subterraneous Shelters of Light-Metal. K. Guler. Aluminium Suisse, v. 11, Jan. 1961, p. 3-18.

Elastic limit, tensile strength, elongation, Brinell hardness, resilience, bend, alternate bend and fatigue strengths of Anticorodal and Extrudal used in the construction of cylindrical and spherical shelters. Stress distribution in the construction and deformations caused by the weight of tanks and detonations. (Q-general; Al-b, SGB-s)

531-Q. (Japanese.) Cooperative Study of the Mechanical Properties of Copper-Base Alloy Castings. Masataka Sugiyama, Takajiro Aizawa and Shigeo Oya. Imono (Japan Foundrymen's Society, Journal), v. 32, Dec. 1960, p. 903-908.

Study conducted by a subcommittee of the Japan Foundrymen's Society for determining mechanical properties of tensile bars and foundry products cast from Cu-based alloys specified in the Japan Industrial Standards (JIS). Properties are determined for shell and green sand mold castings of yellow brass, high-strength yellow brass, leaded gunmetal and Sn, Al and phosphorus bronzes as a function of pouring temperature, heat treatment, wall thickness, solidification mode and feeding direction and gating system in the casting process. 3 ref. (Q-general, E-general; Cu-b)

532-Q. (Japanese.) Mechanical Properties of Castings of Yellow Brasses. Umewo Honma, Setuzi Kobayashi, Masaaki Oya and Kazanori Kobayasi. Imono (Japan Foundrymen's Society, Journal), v. 32, Dec. 1960, p. 908-915.

Tensile properties of 57-84% Cu yellow-brass specimens taken from "L" sectional and stepped castings, produced by dry sand, green sand and shell mold processes. Lack of mechanical property dependence on casting thickness, location of specimen in the casting and feeding direction is attributed to the alloys being of the skin formation type. (Q27, Q-general, E-general, 2-60; Cu-n)

533-Q. (Japanese.) Mechanical Properties of Castings of High Strength Yellow Brasses. Tatsuichi Fukusako, Yukio Kono and Takeshi Miyata. Imono (Japan Foundrymen's Society, Journal), v. 32, Dec. 1960, p. 915-920.

Tensile properties of various sections of step formed and "L" formed castings of 52-59% Cu. Effect of pouring temperature, cooling rate and casting variables, such as position of risers on mechanical properties and defect occurrence. (Q-general, E25; Cu-n)

534-Q. (Japanese.) Mechanical Properties of Castings of Tin Bronzes. Tatsuichi Fukusako, Takeshi Kondo, Seizi Kurata, Shiyoga Yosida and Narimitsu Koto. Imono (Japan Foundrymen's Society, Journal), v. 32, Dec. 1960, p. 921-933.

Mechanical properties, in particular elongation, of tensile test bars produced from stepped and "L" sectioned castings containing 8.45-10.30% Sn. Influence of

pouring temperature and section of casting from which specimen is taken on properties. (Q-general, Q23p, Q27, E-general; Cu-s, Sn)

535-Q. (Japanese.) Mechanical Properties of Castings of Leaded Gunmetals. Tatsuichi Fukusako, Yasumaso Aizawa, Hiroshi Yamada, Takashi Oya, Nobumitsu Kitajima, Takeshi Kordo, Shegemitsu Koto and Kazunori Kabayashi. Imono (Japan Foundrymen's Society, Journal), v. 32, Dec. 1960, p. 933-939.

Tensile test data for specimens taken from stepped and "L" sectioned castings containing 1.69-5.48% Pb, produced in dry and green sand and shell molds. Effect of casting thickness and heaviness and process variables, such as feeding direction, on tensile strength, elongation and other mechanical properties. (Q-general, Q27, E-general 3-73; Cu-b, Pb)

536-Q. (Japanese.) Mechanical Properties of Castings of Phosphor Bronzes. Shigeru Yoshida, Kazuo Tazaki, Horuo Tanisawa and Kyozi Mizuta. Imono (Japan Foundrymen's Society, Journal), v. 32, Dec. 1960, p. 940-947.

Tensile test bars containing 0.5-0.27% phosphorous are taken from stepped and "L" sectioned castings produced in dry sand, shell and metallic molds. Tensile and fatigue data are determined as a function of section thickness and of process variables. (Q6, Q27, Q-general, E-general, 3-73; Cu-s, P)

537-Q. (Japanese.) Mechanical Properties of Castings of Aluminum Bronzes. Masayashi Awada, Nobuya Iwano, Horuo Tanisawa, Syogo Yosida and Kinya Yamagata. Imono (Japan Foundrymen's Society, Journal), v. 32, Dec. 1960, p. 948-957.

Radiographic examination and tensile testing of specimen bars and of stepped and "L" sectioned castings containing 8-11% Al. Influence of casting variables, such as gating systems and pouring temperatures on structure, mechanical properties and defect occurrence. (Q-general, Q27, M23h, E25; Cu-s, Al)

538-Q. (English.) The Effect of Niobium on Properties of 18 Chromium-12 Nickel Austenitic Stainless Steels. Ryuichi Nakagawa and Yasuo Otoguro. National Research Institute for Metals, Transactions (Japan), v. 2, Feb. 1960, p. 63-68.

X-ray diffraction examination and mechanical testing of specimens containing 0-1.80% Cb and 0.029-0.126% C after aging and solution treatment at 650-1200° C. Data are given for creep rupture and tensile strengths, Charpy impact value, hot hardness, age hardening characteristics, microstructure resulting from grain boundary carbide precipitation and resistance to deformation as a function of Cb and C contents at 20-1100° C. (Q-general, M-general, 2-60, 2-61, 2-64; SS-e, Cb)

539-Q. (English.) Chromium-Base Heat Resisting Alloys. Pt. 2. Effects of Titanium and Aluminum on the High Temperature Properties of 60% Chromium-25% Iron-15% Molybdenum. Tetsutaro Mitsuhashi, Renpei Yoda and Masao Yukushiji. National Research Institute for Metals, Transactions (Japan), v. 2, Feb. 1960, p. 69-73.

Age hardening characteristics, bending creep strength, oxidation resistance, forgeability and microstructure of specimens containing up to 2% Al and Ti and up to 15% Co, are examined at 500-1200° C. as a function of Al and Ti content, Co replacement for Fe and aging and solution treatment time and temperature at 800-1300° C. (Q-general, F22, 17-52, M-general, N7a, 2-60, 2-62, 2-64; Cr-b, Mo, Fe, SGA-h)

540-Q. (English.) Nickel-Base Heat Resisting Alloys. Pt. 1. Effect of Aluminum and Titanium on the Forgeability and Age Hardening Characteristics of Nimonic 100 Type Alloys. Renpei Yoda, Heitano Yoshida and Sennosuke Takahachi. National Research Institute for Metals, Transactions (Japan), v. 2, Feb. 1960, p. 74-83.

Hot working and forging tests and metallographic analysis of vacuum cast specimen after aging, solution treatment and water quenching at 900-1150° C. Data are given for Vickers hardness, high temperature strength, deformation and oxidation resistance, microstructure and phase transformations. 9 ref. (Q-general, F22, 17-52, M-general, N7a, 2-60, 2-64; Ni-b, SGA-h)

541-Q. (English.) Hot Workability of Pure Chromium. Susumu Yoshida, Yukio Ohba and Norio Nagata. National Research Institute for Metals, Transactions (Japan), v. 2, Feb. 1960, p. 89-95.

Impact compression testing at 800-1300° C. of high purity specimens prepared by electrolysis from chromic

acid solutions and by the aluminathermic process. Resistance to deformation is temperature dependent as a function of grain boundary dissolution of nitrogen atoms in the grains. 10 ref. (Q23q, Q6, 2-60, 2-62; Cr-a)

542-Q. The Present State of Ship Plate Specification. A. F. Mohri. Canadian Mining and Metallurgical Bulletin, v. 54, Feb. 1961, p. 157-162.

Review of chemical composition specifications and Charpy impact tests for ship plate. Effect of chemical composition, steelmaking practice, metallurgical factors and fabricating practices on the impact properties and transition temperature range of steels. 15 ref. (Q6, Q23r, 2-60, T22; ST, 4-57)

543-Q. B-70 Spurs Wider Use of Sandwich Design. Randolph Hawthorne. Space/Aeronautics, v. 35, Mar. 1961, p. 46-49.

Discussion of trends in sandwich materials, types of sandwich construction and applications for sandwich design. Facing stress, core shear and maximum temperature of some brazed Al, superalloy and stainless steel sandwich panels. Typical physical properties such as strength, thermal conductivity, dielectric constant and heat distortion temperature of foamed-in-place plastics. (Q-general, P-general; Al, SS, SGA-h, 4-57)

544-Q. Materials for Low Temperature Use. O. A. Hansen. Paper from "Short Course on Process Industry Corrosion, Proceedings". National Assoc. of Corrosion Engineers, Houston 2 Tex., 1960, p. 273-286.

Establishment of the ductile-brittle temperature range of alloy steels, cast iron, Cu and Ni alloys, stainless steel, Al alloys and plastics. Evaluation as to suitability for cryogenic application. 8 ref. (Q23r, 2-63, T29; Al-b, AY, CI, Cu-b, Ni-b, SS, NM-d30)

545-Q. (German.) Mechanical Properties of Uranium. G. J. Sergeev, V. V. Titova, E. M. Savickij, A. A. Zulkova and Z. P. Nikolaeva. Kernenergie, v. 2, Oct-Nov. 1960, p. 935-939.

Mechanical testing of uranium containing 0.05-0.24% C at room and elevated temperatures (up to 850° C.) under Ar protective atmosphere. Mechanical properties as influenced by temperature, carbon content and crystal modification (alpha, beta and gamma phase). (Q-general, 2-60, 2-61; U)

546-Q. (German.) Investigation of Increase of Internal Friction With Temperature Changes in Polycrystalline Uranium Specimens. J. N. Sokurskij and J. V. Bobkov. Kernenergie, v. 3, Oct-Nov. 1960, p. 1067-1071.

Change of internal friction with temperature (20-290° C.) is measured in terms of damping of torsion oscillations of specimens, which are quenched from the gamma phase and annealed and recrystallized in the alpha and gamma field. (Q22, 2-61; U)

547-Q. (French.) A New Structure Hardening Nitralloy Steel. W. S. Mounce and A. J. Miller. Revue du Nickel, v. 26, Nov-Dec. 1960, p. 163-166.

Hardness depth and aging behavior of steel samples containing 0.20-0.25% C, 0.25-0.45% Mn, 4.75-5.25% Ni, 0.40-0.60% Cr, 0.20-0.30% Mo, 1.80-2.20% Al and 0.08-0.15% V after end quenching, tempering and artificial aging or nitriding by various methods. Tensile strength, elastic limit and ductility measured at 20-600° C. after normalization at 950° C. and artificial aging at 565° C. for 4 hr. (Q29, Q27, Q23p, 2-65; AY-b)

548-Q. Plastic Flowing; Studies of Yield-Delay Time for Various Materials. J. M. Krafft and A. M. Sullivan. Report of NRL (Naval Research Laboratory) Progress, Feb. 1961, p. 27-28.

Grain size and composition effects on yield strength and yield point mechanisms in mild steel specimens are examined in uniaxial compression by impact and explosive tests at room temperature. Dynamic stress-strain curves are obtained with data for upper yield and plastic flow stresses. (Q23b, Q24b, Q28h, 2-59, 2-60; CN)

549-Q. Metals and Alloys at Elevated Temperatures. G. J. Danek, H. H. Smith and M. R. Achter. Report of NRL (Naval Research Laboratory) Progress, Feb. 1961, p. 29-31. (Available as PB171315 from U. S. Office of Technical Services, Washington 25, D. C.)

High temperature optical strain measurement of metal specimens in reverse

cyclic bending using oscillating mirrors to reflect streaks of light corresponding to the curvature and surface strain. Comparison of results with strain gage measurements on stainless steel, Inconel X and Ni at 68-1500° F. Application to study of high temperature metal fatigue. (Q24h, Q25, Q7j, 1-54, 2-62; SS, Ni-b)

550-Q. Basic Studies of the Metallic State (The Effect of Hydrogen Absorption and Desorption on the Ultrasonic Velocities and Hardness of Palladium). A. I. Schindler and E. W. Kammer. Report of NRL (Naval Research Laboratory) Progress, Feb. 1961, p. 32-33. (Available as PB171315 from U. S. Office of Technical Services, Washington 25, D. C.)

Measurements of the longitudinal velocity at 5 mc., the transverse velocity at 2.5 mc. and the Vickers pyramidal hardness at room temperature on polycrystalline specimens at 99.99% Pd in the as-cast, hydrogen-charged, hydrogen-desorbed and fully annealed conditions. Relation of Debye temperature to acoustic velocities and determination of both by electrical resistivity measurement as a function of lattice expansion. (Q29n, Q26s, P12r, 1-54, 1-74, 2-60; Pd, H)

551-Q. Irradiation of Some Pressure-Vessel Steels. L. P. Trudeau. Paper from "Materials in Nuclear Application". STP no. 276, American Society for Testing Materials, Philadelphia, Pa., 1960, p. 102-115.

Effect of neutron irradiation on tensile and impact properties of high strength A 201, A 203, A 302, A 353, HY-80, T-1, 1146 and Ni-Zr steels and Smithweld 91 weld metal. 4 ref. (Q27, Q6, 2-67, T26q; ST, 17-57)

552-Q. Neutron Radiation Embrittlement at 500 and 650° F. of Reactor Pressure Vessel Steels. J. V. Alger and L. M. Skupien. Paper from "Materials in Nuclear Application". STP no. 276, American Society for Testing Materials, Philadelphia, Pa., 1960, p. 116-135.

Effect of neutron radiation on impact and tensile properties of ASTM A 302 grade B, SA-36 and HY-65 high-strength pressure vessel steel and weld metal. Effect of heat treatment condition. 6 ref. (Q27, Q6, 2-67, T26q; ST, 17-57)

553-Q. Radiation Effects in Steel. Lew F. Porter. Paper from "Materials in Nuclear Application". STP no. 276, American Society for Testing Materials, Philadelphia, Pa., 1960, p. 147-195.

Theoretical interpretation of changes occurring during irradiation. Existing information on the effect of neutron irradiation on the mechanical properties of carbon, alloy and stainless steels. Effect of composition and structural variables on extent of radiation damage. Influence of radiation on recrystallization and phase changes. 82 ref. (Q-general, N5, 2-67; AY, CN, SS)

554-Q. Interpretive Report on Operating Conditions for Nuclear Pressure Vessels. K. F. Smith. Welding Research Council, Bulletin Series no. 66, Jan. 1961, 12 p.

Summary of nuclear pressure vessel operating parameters. Effect of slow and fast irradiation at 175-600° F. on tensile strength, yield strength, area reduction, impact strength and uniform elongation of fabricating materials including 304, 304L and 347 stainless steel, A212, A302B steels, Zircaloy-2 and Inconel. 30 ref. (Q-general, 2-67, T26q; Ni-b, SS, Zr-b, 17-57)

555-Q. How to Find Thermal Stresses in Two-Ply Cylinders. George T. Ladd and D. M. Pearce. Product Engineering, Design Work Sheets, 14th Series, 1961, p. 37-38.

Curves for finding thermal stresses--radial tensile strength and axial shear stress--at bond of cylinders of alloy steel and Al firmly bonded together. (Q25p; Al, AY, 4-60)

556-Q. Best Spring Material for High Temperature. V. A. Stanton. Product Engineering, Design Work Sheets, 14th Series, 1961, p. 110-113.

Comparison of high-temperature stability of ferritic alloys, ferritic austenitic stainless steels, austenitic stainless steels, Ni-base alloys, Ni-Cr-Co alloys and Co-base materials. Selection of spring metals. (Q-general, 2-62; Co-b, Ni-b, SS)

557-Q. How to Get Stronger Parts From Work-Hardened Sheetmetal. Herbert A. Jahnle. Product Engineering, Design Work Sheets, 14th Series, 1961, p. 134-136.

Effect of cold working on mechanical properties of cold worked metals at elevated temperatures. Design of welded joints in cold rolled sheet metal. (Q-general, 3-68; 4-53)

558-Q. Furnace Requirements for the Mechanical Testing of Materials at Elevated Temperatures. J. A. Dunsby. National Aeronautical Establishment Structures Laboratory, Report no. MS-103, National Research Laboratories, Ottawa, Canada, Nov. 1960, 17 p.

Review of the sensitivity to temperature change of the results of tensile, creep, stress rupture and fatigue tests on typical engineering metals such as 24S T3 Al alloy, Ti-4Al-4Mn Ti alloy, AM-350 stainless steel, D-979 Fe-Ni alloy, S816 Cr-Ni-Co alloy, recrystallized Mo and wrought sintered W. Examination of the temperature tolerances specified by existing standard codes for elevated temperature testing. Temperature control requirements of BS1 and ASTM standards. 22 ref. (Q-general, 1-54, 2-62; Al-b, Mo, Ni-b, SS, Ti-b, W)

559-Q. Effect of Strain Rate and Temperature on the True Stress-True Strain Properties of Commercially Pure Titanium. Thomas S. Desistro and David E. Driscoll. Paper from "High Speed Testing", v. 1. Interscience Publishers, Inc., New York, 1960, p. 97-105.

Measurement of specimens in tension at -319 to 800° F. and strain rates of 0.001-40 min.$^{-1}$. Maximum load strain decreases with increasing strain rate and increases with decreasing temperature. 7 ref. (Q25n, Q27, 2-61, 3-68; Ti-a)

560-Q. Studies of Metals at Ballistic Rates of Loading. J. O'Brien and R. S. Davis. Paper from "High Speed Testing", v. 1. Interscience Publishers, Inc., New York, 1960, 107-112.

Procedure for determining the quantitative effects of the tensile fracture of metals, produced when a compression pulse is reflected as a tension pulse from a free surface, i.e., scabbing phenomenon, using specimens of high-purity Al and Al alloys. A stress for fracture of approximately 240,000 psi. is obtained through measurement of stress distribution within a tension pulse resulting from pressure, of energy and rate of crack propagation. 3 ref. (Q6a, Q26r, 3-66; Al-b)

561-Q. (Russian.) Method of Plane Face Grooves, Filled With Lubricant, for Determination of Deformation Resistance. I. M. Pavlov and E. V. Ushakov. Zavodskaya Laboratoriya, Dec. 1960, p. 1403-1404.

Determination of deformation resistance of Al alloy samples of cylindrical shape and of various thickness with paraffin used as lubricant; uniform distribution of deformation in a sample. (Q24, 1-54; Al-b)

562-Q. (Croatian.) Influence of Nickel on the Mechanical Properties of Chromium-Molybdenum Steel During Long Time Testing at High Temperatures. Caslav Vuckovic. Saopstenja, v. 7, June 1959, p. 32-36.

High temperature testing (2900-3900° C.) of Cr-Mo steel castings to determine the effect of Ni on mechanical properties and on the amount and distribution of precipitating elements from base mass and carbides. Supporting data indicate the most suitable effects are obtained with 0.2-1% Ni content. 5 ref. (Q-general, N7b, 2-60, 2-62; ST, Cr, Mo, 5)

563-Q. (Japanese.) Effect of Plastic Deformation on Ultrasonic Attenuation in Metals. Akira Hikata. Government Mechanical Laboratory (Japan), Report no. 39, Oct. 1960, 94 p.

Stress-strain relations in Al, Cu, Al alloys and steel are determined by fatigue and creep testing at various temperatures, stresses, frequencies and strain rates. Attenuation and its recovery mechanisms are analyzed by the Granato-Luecke's dislocation theory. (Q25n, Q3, Q22; Al-b, Cu, ST)

564-Q. (Polish.) Effect of Nickel on the Fatigue Strength of Structural Steels. S. Przegalinski, R. Bak and J. Wojnarowski. Prace Instytutow Hutniczych, v. 12, May 1960, p. 219-222.

Heat treated notched and unnotched Cr-Ni steel samples (up to 2.5% Ni) are subjected to rotary-bend and tensile-compression tests. No significant effect of Ni on fatigue strength is noted. 6 ref. (Q7a, Q5, Q27, 2-60; ST, SGB-s)

565-Q. Microstructures and Notes on Manganese-Nickel-Chromium-Molybdenum Steel Heat Treated to B.S. 3100:1957:1458 and 1459. J. Turton and B.H.C. Waters. British Foundryman, v. 56, Feb. 1961, p. 60-66.

Effects of annealing, hardening and tempering on microstructure, tensile

properties, Izod properties and hardness of Mn-Ni-Cr-Mo low alloy steel. (Q27, Q29n, Q6, M27, 2-64; AY)

566-Q. The Properties of Some Metals and Alloys at Low Temperatures. R. E. Lismer. Institute of Metals, Journal, v. 89, Jan. 1961, p. 145-161.

Plain and notched tensile, Charpy V-notched impact and Navy tear tests at -196 to 60° C. on plate specimens to determine temperature effects on toughness and fracture characteristics. Specimens include Cu and Cu alloys (arsenical Cu, 60-40 brass, 90-10, 80-20 and 70-30 cupronickel, Kunifer 5 and 20 and Superton 40, a Mn-Al bronze; Ni alloys (Monel and Inconel); austenitic stainless steels (Ti-stabilized 18% Cr, 8% Ni with and without 3% Mo) and low carbon Ni steels (2 1/4-9% Ni). Mechanical properties are observed to improve with heat treatment. (Q-general, 2-63; Cu-b, Ni-b, AY, SS-e)

567-Q. The Effect of Persistent Slip Bands on the Fatigue of Copper. A. H. Meleka, W. Barr and A. A. Baker. Institute of Metals, Journal, v. 89, Jan. 1961, p. 176.

Effect of incomplete removal of the fatigue damaged surface layer on the reduction of fatigue life in specimens is examined microscopically with the decrease in fatigue strength of electropolished OFHC Cu specimens being attributed to persistent slip band and "electrogroove" formation leading to microcrack initiation in the deformation area. 3 ref. (Q7, Q24c, L13p, 3-68; Cu-a)

568-Q. The Effect of Low-Temperature Annealing on the Indentation Hardness of Cold Worked Alpha-Brass. C. Baird and P. H. Jennings. Institute of Metals, Journal, v. 89, Feb. 1961, p. 191-192.

Examination of two alternative hypothesis, strain hardening and relief of internal stress, for explaining hardening phenomena observed in heavily cold worked specimens after low temperature annealing. Experiments on cold rolled 70-30 brass, stress relieved by annealing at 105-235° C., by plastic extension and by a combination of both, support the view that the hardening is due to stress relief. (Q29, J29a, 2-64, 3-68; Cu-n)

569-Q. The Properties of Commercial Al-Zn-Mg Alloys. Practical Implications of Trace Additions of Silver. I. J. Polmear. Institute of Metals, Journal, v. 89, Feb. 1961, p. 193-202.

Effect of 0.3% Ag additions on age-hardening, mechanical properties and structures of Al-Zn-Mg alloy specimens, in particular DTD 683, 7079 and 7178 alloys, is examined after aging, solution and quenching heat treatments and cold working. A fine, evenly dispersed precipitate is observed in the grain boundary region as a function of temperature and Ag influence on nucleation of the phase formed on aging. Data are given for tensile properties, S-N curves, stress-corrosion resistance and Vickers hardness. (Q-general, M27, N-general, 2-60, 2-64; Al-b, Ag)

570-Q. Stress Relaxation in Copper and Alpha-Brasses at Low Temperatures. P. Feltham. Institute of Metals, Journal, v. 89, Feb. 1961, p. 210-214.

Relaxation at 77-291° K. of the applied tensile stress at constant strains of up to 1% is studied in polycrystalline copper (99.99 and 99.999%) and alpha-brasses (10-35% zinc), vacuum-annealed at 800° C. to a grain size of 4.5×10^{-3} cm. Logarithmic equations are derived for maximums in the relaxation curves, as a function of temperature and composition, which are ascribed to local ordering near jogs, resulting in a lowering of their misfit energy and facilitation of dislocation migration. Relaxation results from continuation of glide initiated on yielding and the drag of conservatively moving jogs in edge dislocations is rate-determining. 18 ref. (Q3a, M26b, N-general, 2-63; Cu-b)

571-Q. The Tensile Properties of Some Polycrystalline Magnesium Alloys at Low Temperatures. W. J. McG. Tegart. Institute of Metals, Journal, v. 89, Feb. 1961, p. 215-218.

Polycrystalline binary solid-solution alloys of Mg with Ag, Cd and In are tested in tension at -196 to 200° C. While the alloys exhibit plastic properties similar to those of pure Mg, their flow and fracture stresses are higher at all test temperatures. In addition to the size effects of solute and solvent atoms, the valency differences play an important part in the solid solution strengthening of Mg and basal slip is the dominating deformation mechanism. 16 ref. (Q27, Q24, Q25, 2-63; Mg-b)

572-Q. A Simple Test to Predict the Increase in Permanent Set of Springs Under

Repeated Loading. R. S. Loubber. South African Mechanical Engineer, v. 10, Jan. 1961, p. 147-151.

An acceptance overload test of three to four load applications is proposed from data on silico-manganese spring steel blades. (Q7, 1-54; ST, SGA-b)

573-Q. Creep and Stress Relaxation in Alpha-Brass at Low Temperatures. P. Feltham. Philosophical Magazine, v. 6, Feb. 1961, p. 259-270.

Creep of vacuum annealed polycrystalline 65/35 alpha-brass is studied at constant stress in the range 77-300° K., close to the yield point and at elongations not exceeding 3%. Data are correlated with logarithmic stress relaxation. 16 ref. (Q3; Cu-n)

574-Q. Evidence of Subsurface Cross-Slip in Fatigued Copper. A. H. Meleka, W. Barr and A. A. Baker. Philosophical Magazine, v. 6, Feb. 1961, p. 315-316.

Specimens of Cu are fatigued in reverse bending to about half their expected life in order to observe slip bands. Results are used to support the Mott theory of dislocation motion. 6 ref. (Q7, M26b; Cu)

575-Q. (Translation.) Mechanical Properties of Solids at a Temperature of 4.2 K. and Below. O. V. Klyavin. Soviet Physics--Solid State, v. 2, Feb. 1961, p. 1706-1713. (Translation of Fizika Tverdogo Tela, v. 2, Aug. 1960, p. 1681-2006).

Investigation of relatively pure polycrystalline Al, Cu and Ni to determine the effect of preliminary plastic deformation in tension on mechanical properties. Findings indicate that the form of the tension diagram depends on form, amount and temperature of the predeformation of the material. 11 ref. (Q-general, 1-67, 3-68; Al, Cu, Ni)

576-Q. High-Temperature Properties of Rene 41 and Astraloy. Donald P. Moon, James F. Barker and Ward F. Simmons. Metal Engineering Quarterly (American Society for Metals), v. 1, Feb. 1961, p. 3-11.

Effects of heat treatment and prolonged exposure to stress and temperature on the microstructure are reported for two precipitation hardenable high-strength nickel-base alloys, Rene 41 and Astroloy. Microstructural changes are then used as a basis for explaining losses in strength and ductility occurring during long time exposure at elevated temperatures. 6 ref. (Q-general, 2-62; Ni-b)

577-Q. Properties of Gray and Ductile Irons. John F. Wallace. Metals Engineering Quarterly (American Society for Metals), v. 1, Feb. 1961, p. 12-23.

Influence of the different forms of flake graphite in gray iron and spheroidal graphite in ductile iron, together with various matrices in the strength, ductility and stress-strain characteristics of these irons. 29 ref. (Q-general; CI)

578-Q. Failure of Steam-Water Heat Exchangers. B. F. Brown. Metals Engineering Quarterly (American Society for Metals), v. 1, Feb. 1961, p. 68-74.

Gross wastage and embrittlement were observed in plain carbon steel desuperheaters in five new naval power plants. The gross wastage could be duplicated in laboratory bomb tests using sodium hydroxide solutions and was concluded to be caused by free caustic concentrated by high heat flux. The embrittlement is shown to be caused by the flow of corrosion-generated hydrogen which converted the cementite to methane which nucleated voids in the steel. (Q26s, W13b)

579-Q. Fracture-Toughness of Steel for Pressure. Harold Bernstein and George C. Young. Metals Engineering Quarterly (American Society for Metals), v. 1, Feb. 1961, p. 75-89.

Factors influencing notch toughness; comparison of various tests. 5 ref. (Q26, T26q)

580-Q. Brittle Fracture in Welded Structures: A Contemporary View. A. A. Wells. Welding and Metal Fabrication, v. 29, Mar. 1961, p. 89-94.

Effect of stress-relieving on brittle cleavage fracture in welded plates composed of low carbon steel, low and high Ni ferritic alloy steels, austenitic steels and Al alloys. 18 ref. (Q26s, 2-64; Al-b, CN, SS, 4-53, 7-51)

581-Q. Metal Fatigue and Cold Extrusion. Welding and Metal Fabrication, v. 29, Mar. 1961, p. 101.

Review of research on fatigue of mild steel, Cu, Al, 4 1/2% Cu-Al alloy and Zn as affected by static ductility, fretting

and abrasive wear and on cold extrusion of metals to improve surface finish and eliminate machining. (Q7, G5; Al, Cu, CN, Zn)

582-Q. Steels for Reactor Pressure Circuits. Welding and Metal Fabrication, v. 29, Mar. 1961, p. 116-118.

Review of papers from a symposium on fabrication and welding of steel plates to form reactor pressure vessels. Data given for Charpy V-notch impact values, ultimate tensile strength, reduction of area, elongation, yield stress, corrosion resistance and high temperature properties of weldments. (Q-general, T11, T26q; ST, 17-57)

583-Q. Some Factors Affecting the Notch Toughness of Steel Weld Metal. K. E. Dorschu and R. D. Stout. Welding Journal, v. 40, Mar. 1961, p. 97-105.

Welding energy-input, restraint during welding and weld-metal composition are investigated to determine their effects on notch toughness. Using A-201 and 212 steel samples and both submerged-arc and gas-shielded consumable electrode welding processes, it is found that lowering energy input and restraint and adding Ni and Mn will increase notch toughness. 18 ref. (Q23r, K1; ST, 7-51)

584-Q. Use of the Center Notch-Tensile Test to Evaluate Rocket-Chamber Materials. Joseph J. Warga. Welding Journal, v. 40, Mar. 1961, p. 130s-134s.

Tensile testing of Vascojet 1000, Unimach II, 4340, Mellon X-2 and other ultrahigh-strength steels to determine effects of processing variables such as rolling direction, melting practice, heat treatment and welding procedure on mechanical properties. (Q27d, Q-general, T2p; ST, SGB-a)

585-Q. Catastrophic Fracture Caused by Ductile to Brittle Transition Under Residual Stress. W. N. Platte. Welding Journal, v. 40, Mar. 1961, p. 135s-137s.

Controlled testing of the relationship between residual welding stress, catastrophic rupture and transition temperature in b-c-c. metals using arc-cast Mo welds deoxidized with carbon. Cracking due to loss of ductility is prevented if stresses are removed by heat treatment prior to cooling below the ductile-to-brittle transition temperature. 13 ref. (Q23r, Q26s, 2-61, 3-66; Mo, 7-51)

586-Q. Theory of Brittle Crack Initiation and Propagation--A Theoretical Analysis of ESSO Test. Yoshio Akita and Kazuo Ikeda. Welding Journal, v. 40, Mar. 1961, p. 138s-144s.

Information is developed from a dynamic theory on the effects of impact energy, temperature yield stress and plastic surface energy on brittle crack initiation and propagation in steel. Theory is used to interpret the ESSO test which requires an impact on a notch in order to initiate a brittle crack. (Q26; ST)

587-Q. Development of Methods and Instruments for Mechanical Evaluation of Refractory Materials at Very High Temperatures. D. H. Fisher. Battelle Memorial Institute (Wright Air Development Division). U. S. Office of Technical Services, PB 171012, June 1960, 82 p. $2.25.

Mechanical testing system, providing tensile and compressive stress-strain and shear-strength data up to 4000° F. in a vacuum, devised as part of a program to develop equipment and techniques for mechanical-properties measurements of refractory metals. The system evaluated by testing a bar consisting of Mo and 1/2% Ti. Tension, compression, shear and bearing tests are conducted at temperatures up to 3500° F. (Q-general, 1-54; EG-d)

588-Q. The Damping Capacity of Metals. K. M. Entwhistle. Paper from "The Physical Examination of Metals". Edward Arnold Ltd., London, England, 1960, p. 487-558.

Comparison of resonant bar, inertia and mechanical hysteresis loop methods for measuring damping capacity. Theoretical explanation of the origins. Damping capacity measurements as used in flaw detection and other test methods. (Q8g)

589-Q. Measurements of the Elasticity of Metals Using Mechanical Vibrations. G. Bradfield. Paper from "The Physical Examination of Metals". Edward Arnold Ltd., London, England, 1960, p. 559-604.

Fundamentals of elasticity and wave propagation in isotropic solids. Elasticity testing methods, including electrical, resonance and pulse methods. (Q21, 1-54)

590-Q. New Materials for Process Units. Canadian Chemical Processing, v. 45, Feb. 1961, p. 69-76.

Corrosion resistance, oxidation resistance, tensile strength, high temperature resistance and weldability of Ti, Zr, Be, Co, stainless steels, Al alloys, Nucerite, glass, graphite, plastic and brick for use in process equipment. (Q27, K9s, R1h, R-general; Al-b, Be, Co, SS, Ti, Zr)

591-Q. (Japanese.) Structure and Rolling Fatigue of Bearing Steel. Masao Kuroda. Japan Society of Mechanical Engineers, Journal, v. 63, Nov. 1960, p. 1442-1451.

Specimens of bearing steel are tested by rotary testing machines until galling occurs. Data are given for fatigue life as influenced by impurities, composition, segregation, cracks and scars, micro and macrostructures, grain size, mechanical strength and deformation. (Q7; ST, SGA-c)

592-Q. High-Strength Steel: Effect of Varying Composition to a Target Hardenability, and an Experimental Silicon-Rich Boron-Treated Low Alloy Steel. S. V. Arnold. Watertown Arsenal Laboratories. U. S. Office of Technical Services, PB 161007, Oct. 1959, 39 p. $1.

To determine the feasibility of measures for conserving alloys, studies are made of the tensile, notched tensile and impact properties of a number of 0.3% carbon nickel-chromium-molybdenum steels after quenching and tempering at 450° F. In one series nickel content was reduced from 1.74% to 0% while hardenability was maintained approximately constant by increasing Mn from 0.81-1.47%. Nickel content in a second series was reduced from 2.02-0% while hardenability is maintained by increasing Mn from 1.06-1.74%. (Q-general, 2-60; AY, B, Si)

593-Q. Kinetics and Mechanism of Hydrogen Attack of Steel. L. C. Weiner. Corrosion, v. 17, Mar. 1961, p. 137t-143t.

Kinetics of hydrogen attack on a killed steel and high purity Fe-C alloys at temperatures of 800-1200° F. and at hydrogen pressures of 450-950 psi. Quantitative relationship between incubation time of attack and temperature and pressure. Theoretical mechanism of hydrogen attack. 14 ref. (Q26s; Fe-b, ST-c)

594-Q. Recent Advances in Beryllium Metallurgy. S. H. Salles, J. J. Peckett and A. Wolff. Norelco Reporter, v. 8, Jan-Feb. 1961, p. 16-20.

Attempt to reduce the brittleness of Be by alloying with Ni to produce a crystal structure having greater ductility than the hexagonal close packed structure found in Be at room temperature. Effect of impurities on the brittleness of Be. 11 ref. (Q26s, 2-60; Be-b, Ni)

595-Q. Recent Research on Fatigue in Metals. P. G. Forrest. Chartered Mechanical Engineer, v. 8, Mar. 1961, p. 148-157.

Fatigue testing of mild carbon steel, austenitic steel, Cu, Al, Zn, Tufnol, 4% CuAl alloy, 5 1/2% ZnAl alloy, M-252 Ni alloy, S-816 Co alloy, brass and phosphor bronze at high and low temperatures and in various environments. Fretting corrosion, corrosion fatigue, thermal fatigue and crack propagation due to fatigue failure are investigated. 67 ref. (Q7, R-general; Al-b, Co-b, Cu-b, Ni-b, ST)

596-Q. (Russian.) Surface Layer Processes in Steel During Cyclic Deformation in Low-Melting Metals. M. I. Chaevskii. Doklady Academii Nauk SSSR, v. 134, June 1960, p. 1399-1402.

1KH18N9T and 50 steel are deformed at 50 cycles per sec. in molten Sn, Pb-Sn or Pb-Bi baths maintained at 400° C. in air of 20° C. Diffusion process and formation at intermetallic compounds. Fatigue strength as a function of composition of the deformation medium. 14 ref. (Q24g, N12, N7a; ST)

597-Q. Graphic Methods for Calculating Principal Stresses and Equivalent Stresses. Paul Sahmel. Acier-Stahl-Steel, v. 26, Jan. 1961, p. 41-44.

Illustration of graphic methods for determining stresses in rolled steel beams sections with relatively thin webs. (Q25; ST, 4-57)

598-Q. Titanium-5% Aluminum-4% Vanadium Alloy: Effects of Sponge Purity, Aluminum Content and Heat Treatment. L. S. Croan. Watertown Arsenal Laboratories. U. S. Office of Technical Services, PB 151995, Sept. 1959. 42 p. $1.25.

Tests to determine heat treating characteristics should consist of a

solution temperature, high in the alpha-plus-beta range, followed by short-time aging at a temperature that will give the maximum strength. Increased aluminum or interstitial content produces increased strength but lowers the toughness. (Q27, Q23r, 2-60, 2-64; V-b, Al, Ti)

599-Q. (Russian.) Decrease in Strength of Lead-Coated Steel Caused by Adsorbtion. H. F. Koshohov and V. I. Likhtman. Doklady Akademii Nauk SSSR, v. 134, Jan. 1960, p. 81-84.

Tensile testing of steel samples coated with a layer of Pb, Sn, Bi or Cd to determine tensile strength and elasticity as a function of coating composition and thickness. Influence of the amount of C and N in steel on the coating process. (Q27, Q21; ST, Bi, Cd, Pb, Sn, 8)

600-Q. Elevated Temperature Dynamic Moduli of Vanadium, Titanium and V-Ti Alloys. W. H. Hill and B. A. Wilcox. Materials Central (Wright Air Development Division). U. S. Office of Technical Services, PB 171014, May 1960, 16 p. $.50.

Dynamic moduli of calcium-reduced vanadium, high-grade aluminothermic vanadium, iodide titanium and titanium-75 argon alloy determined for temperatures up to 1250° F. The decrease in modulus of vanadium with increasing temperature is fairly small in comparison to iodide titanium and titanium-75 argon. (Q21; Ti-b, V-b)

601-Q. A Study of the Titanium-Liquid Oxygen Pyrophoric Reaction. J. D. Jackson. Battelle Memorial Institute (Wright Air Development Division). U. S. Office of Technical Services, PB 171017, June 1960, 59 p. $1.50.

Determination of the mechanism of the Ti-LOX reaction. Investigations using both an unalloyed Ti and an alloy (6Al-4V) suggests that the primary cause of this reaction is that heat generated by impact produces gaseous oxygen, which is compressed at local sites. A fresh surface exposed by the impact reacts with the high-pressure gaseous oxygen. Propagation is dependent on the amount of heat generated and the rate of heat loss from the affected area. (Q6, R1h; Ti-b)

602-Q. Mechanical Properties of Titanium Alloys as a Function of Heat Treatment and Section Size. C. F. Hickey, Jr. Watertown Arsenal Laboratories. U. S. Office of Technical Services, PB 161799, July 1960, 61 p. $1.75.

Effects of heat treatment, section size, directionality and specimen location on three Ti alloys of Al-V, Al-Mo-V and Mo-Al. (Q-general, 2-64, 3-73; Ti-b)

603-Q. Ultra-Short-Time Creep Rupture. Pt. 2. J. S. Ives, Jr. American Machine and Foundry Co. (Wright Air Development Division). U. S. Office of Technical Services, PB 161983, May 1960, 131 p. $2.75.

Sheet materials used in high speed aircraft and missiles encounter aerodynamic drag friction which causes a rapid increase in the temperature of stressed skin sections. Apparatus is developed to heat samples of these materials to temperatures up to 3000° F. within 200 milliseconds so as to simulate the extreme temperature shocks these materials are subjected to when re-entering the atmosphere. Results for a test program using this apparatus to examine the creep behavior of eight structural sheet materials at four creep rates for each temperature. (Q3)

604-Q. Selected Short-Time Tensile and Creep Data Obtained Under Conditions of Rapid Heating. D. P. Moon and W. F. Simmons. Battelle Memorial Institute (Defense Research and Engineering Division). U. S. Office of Technical Services, PB 151088, June 1960, 88 p. $2.25.

Selected short time elevated-temperature strength data obtained under conditions of rapid heating for 28 alloys in sheet form, including 3 Al alloys, 6 Ti alloys, 2 Al steels, 3 toolsteels and 8 superalloys. (Q3, 2-62; Al, Ti, AY, TS, 4-53)

605-Q. Investigation of Bearing Creep of Two Forged Aluminum Alloys. L. Mordfin, N. Halsey and P. J. Granum. National Bureau of Standards (Bureau of Naval Weapons). U. S. Office of Technical Services, PB 161556, Aug. 1960, 32 p. $1.

Results of creep tests on 14 bearing specimens of 7075 T6 and 2014-T6 forged aluminum alloy at 400° F. (Q3; Al-b)

606-Q. A Mechanical Property Forecaster for Titanium Alloys. C. F. Hickey, Jr., and L. S. Croan. Watertown Arsenal Laboratories. U. S. Office of Technical Services, PB 161018, Sept. 1959, 16 p. $.50.

Economical, time-saving method of forecasting the mechanical properties of heat treated titanium alloy forgings in various upset thicknesses. Method employs controlled simulated cooling in a thin test coupon section of the material. By duplicating the cooling rates of the heavier section of the material in the test coupon, the mechanical properties of the heavier section can be calculated. (Q-general, 1-54; Ti-b)

607-Q. Fracture Testing of High-Strength Sheet Materials Under Conditions Appropriate for Stress Analysis. G. R. Irwin. U. S. Naval Research Laboratory. U. S. Office of Technical Services, PB 161474, July 1960, 48 p. $1.25.

Method for testing the fracture toughness of thin sheet metals, which involves taking the criterion of toughness as a parameter K which characterizes the intensity of the stress field surrounding the crack tip. A fixed load, this intensity grows with crack length; when it can no longer be counteracted by the fracture toughness, crack growth becomes unstable. (Q26q; SGB-a, 4-53)

608-Q. Study of Fatigue Properties of Ultra-High Strength Steel. H. B. Nudelman and J. P. Sheehan. Illinois Institute of Technology (Wright Air Development Division). U. S. Office of Technical Services, PB 171056, Apr. 1960, 57 p. $1.75.

Fatigue strength of a temper-resistant, high-strength steel alloy prepared by two different melting techniques. The first method consisted of induction melting in air using standard deoxidation techniques. The second method involved the application of a special deoxidation practice to induction melting; silicon-free steel was deoxidized with carbon and aluminum to minimize the presence of silicate inclusions. (Q7; ST, SGB-a)

609-Q. Crack Propagation Tests of High-Strength Sheet Materials. Pt. 5. Air-Melted and Consutrode AMS 6434 Steel. C. D. Beachem and J. E. Strawley. U. S. Naval Research Laboratory. U. S. Office of Technical Services, PB 161697, Aug. 1960, 22 p. $.75.

Tests on high-strength sheet material using sheets of four different thicknesses rolled from a conventional heat of low-alloy steel and sheets of two thicknesses from a consumable-electrode vacuum remelt of material from the same conventional heat. (Q26q; AY, SGB-a)

610-Q. The Effect of Neutron Irradiation on the Charpy V and Drop-Weight Test Transition Temperatures of Various Steels and Weld Metals. J. R. Hawthorne and I. E. Steele. U. S. Naval Research Laboratory. U. S. Office of Technical Services, PB 161448, May 1960, 28 p. $.75.

Charpy V-notch and drop-weight specimens used to determine changes in transition temperatures of various steels and weld metals irradiated in different nuclear and thermal environments. Irradiations to integrated fast-neutron flux levels of 5×10^{18} causes shifts in transition temperature of 40-100° F. (Q6, 2-67; ST, 7-51)

611-Q. (German.) Current State of Development of Heat-Resistant Titanium Alloys. Hans Hermann Weigand. Jahrbuch 1959 der WGL, v. 13, Oct. 1959, p. 383-388.

Review of chemical composition, mechanical properties after heat treating, high-temperature strength, stress rupture strength, thermal stability and other properties (elasticity, deformability, machinability and weldability) of following Ti alloys: Ti12Zr4Al, Ti5Al2.5Sn, Ti8Al2Cb1Ta, Ti8Al8Zr1Cb, Ti16V2.5Al, Ti4Al3Mo/V, Ti6Al4V, Ti7Al4Mo and Ti13V10Cr3Al. (Q-general, G17k, K9s; Ti-b)

612-Q. (German.) Steels for High-Speed Aircraft. Rudolf Oppenheim. Jahrbuch 1959 der WGL, v. 13, Oct. 1959, p. 376-383.

Review of workability, mechanical properties, machinability and weldability of following steels for supersonic aircraft low-alloy structural steel, heat treatable 12% Cr steel, high-temperature toolsteel, cold rolled stainless steel, age hardenable stainless steel, age hardenable austenitic steel and Ni based alloys. (Q-general, G17k, K9s, T24; ST)

613-Q. A Study of the Strain-Hardening and Cumulative Damage Behavior of 2024-T4 Aluminum Alloy in the Low-Cycle Fatigue Range. R. D'Amato. Massachusetts Institute of Technology (Wright Air Development Division). U. S. Office of Technical Services, PB 161905, Apr. 1960, 108 p. $2.50.

Tests on tapered round specimens of 2024-T4 aluminum alloy under axial loading show that the amount of strain-hardening or strain-softening that occurs during cyclic straining depends upon the rate of straining. Cycling tests are carried out between limits of local strain based upon the change of diameter at the minimum section or the strain across the specimen depending upon the length of the tapered portion. (Q7, N7e; Al-b)

614-Q. (German.) Development of High-Temperature Resistant Metallic Material. Albert von der Steinen. Jahrbuch 1959 der WGL, v. 13, Oct. 1959, p. 370-376.

Mechanical properties at elevated temperature with particular emphasis on stress rupture strength and chemical composition of heat treatable Cr steel, austenitic CrMn steel and CrNi steel, Co and Ni alloys and alloys of the high melting metals W, Re, Ta, Mo, Cb and Cr. Vacuum melting of Ti and Al alloyed Ni alloys. Temperature limits in application of Fe, Ni and Co alloys. (Q-general; SGA-h)

615-Q. Statistical Summary of Mechanical Property Data for Titanium Alloys. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 87, Feb. 14, 1961, 23 p. (Available as PB 161237 from U. S. Office of Technical Services, Washington 25, D. C.)

Review in a series of histograms and charts of the mechanical properties of several alpha and alpha beta Ti alloys. Room temperature properties and variation of properties with temperature. (Q-general, 2-61; Ti-b)

616-Q. Pressure Vessels for Space, Aerospace and Hydrospace - A Symposium. Pt. 1. Evaluating Fracture Toughness. W. S. Pellini and J. E. Srawley. Journal of Metals, v. 13, Mar. 1961, p. 195-199.

Evaluations by explosion bulge testing are made on pressure vessel steel plates to determine fracture toughness, tensile stress and stress concentration, fracture path and transition temperatures. The features of the test transition series are correlated to Charpy V transition curves. (Q26, Q27, T26q; ST, 4-53)

617-Q. Pressure Vessels for Space, Aerospace and Hydrospace - A Symposium. Pt. 2. Materials for Space Pressure Vessels. V. W. Cooke and R. C. Powell. Journal of Metals, v. 13, Mar. 1961, p. 198-201.

Comparison of steels, Al alloys and Ti alloys as to strength-weight ratio, ductility, fracture toughness, fabricability, corrosion resistance and stability in pressure vessel applications. (Q27, Q23p, Q26r, T26q; Al-b, ST, Ti-b, 17-57)

618-Q. Pressure Vessels for Space, Aerospace and Hydrospace - A Symposium. Pt. 3. Structural Significance of Ductility. George Gerad. Journal of Metals, v. 13, Mar. 1961, p. 201-203.

A ductility ratio is determined for Ti alloys by evaluating ductility in the presence of stress concentrations. Data are given for relationship between the strength-to-weight and ductility ratios and the influence of geometry upon fracture strains. Elastic stress concentration factors are plotted against plastic concentration factors. (Q23p, T26q; Ti-b, 17-57)

619-Q. Pressure Vessels for Space, Aerospace and Hydrospace - A Symposium. Pt. 4. Titanium Alloys for Hydrospace Vehicles. George Sorkin and Abner Willner. Journal of Metals, v. 13, Mar. 1961, p. 204-205.

Tension, compression, impact and grain size evaluations using standard ASTM procedures were employed for drop weight and explosion crack starter testing of Ti alloy plates. Data are given for loading rate sensitivity, compressive-tensile yield strength ratio, ductile to brittle transition behavior, energy absorption and mechanical properties. (Q-general, T26q; Ti-b)

620-Q. Uranium in Steel. S. L. Gertsman. Machine Production, v. 20, Mar. 1961, p. 21-23.

Addition of uranium to 1010 and 1040 carbon steels as it affects pitting, corrosion resistance, fatigue strength and stress-rupture life at high temperatures. (Q7a, Q3m, R-general, 2-60; CN, U)

621-Q. Intercrystalline Cracking and Creep Rupture Life. H. H. Bleakney. Materials Research & Standards, v. 1, Mar. 1961, p. 181-183.

Effect of impurities, precipitation, grain growth and atmosphere on the creep rupture life of Al, Sn-Cd alloy, C-Mo steel and heat resisting steels and alloys. 9 ref. (Q3, 3-71; Al, Cd-b, ST, SGA-h)

622-Q. Apparatus for Hardness Testing at Low Temperatures. L. L. France, R. T. Gegley and H. Kohute. Materials Research & Standards, v. 1, Mar. 1961, p. 192-194.

Hardness testing of recrystallized electron-beam melted Cb at -196 to 20° C. in a test chamber cooled with liquid nitrogen. The temperature dependence of the diamond pyramid hardness number is shown to be almost identical to that of the various flow stress criteria. 11 ref. (Q29; Cb)

623-Q. Creep in Pressurized Cylindrical Shells. Ivan Rattinger and Joseph Padlog. Aerospace Engineering, v. 20, Mar. 1961, p. 26, 97-108.

Theoretical analysis of creep deformation and time to failure in pressurized propellant tanks under biaxial and uniaxial loading. Derivation of equations to determine various creep properties and time to rupture. Comparison of theoretical time to rupture values with those resulting from tests on various steel specimens. 15 ref. (Q3, T26q; ST)

624-Q. (Russian.) The Mechanism of Continued Destruction of Metals Under Load. B. Ya. Rineo and A. F. Sirenko. Doklady Akademii Nauk SSSR, v. 134, May 1960, p. 1061-1064.

The diffusion hypothesis concerning crack propagation in metals is tested by static tensile loading of annealed, 20% and 50% cold worked Cu-ceramic specimens and electroplated Cu at 600-1040° C. Logarithmic isothermal plots of the ratio of nonequilibrium to equilibrium autodiffusion coefficients versus time show order of magnitude and slope resemblances to known diffusion phenomena. 8 ref. (Q26q, N1, Q27; Cu)

625-Q. (Italian.) The Effect of Overstressing in Fatigue Tests Carried Out With Decreasing Loads. Ugo Rossetti and Graziano Luboz. Ingegneria Meccanica, v. 11, Dec. 1960, p. 49-55.

NCM2 Cr-Ni steel is heated up to 850° C. in a salt bath, cooled to 200° C. in another salt bath and held at this temperature for 5 min., air cooled and salt bath annealed at 600° C. for 1 hr. Evaluation of fatigue tests. 12 ref. (Q7, 3-66, J-general; SS)

626-Q. Reports on Fatigue Failures. British Welding Journal, v. 8, Mar. 1961, p. 1s-16s.

Study of fatigue failure of weldments in steel structure such as trailer axles, the plating bulkheads and decks of ships, hoists and drive shafts of rolling mill reduction gears exposed to cyclic, static and bend stressing. (Q7, ST, 4-57, 7-51)

627-Q. Effect of Orientation and Temperature on the Modes of Deformation of Uranium. R. O. Teeg and R. E. Ogilvie. Journal of Nuclear Materials, v. 3, Jan. 1961, p. 81-88.

Specimens of alpha uranium are deformed in compression and thermal cycled at -196 to 350° C. with examination by Laue back reflection and establishment of orientation relationship by two-surface analysis. Data are presented for slip, twin and kink band mechanism and deformation planes and directions. 5 ref. (Q24, 2-61, 3-72; U)

628-Q. Graphite Metal Compatibility at Elevated Temperatures. J. C. Bokros. Journal of Nuclear Materials, v. 3, Jan. 1961, p. 89-100.

Austenitic stainless steels, ferritic and Ni-base heat resisting alloys, refractory metals and electroplated alloys are reacted with graphite in a He atmosphere at 704-1010° C. to determine applicability as a cladding material on graphite in nuclear reactor. Data are given for physical and mechanical properties, transformation, carburization reactions and microstructures. 9 ref. (Q-general, N-general, P-general, T11g, 2-62; Fe-b, SS, Ni-b, EG-d37, SGA-h, 8-62, NM-k36, 17-57)

629-Q. Plastic Anisotropy and Fracture in Beryllium. A. P. Green and J. Sawkill. Journal of Nuclear Materials, v. 3, Jan. 1961, p. 101-110.

Relationship between plastic anisotropy and ductility in beryllium between 20 and 400° C. and features of the plastic deformation and fracture of single crystals, including basal slip, bend plane formation and splitting,

crack initiation and propagation. Comparison with basal fracture observed in An and application of Stroh's theory for this type of fracture to Be. 23 ref. (Q23p, Q24, Q26, 2-61, 3-72; Be)

630-Q. Improved Mechanical Properties and Associated Constitutional Changes in Commercially Pure Ingot Beryllium as Affected by Heat Treatment Above 700° C. A. Moore. Journal of Nuclear Materials, v. 3, Jan. 1961, p. 113-114.

Specimens of 99.3-99.7% purity Be containing 0.04-0.4% Fe are solution treated, aged and overaged and annealed at 600-1050° C. Microprobe and X-ray diffraction analysis and mechanical testing methods are used to ascertain influence of Fe impurity and heat treatment on ductility and brittle ductile transition temperature. Hardening mechanism, including grain boundary segregation and precipitation are determined with data for lattice parameters, phase stability and deformation and fracture modes. (Q23p, Q23r, N-general, 2-60, 2-62, 2-64; Be-a)

631-Q. (French.) Some Fundamental Progress on Fatigue. Ch. Massonnet. Revue de Mecanique, v. 6, no. 4, 1960, p. 166-177.

Initiation and propagation of fatigue cracks in high-purity Al is investigated by electron microscopy. Outline of European research programs in this field. 15 ref. (Q26, M21e; Al)

632-Q. (French.) Fatigue and Welding. Henri de Leiris. Revue de Mecanique, v. 6, no. 4, 1960, p. 178-192.

Study of fatigue failures in welded steel structures during service and factors determining their fatigue resistance such as geometric and metallurgical notching and rigidity. Fatigue tests on welded structures. 19 ref. (Q7b; ST, 4-57, 7-51)

633-Q. (French.) Some Practical Endurance Examples and Stability of Various Parts and Assemblies. G. Bourceau. Revue de Mecanique, v. 6, no. 4, 1960, p. 193-208.

Study of cracking and fatigue failure in diesel engine crank shafts and engine mounts in ships. Stress measurements are made by strain gages and fatigue limit determined by rotary bend testing. (Q7, T22)

634-Q. (French.) Influence of Surface Finish on Fatigue Resistance. R. Mossoux and J. Collin. Revue de Mecanique, v. 6, no. 4, 1960, p. 209-210.

Influence of surface grinding, polishing and electropolishing on the descending part of the Wohler curve and the fatigue limit of 65 and 42 steel. (Q7; ST)

635-Q. (French.) Measuring Surface Conditions. E. Bodart. Revue de Mecanique, v. 6, no. 4, 1960, p. 211-222.

Microgeometric surface defects and their effect on fatigue behavior are studied by mechanical and optical surface scanning combined with oblique notching. (Q7, S15, 9-71)

636-Q. Heat Treatment Characteristics of a Cast Aluminum Bronze Alloy. A. Taub and I. Haas. Metal Treating, v. 12, Feb-Mar. 1961, p. 8-11.

Investigation of the effect of heat treatment on the Rockwell hardness value, Izod impact value and microstructure of an Al bronze in its as-cast condition. Analysis of the alloy is 10% Al, 4.5% Fe, 0.7% Sn, 0.5% Zn, 0.2% Pb and balance Cu. (Q29n, Q6, M27, 2-64; Cu-s, Al)

637-Q. Influence of Induced Internal Stresses on the Endurance Limit. Ondrej Puchner. Czechoslovak Heavy Industry, Jan. 1961, p. 4-11.

Effect of local heating either by resistance welder or oxy-acetylene flame on tensile and compressive stress. Relationship to fatigue strength and endurance limit of chords and girders of steel and Al. Calculations for Smith diagrams, Gerber-Weyrauch diagrams and Woehler curves. 20 ref. (Q7a, Q25p; Al-b, ST)

638-Q. Reliability Factors in Steel Usage. H. T. Hallowel. Test Engineering, v. 5, Feb. 1961, p. 8.

Review of design requirements of fatigue strength, tensile strength and elongation for toolsteel, alloy steel and carbon steel. Survey of testing methods including magnetic, ultrasonic, magnaflux, X-ray diffraction, spectrograph and chemical analysis, micro examination, inclusion count, grain size, checks and hardness, fatigue, tensile and stress corrosion testing. (Q-general, S13, 10-54; ST)

639-Q. (Translation-ConBur.) Effect of the Time Factor on the Character of the Composition-Heat Resistance Diagram of Alloys of the Five-Component System Ni-Cr-W-Ti-Al. I. I. Kornilov, L. I. Pryakhina and O. V. Ozhimkiva. Academy of Sciences of the USSR, Proceedings, Chemistry Section, v. 132, May-June 1960, p. 665-668.

Creep tests are used to study the effect of composition and conversion time on the change in heat resistance of Ni-Cr-Ti-Al-W alloy with a variable Al content (0-7.9%) calculated on Ni content. Results indicate that over a 300-400 hr. deformation period, alloys with 5.1% Al are most heat resistant. With increase in time, alloys with lower Al content show higher heat resistance. 9 ref. (Q3, M24d, 2-60, 2-62, 3-68; Ni-b, Al)

640-Q. (Italian.) Steels Containing Nickel Treated at Temperatures Above and Below the Upper Critical Temperatures. G. Mayer. Trattamenti Termici, v. 3, Nov-Dec. 1960, p. 3-18.

Influence of temperature on the mechanical properties of the core of cemented Ni steels with varying Ni content with attention to hardness of cemented layer of steel subjected to martempering. Effect of heat treatment between As_1 and Ac_3 critical points on low-carbon steel with 9% Ni. (Q-general, N-general, 2-60, 2-62, 2-64; ST, Ni)

641-Q. (Russian.) The Increase of Internal Friction in Uranium Through the Process of Its Temperature Change. Yu. N. Sokurski and Yu. V. Bobkos. Atomnaya Energiya, v. 9, Nov. 1960, p. 392-398.

Internal friction in uranium is investigated at -120 to 20° C. disclosing its dependence upon rate of temperature change, initial thermal condition and vibrational frequency and amplitude. 3 ref. (Q22, 2-61; U)

642-Q. (Italian.) State of Stress in Metal Wire. Aldo Nicolardi. Ingegnere, v. 34, Oct. 1960, p. 937-942.

Dependence of state of stress in drawn steel wire upon the drawing processes. Effect of aging, corrosion, preforming and of magnetic induction at high field intensity on the fatigue resistance of wire. 33 ref. (Q25; ST, 4-61)

643-Q. High-Temperature Stability of Tubular Products for Oil Refinery Use. A. B. Wilder, E. F. Ketterer, D. B. Collyer and D. T. Boughner. United States Steel - Engineering Sciences, v. 7, no. 87, 1960, 12 p.

Mechanical testing of stressed and unstressed bar, tubing and pipe of carbon steels and ferritic alloy steels to determine creep-rupture properties, hardness, tensile and impact strength, microstructure and stability at 900-1200° F. (Q-general, 2-62, T29n; AY, CN, 4-60, 17-59)

644-Q. (English.) X-Ray Examination and Weld Strength Factor. Olavi Eiro. Valtion Teknillinen Tutkimuslaitos, no. 110, 1960, p. 3-24.

X-ray and radiographic examination of steel welded with low-hydrogen and acid-coated electrodes to determine effect of porosity, slag inclusions, root defects and residual stress on tensile strength, yield strength and elongation. (Q27a, Q23, S13e, K1; ST, 7-51)

645-Q. The Friction and Contact Resistance of Metals and Alloys in Reciprocating Sliding. Yasukatsu Tamai. ASLE (American Society of Lubrication Engineers) Transactions, v. 3, Apr. 1960, p. 26-29.

Behavior of Au, Ag, Cu, Pt, Al, Sn and various alloys in reciprocating sliding is examined by measuring the coefficient of friction and the electrical contact resistance simultaneously. Data are given for microhardness and scar appearance. 3 ref. (Q9p; Ag, Al, Au, Cu, Pt, Sn)

646-Q. The Influence of Silicon Additions on Friction and Wear of Nickel Alloys at Temperatures to 1000° F. Donald H. Buckley and Robert L. Johnson. ASLE (American Society of Lubrication Engineers) Transactions, v. 3, Apr. 1960, p. 93-100.

Research is conducted on the hypothesis that the primary role of Si in a Ni alloy is to support the formation of a surface film. Friction and wear data are obtained at 75-1000° F. along with pertinent hot hardness, metallurgical and surface film data. 11 ref. (Q9; Ni-b, Si)

647-Q. Sliding Characteristics of Metals at High Temperatures. M. B. Peterson, J. J. Florek and R. E. Lee. ASLE (American Society of Lubrication Engineers) Transactions, v. 3, Apr. 1960, p. 101-109.

Friction tests are run on Fe, Cu, Ni, Mo and Cr specimens sliding against

themselves. Friction and surface damage are found to result until a particular transition temperature is reached. 13 ref. (Q9p; Cr, Cu, Fe, Mo, Ni)

648-Q. (German.) Bead Impact Bending Test for Investigation of Welded Steels. Wilhelm Radeker. Stahl und Eisen, v. 81, Feb. 16, 1961, p. 228-234.

Method and apparatus for impact bending (30°) of 250 mm. long and 50 mm. wide specimens with a circular bead at temperatures from -180 to 200° C. Interpretation of test results in terms of effect of electrode material and welding parameters, specimen thickness and stress relieving heat treatment on the brittle behavior of steels made by different melting and pouring practices. (Q23r, Q5; ST, 7-51)

649-Q. The Effect of Annealing on Fatigue Damage in Gold. J. M. Young and A. P. Greenough. Institute of Metals, Journal, v. 89, Mar. 1961, p. 241-246.

Hardness measurement and metallographic examination of the surfaces of Au rods after cyclic stressing and subsequent 950° C. heating. Surface cracking is found to be the essential characteristic of fatigue damage, with annealing tending to increase fatigue life. 11 ref. (Q7, Q26q, Q29, M-general, 2-64, 3-66; Au)

650-Q. Effect of Hydrogen on Room Temperature Properties of Titanium-Low-Aluminum-Low-Manganese Alloys. R. Haynes. Institute of Metals, Journal, v. 89, Mar. 1961, p. 249-252.

Tensile and Izod impact testing of Al-Mn-Ti alloys containing up to 200 ppm. hydrogen, with embrittlement and some intergranular fracture occurring during the Izod testing. Increase in hydrogen content does not affect strength and has only a slight effect on ductility at a high strain rate. 7 ref. (Q26s, Q-general, 2-60, 2-61; Ti-b, H, Al, Mn)

651-Q. A Study of Fatigue Deformation by Reflection Electron Microscopy. G. Thomas, N. P. Sandler and I. Cornet. Institute of Metals, Journal, v. 89, Mar. 1961, p. 253-254.

Reflection electron microscopic examination of polycrystalline electropolished high-purity Al to study surface effects resulting from fatigue deformation caused by cyclic stressing. 12 ref. (Q24, Q7, M21e, 3-66; Al-a)

652-Q. Development of Niobium-Base Alloys. Pt. 4. R. T. Begley and W. N. Platte. Westinghouse Electric Corp. (Wright Air Development Division). U. S. Office of Technical Services, PB 161936, May 1960, 132 p. $2.75.

Vacuum tensile data for pure Cb from room temperature to 1371° C. The ductile-brittle transition (in impact) for commercial purity, arc melted Cb is close to room temperature. Effect of binary additions of Ti, Ar, Hf, V, Mo, W, Re, Al and Yt on the hardness and workability of Cb. (Q27, 1-73, Q23, Q29, 2-60; Cb)

653-Q. Physical Metallurgy of Tungsten and Tungsten Base Alloys. R. H. Atkinson. Westinghouse Lamp Division (Wright Air Development Division). U. S. Office of Technical Services, PB 161978, May 1960, 251 p. $4.

Base line data on high-purity and commercial powder metallurgy tungsten reveal differences in tensile transition and recrystallization temperatures believed attributable to variations in metallic impurity concentrations. At high temperature (to 2700° F.) tensile properties of these materials are little affected by differences in levels of trace impurities except for the possibility that observed anomalous and poorly reproducible creep rupture behavior is impurity-induced. (Q27, Q3, 2-60; W-b)

654-Q. (German.) Wear Abatement by Proper Material Selection and Heat Treatment of Steels. K. Junghans. Bergbautechnik, v. 11, Jan. 1961, p. 28-33.

Selection of various rolled, cast or machined wear-stressed alloy steels for wear resistance in machine parts as a function of composition and heat treatment according to the required microstructure rather than strength properties. (Q9, T7, 2-64, 3-71; AY, 17-51, 17-57)

655-Q. (English.) Fatigue Tests and Tensiometric Records on Crankshaft Models Subjected to Torsional Stresses. Alfredo Pasetti. Fiat Stabilimento Grandi Motori, v. 12, Apr-June 1960, p. 49-61.

Determination of fatigue limit with resonance vibrator and stress analysis using brittle coatings performed on models of steel cranks. (Q7h, T21c, 3-66; ST, 17-56)

656-Q. (English.) Some Aspects of Materials for Supersonic Flight. N. F. Harpur. Jahrbuch 1959 der WGL, Oct. 1959, p. 357-365.

Review of design and material requirements for supersonic speed aircraft (at Mach numbers of 2 and over) in terms of skin temperatures as influenced by speed and material properties such as tensile strength, Young's modulus or density ratio, failure stress, creep, fatigue strength and stiffness, as influenced by temperature, emphasis being on Al alloys and steel. (Q-general, T24, 10-54; Al-b, ST)

657-Q. (German.) Deformation of Uranium While Exposed to Thermal Changes and Simultaneous Tensile Stressing. A. A. Bocuvar, G. J. Sergeev and V. A. Davydov. Kernenergie, v. 3, Dec. 1960, p. 1213-1216.

Measurement of dimensional changes of rolled alpha uranium specimens, with ordered and random orientation of crystallites, in a vacuum apparatus (10^{-5} Torr) in thermal shock tests by cycling between 180 and 550° C., with and without simultaneous tensile stressing and in creep tests at 550° C. (Q3, Q7j, Q24, 2-62, 3-66, 3-72; U)

658-Q. Summary of Present Information on Impact Sensitivity of Titanium When Exposed to Various Oxidizers. W. K. Boyd. Defense Metals Information Center, Battelle Memorial Institute, DMIC Rept. 89, Mar. 6, 1961, 7 p. (Available as PB 151108 from U. S. Office of Technical Services, Washington 25, D. C.)

Low-temperature reactivity of titanium and titanium alloys subjected to deformation while immersed in N_2O_4, F_2, ClF_3, ClO_3F, H_2O_2 and liquid oxygen as influenced by alloying, aged or hardened condition, amount of deformation, surface condition, pressure, impact velocity and temperature. 3 ref. (Q6q, 2-63, 2-66; Ti-b)

659-Q. Vacuum Melted Materials. H. C. Child. Engineering Materials and Design Conference, Proceedings, Feb. 1960, p. F1-F22.

Tensile, stress rupture, creep and fatigue properties of vacuum melted Ti alloys, martensitic Cr steels, austenitic steels, Ni base alloys, ball bearing steels and ultrahigh-tensile steels. Effect of heat treatment on properties; application of materials. Evaluation of vacuum melting processes and equipment. (Q-general, 2-60, 2-64, D8m, C25; AY, SS, Ti-b, Ni-b, 17-57)

660-Q. Weldable High Strength Stainless Steels. J. I. Morley. Engineering Materials and Design Conference, Proceedings, Feb. 1960, p. P1-P26.

Hardness, corrosion resistance, physical properties and tensile impact and fatigue properties of low-carbon, martensitic and semi-austenitic stainless steel. Response to heating and cooling treatments, wear resistance and weldability. 4 ref. (Q-general, J5, K9s, P-general; SS)

661-Q. Magnesium Alloys for Engineering Use. P. A. Fisher. Engineering Materials and Design Conference, Proceedings, Feb. 1960, p. R1-R8.

Tensile properties, modulus of elasticity, damping capacity, resistance to fatigue, impact strength and other mechanical characteristics of Mg base alloys. Applications in aircraft and automobile components and industrial and consumer products. (Q-general, T-general; Mg, 17-57)

662-Q. (French.) Steels and Heat Resistant Alloys Used in Cementation Furnaces. Gilles Pomey. Revue du Nickel, v. 26, Nov-Dec. 1960, p. 147-156.

Heat resistance, oxidation temperatures and phase constitution of austenitic Fe-Ni-Cr steels, austenitic Ni-Cr alloys and ferritic Fe-Cr and Fe-Cr-Al alloys and their behavior in various furnace atmospheres. 8 ref. (Q-general, M24, R1h, W27; SGA-h, AY, Cr-b, Ni, 17-57)

663-Q. (German.) Izod Impact Strength of Meehanite Cast Iron for Fittings. Werkstatt und Betrieb, v. 94, Jan. 1961, p. 33.

Comparative impact data for GG-18 and GG-22 gray cast iron and GC, GD and GE Meehanite cast iron in terms of tensile strength, impact energy and Izod impact strength. (Q6; CI)

664-Q. (Czech.) Resistance of Gray Cast Iron and S. G. Cast Iron to Thermal Shock. Josef Koritta and Karel Lobl. Slevarenstvi, v. 9, Jan. 1961, p. 6-7.

Wedge-shaped samples of ferritic gray iron, ferritic-pearlitic gray iron and S. G. iron are exposed to 50-400 thermal cycles by heating at the rate of 91.7-97° C. per min. to 700-800° C. and quenching immediately in a shower of water.

Dependence of the resistance to cycling on structure and composition. 7 ref. (Q10a, Q7j, 2-60, 3-71; CI)

665-Q. Cast Iron as an Engineering Material. H. Morrough. Engineering Materials and Design Conference, Proceedings, Feb. 1960, p. T1-T10.

Mechanical properties of gray, white heart malleable, black heart malleable, pearlitic malleable, nodular graphite, highly alloyed and white cast irons. Applications in industrial machinery and consumer products. (Q-general, T-general; CI, 17-57)

666-Q. Breakthrough: Beryllium Proved Inherently Ductile. Missiles and Rockets, v. 8, Apr. 3, 1961, p. 15.

Single crystals of pure Be are prepared by repeated zone refining. Room temperature, tensile and bend test data are given for the basal plane angle, slip system, reduction in area, elongation, glide strain and basal shear stress. (Q23p, Q24, C28k; Be, 14-61)

667-Q. (Japanese.) Shaper and Dimensions of a Tension Test Specimen for Sintered Metals. Pt. 11. Some Manufacturing Conditions of a Test Specimen. Etsuo Hayashi and Yuzi Nan-ya. Government Industrial Institute, Nagoya, Reports, v. 10, Feb. 1961, p. 76-82.

Effect of gage length, compacting pressure and resultant sintering density, surface finishing and weight on tensile strength and elongation of sintered flat specimens and machined bars. 5 ref. (Q27, Q23p, 3-73; 6-72)

668-Q. (Japanese.) Fatigue of Large Steel Specimens. Pt. 4. Propagation of Fatigue Cracks in Shoulder Fillet Specimens. Jiro Hoshino. Japan Society of Mechanical Engineers, Transactions, v. 27, Jan. 1961, p. 37-45.

Study of the relationship between stress and the propagating speed of fatigue crack by analyzing Shelly patterns of fracture surfaces of shoulder fillet specimens in bend tests. Equations are derived for influence of the stress concentration factor, the coaxing effect and strain hardening at the tip of the fatigue crack on the propagation velocity. 5 ref. (Q7, Q26q, 3-66; ST)

669-Q. (Japanese.) Fatigue of Large Steel Specimen. Pt. 3. Fatigue Tests on Shoulder Fillet Specimens. Jiro Hoshino and Junichi Arai. Japan Society of Mechanical Engineers, Transactions, v. 27, Jan. 1961, p. 25-35.

Determination of stress concentration factor and notch factor as a function of gage length-fillet radius ratio, size, shear strain energy and fatigue limit of specimens 135 and 14 mm. in diameter, the larger being 15, 25 and 40 mm. in fillet radius and the smaller having proportional fillet radius according to its size. 10 ref. (Q7, 3-66, 3-73; ST)

670-Q. (Japanese.) Ball-Bearing Steels Made From Sponge Iron as Raw Material. Manabu Ueno, Hirooki Nakajima and Sadao Ikeda. Tetsu-to-Hagane (Iron & Steel Institute of Japan, Journal), v. 47, Feb. 1961, p. 124-129.

The austenitizing behavior and durability of ball-bearing steels, made from sponge Fe in a basic electric arc furnace, are studied by chemical analysis, point-counting, lineal analysis and Rockwell hardness, static torsion and thrust-type life tests, as a function of sponge content of the charge. 3 ref. (Q9, Q-general, N8, D5a; ST, SGA-c)

671-Q. (Japanese.) Embrittlement of Steel in Contact With Liquid Phase. Pt. 3. Effect of Several Factors on Embrittlement of Solid Metals in Contact With Liquid Metals. Morio Nakajima. Tetsu-to-Hagane (Iron & Steel Institute of Japan, Journal), v. 47, Feb. 1961, p. 134-139.

Embrittlement of mild steel immersed in molten Cu and Cu-Sn and Zn-Sn alloys at 500-1200° C. and of Pb and Sn in liquid Hg and air is examined by tensile and bend tests at room temperature and by metallographic methods. Data are given for elongation and tensile strength of annealed and cold rolled specimens of both coarse and fine grain structures. 7 ref. (Q26s, Q-general; CN, Cu-b, Sn-b, Pb, Zn, 14-60)

672-Q. Three Stainless Steels Retain Hot Hardness Better Than Standard AISI Grade 440C. Materials in Design Engineering, v. 53, Mar. 1961, p. 19.

Modifications of Type 440 steel with decreased Cr content and increased Mo and V contents for improved high temperature properties. (Q29p, 2-60; SS-e, Cr, Mo, V)

673-Q. (Japanese.) Standardization of Hardness Test Pieces. Kentaroh Yamamoto. Japan Society of Mechanical Engineers, Journal, v. 63, Nov. 1960, p. 1474-1482.

Review of hardness tests with the Shore, Brinell, Vickers, Rockwell and micro-Vickers methods; statistics of average values and standard deviations; establishment of reliability and use of a standard test bar. (Q29)

674-Q. (Japanese.) Dimensional Effects on the Fatigue Properties of Steel Materials. Japan Society of Mechanical Engineers, Journal, v. 63, Nov. 1960, p. 1525-1539.

Fatigue test data for carbon, Si-Mn, Si-Mn-Cr and Ni-Cr steel using alternating tension-compression, torsion and rotary bending, with calculation of coefficient of the dimensional effect which is defined as the fatigue limit of a smooth specimen having diameter in relation to the fatigue limit of a standard smooth specimen. (Q7, 3-73; AY, CN)

675-Q. (Japanese.) Heat Treatment of TiC-Ni Cermet. Masataka Sugiyama and Hisashi Suzuki. Japan Institute of Metals, Journal, v. 25, Jan. 1961, p. 1-4.

Effect of heat treatment upon some room temperature properties of TiC-31% Ni cermet. Hardness, transverse-rupture strength, X-ray lattice parameter, Curie temperature and microstructure are observed for specimens held in vacuum at 700-1300° C. for 1/2-25 hr. or quenched from 700-1300° C. 10 ref. (Q-general, M-general, 2-64; Ti-b, Ni, 6-70)

676-Q. (Japanese.) Heat Treatment of TiC-50Ni-Cr-Co. Masataka Sugiyama and Hisashi Suzuki. Japan Institute of Metals, Journal, v. 25, Jan. 1961, p. 8-11.

The effects of heat treatment on some room temperature properties of 1280° x 1 hr. vacuum sintered TiC-50Ni-Cr-Co (3:1:1 ratio) cermet. Variation of transverse-rupture strength, hardness, X-ray lattice parameter, Curie temperature and microstructure of the alloy by heating in vacuum at 950-1260° for 5-25 hr. or by quenching from 950-1280° C. (Q-general, M-general, 2-60, 2-64; Ti-b, Ni, Cr, Co, 6-70)

677-Q. (Japanese.) Effect of Mo on Boron Bearing Low-Alloy High-Strength Steel. Yunoshin Imai and Toshio Saito. Japan Institute of Metals, Journal, v. 25, Jan. 1961, p. 11-15.

Mechanical properties and hardenability of multiple low-alloy high-strength steels such as contain 0.3% C, 1% Cr, 0.3% Cu, 0.01% Ti, 0.002% B and 0.0.5% Mo, oil quenched and tempered to Rockwell C 32 hardness are examined at -80 to 20° C. Improvement in tensile properties, Charpy impact value, toughness and transition temperature is observed as a result of the Mo addition. 13 ref. (Q-general, J5, 2-60, 2-64; AY-n, Mo, B)

678-Q. (Japanese.) The Effect of Cold Drawing and Annealing on the Rigidity Modulus and Internal Friction in Stainless Steel Wires. Seita Sakui and Hideo Takei. Japan Institute of Metals, Journal, v. 25, Jan. 1961, p. 30-33.

Changes in the rigidity modulus, electrical resistivity, hardness and internal friction due to cold drawing and annealing at 100-600° C. are measured in 13 Cr and 18-8 stainless steel wires of 0.7 or 0.6 mm. diameter, using torsion pendulum, potentiometer and micro-Vicker's hardness testing methods. 6 ref. (Q5g, Q22, Q29n, P15g, 2-64, 3-68; SS, 4-61)

679-Q. (Japanese.) The Effect of Age Hardening on the Rigidity Modulus and the Internal Friction in 17-7 PH Stainless Steel Wire. Seita Sakui and Hideo Takei. Japan Institute of Metals, Journal, v. 25, Jan. 1961, p. 34-36.

Changes in the rigidity modulus, electrical resistivity, hardness and internal friction following aging at 20-600° C. for various times are examined for stainless steel wire containing 1.24% Al of 0.65 mm. diameter, using a torsion pendulum, potentiometric and micro-Vicker's hardness measurements. 4 ref. (Q5g, Q22, Q29, N7a, P15g, 2-65; SS, 4-61)

680-Q. (Japanese.) Embrittlement of an Austenitic Stainless Steel Caused by Heating and Corrosion. Gunji Shinoda, Tadeo Sano, Tadakazu Sakurai, Tadashi Kawasaki and Hisashi Izumi. Japan Institute of Metals, Journal, v. 25, Jan. 1961, p. 36-40.

Embrittlement of 304, 316 and 347 stainless specimens by creep and fatigue loading during heating at 400-700° C. for times to 500 hr. and subsequent immersion in 0.1 mole uranium sulphate aqueous solutions for up to 30 days is examined by Charpy V-notch impact tensile tests. Carbide precipitation and intergranular corrosion degradation are determined as dominant mechanisms, as

a function of specimen composition and temperature. (Q26s, N8r, R1d, R2h, 2-60, 2-62; SS-e)

681-Q. (Japanese.) Vickers Microhardness of Zone Refined Copper. Tomisaburo Nara, Mikio Nishihata and Masahisa Akiyama. Japan Institute of Metals, Journal, v. 25, Jan. 1961, p. 72-75.

Effect of purity on Vickers microhardness and grain and grain boundary hardness distribution, is examined for zone-refined polycrystalline Cu wire in comparison with vacuum melted specimens. 14 ref. (Q29q, C28k, 2-60; Cu)

682-Q. A Comparison of Niobium-Vanadium and Niobium-Zirconium Alloys for Structural Applications in Boiling Water Reactors. D. L. Douglass. Nuclear Science and Engineering, v. 9, Mar. 1961, p. 391-398.

Evaluation of fabricability, creep, hot hardness, tensile and corrosion properties for Cb-V and Cb-Zr alloys for use as structural components of boiling water reactors. Results indicate Cb-V alloys possess superior properties for high-temperature application. 9 ref. (Q-general, F-general, G-general, T11; Cb-b, V, Zr, 17-57)

683-Q. Crack Formation in Uranium. K. R. Merckx. Nuclear Science and Engineering, v. 9, Mar. 1961, p. 413-414.

Evaluation of internal cracks in uranium fuel elements caused by post-irradiation thermal cycling. Elements with similar exposures and operating temperatures but with different cooling conditions are found to be crack-free. 5 ref. (Q26q, Q7j; U)

684-Q. (French.) Origin, Nature and Shape of Slip Bands. H. J. Latiere and R. Michaud. Memoires Scientifiques, v. 57, Dec. 1960, p. 923-929.

Slip band types on clusters of high-purity Al crystals. Interaction of mechanical and crystallographic factors. 7 ref. (Q24a, Q24c; Al-a, 14-61)

685-Q. (Italian.) Brittle Fracture of Pressure Vessels and Information Necessary to Avoid it by Correct Design. A. A. Wells. Revista Italiana Della Saldatura, v. 12, Sept-Oct. 1960, p. 222-227.

Role of transitional temperature in brittle fracture. Material requirements. Nondestructive testing, thermal treatment after welding and hydrostatic pressure tests in the course of production of pressure vessels from mild steel. 26 ref. (Q26s, Q-general, K-general, T26q, 17-51; CN, 17-57)

686-Q. Fracture Theory as Applied to High-Strength Steel Pressure Vessels. G. R. Irwin and J. A. Kies. Paper from "High-Strength Steels for the Missile Industry". American Society for Metals, Novelty, Ohio, 1961, p. 79-100.

The problem of determining responsibility for a fracture failure with respect to stress level, fracture toughness and flow size. Examples are given of appropriate methods of fracture toughness evaluation and of their use in the analysis of fracture failures. (Q26s, T26q; ST)

687-Q. Metallurgical Tests as a Contribution to Pressure-Vessel Reliability. Dean K. Hanink. Paper from "High-Strength Steels for the Missile Industry". American Society for Metals, Novelty, Ohio, 1961, p. 111-128.

Correlation of the Allison-developed instrumented bend test results with burst strength of pressure vessels. The importance of accurate appraisal of fracture appearance on pressure vessel performance is emphasized and attention is directed to linking this with crack-propagation behavior when considering maximum potential strength for any particular steel. Mass of the hardware is discussed as it affects compatibility of tensile strength and crack-propagation characteristics. (Q26, T26q; ST)

688-Q. NASA's Program and Findings on the Effects of High-Stress Concentrations on High-Strength Sheet Alloys. G. B. Espey. Paper from "High-Strength Steels for the Missile Industry". American Society for Metals, Novelty, Ohio, 1961, p. 129-152.

Past and recent findings of the influence of high-stress concentrations, at room temperature and low temperatures, on steel and Ti alloys strengthened largely by heat treatment. Outline data obtained and investigations planned on potential cryogenic alloys largely dependent upon deformation for their mechanical properties. (Q25; 4-53, ST, Ti-b)

689-Q. Important Factors in the Future Application of High-Strength Steels. E. P. Klier. Paper from "High-Strength Steels

for the Missile Industry". American Society for Metals, Novelty, Ohio, 1961, p. 254-274.

Steels can be employed in service applications at high-strength levels only if the element of notch sensitivity is suitably weighed in heat treating and fabrication. Several manufacturing methods are available which allow the fabrication of high-strength structural elements. At present, a most important need is the development of steels which have improved notch toughness at yield strengths above those now available. (Q26s; ST, SGB-a)

690-Q. Magnitude of the Zener Relaxation Effect. Pt. 3. Anisotropy of the Relaxation Strength in Ag-Zn and Li-Mg Solid Solutions. D. P. Seraphim and A. S. Norwick. Acta Metallurgica, v. 9, Feb. 1961, p. 85-97.

Variation of the Zener relaxation effect as determined in f-c-c. Ag-Zn and b-c-c. Li-Mg solid solutions from measurements on oscillating single crystal rods in flexure and in torsion. The effect has a high anisotropy, such that the relaxation strength is greater for (111) than for (100) oriented crystals, applying to both the f-c-c. and the b-c-c. solid solutions and explained by relaxations involving next-nearest neighbor atom pairs. 17 ref. (Q3a, Q22, M26, N10, 3-72; Ag-b, Zn, Mg-b, Li, 14-67)

691-Q. Magnitude of the Zener Relaxation Effect. Pt. 4. Anisotropy of the Relaxation Strength in Al-4% Cu. B. S. Berry. Acta Metallurgica, v. 9, Feb. 1961, p. 98-105.

The important parameters controlling the anisotropy of the Zener relaxation in quenched and reverted Al-4% Cu (1.8 at.% Cu) are determined from internal friction measurements in torsional and transverse vibration on (100) oriented single crystal specimens. The anisotropy is much larger than predicted by the theories of Le Claire and Lomer and Zener and the maximum tensile relaxation strength occurs in the (100) orientation, for which this theory predicts a minimum value. 9 ref. (Q3a, Q22, N10, 2-64, 3-72; Al-b, Cu, 14-61)

692-Q. Microstrain in Polycrystalline Metals. N. Brown and K. F. Lukens, Jr. Acta Metallurgica, v. 9, Feb. 1961, p. 106-111.

A theory is developed for the dependence of microplastic strain on stress and grain size of polycrystalline metals and is checked by measuring the stress-strain curve in the micro region, using a capacitance type extensometer, for ingot iron with grain sizes of 44-140 microns. The microplastic strain is calculated in terms of density of sources, applied stress, shear modulus, stress to move first dislocation and grain size. 10 ref. (Q25, 2-59; Fe-a)

693-Q. Twinning in Iron-Aluminum Alloys, R. W. Cahn and J. A. Coll. Acta Metallurgica, v. 9, Feb. 1961, p. 138-148.

Annealing and mechanical twins observed in chill cast and hot rolled 23.5% Al-Fe specimens by X-ray diffraction after annealing at 1150° C. and rapid cooling to 500° C. and impact testing in liquid nitrogen and at room temperature. Twin boundaries and orientation relations are determined as a function of order-disorder conditions. 17 ref. (Q24b, M-general, N10, 2-64, 3-68; Fe-b, Al)

694-Q. Temperature and Composition Dependence of the Strength of Aluminum Base Zinc Alloy Single Crystals. J. Dash and M. E. Fine. Acta Metallurgica, v. 9, Feb. 1961, p. 149-154.

The critical resolved shear stress of solid solution and zone-hardened 1.65-5.3% Zn-Al alloys measured at 4.2 and 293° K. increases with Zn concentration, suggesting that the stress necessary to shear the zones is larger than that necessary to overcome the Matt-Nabarro misfit stresses. This is attributed to off-center cutting of zones, cutting of mismatch dislocations located in the region between the core of the zone and the depleted shell and the presence of clusters in the solid solution. 19 ref. (Q25, Q27, M26, N-general, 2-60, 2-61; Al-b, Zn)

695-Q. (German.) The Plastic Deformation of Polycrystals. E. Kroner. Acta Metallurgica, v. 9, Feb. 1961, p. 155-161.

Derivation of a two part formulation for polycrystalline plasticity involving solution of a plastic deformation problem in single crystals and application of elasticity theory to polycrystals. Effective stresses in single crystals and resultant glide systems are determined as dependent on prior treatment, external stress and orientation. Using these calculations, the polycrystalline stress-strain curve is derived from the single crystal curve. 14 ref. (Q24)

696-Q. Steel Plus Uranium: What's the Result? S. L. Gertsman. Canadian Metalworking, v. 24, Mar. 1961, p. 36-37.

Effects of uranium addition on hardenability, fatigue strength, stress rupture life and corrosion resistance of SAE 1010 and SAE 1040 steels. (Q-general, J5, R-general, 2-60; ST, U)

697-Q. Can Uranium Improve Steel? S. L. Gertsman. Iron Age, v. 187, Apr. 6, 1961, p. 110-111.

Tensile and corrosion tests on various steels with uranium as alloying agent show improvement in hardenability, corrosion, heat and stress rupture resistance. (Q27, Q-general, R-general, 2-60, 2-62; ST, U)

698-Q. What Steels Next in Power Generation. Engineering, v. 191, Feb. 24, 1961, p. 274.

Evaluation of alloy ferritic steels containing C, Mn, Si, Cr, Mo, W, V and Ti as components of alloy ferritic steels in terms of design requirements for use in high-pressure steam power plant for electricity generation. It is suggested that some alloys require more development work particularly where a compromise is sought between strength, weldability and corrosion resistance and between hardenability and creep strength. (Q-general, A-general, W11, 17-57; AY, 17-51)

699-Q. Review of Recent Developments in the Evaluation of Special Metal Properties. J. E. Campell. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 94, Mar. 28, 1961, 6 p. (Available as PB 161244 from U. S. Office of Technical Services, Washington 25, D. C.)

Tensile tests on notched and straight specimens of Ti and steel alloys at 75, -320 and -423° F. Data include yield strength, smooth tensile strength, elongation, sharp notch tensile strength ratio of yield strength to density and fracture-toughness. 6 ref. (Q23, Q26s, Q27, 2-61; ST, Ti-b)

700-Q. Internal Friction Effects in Iron-Silicon-Nitrogen Alloys. R. Rawlings and P. M. Robinson. Iron and Steel Institute, Journal, v. 197, Mar. 1961, p. 211-215.

Internal friction of Fe-Si-N alloys containing 0.5-1.9 Si when quenched from the gamma and from alpha ranges. Probable causes of the five peaks in the internal friction-temperature curve. 18 ref. (Q22, 2-61, 2-64; Fe-b, Si, N)

701-Q. Resistance to Thermal Stress Fatigue of Some Steels, Heat Resisting Alloys and Cast Irons. H. G. Baron and B. S. Bloomfield. Iron and Steel Institute, Journal, v. 197, Mar. 1961, p. 223-232.

Thermal fatigue test in which cracks are produced by repeated heating of one edge of the cold specimen. Influence of temperature cycle, martensitic transformation and stress concentration on fatigue life. Resistance of cast irons, low alloy steels, stainless steels and Ni and Co heat resisting alloys to thermal fatigue. 10 ref. (Q7j, Q25, 2-62; ST, CI, Ni-b, Co-b, SGA-h)

702-Q. Hidden Causes of Bolt Failure: "Carb" and "Decarb". Iron Age, v. 187, Mar. 30, 1961, p. 112-113.

Effect of carbon content on fatigue life, surface strength, hardness and subsurface cracking in steel fasteners. Means of detecting carburization and decarburization. (Q7, Q27, Q29, 2-64, T7f; ST, 17-57)

703-Q. The Role of Stress Distribution in Fatigue. R. E. Peterson. Experimental Mechanics, v. 1, Apr. 1961, p. 105-115.

Effect of stress distribution, maximum stresses and stress-concentration factors on fatigue. An approximate method for analysis of conditions for crack formation and propagation in notched members. 35 ref. (Q7, 3-66; ST)

704-Q. Stress Redistribution During Bending Fatigue. A. A. Blatherwick. Experimental Mechanics, v. 1, Apr. 1961, p. 128-135.

Examination of the relationships among stress, strain and bending moment to determine the distribution of stress in bending fatigue specimens of 1020 steel and Al and its redistribution during fatigue resulting from change in the cyclic secant modulus of the material. 12 ref. (Q5m, Q7; Al, ST)

705-Q. We Can Predict Spot Weld Strength. W. A. Soward. Welding Design & Fabrication, v. 34, Mar. 1961, p. 45-46.

A formula based on nugget size, material composition, minimum gage shear

strength and stacked sheet thickness is used to accurately predict shear strength of spot welds in missile airframes without intensive testing. (Q2g, T24e; 7-51)

706-Q. Recommendations and Precautions for Fabricating 5% Cr Ultra-High Strength Steel. W. Scott Lightner and J. C. Hamaker, Jr. Western Machinery and Steel World, v. 52, Mar. 1961, p. 34-39.

Comparison of fatigue, notch, tensile and ductility properties in air and consumable-vacuum melted specimens subjected to various heat treatments. Recommendations for hot working, annealing, forming and joining. (Q-general, 2-64, G-general, K-general; ST, SGB-a)

707-Q. Exotic Alloys Forged by Heavy Presses. J. R. Canal and W. C. Kunkler. Space Aeronautics, v. 35, Apr. 1961, p. 54-57.

Tensile and stress-rupture properties of press forged Astroloy, Be, Cb, B120VCA Ti alloy, Waspaloy, Rene 41, Udimet 500, 6Al-4V-Ti alloy, Mo, H-11, 17-4PH, 4335, AM 355, 300M and D-6C steels. Applications in missiles, rockets and other space craft. (Q-general, T24e; SGA-h, EG-d37, 4-51, 17-57)

708-Q. When to Use Tool Steels for High Temperature Parts. G. B. Heydt. Space Aeronautics, v. 35, Apr. 4, 1961, p. 65-66, 68.

Data are given for stress-rupture properties, ultimate tensile strength and yield strength of Pyromet 882, Carpenter 636, Greek Ascoloy, A286 alloy, M252 alloy, Inconel X and Waspalloy tested at 1000-1800° F. (Q-general, 2-62; TS, SGA-h)

709-Q. Simple Fatigue Testing as an Essential Corollary to Nondestructive Testing. Frank Nixon. Nondestructive Testing, v. 19, Mar-Apr. 1961, p. 124-130.

Fatigue tests on cast, forged and welded aircraft engine components are used to determine the extent to which flaws detected by nondestructive testing will become critical under actual operating conditions of high stress. (Q7, S13, T24b, 3-66)

710-Q. (Japanese.) Free Cutting Steel. Chiaki Asada. Japan Society of Mechanical Engineers, Journal, v. 64, Feb. 1961, p. 231-239.

Data are given for composition, machinability, mechanical properties at high and low temperatures, wear resistance and degree of carburization obtainable. (Q-general, G17k; ST, SGA-k)

711-Q. (Japanese.) Some Studies on Dimensional Effects. Hisashi Ouchida. Japan Society of Mechanical Engineers, Journal, v. 64, Feb. 1961, p. 263-272.

Fatigue character of plain and notched specimens of steel, tested by universal, rotary bending or supported beam fatigue testers. Determination of fatigue limit, cracking susceptibility and notch sensitivity as a function of the notch and specimen geometry. (Q7, Q-general, 3-73; ST)

712-Q. (English.) High Temperature Materials Under Dynamic Stresses. A. J. Kennedy. Jahrbuch 1959 der WGL, v. 13, Oct. 1959, p. 365-369.

Creep, self-diffusion, fatigue, precipitation, aging transformation and recovery mechanisms as induced or accelerated deleteriously by dynamic stress. Stress-strain and related data are given for Al and steel alloys. (Q-general, Q25m, N-general, 3-66; Al-b, ST, SGA-h)

713-Q. Materials of Construction for Chemical Plant: Titanium. B. J. Connolly and R. J. Watkins. Chemical & Process Engineering, v. 42, Feb. 1961, p. 83-89.

Mechanical and physical properties and application of Ti alloys in chemical processing equipment with emphasis on the alloys' high resistance to corrosion fatigue. (Q-general, P-general, R-general, T29; Ti-b, 17-57)

714-Q. Microstructures and Notes on Carbon Steels Made to B.S. 3100:1760 Grades A and B. J. Turton and B. H. C. Waters. British Foundryman, v. 53, Dec. 1960, p. 524-530.

Mechanical tests show the effect of increasing carbon content from 0.4-0.49% in both annealed and normalized conditions on the tensile strength elongation, reduction in area and Izod properties. (Q27, Q23p, Q6, 2-60; CN)

715-Q. Structure and Properties of Sand-Cast Gunmetals. J. E. Stolarczyk. British Foundryman, v. 53, Dec. 1960, p. 531-548.

Tensile strength, elongation and hardness of sand-cast gunmetals as a function of Sn, Zn and Pb content. (Q27, Q23p, Q29n; Cu-b)

716-Q. Thoughts on Phosphoric Cast Iron. R. V. Riley. British Foundryman, v. 53, Dec. 1960, p. 549-555.

Fluidity, shock resistance, fatigue properties, hardness and other mechanical properties of phosphoric cast iron. Comparison with Zn, Al and other Fe alloys. (Q-general; CI)

717-Q. Double Block Shear Test for Foil Honeycomb Cores. H. P. O'Sullivan. Aircraft Engineering, v. 33, Mar. 1961, p. 64-66.

Double block shear testing to determine the core shear stiffness of a honeycomb core of B.S. 1470 Al foil bonded to the face plates with Araldite epoxy resin. (Q21d; Al-b, 7-59)

718-Q. Fatigue in Metal Joints. Pt. 2. Welded Joints. Ralph G. Crum. Machine Design, v. 33, Apr. 13, 1961, p. 176-178.

Cyclic stressing of spot welds and fusion welds in 17-7PH and 18-8 stainless, Cor-tin and alloy steels; Ti; 2014, 2024 and 7075 Al alloy to determine the fatigue strength of the weld. 3 ref. (Q7; ST, Ti, Al-b, 17-57)

719-Q. (Translation-Brutcher no. 4654.) Failure of Steels in Hydrogen at High Temperatures and Pressures. N. N. Kolgatin. Metallovedenie i Termicheskaya Obrabotka Metallov, July 1959, p. 16-21.

Microscopic study of changes in technical iron, carbon and alloy steels when in contact with hydrogen at high pressures and temperatures. Decarburization suffered by solid and tubular specimens exposed to hydrogen on one as against on all sides. Nature and progress of cracking in decarburized zone. (Q26s; AY, CN, Fe)

720-Q. (Translation-Brutcher no. 4655.) Study of High-Performance High-Speed Steels. A. P. Gulyaev and S. M. Saverina. Metallovedenie i Termicheskaya Obrabotka Metallov, July 1959, p. 22-30.

Technological properties and cutting performance of seven new experimental steels compared with standard 18-4-1. Data on compositions; optimum conditions of quenching and tempering. Factors governing carbide segregation. Mechanical properties, red hardness, grindability and carbon depletion in quenching. (Q-general, Q29n; TS-m)

721-Q. (Translation-Brutcher no. 4656.) Low Alloy Toolsteels. Yu. A. Geller and Ts. L. Olesova. Metallovedenie i Termicheskaya Obrabotka Metallov, July 1959, p. 30-45.

Advantages of low alloy over carbon toolsteels. Current Russian and American alloy toolsteels. Effects of carbon and small amounts of Cr and W, also of Cr + V and Cr + W, on steel structure, bend strength, hardness, hardenability, stability in tempering and magnetic saturation. (Q29, Q5g, P16; TS)

722-Q. (Translation-Brutcher no. 5079.) Data Sheet on a New Cr-W-V Toolsteel. A. P. Gulyaev and A. A. Badaeva. Metallovedenie i Termicheskaya Obrabotka Metallov, July 1959, p. 31-34.

T-T-T diagram, mechanical properties, hardenability and heat treatment of a 1-1.5% C, 0.45% Mn, 0.35% Si, 5.5-7% Cr, 1.1-1.5% W, 0.5-0.7% V, 0.35% Ni, 0.03% P, 0.03% S toolsteel for cold work dies. (Q-general, Q29, J-general; TS)

723-Q. (Translation-Brutcher no. 5064.) Effect of Tungsten on the Characteristics of 18% Cr, 12% Ni Stainless Steel. R. Nakagawa and Y. Otoguro. Tetsu-to-Hagane (Iron and Steel Institute of Japan, Journal), v. 46, Mar. 1960, p. 575-577.

Aging behavior, microstructure, intermetallic compounds, tensile properties at room and elevated temperatures and stress rupture strength of 18% Cr, 12% Ni stainless steel as function of tungsten contents of 1.90-5.5% and 0.03 and 0.11% carbon. (Q27, Q3m, N7a, M27, 2-60; SS, W)

724-Q. (Translation-Brutcher no. 5066.) Effect of Phosphorus and Boron Upon the Reversible (High Temperature) Temper Brittleness of Low-Carbon Nickel Steels. L. S. Lyakhovich and T. S. Shilkova. Izvestiya Vuz-Chernaya Metallurgiya, Sept. 1960, p. 167-168.

Study of 0.12% C, 1.20% Ni steel with 0.02, 0.06 and 0.11% P for effect of increasing P contents, in part jointly with 0.015% B on the high-temperature (reversible) temper embrittlement with rapid versus slow cooling from tempering temperature. Conditions under which

boron promotes reversible temper brittleness in the presence of phosphorus. (Q26s, 2-60; CN-g)

725-Q. (Translation Brutcher no. 5103.) On the Nature of Slip Lines on Steel. N. S. Alferova. Izvestiya Akademii Nauk SSSR, June 1959, p. 131-132.

Electron microscope study of the nature of slip lines in deformed Ti-stabilized 18% Cr, 9% Ni steel and ferritic 25% Cr, 0.8% Ti steel. Explanation of discontinuity of slip lines; localized distortion; microcracks; their orientation. Effect of externally applied loads. (Q24c; SS)

726-Q. Fatigue in Metal Joints. Pt. 1. Mechanical Joints. Ralph G. Crum. Machine Design, v. 33, Mar. 30, 1961, p. 108-113.

Stress ratio, linear-damage accumulation, notching and corrosion as they affect fatigue failure in riveted and threaded joints. 4 ref. (Q7; 7-53)

727-Q. (French.) Tensile Deformation Bands in Aluminum Single Crystals. H. J. Latiere. Journal de Physique et le Radium, v. 21, Nov. 1960, p. 106S-108S.

An Al single crystal is deformed 15% and subsequently X-ray tested to study the formation of slip lines of a width of 150-5000 Å and secondary slip bands of approximately 1 mm. width. 6 ref. (Q24c; Al, 14-61)

728-Q. (German.) Examination of Brittle Turbine Blades of 13% Cr Steel. H. Schumann. Technik, v. 16, Feb. 1961, p. 78-82.

Report of impact strength measurements, microstructural investigations and hardness measurements made on X20 Cr 13 steel specimens to investigate temper embrittlement after various heat treatments. (Q26s, Q6, Q29; ST)

729-Q. Heading With High Vanadium Dies. Robert S. Holder. American Machinist/Metalworking Manufacturing, v. 105, Jan. 9, 1961, p. 72-73.

Vanadium added to basic 0.90 carbon, water-hardening toolsteel used for cold heading dies increases wear resistance and stabilizes fine grain over the normal hardening range. Application of the dies to production of fasteners and bolts from 18-8 stainless and 1010 steel. (Q-general, J5, 2-60, G10, 17-57; TS)

730-Q. (German.) Steel Selection and Heat Treatment for Hot and Cold Working Tools. E. Zmihorski. Harterei-Technische Mitteilungen, v. 15, Apr. 1951, p. 229-233.

Comparison of hardness distribution and lifetime of various alloy steels for hot working tools. Wear and compression fatigue tests of cold working toolsteels after various hardening operations and subsequent annealing at temperatures from 175-570° C. (Q29, J-general; TS)

731-Q. Microhardness of Silver Deposits. S. Ramachandran and N. V. Parthasaradhy. Metal Finishing, v. 59, Mar. 1961, p. 40-44, 60.

Microscopic determination of the microhardness of electroplated films of Ag on brass and mild steel. Microhardness tests give a good indication of the wear resistance of the electrodeposited coating. 16 ref. (Q29q, L17; CN, Cu-b, Ag)

732-Q. Studies of Fracture Strength. H. L. Smith, W. E. Anderson and K. McKinney. Report of NRL (Naval Research Laboratory) Progress, Mar. 1961, p. 21-23. (Available as PB 171316 from U. S. Office of Technical Services, Washington 25, D. C.) $1.25.

The influence of various liquid environments on the fracture stress and crack propagation of 3 in. wide centrally Elox notched flat tensile specimens of X-200, M-255 and 300-M high-strength steels loaded to fracture in India ink, water, oils and preservatives. (Q26, 2-66; AY-n)

733-Q. Metals and Alloys at High Temperature. T. R. Cass and M. R. Achter. Report of NRL (Naval Research Laboratory) Progress Report, Mar. 1961, p. 23-25. (Available as PB 171316 from U. S. Office of Technical Services, Washington 25, D. C.) $1.25.

The rupture strength of metal couples bonded by sintered oxide layers is studied on 99.8% Ni specimens, preoxidized and sintered under compressive stress at 1500° F. to determine the stress at which oxide bonded grain boundaries will part and to investigate the influence of air strengthening or internal oxidation mechanism on the improvement of creep rupture strength of Ni and Ni alloys at high temperature. (Q3m, M27f, R2s, 2-64, 3-66; Ni-b, 6-72)

734-Q. Radiation Damage of Metals - (Neutron-Induced Changes in Steel--Relation to Total Neutron Dosage and Irradiation Temperature). L. E. Steele and J. R. Hawthorne. Report of NRL (Naval Research Laboratory) Progress, Mar. 1961, p. 30-31. (Available as PB 171316 from U. S. Office of Technical Services, Washington 25, D. C.) $1.25.

Upward shift of the brittle-ductile transition temperature for A201, A212B, A302B and SA336 pressure vessel steels as a function of specimen temperature and neutron dosage examined for Charpy V-notch specimens irradiated at 200-550° in a low intensity reactor. 3 ref. (Q23r, 2-67; AY)

735-Q. Bearing Materials and Properties. E. R. Booser. Machine Design Reference Manual (The Bearings Book), 1961, p. 95-103.

Load capacity, tensile strength, temperature effects, hardness, corrosion resistance, fatigue resistance and coefficient of expansion for babbitts, bronzes, Cu alloys, Al, plastics, porous bronze and Fe, steel, cast iron, graphite, cermets and ceramics. (Q-general, T7d; SGA-b, Al, ST, Cu-b, Fe-b, NM)

736-Q. High-Strength Aluminum Alloys: Where They Stand Now. Donald Peckner. Materials in Design Engineering, v. 53, Apr. 1961, p. 133-135, 138-140.

Data are given for composition, tensile properties, corrosion resistance and elevated temperature properties of 2014, X2020, 2024, 7075, 7079 and 7198 Al alloys. Comparison with steel. (Q27, R-general; Al-b, SGB-a)

737-Q. (Pamphlet.) Statistical Variations in the Lap-Joint Strength of Metal-Bonding Adhesives at Elevated Temperatures. H. W. Eickner and W. Z. Olson. U. S. Dept. of Agriculture Forest Service, Madison 5, Wis. no. 1880, Feb. 1961, 22 p.

Bonds of corrosion resistant Type 301 steel with epoxy phenolic and acrylonitrile phenolic are tested from 300-500° F. to determine effect of statistical variations such as curing and drying time, temperature and pressure on lap joint strength. (Q10c, K12; SS)

738-Q. (Pamphlet.) Bend Properties of Welded High Strength Titanium Alloy Sheet. A. J. Brothers, H. E. Martens and H. L. Wood. Jet Propulsion Laboratory, California Institute of Technology, Technical Report no. 32-39, Jan. 30, 1961, 12 p.

Six Ti sheet alloys with a 0.2% yield strength of greater than 150,000 psi. are welded with different Ti filler wire alloys. A combination three-point free and guided bend test is used to determine the ductility of the weld joints. Results are evaluated according to the effect of filler wire composition and welding heat treatment sequence on weld strength and graded according to weldability. (Q5, K9s, 2-60, 2-64; Ti-b, 4-53, 7-51)

739-Q. (Japanese.) The Effect of Rare Earth Metal "Mischmetal" on Some Properties of Al and Its Alloys. Pt. 2. Heat Resistance Properties of Al and Al-Mg Alloys Additions. Shigeo Sakai and Riei Ichikawa. Nagoya Institute of Technology, Bulletin, Dec. 1960, p. 323-328.

Mechanical properties, heat resistance and oxygen absorption of specimens containing 0.04-5.0% mischmetal are investigated by microscopic examination and tensile impact and oxidation tests at 20-400° C. 5 ref. (Q-general, R1h, 2-60, 2-62; Al-b, Mg, EG-g)

740-Q. (German.) Influence of Coarse-Grain Widmanstatten Microstructure on Bending Fatigue Strength of Notched and Unnotched C45 Steel. Gerhard Seeger and Gunther Holzmann. Archiv fur das Eisenhuttenwesen, v. 32, Feb. 1961, p. 103-105.

Bending fatigue testing of normalized and as-hot rolled notched and unnotched C45 steel specimens of given mechanical properties and microstructure. Influence of grain size and specimen surface on fatigue strength. (Q7, 2-59; ST)

741-Q. (German.) Crack Propagation in Fatigue Stressed Steels. Alexander Matting and Herbert Wolf. Materialprufung, v. 3, Feb. 1961, p. 51-62.

Crack propagation is investigated during fatigue bending and fatigue tensile testing by microstructure examination for unalloyed steels (0.07-0.35% C) of given mechanical properties. Reaction mechanism and kinetics of crack propagation. (Q26q, Q7; ST)

742-Q. (German.) Influence of Mounting Length and Pickling on Twist Testing of Steel Wire. Franz Bleilob and Horst Borst. Stahl und Eisen, v. 81, Mar. 16, 1961, p. 356-360.

Twist testing, using varying mounting lengths of steel wire (0.55-0.90% C) of 0.5-7 mm. diameter after various pickling treatments. (Q1; ST, 4-61)

743-Q. (German.) Heat Treatment in Hydrogen Atmosphere of Binary and Ternary Magnesium-Zirconium Base Alloys (Hydrogen-Effect). Hans Joachim Taschow and Franz Sauerwald. Zeitschrift fur Metallkunde, v. 52, Feb. 1961, p. 135-141.

Change of mechanical properties, electrical resistance and microstructure is investigated for MgZrZn alloys with 0.52-0.81% Zr and 0-5.38% Zn on annealing in pure hydrogen at temperatures from 250-500° C. Precipitation hardening by hydrogen (hydrogen effect). (Q-general, P15g, M27, 2-64; Mg-b, Zr-b, Zn)

744-Q. (English.) Slipping and Twin Bands in Crystals of White Tin. Tomoo Hirokawa. Hiroshima University, Journal of Science, Series A, v. 24, Oct. 1960, p. 337-357.

Electron and optical microscopic examination of etched and annealed single crystal Sn plates to determine effect of stretching on crystal structure. Relation between shear stress and slipping and twinning mechanism. (Q24, M26, M21, 3-68; Sn, 14-61)

745-Q. Structural Factors Affecting the Creep Properties of Precipitation-Hardened Nickel-Chromium Alloys. W. Butteridge. Metallurgia, v. 63, Feb. 1961, p. 79-85.

Factors in the development of creep-resisting Ni-Cr alloys including compositional effects relating to the matrix, precipitable phases and minor constituents and influences of processing procedure, heat treatment and size of the test bar. 14 ref. (Q3, 3-71; Cr-b, Ni-b)

746-Q. Easy Glide of Lead Single Crystals. R. L. Fleischer. Acta Metallurgica, v. 9, Mar. 1961, p. 184-190.

Effect of purity, orientation and temperature on easy glide and work hardening phenomena in f-c-c. Pb single crystals containing small impurities of Al, Cu or Sn tested in tension at 4.2 and 77° K. Examination by Laue back reflection and creep and hardness measurements with data for stress-strain relations and theoretical analysis in terms of a model due to Diehl. 23 ref. (Q24, Q23a, M-general, 2-60, 2-61, 3-72; Pb, Al, Cu, Sn, 14-61)

747-Q. Effect of Grain Size and Temperature on Slip Twinning and Fracture in 3% Silicon Iron. D. Hull. Acta Metallurgica, v. 9, Mar. 1961, p. 191-204.

The importance of twinning in brittle fracture is studied in a 3% silicon iron with tensile tests at 20, -78, -196 and -253° C. on unirradiated and irradiated specimens over a range of grain sizes. Specimens show plastic deformation by slip, with twins close to the fracture in the case of brittle fracture, the twinning causing crack nucleation. Twinning is observed to be most pronounced in the larger grains. 14 ref. (Q26s, Q24a, Q24b, 2-59, 2-67; Fe-b, Si)

748-Q. (Czech.) Computation of High-Temperature Creep. J. Sedlacek. Strojirenstvi, v. 10, Dec. 1960, p. 895-900.

Computation from the absolute temperature, time elapsing until rupture or a predetermined elongation and the initial load, based on the Larson-Miller equation. 6 ref. (Q3, 1-66)

749-Q. How Fastener Tension Varies With External Joint Loads. Pt. 1. W. T. Appleberry. Assembly & Fastener Engineering, v. 4, Apr. 1961, p. 26-30.

Factors affecting fatigue life of joints. Derivation of formulas relating bolt tension with preload and service load. (Q7; 7-54)

750-Q. Effect of Forming and Welding on Stainless Steel Columns. Robert E. Petersen and Axel O. Bergholm. Aerospace Engineering, v. 20, Apr. 1961, p. 26-27, 71-77.

A method is derived for predicting mechanical properties of Type 301 stainless steel columns taking into consideration the nonlinearity of the stress-strain relationship, the effects of forming and spot welding and the direction of rolling. 4 ref. (Q27, Q29, 3-68; SS, 4-57)

751-Q. Photoelastic Strain Gages. G. U. Oppel. Experimental Mechanics, v. 1, Mar. 1961, p. 65-73.

Measurement of stress magnitude and direction in Al, Mg and steel with uniaxial and biaxial photoelastic strain gages at temperatures to 1400° F.

Effects of stress ration, torsion and temperature on strain fringe pattern. (Q25, 1-52; Al, Mg, ST)

752-Q. Experimental Investigation of the Buckling Instability of Monocoque Shells. R. H. Homewood, A. C. Brine and A. E. Johnson. Experimental Mechanics, v. 1, Mar. 1961, p. 88-96.

Hydrostatic pressure tests and wire strain gage and electronic pressure transducer measurements to determine critical buckling pressure and stress distribution for shells of SAE 1020 steel, 2024 T3 Al alloy and 6061 T6 Al alloy of various shapes and thicknesses. (Q24, Q10, 3-74; ST, Al-b)

753-Q. Dislocation Relaxation Spectra of Cold Worked Body-Centered Cubic Transition Metals. R. H. Chambers and J. Schultz. Physical Review Letters, v. 6, Mar. 15, 1961, p. 273-275.

Measurement of the damping spectra of b-c-c. transition metals showed peaks in the internal friction versus temperature curve for Cb, Mo, Ta and W. 6 ref. (Q22, 2-61; Cb, Mo, Ta, W)

754-Q. (Russian.) Influence of Alloying Elements on Properties of Titanium-Aluminum Alloys. I. E. Kontorovich and A. T. Semenchenkov. Tsvetnaya Metallurgiya, June 1960, p. 144-148.

Determination of hardness, microstructure and electrical resistance of Ti-4% Al alloy as influenced by additions of Co, Fe, Ni, Cu, Nb, Cr, Mn, W, Mo and Cr. Influence of atomic diameter and lattice type of alloying elements on Ti-Al alloy. (Q29n, P15g, M27, 2-60; Ti-b, Al)

755-Q. (Russian.) Deformation Mechanisms in Round Samples Under Cyclic Heat Treatment. H. P. Lazarev. Tsvetnaya Metallurgiya, June 1960, p. 149-152.

Deformation and volume changes in solid Al rods and bimetallic two layer Al-Armco iron rods as affected by the number of cyclic heat treatments. Nonuniform strain and stress are obtained in various layers due to the increased lattice size of Al. (Q24, P10d, 2-64; Al, Fe-a, 4-55)

756-Q. Fatigue--The Problem in Relation to Welded Structures. Pt. 3. R. P. Newman. Welder, v. 29, Oct-Dec. 1960, p. 86-92.

Survey of factors influencing fatigue strengths of mild steel butt welds. Recommendations for obtaining high-fatigue strength welds in mild steel structures, plates and pipe. (To be continued.) (Q7a; CN, 7-51)

757-Q. Tensile and Compressive Creep of 6Al-4V Titanium-Alloy Sheet and Methods for Estimating the Minimum Creep Rate. H. L. Price and G. J. Heimerl. NASA Technical Note D-805, Apr. 1961, 19 p. (Available from National Aeronautics and Space Administration, Washington, D. C.) $.50.

Heat treatment at 1700° F. and aging at 1000° F. Testing at 80-1200° F. with tensile and compressive loads to determine effect of strain rate and temperature on tensile and yield strength, Young's modulus, elongation, stress and creep rate. (Q3, Q27, Q23, 2-64; Ti-b, Al, V, 4-54)

758-Q. Sag Characteristics of Steel Versus Temperature. Robert F. Patrick. Paper from "Porcelain Enamel Institute Forum, Proceedings". v. 20. Porcelain Enamel Institute, Inc., Washington, D. C., 1958, p. 8-12.

Strips of different cold rolled steels and of enameling irons are supported over a 10 in. span, placed in a furnace and fired for 3 1/2 min. at 1200-1550° F. Effect of firing temperature and metal thickness on sagging. 6 ref. (Q24, 2-61; Fe, ST)

759-Q. Mechanical Properties of Porcelain Enameled Aluminum. A. L. Sopp, Jr. Paper from "Porcelain Enamel Institute Forum, Proceedings". v. 21. Porcelain Enamel Institute, Inc., Washington, D. C., 1959, p. 69-77.

Determination of tensile strength, yield strength and elongation of no. 1 PEX, no. 1 PES, no. 3 PES and 6063 Al sheet and extrusion alloys. Effect of metal thickness, enamel thickness, age hardening and rate of cooling from enameling temperature to room temperature on strength properties. Data also given for static flexure, flexural fatigue and dent resistance properties. (Q27, Q23; Al, 4-53, 8-71)

760-Q. Factors in Evaluating Fatigue Life of Structural Parts. W. Illg. NASA Technical Note D-725, Apr. 1961, 10 p. (Available from National Aeronautics and

Space Administration, Washington, D. C.) $.50.

Evaluation of fatigue life by variable-amplitude loading, fatigue-crack propagation and equivalent fatigue loading. Effect of crack length and area on static residual strength. Experimental testing of parts made from 2024-T3 steel and 7075-T6 Al alloy. (Q7b; Al-b, ST)

761-Q. Welding--Engineering and Metallurgical Aspects. R. P. Newman and P. T. Houldcroft. Chartered Mechanical Engineer, v. 8, Apr. 1961, p. 214-221, 249.

Fatigue properties, brittle fracture at low stress and hydrogen embrittlement of arc welded mild steel, high-strength steel, alloy steel and Al alloys. (Q7, Q26s; Al-b, AY, CN, SGB-a, 7-51)

762-Q. Review of Recent Developments in the Technology of Columbium and Tantalum. F. S. Bartlett and F. F. Schmidt. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 97, Apr. 10, 1961, 5 p. (Available as PB 161247 from U. S. Office of Technical Services, Washington 25, D. C.)

Effect of additions of W, Mo, Rh, Zr, Hf and V on the tensile properties and ductile to brittle transition temperatures of Cb and Ta alloys. Effect of heat treatment on stress-rupture life. 11 ref. (Q27, Q23r, Q3m, 2-60, 2-64; Cb-b, Ta-b)

763-Q. The Bending Stress Distribution at the Base of a Stationary Crack. M. L. Williams. Journal of Applied Mechanics, Series E (American Society of Mechanical Engineers, Transactions), v. 28, Mar. 1961, p. 78-82.

Mathematical determination of the stress distribution at the base of a crack in a metal plate subjected to symmetrical and antisymmetrical bending. Computations indicate that reciprocity relationships exist between both types of bending conditions for the asochromatic fringe lines and stress trajectories. 5 ref. (Q5m)

764-Q. Size Effect in Brittle Fracture of Notched E-Steel Plates in Tension. J. H. Ludley and D. C. Drucker. Journal of Applied Mechanics, Series E (American Society of Mechanical Engineers, Transactions), v. 28, Mar. 1961, p. 137-139.

Testing in support of the assumption that the Griffith theory, based on a strong size effect, is not applicable to the initiation of brittle fracture in structural steel plates. 9 ref. (Q26s; ST, 4-53)

765-Q. Stresses in Thin-Walled Pressure Vessels With Ellipsoidal Heads. H. Kraus, G. G. Bilodeau and B. F. Langer. Journal of Engineering for Industry, Series B (American Society of Mechanical Engineers, Transactions), v. 83, Feb. 1961, p. 29-40.

Digital computer calculations of stresses in thin-walled pressure vessels with ellipsoidal heads, using a finite difference approximation to the Love-Meissner equations for the ellipsoidal shell. Tabulations are presented for stress and stress intensity indexes. 14 ref. (Q25, T26q)

766-Q. Studies of the Design of Steel Casting and Steel Weldments as Related to Methods of Their Manufacture. Harry R. Nara, D. K. Wright and Charles W. Briggs. Journal of Engineering for Industry, Series B (American Society of Mechanical Engineers, Transactions), v. 83, Feb. 1961, p. 73-91.

Research report on the design of steel castings and weldment sections and a comparison of their properties including fatigue, discontinuities, strength and stress concentrations. (Q7, Q27, Q25k; ST, S, 7-51)

767-Q. (Czech.) Dimensioning of Thick-Walled Tubing Designed to Withstand High Pressure at Elevated Temperature. N. Gorbatov. Strojirenstvi, v. 11, Jan. 1961, p. 4-12.

Low alloy steel with 0.83-2.08% Cr is creep tested at 482-649° C. and tubing of Cr-Ni steel containing 0.12% C, 1.0% Mn, 0.55% Si, 0.025% P, 0.02% S, 13% Cr, 13% Ni, 1.8% Mo, 1.3% W, 0.1% Ti, 0.4% V and 0.3% Cb is pressurized at 650° C. to determine optimum wall thickness. 22 ref. (Q3, Q10, S14; AY, 4-61)

768-Q. (Japanese.) Aluminum (Alloy) Sheet Ingot. Pt. 1. Relation Between Hot Cracking and Chemical Composition. Kobayashi Toziro and Otuzi Hisao. Light Metals, v. 11, Jan. 1961, p. 11-19.

Hot cracking of ring cast ingot specimens of Al-Fe-Si alloys containing 0.1% Fe and 0.8% Si and Al-Mg-Si alloys containing 0-4% Mg and 0-2% Si, 0.04-15% Ti or 0.3-4.5% Cu being

added to both alloys. Macrostructures and crack length data are given as a function of composition. 8 ref. (Q26q, M28p, 2-60; Al-b, 4-53)

769-Q. (Japanese.) The Directionality of Aluminum Sheet as Affected by Addition Elements. Pt. 1. The Effect of Mn and Sn. Morinaga Takuichi, Muromachi Shigeo and Zaima Shigeo. Light Metals, v. 11, Jan. 1961, p. 24-28.

Effect of 0.2-2.3% Mn and 0.1-2.0% Sn addition on the directionality elongation and recrystallization temperature of 1S Al alloy determined by Knoop indenter after 260-500° C. annealing and cold rolling. (Q23, Q29n, N5, 2-60, 3-72; Al-b, 4-53)

770-Q. (Japanese.) The Directionality of Aluminum Sheet as Affected by Addition Elements. Pt. 2. The Effect of Fe, Mg and Ti. Morinaga Takuichi, Muromachi Shigeo and Zaima Shigeo. Light Metals, v. 11, Jan. 1961, p. 29-34.

Effect of 0.1-0.6% Fe, 1.0-3.5% Mg and 0.2-1.5% Ti additions on the directionality, elongation, hardness and recrystallization temperature of 1S Al alloy determined by Knoop indenter after 260-500° C. annealing and cold rolling. 7 ref. (Q23, Q29n, N5, 2-60, 3-72; Al-b, 4-53)

771-Q. (Japanese.) Extrusion Effects on 61S Aluminum Alloy. Asada Hiroshi and Koike Kichizo. Light Metals, v. 11, Jan. 1961, p. 43-51.

Effect of extrusion ratio and temperature, heat treatment temperature and Cr content on the tensile strength and substructure of 61S Al alloy. Relation of substructure hardening and strengthening due to interaction between edge dislocations at sub-boundaries and solute atoms formed in Guinier Preston zones on aging. 23 ref. (Q27, M27, 2-60, 2-64, 3-68)

772-Q. The Crystallographic Dependence of Low Load Indentation Hardness in Beryllium. N. A. Hill and J. W. S. Jones. Journal of Nuclear Materials, v. 3, Feb. 1961, p. 138-155.

Low load indentation diamond pyramid hardness of Be as dependent on orientation, surface condition, deformation mechanism and angle of inclination of indentation. Data are given for measurements on single crystals, sheet rod and cylindrical specimens fabricated by extrusion, casting and sintering with various machining, etching, deformation and electropolishing treatments. 21 ref. (Q29n, 3-68, 3-72; Be)

773-Q. The Effect of Inclusions on the Fracture of Uranium. D. M. Davies and J. W. Martin. Journal of Nuclear Materials, v. 3, Feb. 1961, p. 156-161.

Metallographic study of the nucleation and propagation of tensile fracture in the alpha range of commercially pure uranium, the crack nucleus being associated with the inclusions present. Effect of prior annealing in the gamma range upon the size-distribution of inclusions. 20 ref. (Q26q, 2-64, 9-69; U-a)

774-Q. Creep Properties of a Zirconium-Hydrogen-Uranium Alloy. J. C. Bokros. Journal of Nuclear Materials, v. 3, Feb. 1961, p. 216-221.

The temperature and stress dependence of the steady-state creep rate of a Zr-8.03% U-1.07% H alloy is determined at 500-600° C., which includes an eutectoid transformation. Data are given for activation energy and transformation temperature. 3 ref. (Q3, N-general, 2-62, 3-66; Zr-b, H, U)

775-Q. Temperature Dependence of the Slip Direction for (100) Slip in Alpha-Uranium. L. T. Lloyd, P. LaCombe, D. Calais and N. Simenel. Journal of Nuclear Materials, v. 3, Feb. 1961, p. 241-245.

Theoretical analysis and review of experimental data for slip mechanisms and orientation relationships of crystals deformed in tension and compression at -196 to 600° C. 7 ref. (Q24a, M26c, 2-61, 10-54; U-a)

776-Q. Selection of Metals for Use at Cryogenic Temperatures. A. Hurlich and J. F. Watson. Metal Progress, v. 79, Apr. 1961, p. 65.

Since the newer missiles and rockets will be powered by liquid oxygen (boiling point, -297° F.) and liquid hydrogen (boiling point, -423° F.), there is much interest in materials which will remain tough at such low temperatures. List of several of the Al, Ti and stainless steel alloys which can be used for low temperature applications. (Q-general, T24e, T2p, 2-63, 17-57; Al-b, Ti-b, SS)

777-Q. A New Cast Alloy for Use at 1900° F. C. G. Bieber and T. E. Kihlgren. Metal Progress, v. 79, Apr. 1961, p. 97.

Laboratory tests indicate that IN-100--a new nickel-based alloy--has adequate tensile and rupture strength for turbine blades operating up to 1900° F. (Q-general, T7h, 17-57; Ni-b, 5-62)

778-Q. (French.) New Case-Hardened American Steels for the Automobile Industry. Revue du Nickel, v. 27, Jan-Feb. 1961, p. 15-18.

Composition, hardenability, mechanical properties and machinability of Inco 1-4, AISI 8620 and AISI 4620 steels. (Q-general, J5, G17k; ST)

779-Q. Hydrogen and Delayed Cracking in Steel Weldments. E. P. Beachum, H. H. Johnson and R. D. Stout. Welding Journal, v. 40, Apr. 1961, p. 155s-159s.

Lehigh restraint test used to study delayed cracking in carbon and alloy steel weldments. Relation of cracking susceptibility to base plate and welding wire composition and to hydrogen concentration. Effect of low-aging temperatures on cracking time. 14 ref. (Q26s, Q26q, K9r, 2-60, 2-64; ST, 7-51)

780-Q. Properties of Flash-Welded Molybdenum. Ernest G. Thompson, Harold Binder and Harold Collins. Welding Journal, v. 40, Apr. 1961, p. 160s-165s.

Technique for flash welding arc cast 0.5% Ti-Mo alloy bar stock. Mechanical properties of as welded joints at room temperature; influence of upset and of test temperature on weld bend ductility; and tensile properties of cold worked, flash welded sheet specimens at 2200-3200° F. 6 ref. (Q-general, K3s; Mo-b, Ti, 7-51)

781-Q. Influence of Residual Stresses and Metallurgical Changes on Low-Stress Brittle Fracture in Welded Steel Plates. A. A. Wells. Welding Journal, v. 40, Apr. 1961, p. 182s-192s.

Survey of failures induced by slowly applied loads in welded and notched wide plate and pressure vessel tests. Conditions for the initiation and propagation of cleavage cracks. Effects of residual stresses and defects. 40 ref. (Q26q, Q26s, 3-66, 9-71; ST, 4-53, 7-51)

782-Q. (English.) A Review of Pull and Torsion Tests on Cast Iron. Akimasa Ono. Japan Academy, Proceedings, v. 36, Nov. 1960, p. 601-606.

Mathematical analysis and review of rupture in pull and torsion testing of cast iron. Formulas developed are applicable to shearing, critical and tensile stress and cracking properties. (Q3q; CI)

783-Q. (English.) Photoelastic Investigation of Stresses Caused by Notches in Reinforced Bars. Heihachi Shimada. Japan Society of Mechanical Engineers, Bulletin, v. 4, Feb. 1961, p. 1-5.

Photoelastic investigation of bars of epoxy resin with a central duralumin or Cu stringer adhesively bonded by Araldite 121 to determine stress concentration at notches. 11 ref. (Q23s, Q25k; Al-b, Cu)

784-Q. (English.) Some Studies on Rotating Bending Fatigue of Large Mild Steel Specimens. Jiro Hoshino. Japan Society of Mechanical Engineers, Bulletin, v. 4, Feb. 1961, p. 33-40.

Study of relationship between stress and propagation speed of fatigue cracks in mild steel in terms of shell pattern. Development of formula to express this relationship. (Q7c; CN)

785-Q. (English.) Residual Stresses Due to Alternate Stressing of Annealed Steels. Shuji Taira and Yasunori Murakami. Japan Society of Mechanical Engineers, Bulletin, v. 4, Feb. 1961, p. 41-45.

Report of development of residual compressive stress in annealed steel caused by alternating stress in reversed bending as affected by carbon content and yield. The impact of residual stress on fatigue and the co-axing phenomena is calculated. 10 ref. (Q25h; ST)

786-Q. (English.) A Mechanism of Deformation of Metals at High Temperature With Special Reference to the Creep After a Sudden Change in Stress. Shuji Taira, Kichinosuke Tanaka and Kiyotsugu Ohji. Japan Society of Mechanical Engineers, Bulletin, v. 4, Feb. 1961, p. 46-51.

Study of work hardening and recovery mechanisms following abrupt stress change based on behavior dislocations. Using creep test data, mild steel behavior is predicted after stress changes. 5 ref. (Q3, Q23a, N4; CN)

787-Q. Fracture of Notched Bar Tension Specimen. Kazuo Terazawa, Midori

Otani, Toshio Yoshida and Kiyoshi Terai. Osaka University, Technology Reports, v. 10, Oct. 1960, p. 763-778.

Effect of notch geometry on crack initiation in mild steel specimens fractured in tension at room temperature is evaluated in terms of flow stress and the rim effect. Center cracking of the notched section is attributed to ductile or fibrous fracture while contour cracking is related to shear fracture. 13 ref. (Q26, Q27d; 3-73; CN)

788-Q. Brittle Fracture and Ductile Fracture of Alpha-Iron. Masaki Watanabe and Kazuyoshi Kamachi. Osaka University, Technology Reports, v. 10, Oct. 1960, p. 779-788.

X-ray microbeam and microscopic examination of fracture patterns and deformation modes of specimens tensioned and impacted to failure at liquid nitrogen and room temperature. 3 ref. (Q26, Q24, M23p, 2-61; Fe-a)

789-Q. (German.) Unsteadiness in the Temperature Curves of Notch Impact Strength of Ferritic Steels. Karl Wellinger and Hans-Joachim Wittwer. Naturwissenschaften, v. 48, Feb. 1961, p. 69.

Stepwise change of impact strength of notched and unnotched specimens of heat treated and soft ferritic steels of medium carbon content (Ck 35, Ck 45 and Ck 60 steel) and of hexagonal MgAl 6 Zn alloy and pure Zn as influenced by testing temperature, composition and heat treatment. (Q6n, 2-60, 2-61, 2-64; Al-b, CN-p, Mg-b, Zn-b)

790-Q. (German.) Behavior of a Magnesium Rolling Alloy After High-Degree Working in the Recovery Field. E. Mohr. Metall, v. 15, Mar. 1961, p. 228-230.

Tensile testing of a Mg-1.82% Mn alloy after rolling of 100 mm. thick bars to 0.55 mm. sheet with various intermediate annealing operations and 30 min. final annealing of the rolled sheet at temperatures from 90-290° C. Influence of final annealing temperature on tensile strength, yield point and elongation. (Q27, Q-general, F23, 2-64; Mg-b, Mn, 4-53)

791-Q. (German.) Mechanical Properties of Martensitic Nickel Steel Containing 13% Nickel at Temperatures of Liquid Air. Hermann Schumann. Neue Hutte, v. 6, Feb. 1961, p. 92-98.

Tensile and notch impact testing at -180 to 20° C. of hot rolled X 8 Ni 13 steel in the as-rolled state and after single and repeated normalizing at 750-900° C. Investigation of transformation mechanisms by magnetic, microstructure and X-ray (Co-K-alpha radiation) methods. (Q6, Q27, M-general, N-general, 2-63, 2-64, 3-68; SS-c)

792-Q. (German.) Work Hardening and Residual Stress of Surface Layers of Tensile Deformed Copper Specimens. Carl-Otto Leiber and Eckard Macherauch. Zeitschrift fur Metallkunde, v. 52, Mar. 1961, p. 196-203.

Plastic tensile deformation of electrolytically polished and vacuum stress-free annealed (300-450° C.) pure Cu specimens (99.985% Cu) with subsequent lattice expansion measurements of the surface layer by X-ray back reflection to investigate work hardening and the order of residual stresses. (Q23a, Q25, M22g, 3-68; Cu)

793-Q. (Russian.) Distribution of Stresses in Relation to Flake Formation in Deformed Steel Forgings. I. E. Brainin and V. A. Kharchenko. Izvestiya Vuz Chernaya Metallurgiya, Oct. 1960, p. 139-142.

Effect of residual elastic stresses and hydrogen diffusion and content on flake formation. Hydrogen embrittlement of areas at dislocations due to accumulation of atomic hydrogen. 4 ref. (Q25, Q26s, 9-70; ST, 4-51)

794-Q. (Russian.) Effect of Homogenizing on Redistribution of Silicon and Mechanical Properties of Magnesium Gray Cast Iron. V. G. Permyakov, R. P. Todorov, G. I. Koshovnik and A. V. Belotskii. Izvestiya Vuz Chernaya Metallurgiya, Oct. 1960, p. 143-147.

X-ray analysis and mechanical tests of samples heat treated by holding at 1050° C. for 5 min. to 15 hr. Microhardness of various structure constituents as a function of distribution. (Q-general, M22g, 2-60, 2-64, 9-69; CI-n, Si, Mg)

795-Q. Sulphide Inclusions in Steel. Lawrence H. Van Vlack, O. K. Riegger, R. J. Warrick and J. M. Dahl. Metallurgical Society of AIME, Transactions, v. 221, Apr. 1961, p. 220-228.

Summary of the dependence of sulphide inclusion microstructures upon

steel composition, particularly the Mn-Si-O ratio and an interpretation of the behavior of sulphide inclusions at steel-rolling temperatures to suggest a mechanism for MnS deformation in re-sulphurized steels and to rationalize hot shortness anomalies between plain carbon and resulphurized steels. 12 ref. (Q26s, Q24, F23, 2-60, 2-61, 9-69; ST, Mn, S)

796-Q. Effect of Temperate on the Creep of Polycrystalline Aluminum by the Cross-Slip Mechanism. J. E. Dorn and N. Jaffe. Metallurgical Society of AIME, Transactions, v. 221, Apr. 1961, p. 229-233.

An activation energy of 27,400 ± 1000 cal. per mole is obtained for the creep of polycrystalline Al at 273-350° K. at strains of 0.003-0.230 and stresses of 2250-6000 psi. and at varying strain rates. A strain temperature-compensated time correlation is obtained indicating that the structure is dependent solely upon the strain at a given stress. 8 ref. (Q3, Q24a, P13a, 2-61, 3-66, 3-68; Al-a)

797-Q. Effect of Hydrogen on the Tensile Properties of Iodide Vanadium. A. L. Eustice and O. N. Carlson. Metallurgical Society of AIME, Transactions, v. 221, Apr. 1961, p. 238-241.

Tensile tests on vacuum annealed and hydrogenated specimens at -200 to 40° C. showing that the presence of 10 ppm. hydrogen is sufficient to cause embrittlement over a small temperature range. The temperature of the observed ductility minimum, -100° C., is determined as a function of strain rate and hydrogen concentration with the yield stress rising sharply in the brittle temperature range. 10 ref. (Q27, Q26s, Q23b, 2-60, 2-61, 3-68; V-a, H)

798-Q. Easy Glide and Grain Boundary Effects in Polycrystalline Aluminum. Robert L. Fleischer and William F. Hosford, Jr. Metallurgical Society of AIME, Transactions, v. 221, Apr. 1961, p. 244-247.

Tensile data for coarse grained aluminum polycrystals suggest that the "grain size" effect is not due to dislocation piled up at grain boundaries but rather is primarily a relative size effect due to surface crystals being weaker and less confined. 17 ref. (Q24c, Q27, M26, M27f, 3-73; Al-a)

799-Q. A Study of Fracturing Behavior of Copper and Zinc Coated With Mercury. N. A. Tiner. Metallurgical Society of AIME, Transactions, v. 221, Apr. 1961, p. 261-265.

Effects of temperature (-70 to 120° F.), cyclic and static loading and electric polarization on the fracturing behavior of Hg-coated Cu and Zn single crystals. Hg embrittlement appears to result from the rapid propagation of cracks along an active path, such as grain boundaries, basal slip planes or the tip of fatigue crack embryos. 18 ref. (Q26s, R6m, 2-61, 3-68; Cu, Zn, Hg, 14-61)

800-Q. Yield Point and Easy Glide in Silver Single Crystals. Joachim J. Hauser. Metallurgical Society of AIME, Transactions, v. 221, Apr. 1961, p. 305-309.

Tension, compression and Bauschinger tests are used to determine latent hardening characteristics due to slip deformation, in particular, the effect of deformation direction on easy glide and yield point phenomena and on the stress level of the stress-strain curve. 11 ref. (Q24a, Q24c; Ag, 14-61)

801-Q. Creep and Creep-Rupture Relationship in an Austenitic Stainless Steel. F. Garofalo, R. W. Whitmore, W. F. Domis and F. von Gemmingen. Metallurgical Society of AIME, Transactions, v. 221, Apr. 1961, p. 310-319.

Constant-load creep-rupture tests at 1100-1500° F. on a Type 316, 18 Cr-8 Ni-2Mo, austenitic stainless steel to determine the relationship between rupture life and other aspects of creep behavior. The dependence of the rupture life on the initial stress is related to the stress dependence of the minimum creep rate and secondary creep strain. The secondary creep strain depends on the nature of the grain boundary precipitate, which affects grain boundary migration. 17 ref. (Q3, N3, 3-66; SS-e)

802-Q. The Effect of Copper, Nickel, Iron and Chromium on the Tensile Properties of Preferentially Oriented Beryllium Sheet. F. M. Yans, A. D. Donaldson and A. R. Kaufmann. Metallurgical Society of AIME, Transactions, v. 221, Apr. 1961, p. 364-370.

Be is mixed by powder metallurgical techniques with Cu, Ni, Fe and Cr to

form Be rich binary alloys which are then extruded and rolled transverse to the extrusion direction. The solution hardening and embrittlement effects of each alloying element is determined by tensile testing and by X-ray diffraction, metallographic and fractographic methods. 10 ref. (Q27, Q26s, Q29n, M-general, N7, 2-60, 3-68, 3-72; Be-b, Cr, Cu, Ni, Fe)

803-Q. Dispersion Strengthening in the Copper-Alumina System. K. M. Zwilsky and N. J. Grant. Metallurgical Society of AIME, Transactions, v. 221, Apr. 1961, p. 371-377.

A series of Cu-Al_2O_3 dispersion strengthened alloys are prepared using different Cu and Al_2O_3 powder sizes. Improvements in strength of up to 10 times that of pure Cu are found in room temperature and elevated temperature stress-rupture tests. Conductivity values remain from 70-90% that of pure Cu. 10 ref. (Q3m, Q27, N7a, P15g, 3-71; Cu-b, Al, 6-70)

804-Q. Trapping of Hydrogen in Cold Worked Steel. H. H. Podgurski. Metallurgical Society of AIME, Transactions, v. 221, Apr. 1961, p. 389-394.

Low temperature extraction of methane and calculation of volume of methane entrapping microvoids to determine the solubility of hydrogen in low alloy steel due to cold work deformation and density changes. 11 ref. (Q26s, P12e, 3-68, 3-71; ST, H)

805-Q. Recovery and Recrystallization in 99.85% Cr. M. E. de Morton. Metallurgical Society of AIME, Transactions, v. 221, Apr. 1961, p. 395-400.

Recovery and early recrystallization of heavily deformed, 99.85% Cr investigated by studying metallographic structure, X-ray line sharpening, electrical resistivity, plastic properties, internal friction and shear modulus. Effect of strain and relative dislocation mobility on anelastic properties. 17 ref. (Q22n, Q-general, M-general, N5, 3-68; Cr-a)

806-Q. Mercury Embrittlement of Titanium Alloy RC-130-A. H. P. Leighly, Jr. Metallurgical Society of AIME, Transactions, v. 221, Apr. 1961, p. 408-409.

Reduction of tensile strength, accompanied by brittle fracture, of specimens wet by Hg under stress. (Q27, Q26s, R6m, 3-66; Ti-b, Hg)

807-Q. A Simple Device to Improve Uniaxial Loading in Compression Tests. Wilhelm in der Schmitten. Metallurgical Society of AIME, Transactions, v. 221, Apr. 1961, p. 409.

Application of a steel hemisphere as a "self-adjusting" upper compression plate for central and uniform distribution of stress over the whole specimen surface to prevent crumbling due to load misorientation in testing brittle specimens such as ionic crystals. (Q28, 1-52)

808-Q. Observations on the Ductility and Fracture of Recrystallized Chromium. Rollin E. Haak, Attwell M. Adair and Harry A. Lipsitt. Metallurgical Society of AIME, Transactions, v. 221, Apr. 1961, p. 409-411.

Intergranular and transgranular fracture and loss of ductility in electrolytic Cr wire, single crystal and large grain polycrystals as a result of embrittlement caused by recrystallization annealing in vacuum at 1150° C. for two hours. 6 ref. (Q23p, Q26s, N5, 2-64; Cr-a)

809-Q. The Role of Strain Hardening in the Plastic Range Fatigue. Dogan E. Gucer. Metallurgical Society of AIME, Transactions, v. 221, Apr. 1961, p. 415-416.

Relation between the relative endurance of A-302 low alloy structural steel and A-201 low carbon steel under plastic range cycling and their strain hardening characteristics. Tests are made on grooved specimens after normalizing and stress relief heat treatment. (Q7, N7e, 2-64, 3-68; ST)

810-Q. Some Peculiarities in the Shape of Hardness Curves of End Quenched and Tempered Steels. H. R. S. Rao and V. G. Paranjpe. Tisco (Tata Iron & Steel Co., India), v. 8, Apr. 1961, p. 71-90.

Effect of composition, cooling rate, tempering, austenitizing and quenching temperatures of silicomanganese and other alloy steels on the Rockwell C hardness, end quench hardness traverse and microstructure. 21 ref. (Q29n, M27, 2-60, 2-64; AY)

811-Q. Minimum Toughness Requirements for High Strength Sheet Steel. J. A. Kies, H. Romine, H. L. Smith and H.

Bernstein. Journal of Basic Engineering, Series D (American Society of Mechanical Engineers, Transactions), v. 83, Mar. 1961, p. 1-7.

Theoretical considerations based on the macro-aspects of fracturing and experimental test results on specimens of various widths are used to state a value for the minimum required toughness based on effects of flaw dimensions, temperature, section thickness, stress or strain history and working stresses. 3 ref. (Q23r; ST, SGB-a, 4-53)

812-Q. Energy Versus Stress Theories for Combined Stress--a Fatigue Experiment Using a Rotating Disk. W. N. Findley, P. M. Mathur, E. Szczepanski and A. O. Temel. Journal of Basic Engineering, Series D (American Society of Mechanical Engineers, Transactions), v. 83, Mar. 1961, p. 10-14.

Description of an experiment in which the strain-energy at the critical location for fatigue failure is maintained constant while the stresses on a given plane of the material at the same location are caused to fluctuate. Material tested is 355-T61 cast Al alloy. 7 ref. (Q7c, 3-66; Al-b)

813-Q. Microplastic Strain Hysteresis Energy as a Criterion for Fatigue Fracture. C. E. Filtner and Jo Dean Morrow. Journal of Basic Engineering, Series D (American Society of Mechanical Engineers, Transactions), v. 83, Mar. 1961, p. 15-22.

On the basis of the postulated energy criterion for fatigue failure, a relation is developed between stress amplitude and the number of cycles to failure which utilizes only material properties obtained from the static true stress-strain tension test. Theoretical predictions are compared with experimental results on 4340 steel. 16 ref. (Q7, Q26r; ST)

814-Q. Crack Propagation in Thin Metal Sheet Under Repeated Loading. H. W. Liu. Journal of Basic Engineering, Series D (American Society of Mechanical Engineers, Transactions), v. 83, Mar. 1961, p. 23-31.

An expression for crack length in 2024-T3 Al alloy sheets is derived for a semi-infinite sheet subjected to repeated loads consisting of a constant stress and mean stress. The expression is in terms of a stress dependent propagation factor and an exponential function of the number of cycles of loading. It is modified for specimens of finite width. 13 ref. (Q26q; Al-b, 4-53)

815-Q. Fracture of Flat and Curved Aluminum Sheets With Stiffeners Parallel to the Crack. J. Frisch. Journal of Basic Engineering, Series D (American Society of Mechanical Engineers, Transactions), v. 83, Mar. 1961, p. 32-38.

Mode of crack propagation and failure is investigated in large 2024-T3 Al sheets reinforced as above to determine the effects of curvature, crack location and stiffener spacing. 8 ref. (Q26q; Al-b, 4-53)

816-Q. A Study of Theories of Fracture Under Combined Stresses. I. Cornet and R. C. Grassi. Journal of Basic Engineering, Series D (American Society of Mechanical Engineers, Transactions), v. 83, Mar. 1961, p. 39-44.

Experimental data are presented for a cast nodular iron and for high-Si cast iron materials which represent limiting conditions of ductility in a test of fracture theories. It is concluded that failure of brittle materials under combined stresses may be predicted by applying a notch modified distortion energy criterion. 25 ref. (Q26r; CI)

817-Q. (Translation.) Nature of Shear Formation on the Yield Surface of Metals. N. W. Davidenkov and E. I. Brainin. Soviet Physics Solid State, v. 2, Feb. 1961, p. 1642-1643. (Translation of Fizika Tverdogo Tela, v. 2, Aug. 1960, p. 1681-2006.)

Study of yield surface deformation of thin steel samples as characterized by massive shear formation which leads to an abrupt bend in the rectilinear axis of the sample forming an additional source of stress. (Q24c, Q2j; ST)

818-Q. Higher Strength Steels Mean Reduced Weight With Economy. G. Haaijer. SAE Preprint 327B, 1961, 18 p.

Data given for tensile strength, yield point, elongation and bend diameter of ASTM A245 structural steel, USS Exten 45, USS Exten 50, USS Manten, USS Triten and ASTM 375A high-strength steels and USS T-1 constructional alloy steel. 4 ref. (Q27a, Q24c, Q23p, Q5; ST, SGB-a)

819-Q. The Gear Blank and Heat Treatment. W. G. Wallace. SAE Preprint 333B, 1961, 7 p.

Effect of carbonitriding, cooling stress, carbon content and martensite

formation during and following heat treatment on wear resistance, strength and hardness of gears. (Q9n, Q29n, Q27, 2-64, T7a)

820-Q. Metallurgical Influences on Mechanical Properties of Induction Furnace Melted 13% Chromium Steel Castings. Jaroslav Koutsky. Foundry Trade Journal, v. 110, Mar. 30, 1961, p. 395-404.

Effect of chemical composition, melting method, heat treatment and cooling rate on notch impact strength, ductility, tensile strength, yield strength, hardness, temper brittleness and microstructure. 9 ref. (Q-general, 2-60, 2-64; ST, Cr, 5)

821-Q. (French.) Steels for Low Temperature. H. Lejay. L'Industrie de Petrole, v. 28, Dec. 1960, p. 89, 91.

Embrittlement factors determining fracture of steel at low temperatures are examined by Charpy V-notch, stress rupture and elastic modulus tests. (Q26s, Q-general, 2-63; ST)

822-Q. (Russian.) Hardness of Some Cb Base Alloys at High Temperatures. I. I. Kornilov and R. S. Polyakova. Atomnaya Energiya, v. 10, Feb. 1961, p. 170-172.

Pure Cb and five of its alloys containing 5% Mo, 0-5% Zr, 0-1% Si, 0-1% Al and 0-0.2% C are vacuum homogenized at 1600° C. for 10 hr. and structure tested. Hardness is measured at 20-1000° C. 3 ref. (Q29n, 2-61; Cb-b)

823-Q. Metallurgical Influences on Mechanical Properties of Induction-Furnace-Melted 13% Chromium-Steel Castings. Jaroslav Koutsky. Foundry, v. 110, Apr. 6, 1961, p. 430-434.

Effect of chemical composition, time of addition and particle size of ferrochromium added, deoxidation agent, casting temperature and pouring atmosphere on the notch impact strength and brittleness of 13% Cr steel melted in a high-frequency furnace. (Q6n, Q26, E25, D6; ST, Cr)

824-Q. Pressure-Die-Casting of Complicated Aluminum Alloy Castings. D. P. Tatanov and N. V. Kuranova. Foundry, v. 110, Apr. 6, 1961, p. 437-438.

Data given for tensile strength, elongation, notch-impact strength and Brinell hardness of a pressure-die-cast Al alloy. (Q27a, Q23p, Q6, Q29n; Al-b, 5-61)

825-Q. (Russian.) Effect of Surface Work Hardening on the Wear Resistance of Steel. G. A. Preis and B. M. Zinko. Trudy Kievskago Tekhnologicheskago Instituta Pishchevoi Promyshlennosti, no. 21, 1960, p. 143-152.

Numerous steels are normalized and hardened from 780-1050° C. with subsequent shot blasting or roll peening. Effect of strain hardening on the frictional wear and acid corrosion resistance. 18 ref. (Q9n, R6g, 2-64; ST)

826-Q. Review of Current Developments in the Metallurgy of High-Strength Steels. H. J. Hucek and A. R. Elsea. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 100, Apr. 20, 1961, 2 p. (Available as PB 161250 from U. S. Office of Technical Services, Washington 25, D. C.)

Effect of impurities, rolling rate, plate thickness and decarburization on ultimate tensile strength, yield strength, elongation, reduction of area, ductility, resistance to crack initiation and crack propagation and transverse toughness of Rocoloy 270 and high-strength steels used in rockets and missiles. 4 ref. (Q-general, T24e; ST, SGB-a)

827-Q. (Translation-Brutcher no. 5059.) Effect of Plastic Tension on the Fatigue Limit of Heat Resistant Alloys. M. I. Chernyak. Dopovidi Akademii Nauk Ukrainskoi RSR, Feb. 1961, p. 173-174.

Variation of fatigue limit of Ni-base alloys tested at room temperature and at 700° C. with the strain hardening effects resulting from the machining of the specimens eliminated. (Q7, 2-61; Ni-b)

828-Q. (Translation-Brutcher no. 5107.) Attack of Hydrogen on Oil Refinery Steels. M. Hasegawa and S. Fujinaga. Tetsu-to-Hagane (Iron and Steel Institute of Japan, Journal), v. 46, Oct. 1960, p. 1349-1352.

Study of hydrogen embrittlement at a Japanese oil refinery where all welded pipelines of plain carbon steel failed after four years of service. (Q26s, T26r; CN)

829-Q. (Translation-Brutcher no. 4953.) Relation Between Hardness and Resistance to Cold Welding (Antifriction Property). A.

D. Kuritsyna. Metallovedenie i Termicheskaya Obrabotka Metallov, Aug. 1959, p. 27-31.

Study of hardness of annealed Cu alloyed with various elements as related to strain hardening during plastic flow. (Q29n, N7e; Cu-b)

830-Q. (Italian.) Heat Resistant Chromium-Nickel Stainless Steel for Castings. Nickel, Dec. 1960, p. 8-12.

Physical and mechanical properties, composition and fabrication characteristics of HD and HE steel. (Q-general, F-general, G-general, P-general, 17-52; SGA-h, SS)

831-Q. Preventing Fatigue Failures. Pt. 1. Basic Factors. F. B. Stulen, H. N. Cummings and W. C. Schulte. Machine Design, v. 33, Apr. 27, 1961, p. 116-120.

Service load, critical stress and material behavior factors in designing steel components to withstand fatigue load. (To be continued.) (Q7k; ST)

832-Q. Review of Current Data on the Tensile Properties of Metals at Very Low Temperatures. J. E. Campbell. Defense Metals Information Center, Battelle Memorial Institute, DMIC Rept. 148, Feb. 14, 1961, 76 p.

Effect of temperatures from -423 to 78° F. on the ductility, yield strength, tensile strength and elastic modulus of Al, Cu, Mg, Ni, Co, Ta, Cb, Ti and Fe alloys. 29 ref. (Q27a, 2-63)

833-Q. Deflection of a Wohler Test Piece During Fatigue Cycling. T. R. G. Williams and D. H. Hughes. Engineer, v. 211, Mar. 31, 1961, p. 498-499.

Effect of varying amounts of fatigue cycling on the transition temperature of a notched fatigue test piece of mild steel. The change in vertical deflection of a Wohler test piece is used as a guide to crack initiation. Fatigue stressing raises the transition temperature of the steel. (Q23r, 3-66, Q7; CN)

834-Q. (German.) Nonmagnetizable Steels for High Stresses. Max Kroneis and Reinhold Gattringer. Stahl und Eisen, v. 81, Mar. 30, 1961, p. 431-445.

Mechanical testing of heat treated, age hardened and cold worked nonmagnetizable X 35 Mn 18, X 120 Mn 12, X 40 MnCr 18, X 12 MnCr 18 10, X 40 MnCr 18, X 20 CrNiMn 129 and X 55 MnNiCr 14 steel. Improvement of strength, with emphasis on yield strength, by aging and cold working. (Q-general, Q23b, 2-65, 3-66, 3-68; AY)

835-Q. (German.) Titanium Carbide Base High-Temperature Materials. Curt Agte and Gotthard Blum. Neue Hutte, v. 6, Mar. 1961, p. 139-146.

Review of pressing and subsequent sintering properties at up to 1200° C. including sealing resistance and bending, creep, impact and tensile strength and engineering applications such as for turbine blades and hot working tools of alloys of 80% TiC and 20% TaC or NbC with a NiCoCr alloy binder. Influence of TiB_2 (1%) and Cr_3C_2 (1.25-5.5%) additions on properties. (Q-general, 2-62; Ti-b, SGA-h, 6-69)

836-Q. (German.) Relations Between Microstructure and Strength Properties of Aluminum Alloyed Nitriding Steels. Herbert Tauscher and Eberhard Stecher. Neue Hutte, v. 6, Mar. 1961, p. 146-150.

Soft-annealed or normalized specimens of nitrided and nonnitrided K 38 CrAlMo 6 steel are hardened (850-950° C.) and annealed at 630° C. with subsequent tensile and fatigue testing for evaluating strength properties as influenced by amount of free ferrite in microstructure. (Q-general, J28k, M27, 2-60, 2-64; AY, Al)

837-Q. (German.) Use of High-Strength Steel Castings in Aircraft Construction. Herbert Tauscher and Heinz Fleischer. Neue Hutte, v. 6, Mar. 1961, p. 151-156.

Tensile and notch impact testing at -80 to 20° C., fatigue testing at room temperature and weld testing of CrMo 44-electrode welded specimens of Si-Mn-Cr-Mo alloyed and Cr-alloyed cast steel to determine weldability, susceptibility to heat treatment and temperature dependence of properties. Review of alloy development and applications in aircraft. (Q-general, T24, 2-60, 2-61, 2-64; AY, SGB-a, 5, 17-57)

838-Q. (German.) Stress-Rupture Strength of Heat Resistant High-Alloyed Chromium Steel. W. A. Stauffer and A. Keller. Schweizer Archiv, v. 27, Mar. 1961, p. 121-125.

Stress-rupture testing at 600° C. of heat treated 12 Cr + Z steel for various

times. Unsteadiness in the stress-rupture curves is observed at long testing times. (Q3m, 3-67; SS, Cr)

839-Q. Investigation of Creep Buckling of Columns and Plates. Pt. 2. R. Papirno and G. Gerard. New York University (Wright Air Development Division). U. S. Office of Technical Services, PB 171082, July 1960, 46 p. $1.50.

Creep buckling and short time buckling studies performed on columns of Ti alloy Ti-7Al-4Mo with simulated simple support and fixed and boundary conditions. Both end shortening and central deflection are recorded autographically during loading and during creep. (Q3c; Ti-b, Al, Mo)

840-Q. An Investigation of Column Action During Creep Buckling. R. L. Carson. Battelle Memorial Institute (Aeronautical Research Laboratories). U. S. Office of Technical Services, PB 171149, June 1960, 50 p. $1.50.

Procedures for inspecting a creeping column for stability. An alternative inspection procedure is proposed and an analysis of the mechanics given. (Q3c)

841-Q. Creep Collapse of Long Cylindrical Shells Under High Temperature and External Pressure. T. Wah and R. K. Gregory. Aeronautical Research Laboratories. U. S. Office of Technical Services, PB 171152, Aug. 1960, 117 p. $2.75.

Results of theoretical and experimental work on the creep collapse of long cylindrical shells subjected to a uniform external pressure and high temperature (300-500° F.) (Q3, 2-61)

842-Q. Minimum Toughness Requirements for High-Strength Sheet Steel. J. A. Kies. U. S. Naval Research Laboratory. U. S. Office of Technical Services, PB 161786, Oct. 1960, 18 p. $.75.

Requirements are discussed in specific terms of an assumed through flaw (or crack) twice the sheet thickness in length. Tests measuring the critical driving force, or work per unit area, required for specimen fracture at the point of crack growth instability show that a test specimen width of at least 3 in. is required for most materials to guarantee a strength equal to or above the yield strength in a pressure vessel with the largest crack 2t or less in length. (Q23r; ST, SGB-a, 4-53)

843-Q. (Japanese.) The Wear Resistance of High Phosphorus Brake Shoes Containing Added Alloying Elements. Minoru Nakai, Seizo Saito and Kunio Okabayashi. Imono (Japan Foundrymen's Society, Journal), v. 33, Jan. 1961, p. 24-29.

Effect of 0.4-1.0% Cu and 0.2-0.7% Cr additions on the wear properties of 0.5% phosphorus cast iron brake shoe castings. Influence of pearlite matrix strengthening as a function of composition on hardness and microstructure. 3 ref. (Q9, Q29n, N8h, T23s, 2-60; CI, P, Cu, Cr)

844-Q. (Japanese.) Generating Process of Residual Stress in Bronze Castings. Toshiro Owadano. Imono (Japan Foundrymen's Society, Journal), v. 33, Jan. 1961, p. 30-34.

Relation of temperature difference during cooling, as a function of cross sectional area, to tensile and compressive stress development and resultant plastic deformation and stress relaxation phenomena. 4 ref. (Q25, E25n, 2-61, 3-73; Cu-s, 5)

845-Q. Formability of Chromium and Chromium-Tungsten Alloys. S. T. M. Johnstone, F. Henderson and H. L. Wain. Industrial Heating, v. 28, Apr. 1961, p. 736-737.

Report on the effect of tungsten content on the workability and ductility of Cr through an extrusion process. Results indicate that W-Cr alloy with 10-17% W has superior creep properties (at 950-1000° C.) provided the alloy is in a cold worked condition. (Q23q, Q3, 2-60; Cr-b, W)

846-Q. Effect of Creep Testing on the Hydrogen Embrittlement of a Titanium Alloy Containing 2% Aluminum and 2% Manganese. L. M. T. Hopkins, M. F. Grimwade, A. I. Smith and M. F. Day. Industrial Heating, v. 28, Apr. 1961, p. 738.

Investigation to determine the effects of creep deformation on hydrogen induced brittlement in Ti-Al-Mn alloys. Impact test results indicate that embrittlement is not aggravated by creep and that short time tensile and creep properties are not affected by hydrogen. (Q26s, Q3; Ti-b, Al, Mn)

847-Q. Effect of Hardenability on Development of Cracks in Tools. E. I. Malinkina. Metal Treating, v. 12, Apr-May 1961, p. 12-14, 35.

Formation of cracks in shank tools of 1.0 and 1.2% carbon steels as affected by cross sectional areas and hence hardenability of tools. Data are given for effect of quenching temperature on number and shape of cracks, conditions favoring bow-shaped cracks and core hardness as function of quenching temperature and cross sectional area of tools. (Q26q, J5, T6; CN, 17-57)

848-Q. Some Results of the Examination of Aluminum Alloy Specimen Fracture Surfaces. P. J. E. Forsyth and D. A. Ryder. Metallurgia, v. 63, Mar. 1961, p. 117-124.

Fatigue, stress-corrosion and tensile fracture surfaces of aluminum alloy specimens are examined by optical and electron microscopy. Fatigue crack growth is observed as an irregular process dependent on the shape of crack front developed. (Q7, R1d, Q27, M21; Al-b)

849-Q. Special Purpose Brazing Alloys. Metallurgia, v. 63, Mar. 1961, p. 142-144.

Brazing alloys containing combinations of Ag-Cu-Au-Ni-Pd-Mn are compared with conventional brazing materials as to strength, hardness and corrosion resistance. (Q27, Q29n, R-general; Ag, Au, Cu, Mn, Ni, Pd, SGA-f, 17-57)

850-Q. (German.) Impact and Bursting Tests With Containers of Cold Tough 9% Nickel Steel at -196° C. F. W. Strassburg. Stahlbau, v. 30, Mar. 1961, p. 75-80.

Impact testing of rectangular and cylindrical 9% Ni-steel containers of 10 mm. wall thickness by a pendulum impact device (11400 m-kg.) and bursting tests at -196° C. (cooled by liquid nitrogen). Bursting pressure, non-brittle fracture. (Q6, Q10b, T26q; ST, Ni)

851-Q. (German.) Table of Characteristic Torsion Data for Structural Shapes According to Standards DIN 1025-1027. F. W. Bornscheuer and L. Anheuser. Stahlbau, v. 30, Mar. 1961, p. 81-82.

Following torsion data are computed for eight different structural shapes according to DIN 1025-1027: torsion resistance, arch resistance, section modulus, torsion stiffness, arch stiffness. (Q1a; 4-57)

852-Q. (French.) Malleable Pearlitic Castings. Laurence W. Collins, Jr. Machine Moderne, v. 55, Mar. 1961, p. 17-20.

Thermal treatment for producing globular structure. Tensile strength, wear resistance and hardness of material. Application in the automobile industry. (Q27a, Q9n, Q29n, T21; CI-s, 5)

853-Q. The Pitting of Lubricated Gear Teeth and Rollers. Pt. 1. P. H. Dawson. Power Transmission, v. 30, Apr. 1961, p. 208-217.

Experiments using 0.3% carbon steel and 3 1/2% Ni steel disks in a 6 in. center disk machine to determine process of crack initiation and pitting. Examination of Way theory of mechanism of crack propagation. 13 ref. (Q26, R2j, T7a; CN, ST, Ni)

854-Q. The Distribution of Deformation in Lead Fatigued in Vacuum. K. U. Snowden. Philosophical Magazine, v. 6, Mar. 1961, p. 321-327.

Nature of the deformation, hardening and recrystallization in polycrystalline specimens of high-purity Pb fatigued in reverse-plane bending in vacuum. Slip is induced by fatigue straining with grain boundaries migrating to more stable positions. Recrystallization and grain growth are observed in hardened zones formed by slip and grain boundary interaction. 24 ref. (Q24, N3, N5)

855-Q. Deformation Twinning in Face-Centered Cubic Metals. J. A. Venables. Philosophical Magazine, v. 6, Mar. 1961, p. 379-396.

Deformation twinning in f-c-c. metals is explained in terms of an extension of the "prismatic" source mechanism of Cottrell and Bilby (1951). Suitable prismatic dislocation sources are thought to be long jogs in the dislocations of the two conjugate slip systems in a work-hardened metal and prismatic dislocation loops produced by vacancy condensation in a neutron-irradiated metal. 14 ref. (Q24a, M24b, 2-67, 3-68)

856-Q. The Influence of Atmospheric Corrosion on the Fatigue Limit of Iron-0.5% Carbon. N. J. Wadsworth. Philosophical Magazine, v. 6, Mar. 1961, p. 397-401.

Specimens are fatigued in air and in vacuum with a knee in the S-N curve at the fatigue limit occurring at about the

same number of cycles in vacuum as in air but at a higher strain. Slip is observed with crack initiation and growth near the fatigue limit. 8 ref. (Q7, Q26, R3; Fe-b, C)

857-Q. Observation of de Haas-Van Alphen Type Oscillation in the Acoustomagnetic Attenuation of Zinc. D. F. Gibbons. Philosophical Magazine, v. 6, Mar. 1961, p. 445-447.

Oscillations observed in the acoustomagnetic attenuation of single crystal specimens as a function of temperature at 1.0-4.2° K., orientation mode, direction of shear wave propagation and magnetic field strength. 8 ref. (Q21f, P16; Zn, 14-61)

858-Q. (Ukrainian.) Fatigue Strength Characteristics as Influenced by Previous Stressing. M. I. Chernyak. Dopovidi Akademii Nauk Ukrainskoi RSR, Nov. 1960, p. 1492-1494.

Heat treated structural steels are subjected to minor plastic deformation by tensile stressing, bending or torsion. Changes of the fatigue limit as a function of degree of deformation. 11 ref. (Q7a, 3-66; ST, SGB-s)

859-Q. (Russian.) Effect of Hydrostatic Pressure on the Elasticity Characteristics in Cerium. I. I. Voronov, L. F. Vereshchagin and V. A. Goncharova. Doklady Akademii Nauk SSSR, May 1960, p. 1104-1107.

Measurement of the rate of ultrasonic wave emission in Ce undergoing polymorphic transformation at 16.0 + 0.1° C., while exposed to a high hydrostatic pressure. Young modulus, Poisson's ratio and shear modulus are determined at various pressures. 15 ref. (Q21, 3-74; Ce)

860-Q. (Dutch.) Plastic Flow in Various Deformation Processes. Pt. 2. P. Landberg. Metaalbewerking, v. 26, Mar. 16, 1961, p. 374-383.

Deformation in direct and impact extrusion is tested by extruding a block composed of horizontal layers of white and dark plasticine. Flow tests in impact extrusion are also performed by using slugs composed of Al laminations or cutting the slug in half and engraving a line net on the cut surface. Deformation macrostructure. Force-way diagram. (Q24, F24, G5; Al, NM-d30, NM-d31)

861-Q. An Adhesion Test for Aluminum Spray Coatings and Other Metallized Surfaces. R. S. Smith and N. Stephenson. British Welding Journal, v. 8, Apr. 1961, p. 161-165.

Development of laboratory and field techniques for measuring deposit adhesion strength of snythetic resins utilized, in conjunction with Al spray coating, to bond steel buttons to grit-blasted mild steel plates. Subject to limitations, non or semidestructive tests are applied. 5 ref. (Q10c; CN, 8-67)

862-Q. Influence of Storage Time on Weld Metal Ductility. Claes Pfeiffer. British Welding Journal, v. 8, Apr. 1961, p. 172-175.

Determination of the effect of storage time on the ductility of all-welded metal test bars. Results indicate that fisheye formation is related to length of storage, metal hydrogen content and type of electrode utilized. 12 ref. (Q23p, 3-67; 7-51)

863-Q. (German.) Investigation of Decrease of Deformability of an Unalloyed Structural Steel in the Temperature Range 150-300° C. Franz Lihl and Alexander Sommerfeld. Archiv fur das Eisenhuttenwesen, v. 32, Mar. 1961, p. 165-167.

Tensile testing of unalloyed 0.21% carbon steel at -70 to 500° C. and X-ray measurement (Co-K-alpha radiation) of lattice deformation as influenced by elongation and temperature. Stress-strain diagrams in the 100-400° C. temperature range. (Q23q, M26, Q27; ST, SGB-s)

864-Q. (German.) Production of "Fish Eyes" on Steel by External Effect of Hydrogen at Room Temperature. Wilhelm Hofmann and Walter Rauls. Archiv fur das Eisenhuttenwesen, v. 32, Mar. 1961, p. 169-171.

Tensile testing of normalized unalloyed Ck 22 steel specimens at room temperature in hydrogen atmosphere of up to 150 atm. pressure and in Ar atmosphere of up to 100 atm. pressure. Hydrogen embrittlement, formation of "fish eyes". (Q26s, Q27; ST)

865-Q. (Italian.) Properties of Spheroidal Cast Iron at High Temperatures. A. Plesinger. Termotecnica, v. 15, Jan. 1961, p. 43-48.

Chemical composition, elongation, resiliency, elastic modulus and oxidation resistance of various spheroidal cast irons at temperatures to 450° C. Comparison with gray cast iron, carbon steel and other types of cast iron. (Q23p, Q21, R1h, 2-61; CI-r)

866-Q. Residual Static Strength of Aluminum-Alloy Box Beams Containing Fatigue Cracks in the Tension Covers. Herbert A. Leybold. NASA Technical Note D-796, Apr. 1961, 25 p. (Available from National Aeronautics and Space Administration, Washington, D. C.) $.75.

Static testing of 31 box beams constructed of 2024 and 7075 Al alloys and employing stringers that are bonded, united or an integral part of the skin. Beams with stringers bonded to the skin had the highest residual static strength. 4 ref. (Q27, Q26q; Al-b, 4-57)

867-Q. Fatigue Investigation of Full-Scale Wing Panels of 7075 Aluminum Alloy. Claude B. Castle and John F. Ward. NASA Technical Note D-635, Apr. 1961, 31 p. (Available from National Aeronautics and Space Administration, Washington, D. C.) $1.

Constant amplitude testing of 7075 Al alloy wing panel using the resonant frequency method at three different alternating load levels. Data given for crack location, cycles to crack initiation, crack propagation and residual static strength. (Q7, Q26q, T24a; Al-b)

868-Q. Selecting the Right Spring Material. V. A. Stanton. Design Engineering, v. 7, May 1961, p. 39-42.

Data given for the composition, heat treatment and tensile strength of NS-1000, 17-7 PH, PH 15-7Mo and A 286 steels, Inconel X, Refractaloy 26, Rene 41, Waspalloy and L 605 alloy to be used as spring materials. (Q27a, J-general; SGA-b)

869-Q. The Effect of Grain Size on the Stress-Strain Curve of Alpha-Iron and the Connection With the Plastic Deformation of the Grain Boundaries. H. H. Tjerkstra. Acta Metallurgica, v. 9, Apr. 1961, p. 259-263.

Experimental data for grain size dependence of yield stress under uniaxial load is correlated with dislocation theory to determine grain boundary stresses in denitrided and decarburized steel (alpha Fe solid solution) under uniaxial load. The magnitude of these stresses suggests that dislocations do not stop at grain boundaries during plastic deformation but slip across into adjacent grains. 4 ref. (Q7, Q23b, Q24c, M26b, M27f, 2-59, 3-66; Fe-a)

870-Q. The Dependence of the Flow Stress of Fe_3Al on Crystallographic Order. A. Lawley, E. A. Vidoz and R. W. Cahn. Acta Metallurgica, v. 9, Apr. 1961, p. 287-296.

Polycrystalline tensile samples of Fe alloys containing 24.8-27.8% Al are equilibrated and quenched from various temperatures into oil or water with subsequent isothermal annealing. Flow stress is determined as a function of heat treatment time and temperature, order hardening, strain and dislocation climb. 27 ref. (Q24, M26b, N10, 2-64, 3-72; Fe-b, Al)

871-Q. Unloading Effects in Crystals. Pt. 1. The Unloading Yield Point Effect. H. K. Birnbaum. Acta Metallurgica, v. 9, Apr. 1961, p. 320-326.

The orientation dependence of the "unloading field effect" and the role of secondary slip systems in the mechanisms are investigated in Cu single crystals, utilizing combined tensile-torsion deformation. Increase in flow stress due to unloading is found to be independent and the variation of the unloading yield dependent on orientation. A mechanism is proposed for the effect based on forest dislocation interaction. 12 ref. (Q24c, M26b, 3-72; Cu-a, 14-61)

872-Q. Twinning in Zirconium. D. G. Westlake. Acta Metallurgica, v. 9, Apr. 1961, p. 327-331.

Models are proposed for the dislocation mechanism of twinning in Zr on (10.2), (11.2) and (11.1) planes with experimentally determined twin elements and thickness for various twin modes in specimens deformed in compression at 300° K. Critical resolved shear stress is considered as a determining factor if twinning is by a Cottrell-Bilby mechanism. 10 ref. (Q24b, M26b, 3-66, 3-72; Zr)

873-Q. Zigzag Configurations of Twins in Alpha-Iron. A. W. Sleeswyk and J. N. Helle. Acta Metallurgica, v. 9, Apr. 1961, p. 344-351.

Configuration of twin bands in alpha Fe obtained after 9.2% strain in tension or compression at -183° C. The zigzags are explained in terms of the geometrical and mechanical compatibility of the twelve possible (211) (111) twin systems. 11 ref. (Q24b, Q24c, 2-63, 3-68, 3-72; Fe-a)

874-Q. The Formation of Fatigue Cracks in Aluminum Single Crystals. T. W. Alden and W. A. Backofen. Acta Metallurgica, v. 9, Apr. 1961, p. 352-366.

Pure Al single crystals of a fixed orientation are cycled at constant deflection in reverse pure bending with observation of strain hardening and slip-band formation. Fatigue cracks forming in the resulting slip bands are attributed to active cross slip in the presence of free surface. 24 ref. (Q7, Q24, Q26p, N7e, 3-68, 3-72; Al-a, 14-61)

875-Q. On the Rate-Controlling Mechanism for Plastic Flow of Mg Crystals at Low Temperatures. H. Conrad, L. Hays, G. Schoeck and H. Wiedersich. Acta Metallurgica, v. 9, Apr. 1961, p. 367-378.

The plastic flow of a Mg single crystal is investigated by "differential type creep and constant strain rate tests at 78-364° K. The deformation rate is given by an equation in terms of activation energy, activation volume and effective stress. The rate-controlling mechanism is determined as the intersection of dislocations. 21 ref. (Q3, Q24, M26b, 2-63, 3-66; Mg, 14-61)

876-Q. On the Yield Stress in B.C.C. Metals. G. Schoeck. Acta Metallurgica, v. 9, Apr. 1961, p. 382-384.

The temperature dependence of the yield point in b-c-c. metals such as alpha Fe and SiFe as a function of frictional stress acting on unpinned dislocations. The friction force is related to jog concentration, with the deformation rate being controlled by thermal activation. 17 ref. (Q23b, M26b, 2-61, 3-66; Fe-b)

877-Q. Concerning Delayed Yielding in Body-Centered Cubic Metals. H. R. Peiffer. Acta Metallurgica, v. 9, Apr. 1961, p. 385-387.

The time delay before sharp yield occurs when a constant stress is applied to specimens of Fe or Mo is determined to be a linear function of stress. 8 ref. (Q24c, 3-66, 3-67; Fe, Mo)

878-Q. (Japanese.) The Influence of Cold Working on Frictional Characteristics of Mild Steel Strip. Kenichi Nakamura and Susumu Aono. Journal of Mechanical Laboratory (Japan), v. 15, Jan. 1961, p. 20-31.

Electron diffraction study of the rubbing surfaces of cold rolled and annealed strip specimens lubricated with boundary films of light oil, benzoic, capric, oleic and stearic acid. Surface scratching and orientation of the absorbed lubricant surface layer are affected aversely by cold work, with accompanying stick slip friction. 7 ref. (Q9p, 3-68, 18-73; ST, 4-53)

879-Q. (Japanese.) Research on the Mechanism of Mechanical Wear. Government Mechanical Laboratory Report no. 41, 1961, 81 p.

Effect of temperature of rubbing surface, mode of contact during wearing and localized hardening on wear mechanism for carbon steels. Applications of metal transfer theory. 72 ref. (Q9; CN)

880-Q. Uranium Ups Steel Strength. Question: How Much Needed? Canadian Chemical Processing, v. 45, Apr. 1961, p. 70, 108.

Report on the addition of uranium to carbon steel. Test results indicate that 0.23% uranium added to 1040 steel lowers corrosion rate from 1/2 to 1/4 and an addition of 0.02% uranium increases endurance limit from 29,000 to 36,000 psi. (Q7a, R-general, 2-60; CN, U)

881-Q. Notch Sensitivity of Refractory Metals. A. G. Imgram. Battelle Memorial Institute (Wright Air Development Division). U. S. Office of Technical Services, PB 171198, Sept. 1960, 115 p. $2.50.

Tensile and notch tensile properties of Mo, W, Cb and Ta and one alloy, Mo-0.5Ti, investigated at five temperatures selected to encompass the brittle-to-ductile transition. All specimen failures are classified according to fracture mechanism. (Q23s, Q27a, 2-61; Cb, Mo-b, Ti, Ta, W)

882-Q. Effects of Temperature-Time-Stress Histories on the Mechanical Properties of Aircraft Structural Materials. Pt. 2. Stressed Exposure of 7075-T6. C. D. Brownfield and D. M. Badger. Northrop Corporation (Wright Air Development Division). U. S. Office of Technical Services, PB 171328, Sept. 1960, $2.50.

Investigation of the problem of predicting strength of a hardened metal alloy after subjection to variable thermal and stress environments severe enough to cause permanent loss of properties. Methods for predicting tensile ultimate, tensile yield and compressive yield strengths of 7075-T6 Al alloy after single or multiple exposure to various temperature and stress exposure conditions. (Q27a, Q28g, 2-61, 3-66, T24a; Al-b)

883-Q. Fatigue and Stress Rupture Properties of Inconel 713C, V-57C and Titanium Alloys 7Al-3Mo-Ti and MST 821 (8Al-2Cb-1Ta-Ti). A. E. Cers and A. A. Blatherwick. University of Minnesota (Wright Air Development Division). U. S. Office of Technical Services, PB 171064, July 1960, $2.25.

Fatigue, rupture and creep data at various temperatures obtained at various alternating and mean stress combinations. Data are presented as S-N curves and stress-range diagrams to show the effect of temperature, ratio of alternating-to-mean stress, stress magnitude and specimen notch on the fatigue and rupture properties. (Q7, Q3m; Ni-b, Ti-b)

884-Q. Toughness of Steel Sheet: The Advantage of Laminating. S. Arnold. Watertown Arsenal Laboratories. U. S. Office of Technical Services, PB 171044, Oct. 1960, 25 p. $.75.

Impact tests of simulated sheet prepared in various gages by machining and grinding steel bar stock quenched and tempered to 210,000 psi. and 165,000 psi. tensile strength values to show the relation of impact energy to temperature, gage and strength level. Resulting data demonstrated a behavior pattern whereby sheet of appropriate gage and strength may be selected to assure ductile fracture in tearing under impact loads. (Q23r, Q6; ST, 4-53)

885-Q. High-Frequency Surface Thermal Fatigue Cycling of Inconel at 1405° F. J. J. Keyes, Jr., and A. I. Krakoviak. Nuclear Science and Engineering, v. 9, Apr. 1961, p. 462-474.

Surface thermal fatigue, cracking and intergranular corrosion as influenced by temperature fluctuations, frequency, exposure time, thermal and transient stress and environment investigated for specimens under high-frequency thermal oscillations at 1150-1405° F. 11 ref. (Q7j, Q26q, R2h, 2-62, 3-66; Ni-b)

886-Q. Mechanical Properties of Four Austenitic Stainless Steels at Temperatures Between 300 and 20° K. C. J. Guntner and R. P. Reed. Paper from "Advances in Cryogenic Engineering". v. 6. Plenum Press, Inc., New York, 1961, p. 565-576.

Data are given for tensile and notch-tensile properties and impact strength of USS Tenelon, AM 350, AISI 202 and AISI 304 stainless steels, all of which undergo strain induced transformation at low temperatures. 12 ref. (Q27a, Q6n, 1-67; SS-e)

887-Q. Low Temperature Mechanical Properties of 300 Series Stainless Steel and Titanium. T. S. DeSisto and L. C. Carr. Paper from "Advances in Cryogenic Engineering". v. 6. Plenum Press, Inc., New York, 1961, p. 577-586.

Instantaneous diameter measurements during tensile testing are obtained at -452° F. Data are given for strain at maximum load as a function of temperature. 6 ref. (Q27a, 2-63; SS, Ti)

888-Q. The Fatigue Properties of Aluminum Alloy 5083-H113 Plate and Butt Weldments at 75 and -300° F. Paper from "Advances in Cryogenic Engineering". v. 6. Plenum Press, Inc., New York, 1961, p. 590-603.

Data are given for ultimate tensile strength, yield strength, elongation and fatigue strength of Al alloy plate and weldments with bead-on and bead-off. 5 ref. (Q27a, Q23, Q7a, 2-63; Al-b, 4-53, 7-51)

889-Q. Properties of 7000 Series Aluminum Alloys at Cryogenic Temperatures. J. L. Christian and J. F. Watson. Paper from "Advances in Cryogenic Engineering". v. 6. Plenum Press, Inc., New York, 1961, p. 605-621.

Mechanical properties of high-strength Al alloys are correlated with composition,

impurity content, microstructure, primary working and heat treatment in order to study the mode of deformation and fracture characteristics at cryogenic temperatures. 11 ref. (Q-general, 2-63; Al-b)

890-Q. New Data on Aluminum Alloys for Cryogenic Applications. J. G. Kaufman and E. W. Johnson. Paper from "Advances in Cryogenic Engineering". v. 6. Plenum Press, Inc., New York, 1961, p. 637-649.

Data are given for tensile properties, elastic moduli, shear strength, fatigue strength, notch sensitivity and tear resistance as a function of temperature. 10 ref. (Q-general, 2-63; Al-b)

891-Q. Calculating Residual Stresses in Some Formed Parts. C. S. Yen. American Society of Mechanical Engineers, Paper no. 61-AV-38, 1961, 7 p.

Residual stresses for several Al alloy 7075 sections formed at 20° C. are given for various heat treated conditions. (Q25h, 2-64; Al-b)

892-Q. Evaluation of the Short-Time Mechanical Properties of Structural Beryllium. Eugene C. Bernett. American Society of Mechanical Engineers, Paper no. 61-AV-42, 1961, 13 p.

Evaluation of the conventional and rapid rate tensile properties and short time high-stress creep properties of Be at 75-1500° F. (Q27a, Q3; Be, SGB-s)

893-Q. Elevated Temperature Stress-Rupture and Fatigue Properties of Inconel and Inconel X in Ammonia Atmosphere. Mitchell H. Weisman. American Society of Mechanical Engineers, Paper no. 61-AV-21, 1961, 7 p.

Inconel and Inconel X sheet materials, both parent metal and fusion butt welded specimens, are tested in air and NH_3 atmospheres at up to 1330° F. (Q7, Q3m; Ni-b)

894-Q. Determination of the Mechanical Properties of Aircraft-Structural Materials at Very High Temperatures After Rapid Heating. J. B. Preston and J. R. Katus. Southern Research Institute (Wright Air Development Division). U. S. Office of Technical Services, PB 161893, Apr. 1960, 81 p. $2.25.

Tensile properties of unalloyed Be determined at test temperatures from ambient through 1500° F. The short-time elevated-temperature tensile properties are determined for 10 combinations of base materials and coating materials. (Q27a, 2-61, T24a; Be)

895-Q. Research on Properties of High-Strength Materials Suitable for High-Temperature Applications. H. N. Cummings. Curtiss-Wright Corp. (Wright Air Development Division). U. S. Office of Technical Services, July 1960, 61 p. $1.75.

High-temperature torsion tests of relaxation to study the suitability of two alloys (M-1 toolsteel and Inconel X) for springs at 1000° F. and two alloys (Waspalloy and Udimet 500) for springs at 1500° F. (Q1c; Ni-b, TS, SGA-h)

896-Q. Evaluation and Alloy Development of Hot Work Die Steels for Structural Purposes. M. Schneider and J. Sheehan. Armour Research Foundation of Illinois Institute of Technology (Wright Air Development Division). U. S. Office of Technical Services, PB 171008, May 1960, 94 p. $2.25.

Investigation of the tensile properties of three commercial hot work die steels show that in sheet form these materials are essentially equivalent and develop the following nominal peak properties when air cooled from 1850° F. and doubled tempered at 1000° F.; 295,000 psi. ultimate tensile strength; 233,000 psi. yield strength at 0.2% offset; and 7% elongation in 2 in. gage length. (Q27a; TS)

897-Q. (Swedish.) Fatigue Strength of Low-Carbon Steels for Welded Structures. C. Schaub. Jernkontorets Annaler, v. 145, Feb. 1961, p. 88-108.

Tensile fatigue testing of smooth, notched and welded test bars of various low-carbon steels and low-alloy steels that have been stress relieved, normalized, hardened, tempered, aged or stretched to determine relationship between fatigue strength and yield point. (Q7, Q24c; AY, CN-g, 7-51)

898-Q. Statistical Analysis of Tensile Properties of Heat-Treated Mo-0.5Ti Sheet. H. R. Ogden and G. H. Beatty. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 101, Apr. 24, 1961, 20 p. (Available as PB 161251 from U. S. Office of Technical Services, Washington 25, D. C.)

Longitudinal and transverse tensile testing of stress relieved sheets of Mo-0.5Ti alloy at room temperature. Statistical analysis by digital computer relates heat number and gage to ultimate strength, yield strength and elongation. (Q27, S12; Mo-b, Ti, 4-53)

899-Q. Preventing Fatigue Failures. F. B. Stulen, N. H. Cummings and W. C. Schulte. Machine Design, v. 33, May 11, 1961, p. 193-195.

Stress analysis is used to relate geometrical stress concentration factor, notch reduction factor, hardness, temperature, grain size, residual stress, notch sensitivity and notch form to fatigue strength. Fatigue testing of toolsteel and air and vacuum melted SAE 4340 steel. 15 ref. (Q7a, Q-general; ST)

900-Q. Strength of Refractory Metals. Al Donlevy and Jack K. Y. Hum. Machine Design, v. 33, May 11, 1961, p. 244-249.

Stress rupture testing of electron beam melted Scb 278 Cb-Ta-Mo alloy, Scb 291 Cb-Ta-W alloy, 90 Ta-10 W alloy, 90-10 MK II alloy, Mo and W forgings in vacuum at 1600-2200° F. to determine elongation, fracture mode, rupture stress and failure time. (Q3m; Cb-b, Mo-b, Ta-b, W-b)

901-Q. Metallurgy in Nuclear Power Technology. J. C. Wright. Metal Treatment and Drop Forging, v. 28, Apr. 1961, p. 153-156, 164.

Effects of irradiation on nonfissile materials, Cu, Zr, steel, Mo and other metals. Hardness, embrittlement, stress-strain relationship, creep characteristics and transmutation effects. (Q29, Q26s, Q25n, Q3, 2-67; Cu, Mo, ST, Zr)

902-Q. Stick-Slip Friction as a Cause of Torsional Vibration in Textile Drafting Rollers. H. Catling. Institution of Mechanical Engineers, Proceedings, v. 174, no. 17, 1960, p. 575-586.

Study of stick-slip frictional characteristics of sintered bronze, cast iron, white metal, phosphor bronze, carbon and phenolic bearing materials; bearing arrangement and lubricants utilized in fabricating textile drafting long rollers. 7 ref. (Q9p, T7d, T29q; SGA-c, NM-h)

903-Q. (Book.) Report on the Elevated Temperature Properties of Aluminum and Magnesium Alloys. Howard R. Voorhees and James W. Freeman. ASTM Special Technical Publication no. 291. 308 p. 1960. American Society for Testing Materials, 1916 Race St., Philadelphia 3, Pa. $7.

Data given for composition, tensile strength, yield strength, elastic modulus, reduction of area elongation; creep strength, creep deformation; rupture strength and stress to rupture time of cast and wrought Al and Mg alloys tested at elevated temperatures. (Q-general, 2-62; Al-b, Mg-b, 4, 5)

904-Q. (Pamphlet.) Impact Testing of Sintered Material. 1961. 4 p. Johnson & Co., Inc., 21 West St., New York 6, N. Y.

Test bars of 100% Fe and 2% Cu, 0.6% C steel are subjected to stress on a tension-impact machine. Results are graphed as effect of sintered density on tension impact strength, on tensile strength and on per cent elongation. (Q6, Q27a, Q23p; Fe, ST, 6-72)

905-Q. (Russian.) Investigation of the Occurrence of Reversible Annealing Brittleness by Micro-Emf. Methods. E. V. Panchenko and E. M. Strug. Izvestiya Vuz--Chernaya Metallurgiya, Sept. 1960, p. 157-159.

Measurements on 12KhN3A steel annealed at 1200° C. quenched and re-annealed at 100-600° C. Effect of heat treatment temperature and cooling speed on toughness, hardness, micro-emf. and electrical resistance. 5 ref. (Q26s, Q-general, S11m, 2-64; ST)

906-Q. (Russian.) Investigation of Processes of Working Metals by Pressure Using the Theory of Plasticity. V. L. Kolmogorov. Izvestiya Vuz--Chernaya Metallurgiya, Sept. 1960, p. 79-89.

Hot compression tests on steel cylinders to investigate resulting strain and plastic deformation as a function of direction and location of pressure. Mathematical examination of uniform and nonuniform tube deformation. 5 ref. (Q23p, Q24, Q28f, 3-74; ST)

907-Q. (Russian.) Neutral Zones in Flat-Parallel Upsetting. E. F. Sharapin. Izvestiya Vuz--Chernaya Metallurgiya, Sept. 1960, p. 90-94.

Investigation of neutral zones in the deformation of metals by cold working

of lead. Mathematical treatment regarding neutral line equations and deformation flow. 10 ref. (Q24, F22j, 3-72; Pb)

908-Q. (Russian.) The Question of the Third Stress Relaxational Period in Metals. Ya. S. Gintsburg. Izvestiya Vuz--Chernaya Metallurgiya, Sept. 1960, p. 116-119.

Investigation of relaxation in 880-950° C. annealed and 450-600° C. stress relieved Cr-Ni-Mn, Type 20 and 40 and Armco steels. Stress relaxation is related to temperature, time and type of steels. 13 ref. (Q3a, 2-60, 2-62, 2-64; ST)

909-Q. (Russian.) Improvement of Mechanical Properties of Steels With the Help of Thermo-Ultrasonic Working. E. A. Alftan. Izvestiya Vuz--Chernaya Metallurgiya, Sept. 1960, p. 160-166.

Toughness, microstructure and hardness of 40 KHNMA and 30KHGSA steels as affected by ultrasonic vibration. Relation of annealing characteristics to vibration power and location and annealing temperatures. (Q23r, Q29n, M27, 1-74, 2-64; AY)

910-Q. (Russian.) Effect of Phosphorus and Boron on the Reversible Brittleness of Low-Carbon Nickel Steel. L. S. Lyahovich and T. S. Shilkova. Izvestiya Vuz--Chernaya Metallurgiya, Sept. 1960, p. 167-168.

Toughness of 12.13% C, 1.17-1.30% Ni steels containing .012-.114 P and 0-0015% B after quenching and annealing at 450-650° C. Influence of composition, heat treatment temperature and cooling rate. (Q23r, 2-60, 2-64; AY, P, B)

911-Q. (Russian.) Hardness of Pig Iron. M. S. Drozd. Izvestiya Vuz--Chernaya Metallurgiya, Sept. 1960, p. 169-172.

Improved method of hardness measurement adapted to pig iron using a ball indenter with indenter force measured by postelastic recovery depth of penetration. 5 ref. (Q29b, 1-52; CI-a)

912-Q. Drilling Holes to Measure Residual Stresses. Arthur J. Bush. Metal Progress, v. 79, May 1961, p. 91-93.

In this method, a small hole is drilled into the test specimen to relieve the residual stresses. Drilling is stopped at specific intervals and the changes in stress are determined by strain gages which surround the hole. (Q25h, G25; ST)

913-Q. (Japanese.) Changes of Microstructure of Brake Shoes and Tires Caused by Braking. Minoru Nakai, Seizo Saito and Kunio Okabayashi. Imono (Japan Foundrymen's Society, Journal), v. 33, Feb. 1961, p. 25-31.

Martensitic and austenitic transformations, flow out of pearlite and granulation of graphite in the friction surface layers of cast iron brake shoe specimens in braking tests. Wear of the specimen is attributed to stripping of flake graphite from the friction surfaces and to the nature of the structure as a function of the tempering reaction caused by temperature rise (above 800° C.) during braking. 5 ref. (Q9, Q25m, M27, N8, T23, 2-62; CI, 17-52)

914-Q. (English.) Pressure Vessels Boilers and Pipe Lines. Lastechniek, v. 27, Mar. 1961, p. 55-62.

Effect of residual stress on brittle fracture, corrosion cracking and fatigue failure of boilers. Stress relief by heat treatment and mechanical treatment making use of the thermal expansion in local heating. (Q26s, Q7, R1d, 3-66, T26q)

915-Q. (Czech.) High-Strength Steels Used in Constructions. Jiri Fuchs. Zvaracsky Sbornik, v. 10, Jan. 1961, p. 89-99.

Tensile and yield strength of the low-alloy Cr steel 11523.9, 11583.1, 11483.1 steels and the low-alloy Mn-Ti steel 11603.1. Their relatively low fatigue limit and high notch sensitivity should be considered in the design of constructions exposed to dynamic loads. Reduction of brittle fracture tendency and stress relief is achieved by heat treating welded constructions. (Q27a, Q23b; AY, 4-57, 7-51)

916-Q. (Czech.) High-Strength Steels for Welded Construction Used in the CSSR. Frantisek Sicha. Zvaracsky Sbornik, v. 10, Jan. 1961, p. 100-108.

Composition of the low-alloy Mn-Cr-Si steel CSN 11523 and its notch impact strength at -60 to 20° C. Composition of rolled products from CSN 15223, 11483, 11583 and 11603 steels. Effect

of their thickness on mechanical properties. (Q6, 2-61, Q-general; AY, 4-57, 7-51)

917-Q. Effect of Basic Physical Parameters on Engineering Properties of Intermetallic Compounds. D. L. Wood and J. H. Westbrook. U. S. Office of Technical Services, PB 171393, Aug. 1960, 34 p.

Tensile test specimens of Bi2Tl and AgMg, produced directly by extrusion, provide information applicable to future studies of the properties of NiAl, a material whose melting point and oxidation resistance render it practical as an alloy base should a solution to the ductility problem be found. (Q27, R1h, Q-general; Ag, Al, Bi, Mg, Ni, Tl, 14-68)

918-Q. Effect of Temperature on the Creep of Polycrystalline Aluminum by the Cross-Slip Mechanism. N. Jaffe and J. E. Dorn. University of California (Wright Air Development Division). U. S. Office of Technical Services, PB 171360, June 1960, 21 p. $.75.

The apparent activation energy for creep of polycrystalline Al is determined at 273-350° K. by the effect of small abrupt changes in temperature on the creep rate. A constant activation energy of 27,400 ± 1000 cal. per mole was obtained over strains of 0.003-0.23, stresses ranging from 2250-6000 psi. and strain rates varying from 0.1145 x 10-5 to 29.5 x 10-5 per min. (Q3, 2-61; Al)

919-Q. Detection of Fatigue Damage With Rayleigh Waves. P. J. Brosens, N. A. G. Hakimi and G. R. Khabbaz. Massachusetts Institute of Technology (Air Research and Development Command). U. S. Office of Technical Services, PB 171099, Aug. 1960, 50 p. $1.50.

The detection of fatigue damage by ultrasonic means must be based on concentration of ultrasonic energy at the surface of the examined metal. Among the methods of achieving such focusing of ultrasonic energy, Rayleigh waves appear to be the most promising. They offer the possibility of detecting both fatigue damage prior to crack formation and the fatigue cracks present after crack formation. (Q7, 1-74)

920-Q. A Study of the Effects of Surface Films on the Mechanical Properties of Metals. I. R. Kramer. Martin Co. (Wright Air Development Division). U. S. Office of Technical Services, PB 171150, July 1960, 34 p. $1.

By removing the surface of Al single crystals while they are being deformed, the extent and slope of Stage I and Stage II are affected. The stress at which Stage III starts is also lowered. A dislocation pop-out phenomenon is observed when the rate of metal removed is suddenly increased during the tensile deformation. (Q-general; Al, 14-61)

921-Q. The Effect of Several Geometrical Variables in a Notch Tensile Strength of 4340 Sheet Heat Treated to Three Strength Levels. V. Weiss. Syracuse University (Wright Air Development Division). U. S. Office of Technical Services, PB 171396, Sept. 1960, 42 p. $1.25.

The stress concentration factor and relative stress gradient, which characterize the stress pattern at the notch root, are determined analytically from elastic theory. Results show that the effect of stress gradient on notch strength is identical with that of section width. For a brittle material the stress gradient is the primary factor that influences notch strength at a given value of stress concentration. (Q27a, 3-66; ST, 4-53)

922-Q. Beryllium Crack Propagation and Effects of Surface Conditions. C. O. Matthews. Lockheed Aircraft Corp. (Wright Air Development Division). U. S. Office of Technical Services, PB 171088, July 1960, 197 p. $3.

Investigation of the mechanical properties of Be sheet with various surface finishes shows that sheets etched to remove surface defects caused by machining have the best properties. The fatigue endurance limit, which is improved by etching, is as high as the static tensile strength. (Q26q; Be, 4-53)

923-Q. Effects of Interrupted Quenching Procedures on Properties of Type 410 Stainless Steel. J. Bressanelli and J. Hoke. ASME Transactions, Paper no. 61-Met-5, 1961, 6 p.

The impact strength of hardened 410 stainless is known to be adversely affected when the steel is tempered between 750-1050° F. The cooling rate through the martensite transformation range has a significant effect upon the impact properties after subsequent

tempering. Slow air cooling brings about a marked improvement. (Q6, 2-64; SS)

924-Q. Effects of Specimen Size and Notch Acuity on the Brittle Fracture Strength of a Heat Treated Steel. S. Yukawa and J. G. McMullin. ASME Transactions, Paper no. 61-Met-2, 1961, 4 p.

Effects of various methods of notch preparation on the notched slow bend fracture strengths of heat treated alloy steel specimens. Results indicate that several kinds of cracks result in about 35% lower strength than a machined 0.005 in. root radius notch. 10 ref. (Q26s; AY)

925-Q. An Energy Criterion for Low-Cycle Fatigue. D. E. Martin. ASME Transactions, Paper no. 61-Met-4, 1961, 7 p.

A criterion is developed which supposes that the segment of strain hysteresis associated with work hardening is a measure of damage. On the basis of this "damage" work criterion and assuming a linear work hardening law, the well known plastic strain-cycle life equation is derived. 31 ref. (Q7)

926-Q. An Analysis of the Time and Temperature Dependence of the Upper Yield Point in Iron. P. E. Bennett and G. M. Sinclair. ASME Transactions, Paper no. 61-Met-1, 1961, 8 p.

Torsion tests using strain rates of 12.5 per sec., 0.25 per sec. and 0.0001 per sec. over the temperature range 77-525° K. The upper yield point shows a rapid increase as the temperature is lowered; an increase in the strain rate also causes an increase in the yield point. 25 ref. (Q1, Q24c, 2-61; Fe)

927-Q. Circular-Patch Test for Evaluating Armor Crack-Susceptibility. L. E. Poteat and R. W. Jones. Watertown Arsenal. U. S. Office of Technical Services, PB 161822, May 1960, 39 p. $1.

Test procedure applied to several different heats of armor steel Evaluation by this procedure places the heats in the correct order of susceptibility as determined from the known fabrication history of the heats. (Q26; ST)

928-Q. Practical Evaluation of the Standard Stress-Strain Curves and Related Properties. R. H. Harrington. Watertown Arsenal. U. S. Office of Technical Services, PB 161896, July 1960, 27 p. $.75.

The yield strength can no longer be relied on, per se, for most economical or even safe use of the new high-strength steel, other new alloys and new esoteric treatments. The various properties derived from and associated with the standard stress-strain curve are evaluated and related to the behavior of alloys under stress. Several other properties, directly related to the stress-strain curve, are preferable to the 0.10 or 0.20% offset yield strengths for present applications and future developments. (Q25n)

929-Q. The Effects of Stored Energy and Recrystallization on the Creep Rupture Properties of Internally Oxidized Copper-Alumina and Copper-Silica Alloys. Masao Adachi and Nicholas J. Grant. Massachusetts Institute of Technology (Wright Air Development Center). U. S. Office of Technical Services, PB 161846, Dec. 1959, 30 p. $.75.

Cu-silica and Cu-alumina alloys of low-oxide content are produced by the internal oxidation and extrusion of Cu-Si and Cu-Al alloy powders. These alloys show normal behavior after recrystallization but with increasing amounts of recrystallization at temperatures up to 1050° C. the creep rupture strength at 450° C. decreases and the ductility increases. Cold work results in an increase in creep rupture strength and a decrease in ductility. (Q3, N5; Cu-b)

930-Q. Void Formation and Grain Boundary Sliding in Aluminum-Magnesium Solid Solution Alloys. A. W. Mullendore and N. J. Grant. Massachusetts Institute of Technology (Wright Air Development Division). U. S. Office of Technical Services, PB 171399, Sept. 1960, 37 p. $1.

Void formation and growth during creep are observed in Al-1.92% Mg and Al-5.10% Mg as a function of temperature, stress and time. The origin of voids is related to the development of an irregular (serrated) grain boundary and to grain boundary sliding. (Q3, M27; Al-b, Mg)

931-Q. Plastic Stress-Strain Relations and Yield Surfaces for Aluminum Alloys. H. J. Ivey. Journal of Mechanical Engineering Science, v. 3, Mar. 1961, p. 15-31.

Tensile and torsion testing of solid and tubular specimens of 218M, 226M, 19S and 24S-T4 Al alloys and a Si-Al alloy to determine relationship between shear and tensile stress and shear and tensile strain. 28 ref. (Q1e, Q2j, Q25, Q27; Al-b)

932-Q. Brittle Fracture Strength of Welded Steel Plates. A. A. Wells. British Welding Journal, v. 8, May 1961, p. 259-277.

Results of tensile tests on 60 steel plates, each 3 ft. wide by 1 in. thick. A mild steel, a semikilled higher Mn low-carbon steel and three fully-killed normalized steels are tested under conditions of loading at -60 to 20° C. Samples are previously artificially notched in edges prepared for butt welding, which is carried out along the plate centers in the direction of tension. Effect of electrode type on fracture strength. 16 ref. (Q26s, Q27; ST, 4-53, 7-51)

933-Q. Effect of Plastic Strains on Mechanical Properties of Five Steels. C. F. Tipper. British Welding Journal, v. 8, May 1961, p. 278-281.

Effects of plastic strain, aging and stress-relieving are studied by notch impact and tensile tests on five 1 in. mild steel plates. (Q6, Q27, 2-64, 2-65, 3-68; CN, 4-53)

934-Q. On the Ratio of Transverse to Axial Strain and Other Tensile Properties of a Cold Rolled Steel Alloy. A. Shelton. Journal of Mechanical Engineering Science, v. 3, Mar. 1961, p. 89-104.

Tensile testing of cold rolled 0.4% carbon steel alloy to determine effect of strain reduction on tensile stress, contraction ratio, plastic volume change, Poisson's ratio, Young's modulus and Vickers hardness. Photomicrographs of crystal structure. 17 ref. (Q27, Q-general, M-general, 3-68; CN-g)

935-Q. Sintered High-Temperature Alloys. V. A. Tracey, G. T. Poyner and J. F. Watkinson. Journal of Metals, v. 13, May 1961, p. 363-369.

Report on mechanical properties of alloys produced from atomized Ni-Cr-Co and Ni-Cr-Co-Mo powders including stress-rupture, fatigue, impact resistance, thermal shock, tensile and grain size characteristics. 11 ref. (Q-general; SGA-h, Ni-b, Co, Cr, Mo, 6-72)

936-Q. (Russian.) Development of Pearlitic Steel Composition to Increase Creep Strength at 580° C. T. I. Volkova. Metallovedenie i Termicheskaya Obrabotka Metallov, Feb. 1961, p. 11-16.

Phase and solid solution composition are varied to increase creep strength by additional alloying with Cr, W, Mo, V, Co or Si. (Q3m, 2-60; ST)

937-Q. (Russian.) Destruction in Austentic Steels. I. N. Laguntsov and V. F. Zlepko. Metallovedenie i Termicheskaya Obrabotka Metallov, Feb. 1961, p. 24-27.

Effect of prolonged aging at 600-650° C. on the nature of destruction in 1Kh18N12T, Ei257 and Ei695R steels. Intergranular fractures in long time tensile tested specimens are studied in relation to time and temperature of aging. 5 ref. (Q26, 2-65; SS-e)

938-Q. (Russian.) Medium Tungsten, Cobalt-Vanadium High Speed Toolsteel. A. N. Popandopulo and I. Z. Snegur. Metallovedenie i Termicheskaya Obrabotka Metallov, Feb. 1961, p. 35-40.

Effect of various heat treatments on the red hardness, magnetic permeability, impact strength, microhardness and embrittlement of R9F4K8M steel. Advantages compared with other high-speed toolsteel grades. 9 ref. (Q29, Q6n, Q26s, 2-64; TS-m)

939-Q. (Russian.) Cast Cobalt High-Speed Toolsteels. V. A. Kashchuk. Metallovedenie i Termicheskaya Obrabotka Metallov, Feb. 1961, p. 40-42.

Effect of Co and heat treatment on red hardness and service life of chill cast high-speed steel cutting tools. Development of suitable steel composition. 9 ref. (Q29n, 2-60, 2-64; TS-m, Co, 5)

940-Q. (Russian.) Anisotropy of Mechanical Properties of Rolled Structural Steels. K. M. Gel'fand and V. S. Markov. Metallovedenie i Termicheskaya Obrabotka Metallov, Feb. 1961, p. 53-55.

Plasticity, impact strength, elongation and compression strength in the area transverse to the rolling direction vary with steel composition and heat treatment parameters. Properties of numerous steels are analyzed in both transversal and longitudinal directions. (Q23, Q6n, Q28g; ST, 4-57)

941-Q. The Application of Rabotnov's Creep Parameter. Robert M. Goldhoff. ASTM Preprint no. 75, 1961, 13 p.

Results of calculations are compared with known data for a low-alloy steel, 17-7PH alloy steel, Type A286 steel, Mg, Crucible Type 422 steel, canvas laminate and nylon. 6 ref. (Q3; AY, Mg, SS)

942-Q. Creep and Rupture Properties of Five Copper Base Casting Alloys. Donald P. Moon and Ward F. Simmons. ASTM Preprint no. 78, 1961, 18 p.

Elevated temperature (250-550° F.) testing of alloys ranging from 61.9-80.7% Cu, 6.6-39% Zn, 0-4% Sn, 0-5.6% Pb, 0.11-3.1% Fe, 0-0.14% Sb, 0.01-20.4% Ni, 0-5.8% Al, 0-3.8% Mn, 0-4.12% Si and 0-0.05% S. 6 ref. (Q3, 2-61; Cu-b, Zn)

943-Q. Properties of Hardened Copper-Beryllium Strip After Exposures to Elevated Temperatures. K. G. Wikle and N. P. Sarle. ASTM Preprint no. 79, 1961, 20 p.

Testing at room temperature up to 1150° F. to determine tensile and yield strength, proportional limit, elongation and modulus values. 5 ref. (Q-general; Cu-b, Be, 4-53)

944-Q. Some Effects of Section Size and Testing Condition on Tensile Properties of Zircaloy 2 at 600° F. S. L. Ames. ASTM Preprint no. 84, 1961, 10 p.

Hot rolled strip, sheet and rod, cold rolled strip and forgings tested in the annealed, sandblasted and pickled condition. (Q27; Zr-b, 4-51, 4-53)

945-Q. Vanadium Improves Cold-Heading Die Life. Robert S. Hodder. Metalworking Production, v. 105, Apr. 26, 1961, p. 59-60.

Addition of 3 1/2% vanadium to 0.90% carbon water-hardening toolsteel used in the fabrication of cold heading dies increases wear resistance and stabilizes fine grain over the normal hardening range. (Q9, J5, M27c, W24n, 2-60; TS, V, 17-57)

946-Q. Effect of Surface Condition on Ductile-to-Brittle Transition Temperature of Tungsten. Joseph R. Stephens. NASA Technical Note, D-676, Feb. 1961, 31 p.

Effect of surface finish on yield strength, ultimate tensile strength, elongation, reduction in area and ductile-to-brittle transition temperature of commercially pure sintered tungsten rod. 6 ref. (Q23, Q27, 9-71; W, 6-72)

947-Q. (Japanese.) Fractographic Study of Plain Carbon Steel With an Electron Microscope. Shoichi Nakanishi and Akio Takemasa. Tetsu-to-Hagane (Iron and Steel Institute of Japan, Journal), v. 47, Apr. 1961, p. 581-585.

Crack initiation and propagation, fracture patterns and deformation microstructures observed in 0.17% carbon steel fractured in tension at -60 to 80° C. Relation of phenomena to grain boundary migration and absorption of fracture surface energy and to influence of pearlite structure, deformation banding and nonmetallic inclusions. 7 ref. (Q26q, M21e, M23p, N3, 3-68, 3-71; CN-g)

948-Q. (Japanese.) Study of High Strength Structural Steel. Pt. 2. Effect of Addition of Beryllium and Molybdenum on Si-Mn and Si-Mn-Cr Steel. Eiichiro Asano and Toru Ishida. Tetsu-to-Hagane (Iron and Steel Institute of Japan, Journal), v. 47, Apr. 1961, p. 585-591.

Tensile and yield strengths, Vickers hardness and hardenability of low alloy steel specimens after rolling and forging deformation and after tempering, quenching and furnace and air cooling treatments as a function of 0-.86% Mo and 0.0100% B additions. 5 ref. (Q27, Q29, J5, 2-60, 2-64, 3-68; AY, B, Mo)

949-Q. (Japanese.) Effect of Carbon, Chromium, Molybdenum and Vanadium on Properties of 3% Chromium Heat Resisting Steel. Sadao Koshiba and Tsuneo Kunou. Tetsu-to-Hagane (Iron and Steel Institute of Japan, Journal), v. 47, Apr. 1961, p. 599-603.

Rockwell C hardness after heat treatment, tensile properties at 600-700° C., rupture strength, microstructure and deformation ratio of specimens as a function of alloying elements after various tempering, quenching and cooling treatments. 8 ref. (Q-general, 2-60, 2-62, 2-64; AY, Cr, C, Mo, V)

950-Q. (Japanese.) The Influence of Different Melting Methods on High Temperature Properties of Heat Resisting Steel. Masao Kawahata. Tetsu-to-Hagane (Iron and Steel Institute of Japan, Journal), v. 47, Apr. 1961, p. 604-611.

Mechanical properties, age hardening characteristics and microstructures for vacuum induction melted and air melted A-286 and Incoloy T heat resisting alloy specimens are compared by short time tensile, rotating bending fatigue and high temperature (650-815° C.) creep rupture tests and by electron microscopy and X-ray examination. 4 ref. (Q-general, M-general, N7a, 2-60, 2-62; SGA-h, Fe-b, Ni-b)

951-Q. (Czech.) Impact Strength of Mn-Si-Cr Steels. Roman Sejnoha and Frantisek Pavelka. Hutnicke Listy, v. 16, Mar. 1961, p. 153-158.

Steels with 0.14-0.33% C, 0.95-1.61% Mn, 0.32-1.20% Si, 0-1.89% Cr, 0.018-0.029% P and 0.023-0.036% S are quench hardened and tempered at 200-650° C. for 30 min. to determine effects of C, Mn, Si and Cr on the notch impact strength and on the range of temper brittleness for moderate annealing temperatures. 11 ref. (Q6n, Q26s, 2-60; ST)

952-Q. (Japanese.) Improvement of Cadmium Copper. Yoshitsugu Mishima and Noboru Makino. University of Tokyo, Engineering Research Institute, Annual Report, v. 19, Mar. 1961, p. 77-84.

Effect of 0.1-0.4% Be and 0.4-0.16% Ag additions on the heat resistance, electrical conductivity, microstructure and hardness (Rockwell B) of Cu alloys containing 0.3-1.5% Cd after cold rolling and aging, annealing and solution treatments. 3 ref. (Q-general, M27, P15g, 2-60, 2-62, 2-64; Cu-b, Cd, Be, Ag)

953-Q. (Japanese.) Cu-NiBe and Cu-Ni-Sn Alloys. Yoshitsugu Mishima and Hitoshi Shitara. University of Tokyo, Engineering Research Institute, Annual Report, v. 19, Mar. 1961, p. 85-89.

Intermetallic compounds of Ni with Al, Be, Sn, Sb, P, Ti and Si are alloyed with Cu in tests to find new high-strength, high-conductivity alloys similar to low Be-Cu alloy. Electrical conductivity, tensile properties and age hardenability data are given for the alloys which show most promise, Cu-NiBe and Cu-Ni-Sn. (Q27, N7a, P15g, 2-60; Cu-b, Ni, Be, Sn, 14-68)

954-Q. (Japanese.) Preliminary Tests on Japan Made Hafnium Metal. Yoshitsugu Mishima and Naoaki Takahashi. University of Tokyo, Engineering Research Institute, Annual Report, v. 19, Mar. 1961, p. 115-119.

Mechanical and physical properties of Hf plate and sheet specimens produced from Kroll process sponge by nonconsumable Ar arc and vacuum electron beam melting are compared with those of crystal bar Hf. Data are given for tensile tests, Vickers hardness and electrical resistance measurements and gas analysis of annealed and hot and cold worked specimens with attention to ductility, work hardening effects and purity. (Q-general, C5h, C25, P-general, 2-60; Hf)

955-Q. Bursting Strength of Tubes, Cylinders and Spheres. Mechanical World and Engineering Record, v. 141, May 1961, p. 167-169.

Bursting and working strengths are calculated from formulas in terms of the geometry of the tube, internal pressure carried and material stress. Modifications which take into account the presence of stress raisers. (Q10; 4-60)

956-Q. Structural Behaviour of a Spherical Pressure Vessel. D. S. Houghton and G. A. Ackroyd. Engineer, v. 21, Apr. 28, 1961, p. 686-691.

Stress and strain distribution at the junction of a spherical Al reactor vessel and its supporting skirt is measured using electrical resistance strain gages. (Q25, T26q; Al, 17-57)

957-Q. The Friction of Solids. E. H. Freitag. Contemporary Physics, v. 2, Feb. 1961, p. 198-216.

Study of elastic and plastic deformation and the friction mechanism in metals and nonmetals. Determination of the coefficient of friction for steel sliding on Cu and Bi; Cb carbide sliding on vanadium carbide and graphite sliding on Cb carbide from 0-2000° C. Nonmetals studied are polymers, diamond, rock-salt, rubber, graphite and mica. 23 ref. (Q9p)

958-Q. (German-French.) Assemblies in Aluminum Construction. O. Steinhardt. Schweisstechnik-Soudure, v. 51, Feb. 1961, p. 34-36.

Mechanical testing of smooth, riveted, perforated, screwed and welded light alloy rods to determine tensile strength, fatigue limit and other properties. (Q-general; Al-b, 7)

959-Q. The Phenomenon of Seizure and Its Investigation. A. P. Semenov. Wear, v. 4, Feb. 1961, p. 1-9.

Study of seizure in sheet specimens of Al, Ag, Cu and Cu alloys. Influence of temperature on specific pressure of seizure and upon the seizure deformation. Determination of the relation between atomic concentration of alloying elements in Cu and parameters of crystal lattice and specific pressure of seizure. 17 ref. (Q9q; Ag, Al, Cu-b)

960-Q. A Crossed-Cylinder Wear Machine and Its Use in the Study of Severe Wear of Brass on Mild Steel. J. Halling. Wear, v. 4, Feb. 1961, p. 22-31.

Description of wear machine designed for use in conjunction with a standard center lathe. This machine is used in the study of severe wear of 60/40 brass rubbing on mild steel to determine the variation in wear rate and coefficient of friction with rubbing velocity. 5 ref. (Q9; CN, Cu-n)

961-Q. Theoretical and Experimental Residual Stresses in Quenched Steel Cylinders. H. G. Landau, E. H. Hess and E. E. Zwicky, Jr. American Society of Mechanical Engineers, Paper no. 61-Met-6, 1961, 4 p.

Residual stresses in a quenched cylinder are determined on the basis of previously developed equations assuming an elastic perfectly plastic material with temperature-dependent yield stress. These are compared with measured stresses in tests on subcritically quenched cylinders using the boring out technique and very satisfactory agreement is obtained. (Q25h; ST)

962-Q. Structural Characteristics of Fasteners for Honeycomb. Jack Cherne. American Society of Mechanical Engineers, Paper no. 61-AV-57, 1961, 5 p.

Core material selected is Al honeycomb, the skins are 2024 ST Al and the fasteners used are Shur-Lok SL78 potted-in inserts. Results of the tests are presented as a plot of ultimate strength versus panel thickness for various combinations of skin and core densities. (Q27a; Al-b, 4-57, 7)

963-Q. Segregated Structures in Highly Alloyed Ferritic Gas-Turbine Wheel Forgings. G. R. Heckman and A. W. Herbenar. American Society of Mechanical Engineers, Paper no. 61-GTP-9, 1961, 16 p.

Segregates present in highly alloyed materials, particularly in modified 12% Cr steels, can have very adverse effects on the physical and mechanical properties. Such inhomogeneities can act as inherent notches or stress risers which contribute to or cause premature failures. The fact that such segregation cannot be detected by nondestructive magnetic particle or sonic tests dictates the use of alternate inspection and process methods. (Q-general, 9-69, W11m; SS-d, 5)

964-Q. Hydrogen Embrittlement of Titanium Alloys. A. E. Riesen and D. H. Kah. Wright Air Development Division. U. S. Office of Technical Services, PB 171394, Oct. 1960, 49 p. $1.25.

To establish hydrogen toleration limits in structural Ti sheet alloys, the effect of various hydrogen interstitial contents between 60 ppm. and 312 ppm. on the notch sensitivity and low-strain rate embrittlement of four Ti alloys is investigated at room temperature. The materials investigated included three alpha-beta alloys and one all alpha alloy. (Q26s; Ti-b, SGB-s, 4-53)

965-Q. Study of Fracture Toughness. R. W. Boyle, J. M. Krafft and A. M. Sullivan. Report of NRL (Naval Research Laboratory) Progress, Apr. 1961, p. 29.

The Irwin hypothesis for fast fracture instability as the tangency rather than the intersection of crack driving force and resistance curves is examined for crack growth and its resistance in 7075-T6 Al sheets. From the general shear lip shape characteristics and by measurement of plastic strain energy density for the lip from tests at a given thickness, the initial portion of resistance curves and related crack extension and toughness are predicted. (Q23r, Q26s, 3-68; Al-b)

966-Q. Development of High-Strength Sheet Materials. R. W. Boyle. Report of NRL (Naval Research Laboratory) Progress, Apr. 1961, p. 29-30.

Evaluation of fracture toughness in high-strength materials by measurement of crack length and velocity with a calibration curve having corrections for plastic zone effects using an adaptor with the ink stain method on notched plate specimens. (Q23r, Q26q, 1-54; SGB-a)

967-Q. Properties of Iron Alloys. J. E. Srawley. Report of NRL (Naval Research Laboratory) Progress, Apr. 1961, p. 30-31.

Room temperature tensile and crack propagation tests on low-alloy steel sheet specimens after austenitizing at 1600° F. with subsequent oil quenching and tempering. Data are given for crack propagation resistance and ratio of yield strength to fracture stress. (Q26s, Q27, 2-64, 3-66; AY)

968-Q. Metals and Alloys at Elevated Temperature. P. Shahinian and M. R. Achter. Report of NRL (Naval Research Laboratory) Progress, Apr. 1961, p. 33-34.

Influence of cold work on the strength of a low-alloy steel, AISI 4140, at elevated temperature is investigated by hardness, tensile and creep-rupture tests with optical and electron microscopy and X-ray diffraction examination. An anomalous behavior is observed of alloy strengthening by hardness through lattice strain and strain aging at large amounts of deformation and weakening by small amounts of deformation as a function of softening due to microstructural change. (Q3, Q23a, Q27, M-general, 2-61, 3-68; AY)

969-Q. Metals and Alloys at Elevated Temperature. T. Reuther, P. Shahinian and M. R. Achter. Report of NRL (Naval Research Laboratory) Progress, Apr. 1961, p. 34-35.

Effect of prior creep at constant elongation rate, at 1200° F., in air, nitrogen and vacuum, on the low temperature tensile properties and grain boundary crack propagation of Ni specimens. Investigation of oxidation hardening mechanisms and other environmental phenomena as influencing factors on residual strength and crack number and growth. (Q3, Q26s, Q27, R1h, 2-61, 2-66; Ni-a)

970-Q. The Slow Growth and Rapid Propagation of Cracks. ASTM Bulletin, Materials Research & Standards, v. 1, May 1961, p. 389-393.

Influence of dimensions of the crack, elastic stress field in the vicinity of the crack and stability of the material on speed of crack growth. Application of theory to sheet steel. (Q26q; ST)

971-Q. The Tensile Properties of High-Purity Low-Carbon Iron and Iron-Manganese Alloys. W. C. Leslie, G. B. Williams and D. S. Hutton. Iron and Steel Institute, Journal, v. 198, May 1961, p. 21-29.

Fe-C and Fe-C-Mn alloys containing C(0.0025-0.066), Mn(0.005-0.45), O_2(0.0015-0.003), N_2(0.0009-0.0014) are prepared by vacuum melting and casting. After establishing a constant ferrite grain size, the alloys are treated to vary the carbide particle size and distribution without altering grain size. Tensile properties and deformation are observed to be relatively unaffected. 14 ref. (Q27a, 3-71; Fe-b, C, Mn)

972-Q. Introduction to the Technical Program. E. P. Klier. Paper from "Symposium on the Testing and Evaluation of Materials for Solid Propellant Rocket Motor Casings". Report no. MAB-156-M. National Academy of Sciences, Washington 25, D. C., 1959, p. 5-7.

Analysis of stress conditions in rocket motor cases with attention to materials selection and importance of flaw detection. (Q25, S13, T2p)

973-Q. Fracture Mechanics Theory and Its Application to Analysis of Fractures of Rocket Chambers. George R. Irwin. Paper from "Symposium on the Testing and Evaluation of Materials for Solid Propellant Rocket Motor Casings". Report no. MAB-156-M. National Academy of Sciences, Washington 25, D. C., 1959, p. 24-58.

Theoretical analysis of elastic stress field and plastic strain near the crack edge and of requirements essential to measurement of fracture strength. Application of fracture mechanics analysis to welded AMS 6434 steel. Critical crack extension force values and modes of fracture of 17-7PH stainless steel; B-120 VCA Ti alloy; 7075-T6, 2024-T4 and 2024-T3 Al alloys; SAE 4340, SAE 6150, Tricent, X-200 and Vasco X-3G' steel sheets. 6 ref. (Q26, Q25, T2p, 3-68; SGB-a, ST, Al-b, Ti-b, 4-53, 7-51, 17-57)

974-Q. Summary of U. S. Steel's Experience With Crack Propagation Testing. J. M. Hodge. Paper from "Symposium on the Testing and Evaluation of Materials for Solid Propellant Rocket Motor Casings". Report no. MAB-156-M. National Academy of Sciences, Washington 25, D. C., 1959, p. 59-70.

Importance of protection against susceptibility to rapid crack propagation in the development of ultra-high strength steels for aircraft and missile applications. Evaluation of crack extension force for the onset of rapid crack propagation and of the tensile properties for sheet specimens of 12 MoV steel and Airsteel X-200. Effects of tempering at 450-1000° F., direction of testings, notch radius and transition temperature. (Q26q, Q27, T2p, 2-62, 2-64, 3-66; SGB-a, ST, 4-53, 17-57)

975-Q. Fracture Toughness Tests of High Strength Sheet Metals. Harold Bernstein. Paper from "Symposium on the Testing and Evaluation of Materials for Solid Propellant Rocket Motor Casings". Report no. MAB-156-M. National Academy of Sciences, Washington 25, D. C., 1959, p. 71-92.

Critical crack extension force and net section stress values of sheet and weld specimens of AISI 6150, AMS 6434, Airsteel X-200, Vascojet 1000 steels and B-120 VCA Ti alloys. Effects of temper conditions, thickness, test direction, test temperature, welding, slot configuration and crack starter techniques on fracture toughness. (Q26q, Q23s, T2p, 2-62, 2-64, 3-66, 3-73; SGB-a, ST, Ti-b, 4-53, 7-51, 17-57)

976-Q. Sharp Notch and Smooth Tensile Characteristics for a Number of Ultra-High Strength Steel Sheet Alloys. G. B. Espey, M. H. Jones and W. F. Brown, Jr. Paper from "Symposium on the Testing and Evaluation of Materials for Solid Propellant Rocket Motor Casings". Report no. MAB-156-M. National Academy of Sciences, Washington 25, D. C., 1959, p. 93-157.

Room temperature, sharp notch and smooth tensile properties of SAE 4340, AMS 6434, UHS 280, 300M, X-200, Vascojet 1000, AISI 410, 12 MoV, AM 350, 17-7 PH, PH-15-7Mo, AISI 304L and AISI 3-1 alloy steels. Influence of tempering temperatures, test direction and cold rolling on tensile characteristics. Notch sensitivity of the alloys at various tensile strength and yield strength levels. 31 ref. (Q23s, Q26, Q27, 2-61, 2-64, 3-66, 3-68; SGB-a, SS, 4-53)

977-Q. Preliminary Investigation of Brittle Fracture in Sheet Metals. Alfred J. Brothers and Howard E. Martens. Paper from "Symposium on the Testing and Evaluation of Materials for Solid Propellant Rocket Motor Casings". MAB-156-M. National Academy of Sciences, Washington 25, D. C., 1959, p. 158-188.

Notch tensile properties of mild steel and Ti-75A Ti alloy sheet at -325 to 450° F. under conditions of slow and impact loading. Effect of notch depth and sheet thickness on ductile to brittle transition temperature. Review of testing procedures for evaluating susceptibility to brittle fracture in high-strength sheet materials. 8 ref. (Q23s, Q26s, Q27d, 2-61, 3-68, 3-73; CN, Ti-b, 4-53)

978-Q. Current Position of Crack Propagation Testing of High-Strength Sheet Steels in the Physical Metallurgy Branch at N. R. L. John E. Srawley. Paper from "Symposium on the Testing and Evaluation of Materials for Solid Propellant Rocket Motor Casings". Report no. MAB-156-M. National Academy of Sciences, Washington 25, D. C., 1959, p. 189-201.

Tensile tests at -250 to 500° F. on sheet specimens provided with centrally disposed transverse cracks. Fracture appearance and net fracture stress transition temperatures and their relationship to room temperature yield strength. Effect of specimen thickness and crack dimensions. (Q23, Q26, Q27, 2-61, 3-73; SGB-a, AY, 4-53)

979-Q. Notch Sensitivity and Resistance to Tearing of Titanium Alloy Sheet. S. V. Arnold. Paper from "Symposium on the Testing and Evaluation of Materials for Solid Propellant Rocket Motor Casings". Report no. MAB-156-M. National Academy of Sciences, Washington 25, D. C., 1959, p. 202-220.

Tensile properties and notch strength of Ti sheet alloys Ti-5%Al-2.5%Sn, Ti-8%Al-2%Cb-1%Ta, Ti-6%Al-4%V and Ti-4%Al-3%Mo-1%V at -196 to +400° C. Brittle, intermediate ductile and super ductile modes of fracture are examined by tests on laminated Charpy specimens. Effect of sheet thickness on ductile to brittle transition temperatures and notch sensitivity. 5 ref. (Q23s, Q26q, Q27, 2-61, 3-73; Ti-b, 4-53)

980-Q. The Fracture Sensitivity of Materials for High-Strength Applications. E.

P. Klier, C. P. Gazzara and Arthur MacDonald. Paper from "Symposium on the Testing and Evaluation of Materials for Solid Propellant Rocket Motor Casings". Report no. MAB-156-M. National Academy of Sciences, Washington 25, D. C., 1959, p. 222-237.

Tension, notch tension and bulge tests on Vascojet 1000, PH-17-7Mo, AISI 4135, 6Al-4V-Ti, MST 185, B120VCA sheet alloys. Comparative stress strain curves after heat treatment. Influence of low temperature on tensile and notch tensile strength. 3 ref. (Q23s, Q26s, Q27d; SGA-b, ST, Ti-b)

981-Q. Simple Laboratory Bulge Tests for Sheet Metal Fracture Transition Studies and for Weldment Performance Evaluation. P. P. Puzak and J. Stoop. Paper from "Symposium on the Testing and Evaluation of Materials for Solid Propellant Rocket Motor Casings". Report no. MAB-156-M. National Academy of Sciences, Washington 25, D. C., 1959, p. 238-271.

Method and apparatus for crack starter and weld zone bulge tests for high-strength low alloy steels, toolsteels, AISI 410 steel and Ti-4Al-3Mo-1V alloy sheet. Influence of testing temperature and heat treatment condition on fracture characteristics. 8 ref. (Q10b, Q26, 2-61, 2-64; SGB-a, ST, Ti-b, 4-53, 7-51)

982-Q. A Suggested Code System for Low-Alloy Steels Relating Composition and Performance. Rafael Calvo Rodes. Society of Automotive Engineers, Preprint no. 292B, 1961, 9 p.

Definition of three parameters, the ideal critical diameter, temperature of the beginning of the martensite reaction and the potential hardness of tempering which define steels in such a manner that when the parameters are the same they have the same mechanical properties and performance. (Q-general, N8p, Q29n, 2-60; AY)

983-Q. Research on Light Metals in the Metallurgy Division, National Bureau of Standards. Thomas G. Digges. NML (National Metallurgical Laboratory) Technical Journal, v. 3, Feb. 1961, p. 22-28.

Testing of specimens of Ti, Ti alloys containing Al, Mn and V, single crystals of Al, Al alloys, Mg and AZ31 Mg alloy to determine effect of notch geometry and temperature on flow resistance, fracture resistance, notch strength and ductility and to determine effect of temperature on corrosion resistance, microhardness and microstructure. Nitriding of Ti and Ti alloy at 1800° F. 9 ref. (Q-general, 2-61, M27, J28k; Al-b, Mg, Ti-b)

984-Q. (German.) Transversely Ribbed Concrete Reinforcing Steel ST III a. Application and Current Status of Testing Results. W. Lierow. Technik, v. 16, Apr. 1961, p. 321-323.

Resistance spot, manual arc and autogenous pressure welding of ST III a steel bars; mechanical properties such as tensile strength, adhesive strength (between steel and concrete), fatigue strength of steel and of reinforced concrete bar; consideration for material selection. 6 ref. (Q-general, K-general; ST, 4-55, 17-57)

985-Q. (German.) Necking of Flat Parts Under Notch Stress. H. Motzfeld. Technik, v. 16, Apr. 1961, p. 324-325.

Tensile testing and observation of necking in flat parts of transparent and nontransparent plastics and of light metals. Necking angle as influenced by anisotropy of material. 6 ref. (Q27g, 3-72; EG-a39, NM-d37, 4-53)

986-Q. Strain Ageing and the Fatigue Limit of Steel. J. C. Levy and S. L. Kanitkar. Iron and Steel Institute, Journal, v. 197, Apr. 1961, p. 296-300.

Existence of definite fatigue limit of mild steel is explained in terms of ability of mild steel to undergo strenghening by strain aging. S-N curves are obtained for rimming steel specimens with strain aging ability exhausted previously by progressive under stressing. Data are given for effects of repeated strain aging on UTS and relationship between increases in fatigue strength and in UTS due to strain aging. 8 ref. (Q7, Q27, N7e, 3-68; CN)

987-Q. Influence of Local Temperature Increases on the Fretting Corrosion of Mild Steel. R. B. Waterhouse. Iron and Steel Institute, Journal, v. 197, Apr. 1961, p. 301-305.

Fretted and fatigued specimens of mild steel are examined by metallurgical microscope and back reflection X-rays to determine the conjoint action

between fretting corrosion and cyclic stressing and consequent effects on fatigue life. Recrystallization near the fracture surface accompanied by transformation of gamma Fe_2O_3 is noted as a function of temperature rise, caused by plastic deformation with resultant crack formation by surface fatigue. (Q7, Q26q, R1e, R1f, 2-61, 3-68; CN)

988-Q. (Russian.) Effect of Small Vanadium Additions on the Properties of Structural Carbon Steels. M. I. Gol'dshtein and S. G. Guterman. Stal', Dec. 1960, p. 1130-1134.

The vanadium of a steel containing 0.33-0.40% C, 0.23-0.41% Si, 0.66-0.92% Mn, 0.032-0.043% P, 0.028-0.048% S, 0.16-0.26% Cr, 0.06-0.09% Ni and 0-0.15% Cu is varied in the range from 0-0.093% V. Samples are quench hardened and subsequently heat treated at 400-650° C. for 1 hr. Effect of vanadium content and annealing temperature on hardness, tensile properties, impact strength and the vanadium present in precipitated carbides. 8 ref. (Q29n, Q27a, Q6n; CN, SGB-s)

989-Q. (Russian.) Plastic and Anticorrosive Properties of Cold Rolled Annealed Stainless Steel Sheet. V. K. Barzii. Stal', Dec. 1960, p. 1134-1135.

Kh18N9T sheet steel heat treated at 750-1100° C. is tested for mechanical properties, corrosion resistance in boiling 65% nitric acid for 144 hr. and intercrystalline corrosion. Effect of heat treatment, temperature and Ti concentration. (Q-general, R6g, R2h; SS, 4-53)

990-Q. Preventing Fatigue Failures. Pt. 3. Heat Treatment and Surface Hardening. F. B. Stulen, H. N. Cummings and W. C. Schulte. Machine Design, v. 33, May 25, 1961, p. 146-150.

Effect of heat treatment on tensile strength, grain size and residual stress of various steels. Results of nitriding and carburizing as case hardening methods. 9 ref. (Q7, Q27, Q25h, M27c, 2-64, J28; ST)

991-Q. The Importance of Internal Quality in Welding. I. G. Hamilton. Paper from "Conference on Internal Steel Quality and Methods of Its Assessment". West of Scotland Iron and Steel Institute, Journal, v. 68, 1960-1961, p. 41-60.

Study of internal flaws in welded joints including porosity, piping, nonmetallic inclusions and cracks and their effect on brittle fracture and fatigue. (Q26s, Q7, 9; 7-51)

992-Q. Induction Hardening and Fatigue Strength. Hiroshi Nakamura. Railway Technical Research Institute, JNR, Quarterly Report, v. 1, Dec. 1960, p. 17-27.

Strength tests and stress measurements are made on carbon steel to determine the effect of induction hardening on fatigue strength. Results indicate improved fatigue properties are dependent on carbon content and pretreatment. (Q7a, 2-64; CN)

993-Q. Heat-Treat and Shot-Peen Cycle Cuts Torsional Stresses. Iron Age, v. 187, June 1, 1961, p. 70-71.

Factors responsible for the improved torsional stress progress in power shafts. (Q1a, 2-64, G23n)

994-Q. (Japanese.) The Damping Capacity and Fatigue of Cast Al-Cu Alloys. Takuichi Morinaga and Shigeo Zaima. Imono (Japan Foundrymen's Society, Journal), v. 33, Mar. 1961, p. 182-189.

Torsion fatigue, tensile and hardness tests on specimens containing 3.2-18.6% Cu. An increase in fatigue strength is noted as the damping capacity in torsional oscillation increases, both occurring as a function of Cu content. Data are given for tensile strength, Knoop ratio, Vickers and Knoop hardness, elongation and phase composition. 8 ref. (Q8g, Q7h, Q-general, 2-60; Al-b, Cu)

995-Q. (Japanese.) The Strength of Malleable Iron at Low Temperatures. Nobuhisa Tsutsumi. Imono (Japan Foundrymen's Society, Journal), v. 33, Mar. 1961, p. 202-209.

Tensile, bending, impact and hardness tests on blackheart malleable cast iron at -196 to 0° C. to determine applicability in vehicles operating at low-temperature. 11 ref. (Q27, Q6, Q5, 2-63; CI-s)

996-Q. (Japanese.) Effects of Addition of Phosphorus on Wear Resistance and Braking Effect of Nodular Cast Iron Brake Shoes. Minoru Nakai, Kunio Okabayashi and Masakazu Okami. Imono (Japan Foundrymen's Society, Journal), v. 33, Mar. 1961, p. 209-216.

Improvement of the friction coefficient in wear resistant cast iron for railway brake shoe application by addition of 0.8% phosphorus. 5 ref. (Q9p, T23s, 2-60; CI-r, P, 17-57)

997-Q. Tensile Properties of 17-7 PH and 12 MoV Stainless-Steel Sheet Under Rapid-Heating and Constant-Temperature Conditions. Charles R. Manning, Jr., and Howard L. Price. NASA Technical Note D-823, May 1961, 28 p. (Available from National Aeronautics and Space Administration, Washington, D. C.)

Yield and rupture strengths of 17-7 PH and 12 MoV stainless steels sheet heated to failure at temperature rates from about 1 to 170° F. per sec. under constant load conditions are compared with yield and tensile strengths obtained from short-time elevated-temperature tensile tests. 5 ref. (Q3, Q23b, Q27, 2-62; SS-e)

998-Q. (Japanese.) Effect of Pre-Straining on the Ductility of Pure Chromium. Susumu Yoshida, Yukio Ohba and Norio Nagata. Japan Institute of Metals, Journal, v. 25, Feb. 1961, p. 93-96.

Room temperature ductility of specimens containing 0.004% nitrogen as improved by rolling at 400-500° C. with consequent nitride precipitation which controls the distribution of lattice defects. The solubility and diffusion of solute nitrogen atoms are controlled by the rolling temperature. 8 ref. (Q23p, N7, 2-61, 3-68; Cr-a)

999-Q. (Japanese.) The Brittleness of Annealed Nickel. Pt. 2. The Brittleness of Nickel for Electron Tubes. Satoru Mito. Japan Institute of Metals, Journal, v. 25, Feb. 1961, p. 96-100.

Effect of oxygen content, heat treatment time and temperature, hydrogen pretreatment and cooling rate on embrittlement phenomena and tensile properties of Ni wire specimens containing various amounts of oxygen and carbon after vacuum annealing at 200-1400° C. Embrittlement is attributed to grain boundary precipitation of oxides by a carbon reduction mechanism. 15 ref. (Q26s, Q27, N7, 2-60, 2-64; Ni, 4-61)

1000-Q. (Japanese.) Hydrogen Embrittlement of Nickel. Pt. 3. Brittleness in Nickel for Electron Tubes. Satoru Mito. Japan Institute of Metals, Journal, v. 25, Feb. 1961, p. 101-104.

Brittleness caused by heating in hydrogen is investigated by tensile and bending tests on Ni wire specimens annealed in vacuum and hydrogen at 200-1000° C. and aged at room temperature. Mechanisms of brittleness recovery and delayed failure phenomena are studied as a function of oxygen contents. 10 ref. (Q26s, Q-general, 2-60, 2-64; Ni, 4-61)

1001-Q. (Japanese.) Effect of the Form of Graphite on Mechanical Properties. Hiromu Tanimura and Kiichi Taniguchi. Japan Institute of Metals, Journal, v. 25, Feb. 1961, p. 116-120.

Tensile and Charpy impact tests on 2.53-3.70% carbon specimens having flake and eutectic graphite structures. Influence of graphite structure, carbon content and notch dimension on resilience, tensile strength, elongation, stress-strain curves and slip deformation characteristics. 10 ref. (Q-general, 3-71; CI-b)

1002-Q. What Is Steel-Bonded Carbide? K. J. A. Brookes. Metalworking Production, v. 105, May 10, 1961, p. 65-67.

Development and testing of Ferro-Tic, a steel-bonded carbide, produced by conventional liquid-phase sintering in vacuum of TiC (33% by weight) and chrome-molybdenum alloy steel (67% by weight). Effect of tempering temperature on hardness and transverse rupture strength determined at 100 to 1100° F. (Q-general, H16, 2-60, 2-62, 2-64; ST, Ti, C, 6-69)

1003-Q. Ductility of Beryllium Single Crystals Oriented for Basal Slip and Tested in Tension. M. Herman and G. E. Spangler. Franklin Institute, Journal, v. 271, May 1961, p. 421-422.

Influence of impurities in Be on ductility as observed by determining the amount of basal plane glide during tensile testing of Be single crystals. 3 ref. (Q23p, Q24a, Q27, 3-72; Be, 14-61)

1004-Q. Research Adds to Service Life of Superalloy Castings. Steel, v. 148, May 29, 1961, p. 74-75.

Review of properties of superalloy WI-52 as a function of composition and production. Emphasis on stress-rupture life and rupture elongation. Applications

in jet turbine blades and vanes and in automotive gas turbine engine parts. (Q3m, Q23p, 2-60; SGA-h, Co-b, W, Cr, 17-57)

1005-Q. Influence of Impurity Elements, Structure and Prestrain on Tensile Transition Temperature of Chromium. B. C. Allen, D. J. Maykuth and R. I. Jaffee. NASA Technical Note D-837, Apr. 1961, 48 p. (Available from National Aeronautics and Space Administration, Washington, D. C.)

Iodide chromium is fabricated into subsize buttonhead specimens and subjected to an impurity analysis. Resulting tensile transition temperature is -10° C. for wrought chromium, 300° C. for recrystallized material with a 3° C. per min. cool after annealing and 390° C. for recrystallized material with an oil quench. Hardness, recrystallization and grain-growth behavior of Cr with and without impurity additions is investigated. 26 ref. (Q23r, N5, Q29, N3, 3-69, 3-71; Cr)

1006-Q. The Influence of Surface Preparation of Stainless Steel on Enamel Adherence. A. E. Farr. Porcelain Enamel Institute Forum, Proceedings, v. 22, 1960, p. 78-88.

Effect of various pickling solutions used to prepare 302 stainless steel prior to applying porcelain enamel coatings. Enamel adherence is found to be directly proportional to surface roughness. (Q10c, L27; SS)

1007-Q. Plastic Deformation of Uranium. Metal Industry, v. 98, Apr. 21, 1961, p. 318.

Creep testing of alpha-uranium to determine the effects of thermal cycling on creep rate, plastic strain and deformation of uranium under applied stress. The method of calculating "intermediate" and maximum "recovery" strain. (Q3, Q24, 2-64; U)

1008-Q. The Common Causes of Metal Failure in Service and Their Relative Incidence. J. Waring. Australian Institute of Metals, Journal, v. 6, Feb. 1961, p. 17-20.

Data indicate the incidence of corrosion, pitting, faulty lubrication and fatigue as factors in failure of shafts, baths, rolling bearings, castings and other products. (Q7k, T7)

1009-Q. (Russian.) Thermal Fatigue of Metals. Yu. F. Balandin. Metallovedenie i Termicheskaya Obrabotka Metallov, Mar. 1961, p. 2-8.

A Nimonic type alloy, Kh20N80 alloy and an 18-8 austenitic steel are exposed to thermal cycling at temperatures from 600-850° C. Thermal fatigue strength as a function of temperature, grain size, previous heat treatment and, in the case of notched sample, of the notch radius. 38 ref. (Q7j, 2-59, 2-61, 2-64; Ni-b, SS-e)

1010-Q. (Russian.) Stress-Strain Diagrams of a Steel Quenched From Ac_1, Ac_2 and Ac_3 Temperatures. G. I. Pogodin-Alekseev and B. A. Artamonov. Metallovedenie i Termicheskaya Obrabotka Metallov, Mar. 1961, p. 47-51.

A steel containing 0.24% C, 0.60% Mn, 0.37% Si and 0.83% Cr is heated for 40 min. in boric acid up to 700-880° C., water quenched and heat treated at 100° C. for 2 hr. Hardness, tensile strength, bend strength and resilience as functions of the quenching temperatures. 4 ref. (Q-general, 2-64; ST)

1011-Q. (Russian.) Mechanical Properties of Cu-V and Ni-V Alloys at Elevated Temperatures. E. M. Savitskii and U. K. Duisemaliev. Metallovedenie i Termicheskaya Obrabotka Metallov, Mar. 1961, p. 52-55.

Hardness, tensile strength and ductility of Cu containing 0-3.29% V and Ni containing 0-10% V is measured at 20-700° C. 4 ref. (Q29n, Q27a, Q23p; Cu-b, Ni-b, V)

1012-Q. (Russian.) Fatigue Strength of Surface Rolled Cylindrical Notched Samples. I. V. Kudryavtsev and L. M. Rozeman. Metallovedenie i Termicheskaya Obrabotka Metallov, Mar. 1961, p. 55-57.

Straight and notched samples of 45 steel containing 0.54% C, 0.70% Mn, 0.23% Si, 0.027% P and 0.021% S are rotating-beam tested. Effect of previous surface rolling on fatigue strength. Distribution of residual stress in a surface rolled notched sample. (Q7c, 3-68; ST)

1013-Q. Yield Strength of E9018 Weld Metal. W. L. Wilcox and H. C. Campbell. Welding Journal, v. 40, May 1961, p. 193s-196s.

Effect of using stringer beads and preheat and interpass temperatures on yield strength of weld metal in both as-welded and stress-relieved conditions. (Q23b, 2-61, 2-64, W29h; AY)

1014-Q. On Notch Sensitivity. F. A. McClintock. Welding Journal, v. 40, May 1961, p. 202s-209s.

Definition of load and deformation factors relating to actual behavior of notched sections to that predicted by plasticity theory for fully ductile materials. Tensile tests on notched specimens of pure Al, 7075 Al alloy and 4140 steel. Effects of size, notch angles and root radius on deformation behavior. 23 ref. (Q23s, Q27, Q24, 3-73; Al, ST)

1015-Q. (German.) Significance of Static Torsion Testing in Determination of Toughness for Very Hard Steels. Karl Bungardt, Otto Mulders and Werner Schmidt. Stahl und Eisen, v. 81, May 11, 1961, p. 670-675.

Torsion testing of annealed (180-400° C.) 90 MnV8 steel specimens of varying hardness using a mechanical and electrical measuring device. Evaluation of torsion yield point, torsion strength, elastic, plastic and total torsion angle and deformation work as influenced by annealing temperature and hardness of specimens. Comparison of toughness results with those obtained in static bending tests. (Q1, Q23r; ST, SGB-q)

1016-Q. (German.) Toughness Investigation on High-Speed Steels. Siegfried Wilmes. Stahl und Eisen, v. 81, May 11, 1961, p. 676-684.

Bend testing of heat treated (1170-1270° C. hardened and up to 620° C. annealed) high-speed steels containing 0.78-1.32% C, 0-10.30% Co, 3.72-4.39% Cr, 0.83-8.76% Mo, 1.27-3.77% V, 1.75-17.55% W. Bending strength and toughness as influenced by heat treatment (hardening time, hardening and annealing temperature) and shape of specimens. Role of form of carbides. (Q23r, Q5, 2-64; TS-m)

1017-Q. Stress/Strain Properties of Cast Iron and Poisson's Ratio in Tension and Compression. G. N. J. Gilbert. BCIRA Journal (British Cast Iron Research Assoc.), v. 9, May 1961, p. 347-363.

Variation of longitudinal and lateral strains is measured for cast iron bars loaded in tension and compression and also subjected to reversals of stress (unloading). Poisson's ratio is calculated. A new hypothesis is presented to explain the peculiar stress-strain properties of cast iron in terms of the volume change under stress of the spaces occupied by the graphite. (Q25n, Q21c; CI)

1018-Q. Effect of Carbon, Silicon and Phosphorus on Tensile and Impact Properties of Ferritic Blackheart Malleable Iron. C. T. Moore. BCIRA Journal (British Cast Iron Research Assoc.), v. 9, May 1961, p. 385-405.

Tensile properties of blackheart malleable Fe are improved by decreasing the C content or by increasing the Si and P contents. The best combination of impact and tensile properties is achieved with low P and C, and medium or high Si concentrations. Subcritical quenching and tempering treatments provide good impact ductility at 650 to -180° C. 4 ref. (Q27a, Q6, 2-60; CI-s)

1019-Q. (French.) Relaxation of Four Typical Heat Resistant Steels Subsequent to Torsional Deformation. P. Brozzo. Revue de la Soudure--Lastijdschrift, v. 17, Jan. 1961, p. 44-49.

Steels with 0.09-0.155% C, 0.44-0.54% Mn, 0.23-0.51% Si, 0.75-13.05% Cr, 0-0.20% Ni, 0-1.12% Mo, 0.01-0.021% S and 0.015-0.017% P are hardened at 910-980° C. for 25 min. to 3 hr. and air or furnace cooled. Two of the steels are tempered at 720° C. for 3 hr. Elastic limit and relaxation after torsion as functions of the testing temperature ranging from 35-750° C. (Q3, Q21, 2-61; SS, SGA-h)

1020-Q. (Italian.) Effect of Sulphur and Boron on the Properties of Malleable Cast Iron. A. Molaroni and V. Pozzesi. Fonderia Italiana, v. 10, Mar. 1961, p. 99-100.

Malleable iron containing 0-0.0015% B and 0-15% S is tested for its mechanical, hardness and machinability properties. Effect of the above additions on tensile strength, elongation, impact and bend strengths, hardness and machinability. (Q-general, Q29n, G17k, 2-60; CI-s, B, S)

1021-Q. How Hot Hardness Varies in Tool Steels. David P. Hughes. Metal Progress, v. 79, June 1961, p. 76-79.

With a Rockwell testing machine modified to operate up to 1200° F., Latrobe engineers rated the hot hardnesses of numerous grades of toolsteels and found that they varied according to heat treatment and room temperature hardnesses. (Q29p; TS)

1022-Q. Preventing Fatigue Failures. Pt. 4. Surface Treatment and Environment. F. B. Stulen, H. N. Cummings and W. C. Schulte. Machine Design, v. 33, June 8, 1961, p. 165-170.

Fatigue testing of steel and Al alloy specimens to determine the effect of environment, anisotropy of material and surface preparations such as grinding, shot peening, hammering and plating on fatigue failure. 28 ref. (Q7k; Al-b, ST)

1023-Q. Effects of Lubricants on Fatigue Life of Ball Bearings. E. A. Baniak and G. A. Kohl. Machine Design, v. 33, June 8, 1961, p. 190, 192, 194.

Fatigue testing of ball bearings to determine effects of various oil lubricants applied as flood or mist on bearing life. Design and operation of the fatigue life test assembly. (Q7k, T7d, 18-73)

1024-Q. Extraordinary Physical Properties Obtained With New Mar-Aging Alloys. Industrial Heating, v. 28, May 1961, p. 880.

Heat treatment of steel alloy with 18% Ni-7% Co-5% Mo develops yield strength of 250,000 psi. while maintaining a nil ductility temperature below -80° F. Heat treatment involves age hardening of martensite. Material can be cold formed and shaped with ease and welded by either manual or automatic methods. (Q23, K9s, J-general, N7a; AY)

1025-Q. (Spanish.) Relationship Between Mass and Mechanical Properties of Gray Cast Iron. Albert de Sy and Jan Van Eeghem. Instituto del Hierro y del Acero, no. 70, Oct-Dec. 1960, p. 847-860.

Literature review. Fe containing 0.2 to more than 0.5% phosphorous is cast into test bars of 7.5-90 mm. diameter and 100-1300 mm. length. Effect of shape and size, carbon equivalent and phosphorous content on hardness and tensile strength. (Q27a, Q29n; CI-n)

1026-Q (Spanish) Factors Improving the Modulus of Elasticity of Cast Iron. Alberto Sole Amat. Instituto del Hierro y del Acero, v. 13, Oct-Dec. 1960, p. 835-843.

Cast iron containing 2.90-3.59% C, 1.74-3.83% Si and 0.46-0.97% Mn is cast into test pieces of various diameter. Influences of carbon equivalent, graphite shape and quantity and cross section on the modulus of elasticity. (Q21a, Q21b; CI)

1027-Q. (English.) Mechanical Properties of Tellurium Single Crystals. R. J. Stokes, T. L. Johnston and C. H. Li. Acta Metallurgica, v. 9, May 1961, p. 415-427.

Deformation and fracture behavior of chemically polished specimens of various orientations strained in tension. Slip, crack growth, work hardening and orientation relationships are correlated with chemical bonding anistropy. Data are given for stress-strain, elongation and ductility values with discussion of dislocation interaction. 16 ref. (Q23, Q24, Q26s, 3-68; Te, 14-61)

1028-Q. (English.) On the Mechanism of Crack Initiation in Embrittlement by Liquid Metals. H. Nichols and W. Rostoker. Acta Metallurgica, v. 9, May 1961, p. 504-509.

Generation of brittle fracture by liquid metal wetting at grain boundaries on the surface of specimens and in the center of grains as a function of reduction of surface energy at the liquid-solid interface. Studies on Fe-3% Si alloy in molten Li at 200° C.; 70-30 brass, Al-6% Mg and Al-4% Cu alloys in Hg at 20° C. and Cu in liquid Bi at 300° C. 12 ref. (Q26s, Q26q, M27f, P13h; Al-b, Hg, Fe-b, Li, Cu-b, Bi, 14-60)

1029-Q. (English.) The Influence of Grain Size on the Energy Stored in Deformed Copper. M.H. Loretto and A.J. White. Acta Metallurgica, v. 9, May 1961, p. 512-513.

Power difference curves are obtained as a function of temperature for fine and coarse-grained specimens of 99.999% Cu annealed in vacuum at 6° C. per. min. to 300° C. after 30% strain in compression. Relation of energy release and recrystallization behavior to grain size and purity. (Q25h, N5, 2-59, 2-61, 3-68; Cu-a)

1030-Q. (English.) Cubic Slip in Aluminium Alloy Crystals. C. J. Beevers and R. W. K. Honeycombe. Acta Metallurgica, v. 9, May 1961, p. 513-515.

Temperature dependence and orientation relationships of cubic slip bands occurring in Al-5.3% Cu alloy single crystals tested in tension at 77-373° K. Relation of orientation to work-hardening characteristics, sessile dislocation and Lomer-Cottrell locking mechanisms affecting primary, conjugate and cross slip systems. 8 ref. (Q24, M26b, 2-61; Al-b, Cu, 14-61)

1031-Q. (Translation-ConBur.) Physicochemical Processes in the Surface Layers of Steel During Cyclic Deformation in Melts of Readily Fusible Metals. M. I. Chaevskii. Academy of Sciences of the USSR, Proceedings, Physical Chemistry Section, v. 134, Sept-Oct. 1960, p. 991-994.

Molten Sn and Pb-Bi eutectic as surface active media decrease fatigue strength of steel specimens containing stress concentrators and undergoing cyclic deformation. This decrease is attributed to the failure of intermetallic compounds to form and prevent development of microscopic cracks. 14 ref. (Q26s, Q7a; ST, 14-60)

1032-Q. The Evaluation of the Effects of Very Low Temperatures on the Properties of Aircraft and Missile Metals. L. P. Rice. Battelle Memorial Institute (Wright Air Development Division). U. S. Office of Technical Services, PB 171016, June 1960, 61 p. $1.75.

Tensile and hardness properties of Ti-Al-V, Ti-Mo-V and Type 301 XH stainless steels. Ti, Al-V and 4% Al-3% Mo-1% V Ti alloys and 301 XH stainless do not reveal a serious loss of ductility or fracture before reaching 0.2% offset strain at -253° C. (Q27a, Q29n, 2-63; SS, Ti-b)

1033-Q. Tensile and Impact Properties of Cast Stainless Steels at Cryogenic Temperatures. E. R. Hall. ASTM Preprint no. 80f, 1961, 9 p.

Tensile and notched-bar impact tests performed on production heats of cast chromium-nickel stainless steels at temperatures from 70-430° F. No ductile brittle transition is observed for any of the alloys including those having a small amount of delta ferrite dispersed in the microstructure. (Q27, Q6, 2-63; SS, 5)

1034-Q. Fracture of High-Strength Sheet Steel Specimens Containing Small Cracks. J. E. Srawley and C. D. Beachem. ASTM Preprint no. 80a, 1961, 12 p.

Introduction of small surface cracks into steel sheet specimens. Effect of crack size on tensile strength. Water and India ink are found to have a detrimental effect on fracture strengths of steels. (Q26; ST, SGB-a, 4-53)

1035-Q. Analysis of the Effects of Test Temperature on the Notch Strength of High-Strength Sheet Alloys. Volker Weiss and John G. Sessler. ASTM Preprint no. 80d, 1961, 15 p.

Notch properties of 300 M, Vascojet 1000, Ti-13% V-11% Cr-3% Al and Ti-4% Al-3% Mo-1% V are analyzed as a function of test temperature. Increasing stress biaxiality produces a loss in notch ductility. Notch ductility ration used to analyzed notch tensile strength data. (Q27a, Q23s, 2-61; ST, Ti-b, 4-53)

1036-Q. Influence of Sheet Thickness on Sharp-Edge-Notch Properties of a Beta Titanium Alloy at Room and Low Temperatures. A. J. Repko, M. H. Jones and W. F. Brown, Jr. ASTM Preprint no. 80b, 1961, 17 p.

Room temperature data for aged sheet are analyzed to yield the absolute effect of thickness on fracture toughness, percent shear and slow crack extension. Solution treated condition of B120VCA is very tough. 7 ref. (Q26, Q2, 2-61; Ti-b)

1037-Q. Basic Theories of Fatigue Failure and Their Design Implications. Charles D. Nash, Jr. American Helicopter Society, Inc. Seventeenth Annual National Forum, Proceedings, May 1961, 9-10.

Review of several basic theories of fatigue failure including the Machlin dislocation theory, the Shanley unbonding by reversed slip theory, the Yokobori dislocation theory, the Freudenthal-Weiner local thermal stress theory, the Oding dislocation theory and the Nash theory. Design and material implications of these theories. 10 ref. (Q7, 10-51)

1038-Q. (Translation-ConBur.) Creep in Hot Rolled Uranium. G. Ya. Sergeev and A. M. Kaptel'tsev. Soviet Journal of Atomic Energy, v. 7, Apr. 1961, p. 1023-1025.

Investigation of the resistance of hot rolled uranium to creep as affected by grain size, texture, temperature and stress. Tests were carried out in an atmosphere of purified He at 20-600° C. 4 ref. (Q3, 2-59, 2-61, 3-66; U)

1039-Q. Beryllium. M. K. McQuillan and T. W. Farthing. Nuclear Energy, May 1961, p. 195, 197.

A survey of the attempts of Be research workers to give the metal more room temperature ductility and to improve its workability at higher temperatures by eliminating minima in the ductility/temperature curve. This can be achieved through modification of the electronic structure by addition of metals which form solid solutions with Be or through purification by zone refining, electrolysis, iodide refining, distillation or electron beam melting. (Q23p; Be)

1040-Q. Design Properties of Aluminium Alloys at Elevated Temperatures. I. C. Taig. Aircraft Engineering, v. 33, May 1961, p. 131-135.

Development of a consistent method of data presentation for mechanical properties of Al alloys. Semi-empirical method takes into account realistic temperature conditions and provides a unified set of strength and stiffness properties for design. (Q-general, 17-51; Al-b)

1041-Q. (Spanish.) High-Strength Zinc Alloy. Alexandre Krupkowski and Wladyslaw Kajoch. Instituto del Hierro y del Acero, v. 14, Feb. 1961, p. 129-145.

Mechanical strength, elongation, hardness and corrosion and wear resistance of Zn-Mn-Cu alloys. Method for eliminating carbon from the alloys during preparation. 13 ref. (Q-general, R-general; Zn-b, Mn, Cu)

1042-Q. (Spanish.) Tests on Nodular Cast Iron Inoculated With Cu-Si-Mg Alloys. Francisco Rodriguez-Yufera and Joaquin Orland. Instituto del Hierro y del Acero, v. 14, Feb. 1961, p. 93-128.

Structure, impact strength, resistance to rotary bending load and Young's modulus of nodular graphite Fe cast from crucible, cupola or rotary furnace. Substitution of Cu for Ni and effect of substitution on mechanical and structural properties. 10 ref. (Q-general, M27, 2-60; CI-r, Cu, Si, Mg)

1043-Q. New Directions in Materials Testing. Strength, Stiffness, Ductility, Toughness. M. Spewock. Materials in Design Engineering, v. 53, June 1961, p. 118-124.

Problems of equipment and techniques involved in mechanical test methods. Improved apparatus, electronic technology and mathematical analysis as methods of increasing accuracy. (Q-general, 1-54)

1044-Q. New Directions in Materials Testing. Friction Properties, Wear Resistance. Malcolm Riley. Materials in Design Engineering, v. 53, June 1961, p. 130-134.

Mechanical, thermal and chemical causes of wear. Factors involved in simulating friction. Use of ranking tests. (Q9)

1045-Q. (Italian.) Fatigue Tests on Some Light Cast Alloys. A. Massa. Alluminio Nuova Metallurgia, v. 30, Mar. 1961, p. 131-135.

A particular type of blank-ribbed test piece is suggested for fatigue tests. Application of fatigue tests to selection of alloys, casting methods and quality control in production. (Q7, E25q; EG-a39)

1046-Q. (Rumanian.) Influence of Shape and Distribution of Graphite on Quality of Piston Segments From Alloyed Cast Iron. Traian Dumitrescu. Studii si Cercetari de Metalurgie, v. 5, Apr. 1960, p. 493-515.

Wear resistance, thermal stability, mechanical and physical properties of cast iron alloyed with Cu, Cr-Ni and Cr-V. Comparison of eutectic and lamellar graphite. 14 ref. (Q9n, Q-general, P-general, 3-71; CI, Cu, Cr, Ni, V)

1047-Q. Recent Developments in High Strength Steels. R. A. Lula. American Society of Mechanical Engineers, Paper no. 61-MD-7, 1961, 8 p. $1.

Mechanical properties and fabricating characteristics of newly developed precipitation-hardening stainless steels, cold rolled metastable austenitic stainless steels and low-alloy hardenable stainless steels. Tests are conducted at -400 to 1200° F. with stress of 40,000-280,000 psi. 12 ref. (Q-general; SS, SGB-a)

1048-Q. (Russian.) Constitutional Diagram of Titanium-Palladium System. A. A. Rudnitskii and N. A. Burin. Zhurnal Neorganicheskoi Khimii, v. 5, Nov. 1960, p. 2414-2421.

Determination of hardness, thermoelectromotive force, electrical resistance and its temperature coefficient, tensile strength, elongation, solubility and crystallization of high purity Ti and Pd by thermal and microstructural analysis from 620-1045° C. and 800-1000° C. respectively. (Q29n, Q27a, Q23, P15, M21, M23r; Pd, Ti)

1049-Q. (Russian.) Fatigue Strength of T5K10 Alloy. L. G. Kuklin. Stanki i Instrument, Apr. 1961, p. 30.

Investigation of fatigue properties of cutting tools made of hard alloys by cyclic, tensile and impact loading. Influence of surface condition and working methods on yield strength and subsequent performance characteristics. (Q7, T6n; SGB-q, 17-57)

1050-Q. (Spanish.) Increasing the Fatigue Limit by Localized Heat Treatment of Sheets and Beams With Welded Trusses. Ondrej Puchner. Ciencia y Tecnica de la Soldadura, v. 10, Nov-Dec. 1960, p. 14432, 1-7.

Effect of local heat treatment with oxy – acetylene flame on fatigue limit and local stresses. 6 ref. (Q7b, J2h, Q25; ST, 4-53, 4-57)

1051-Q. Axial-Load and Strain-Cycling Fatigue of Copper at Low Endurance. P. P. Benham. Institute of Metals, Journal, v. 89, May 1961, p. 328-338.

Annealed and cold worked specimens of OFHC Cu are tested in axial constant load and strain cycling to fracture. Cyclic creep strain and 5-N curves are given with data for tensile properties, hysteresis loop, fatigue crack mechanisms, deformation and fracture modes and hardening and softening effect. 9 ref. (Q7, Q-general, 3-68; Cu-a)

1052-Q. The Fracture Characteristics of Brass in Impact at Atmospheric and Elevated Temperatures. A. R. Bailey. Institute of Metals, Journal, v. 89, May 1961, p. 339-342.

Pure alpha, binary beta and ternary and quaternary alpha-beta and beta-gamma brasses containing 28-50% Zn, 0.5% Al, 0.2% Mn and 0.2.1% Fe are impact tested at 20-800° F. to determine effects of composition, structure and temperature on fracture mode. Intercrystalline cracking is influenced by brittleness. 16 ref. (Q26, Q6, 2-60, 2-61, 3-71; Cu-n)

1053-Q. Hot Hardness and Other Properties of Some Binary, Intermetallic Compounds of Aluminum. E. R. Petty. Institute of Metals, Journal, v. 89, May 1961, p. 343-349.

Binary specimens containing Co, Cr, Cu, Fe Mg, Mn and N are tested at 20-600° C. Data are given for microhardness, Knoop and VPN hardness, plasticity and embrittlement as a function of heat of formation, density, melting temperature, interatomic distance, atomic number of the second element, composition and temperature. Survey of literature covering physical properties of intermatallic compounds. 19 ref. (Q29p, Q-general, P-general, 2-60, 2-61; Al-b, 14-68)

1054-Q. (Book.) Handbook of Mechanical Wear. Charles Lipson and L. V. Colwell, Editors. 1961. 469 p. University of Michigan Press, Ann Arbor, Mich. $20.

Mechanisms of surface damage. Fundamental aspects of wear, pitting, scoring, spalling, corrosion and abrasive wear. Wear resistance materials and manufacturing processes. (Q9, R-general; SGA-m, 9)

1055-Q. Compatibility of Metal Pairs. Robert Davies. Chapter 1 from "Handbook of Mechanical Wear". University of Michigan Press, Ann Arbor, Mich., 1961, p. 7-15.

Scoring resistance of common metallic elements in sliding contact with Al, Cu, Ag and steel discs. Criteria for predicting which pairs of metallic elements slide with minimum scoring. 6 ref. (Q9)

1056-Q. Sliding Characteristics of Metals at High Temperature. M. B. Peterson and J. J. Florek. Chapter 2 from "Handbook of Mechanical Wear". University of Michigan Press, Ann Arbor, Mich., 1961, p. 16-34.

Coefficient of friction and surface damage of Cu, Co, Cr, Mo, Al, Zr, Ni, Ni alloys, pure Fe, carbon steel, tool-steel and stainless steels sliding against

themselves at temperatures up to 1600° F. Effects of temperature and various oxide lubricants on friction. 13 ref. (Q9b, 2-61; Cu, Co, Cr, Mo, Al, Zr, Ni, Fe, CN, TS, SS, 9-71)

1057-Q. Friction, Wear and Surface Damage of Metals as Affected by Solid Surface Films. Edmond E. Bisson. Chapter 3 from "Handbook of Mechanical Wear". University of Michigan Press, Ann Arbor, Mich., 1961, p. 35-55.

Function of solid surface films in friction and wear is considered in terms of the adhesion theory of friction. Effects of naturally formed and preformed oxide, chloride, sulphide and various other solid lubricant films on wear and friction of steel, and Ni and Cu alloys sliding against steel. Influence of sliding velocities and elevated temperatures on friction. 31 ref. (Q9, 2-62, 18-73; ST, Ni-b, Cu-b, NM-h)

1058-Q. Experimental Load-Stress Factors. W. D. Cram. Chapter 4 from "Handbook of Mechanical Wear". University of Michigan Press, Ann Arbor, Mich., 1961, p. 56-91.

Surface endurance limits of mating materials subjected to rolling or combined rolling and sliding action. Nature of contact and stresses in mating elastic cylinders. Experimental load stress factors and surface fatigue curves for cast irons, steels, bronze, Al and nonmetallic materials. Influence of cold working, conversion coatings, speed, lubrication and heat treatment. 13 ref. (Q25, Q7, 2-64, 3-67, 3-68; CI, ST, Cu-s, Al)

1059-Q. Subsurface Fatigue. Horace J. Grover. Chapter 5 from "Handbook of Mechanical Wear". University of Michigan Press, Ann Arbor, Mich., 1961, p. 95-107.

Stress conditions under which subsurface fatigue may occur. Examples of fatigue originating subsurface inclusion, subsurface fatigue of surface hardened parts and under rolling loads. 16 ref. (Q7, 3-66, 3-68)

1060-Q. Resistance of Materials to Rolling Loads. E.S. Rowland. Chapter 6 from "Handbook of Mechanical Wear". University of Michigan Press, Ann Arbor, Mich., 1961, p. 108-130.

Alloy steels used commercially in rolling contact bearings. Conditions for rolling fatigue and calculation of stress distributions. Effects of composition, heat treatment and other processing variables on bearing life. Development of steel and other alloys for high-temperature service. Advantages of vacuum melted steels. 24 ref. (Q7, 2-60, 2-64, T7d; AY, SGA-h, 17-57)

1061-Q. The Importance of Surface Temperature to Surface Damage. B.W. Kelly. Chapter 8 from "Handbook of Mechanical Wear". University of Michigan Press, Ann Arbor, Mich., 1961, p. 155-172.

Calculation of surface temperature resulting from frictional heating by rolling and sliding contacts. Scoring of lubricated and unlubricated surfaces. Behavior of lubricated films at elevated temperatures. Stress conditions in the contact area causing pitting. Calculation of thermal gradients on and below surface and effect of thermal stresses on stress system. 22 ref. (Q9, 3-66, 2-61, 18-73; 9-71, NM-h)

1062-Q. Wear Resistance. Howard S. Avery. Chapter 14 from "Handbook of Mechanical Wear". University of Michigan Press, Ann Arbor, Mich., 1961, p. 315-352.

Techniques for evaluation of wear resistance and wear conditions. Influence of impact, heat, corrosion, friction, abrasion and vibration. Method of surface protection. Merits of various ferrous and nonferrous materials. 26 ref. (Q9, 2-61)

1063-Q. Modern High-Carbon Ferrous Metals for Resistance to Surface Damage. F.B. Rote. Chapter 15 from "Handbook of Mechanical Wear". University of Michigan Press, Ann Arbor, Mich., 1961, p. 355-377.

Microstructure, composition, tensile properties, hardness and abrasion resistance of gray iron, malleable iron, pearlitic gray iron, nodular iron and white cast iron. Suitability for various applications. 5 ref. (Q27, Q29, Q9, M27, 2-60; CI, SGA-M, 17-57)

1064-Q. Wear Resistance of Cast-Iron Components. J.E. LaBelle. Chapter 16 from "Handbook of Mechanical Wear".

University of Michigan Press, Ann Arbor, Mich., 1961, p. 378-400.

Characteristics of frictional wear and scuffing. Structure of gray cast iron. Effects of graphite and matrix structures, chemical composition and surface finish on resistance of cast iron to normal wear and to scuffing. 9 ref. (Q9, 3-71, 2-60; CI)

1065-Q. (German.) Sintered Nickel Steels. Gerhard Findeisen. Zeitschrift fur Metallkunde, v. 52, Apr. 1961, p. 236-243.

Measurement of mechanical properties, density and microstructural investigation of pressed and sintered (1000-1200° C.) specimens of various concentrations: Fe powder, Ni carbonyl powder and graphite, carbon containing Fe and Ni powders, pulverized Ni-Fe alloy and lampblack, Fe powder and low-melting eutectic Ni-Si alloy. (Q-general, M27, P10a; ST, Ni, 6-72)

1066-Q. (German.) Residual Stresses Induced in Metallic Uranium by Improper Machining. Hans Duhler and Walter Schreiber. Zeitschrift fur Metallkunde, v. 52, Apr. 1961, p. 270-275.

Investigation of internal stress by measurement of elastic deformation using strain gages in uranium specimens containing 0.35% Cb after boring and combined boring and turning operations. Internal stress states as caused by plastic deformation. (Q25h, G17; U)

1067-Q. (German.) Mechanical Properties and Microstructure of Several Structural Materials After Neutron Irradiation. I. M. Voronin, V. D. Dmitriev, S. S. Ibragimov and V. S. Ljasenko. Kernenergie, v. 4, Feb. 1961, p. 129-132.

Measurement of mechanical properties and examination of microstructure of heat treated austenitic, ferritic and ferritic-martensitic steels and Mo after (0.9-3.4%) x 10^{20} neutron per cm. sq. irradiation at 450-650° C. and after annealing at 600-1250° C. (Q-general, M27, 2-64, 2-67; ST, Mo)

1068-Q. (Spanish.) Manufacture of Quality Castings From Bronze. Masataka Sugiyama. Instituto del Hierro y del Acero, v. 14, Jan. 1961, p. 1-9.

Bronze containing 83.86-94.34% Cu, 2.29-14.70% Sn, 1.80-3.76% Zn and 0.02-0.04% impurities is cast into test pieces which are X-ray tested. Effect of casting temperature on density, tensile strength, elongation and macrotincture and of the temperature gradient measured for various distances from the sample end and sample thickness on pipe, porosity and length of sound zone. (Q23p, Q27a, M28, P10a, 9; Cu-n, 5)

1069-Q. (Spanish.) Elastic Constants of Aluminum. Jose Ors Martinez. Instituto del Hierro y del Acero, v. 14, Jan. 1961, p. 46-57.

Poisson's coefficient, modulus of rigidity and Young's modulus of elasticity of sintered Al and cast 0.95-0.99% purity Al are determined by ultrasonic measurements to study the effects of various heat treatments, deformation and recrystallization. 41 ref. (Q21e, 2-64, 3-68; Al, 5, 6-72)

1070-Q. Slow Growth and Rapid Propagation of Cracks. J. E. Srawley. Report of NRL (Naval Research Laboratory) Progress, May 1961, p. 21. (Available as PB 171318 from U. S. Office of Technical Services, Washington 25, D. C.) $1.25.

Application of fracture mechanics to crack propagation testing and fracture of high-strength, thin-section materials is examined in relation to the development of a fracture failure from a small, semi-elliptical, surface crack origin as influenced by the fracture toughness for the thickness under consideration and the initial crack dimensions. (Q26q, Q26r, Q23n, 3-73)

1071-Q. Properties of Iron Alloys. W. S. Pellini and J. E. Srawley. Report of NRL (Naval Research Laboratory) Progress, May 1961, p. 21-22. (Available as PB 171318 from U. S. Office of Technical Services, Washington 25, D. C.) $1.25.

Evaluation of fracture toughness in high-strength steels for use in pressure vessels, submarine hulls, rockets and air frames. Relation of crack propagation and shear tearing to yield strength, density ratio and transition temperature. (Q26, Q23r, T-general, 17-57; ST)

1072-Q. Metals and Alloys at Elevated Temperatures. G.J. Danek, Jr., H.H. Smith and M.R. Achter. Report of NRL (Naval Research Laboratory) Progress, May 1961, p. 22-24. (Available as PB 171318 from U.S. Office of Technical Services, Washington 25, D.C.) $1.25.

Reverse bending tests at 5 cycles per sec. in air and vacuum at 1500° F. on 316 stainless steel, Ni and Inconel X to determine effects of environment on fatigue properties. Relation of oxidation and air strengthening mechanism and surface absorption of gaseous impurities to S-N curves and crack propagation. (Q26q, Q7, R1h, 2-62, 2-66, 3-69; SS-e, Ni-b, SGA-h)

1073-Q. Investigation of Refractory Metals Processing (Mechanical Properties of Refractory Alloys). R. W. Huber and E. J. Chapin. Report of NRL (Naval Research Laboratory) Progress, May 1961, p. 25-28. (Available as PB 171318 from U. S. Office of Technical Services, Washington 25, D. C.) $1.25.

Sheet and strip Cb-Ti alloy of 10-90% Ti are produced from vacuum arc melted high purity powder or by vacuum sintering with subsequent hot forging and cold rolling after vacuum annealing to determine effects of fabrication processes on mechanical properties. Data are given for tensile strength, VHN hardness and ductility, and alpha to beta martensite transformations, phase diagram grain size and recrystallization microstructures. 4 ref. (Q-general, F-general, H15, N-general, 2-64, 3-68; Cb-b, Ti-b)

1074-Q. Casting or Fabrication. Engineering Materials and Design, v. 4, June 1961, p. 364-365.

Stress concentration factors for steel castings and welded sections compared by strain measurement and photoelastic stress techniques. Data for yield strength and fatigue life indicating superior properties for castings. (Q25h, Q23b; ST, 5, 7-51)

1075-Q. (Italian.) Influence of Chemical Composition on Structure and Mechanical Characteristics of a 13% Chromium Martensitic Steel. Piero Virdis. Fonderia Italiana, v. 10, Feb. 1961, p. 43-47.

Phase diagrams, equilibrium structures and impact and Brinell hardness values are obtained for cast steels after heat treatment from 750-1150° C. 9 ref. (Q7, Q6, M-general, 2-60; 2-64; SS-e, Cr)

1076-Q. Stress Redistribution During Bending Fatigue. A. A. Blatherwick. Society for Experimental Stress Analysis, Proceedings, v. 18, Apr. 1961, p. 128-135.

Comparison of experimental and analytical results for Al and SAE 1020 steel specimens under cyclic stressing to determine relationship between stress, strain distribution, bending moment, fatigue life and modulus of static elasticity. 12 ref. (Q25, Q5m, Q7, 3-68; Al, ST)

1077-Q. (Russian.) Mechanical Tests Performed With NiAl Base Sintered Alloys. S. M. Astrakhantsev, E. I. Mozzhukhin and Ya. S. Umanskii. Isvestiya VUZ-Tsvetnaya Metallurgiya, Feb. 1961, p. 110-115.

Alloys composed of only the NiAl phase (i.e., containing 53-9% Ni and 44.4% Al) and alloys showing the phases NiAl and Ni_3Al, containing 58.9-64.4% Ni and 34.4-41.3% Al are tested at room temperature. Effect of composition on bend creep strengths from 800-850° C.; microhardness and microstructure. 12 ref. (Q5q, Q3m, Q29q, M27, 2-60; Al-b, Ni-b, 6-72)

1078-Q. Scuffing of Porous Chrome-Plated R-4360 Cylinders. George C. Lawrason, John F. Rainosek, Jr., and William P. Wisdom. SAE Paper no. 393A, 1961, p. 6 p.

Wear testing of malleable iron, alloyed cast iron and AMS7310 alloy piston rings to determine compatability with chrome-plated cylinder bores. Data given for scuff resistance of the bores and wear of the rings. (Q9, T21b; CI, 8-62, 17-57)

1079-Q. Effect of Engine Design Variables Upon Compression Ring Wear as Determined by Radioactive Tracer Technique. J. J. Martin and Hugh A. Williams. SAE Paper no. 362B, 1961, p. 11 p.

Cast iron and chromium plated compression rings for diesel engines are tested to determine the influence of design of fuel injector, fuel quality and oil control ring on wear rate. (Q9, T21b; CI, 8-62, 17-57)

1080-Q. A New Concept of Measuring Frictional Characteristics. G. R. Smith, V. J. Jandasek, S. R. Sprague and R. B. Singer. SAE Paper no. 363A, 1961, p. 17 p.

Development of a steady state wet friction test with testing points taken at fixed pressures, stabilized velocity and

with test oil flowing over the interface of grooved friction plate to control the temperature. Coefficient of friction curves are obtained on steel plates for various rates, time and temperatures. (Q9p; ST)

1081-Q. (German.) Investigation of Properties and Structure of Metals and Steels After Irradiation by Fast Neutrons. S.S. Ibragimov, V.S. Ljasenko and A.I. Zav'jalov. Kernenergie, v. 4, Feb. 1961, p. 117-122.

Measurement of mechanical properties, microhardness and electrical resistivity and examination of microstructure after irradiation of steel (0.14-1.12% C, 16-17% Cr, 9-17% Ni, 0-2.1% Mo, 0-0.6% Ti), Ni and Mo at 40-70° C. and after subsequent annealing at temperatures to 1100° C. (Q-general, M27, P16g, 2-64, 2-67; ST, Ni, Mo)

1082-Q. Microhardness Testing in Powder Metallurgy Research. H. Buckle. Paper from "Powder Metallurgy". Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 221-249.

Most typical applications are based on the principle of comparative studies of hardness variations which gives valuable information about the structure of heterogeneous or porous bodies. The determination of the intrinsic hardness of minor phases is less reliable, but satisfactory results are obtained by the use of specially developed microhardness test plates, the application of which is described in the identification of single phases (hard metals) and of the nondestructive determination of thickness and the nature of thin protective coatings. 6 ref. (Q29q, H-general)

1083-Q. Some Properties of Nickel Containing a Dispersed Phase of Thoria. D. K. Worn and S. F. Marton. Paper from "Powder Metallurgy". Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 309-342.

Data are presented correlating room temperature mechanical properties and elevated temperature stress-rupture properties with the characteristics of the oxide dispersion. The work hardening and recrystallization behavior of cold drawn nickel-thoria alloys is discussed in relation to the alloy structure. Effect of aging at temperatures up to 1400° C. of the dispersion. 16 ref. (Q-general, Q3m, N7a; Ni-b, Th, 14-68)

1084-Q. Recent Investigations of High Temperature Alloys of Molybdenum and Tungsten With Transition Metals of Groups IVa to VIIa of the Periodic Table. Horst Braun and Karl Sedlatschek. Paper from "Powder Metallurgy". Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 645-660.

Workability of sintered and arc melted W-Cb and W-Ta alloys is examined as well as the following properties of alloys with compositions across the entire binary systems: density, hardness at room and elevated temperatures, specific electric resistivity, thermoelectric force, hydridability and corrosion resistance against acids and alkali. Alloys of Mo with 0-100% Cb and Ta are also surveyed. 25 ref. (Q23q, Q29n, P10a, P15, R-general; Cb-b, Ta-b, W-b, 6-72)

1085-Q. Sintered High Temperature Alloys. G. T. Poyner, V. A. Tracey and J. F. Watkinson. Paper from "Powder Metallurgy". Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1961, p. 701-729.

Properties obtained on material produced by vacuum sintering certain Ni-Cr-Co pre-alloyed powders. Results show that the stress-rupture properties obtained on sintered material can compare favorably with the stress-rupture properties of wrought materials of the same composition, although the hot fatigue and cold impact properties are generally lower. Stress-rupture properties of one particular composition are found to be variable, but in some instances notably improved properties over the wrought alloy are observed. 11 ref. (Q3m, Q7, Q6, H15, 1-73; Co-b, Cr-b, Ni-b, 6)

1086-Q. (Book.) Full-Scale Fatigue Testing of Aircraft Structures. F. J. Plantema and J. Schive, Editors. 1961. 426 p. Pergamon Press, Inc., 122 E. 55th St., New York 22, N. Y. $15.

Papers presented on aircraft component fatigue testing at a symposium in Amsterdam, Holland, June 9-11, 1959, sponsored by the International Committee on Aeronautical Fatigue. Subjects covered include current trends, random and constant-load amplitude testing, relationship of fatigue ratio, design, structure analysis methods, statistical approaches and testing of specific model aircraft. 133 ref. (Q7, T24)

1087-Q. Current Trends in Fatigue Tests of Aircraft. Pilot Lecture on the Planning and Interpretation of Full-Scale Aircraft Fatigue Tests. H. F. Hardrath. Paper from "Full-Scale Fatigue Testing of Aircraft Structures". Pergamon Press, Inc., New York 22, 1961, p. 1-13.

Review of metal fatigue factors in aircraft structures, including fatigue safe-life and fail-safe concepts and testing procedures. Effects of sonic excitation and elevated temperatures on fatigue. 6 ref. (Q7, T24)

1088-Q. The Significance of Constant-Load Amplitude Tests for the Fatigue Evaluation of Aircraft Structures. E. Gassner and W. Schutz. Paper from "Full-Scale Fatigue Testing of Aircraft Structures". Pergamon Press, Inc., New York 22, 1961, p. 14-40.

One-level tests for fatigue life evaluation of aircraft light alloys in the range of 5×10^3-10^5 cycles carried out at the maximum stress of the load spectrum. Program tests (8 load levels, arranged on ascending/descending order, logarithmic-binomial frequency distribution) for predicting higher degree of service life as affected by materials and design principles. 27 ref. (Q7k, T24; EG-a39)

1089-Q. Fatigue Ratio as Design Evaluation of Aircraft Structures--Some Results From Tests on the G 91. L. Locati and G. Sarzotti. Paper from "Full-Scale Fatigue Testing of Aircraft Structures". Pergamon Press, Inc., New York 22, 1961, p. 41-59.

Review of procedures for estimating aircraft component fatigue life by fatigue curve calculation, reduction of wing load spectrum to one load amplitude, then testing and periodic sequential testing of load spectrum of components. Endurance estimation based on program fatigue tests of 2024 T Alclad and 7075 T Clad. 17 ref. (Q7, T24; Al-b)

1090-Q. On the Relation Betwen Fatigue Lives Under Random Loading and Under Corresponding Programme Loading. J. Kowalewski. Paper from "Full-Scale Fatigue Testing of Aircraft Structures". Pergamon Press, Inc., New York 22, 1961, p. 60-75.

Differences between effect of random and program loading tests on fatigue life of aircraft components as related to distribution of peak values and load cycle arrangements. 8 ref. (Q7, T24)

1091-Q. Determination of the Fatigue Resistance of Aircraft Wings by Full-Scale Testing. A. O. Payne. Paper from "Full-Scale Fatigue Testing of Aircraft Structures". Pergamon Press, Inc., New York 22, 1961, p. 76-132.

Review of investigation into fatigue characteristics of full-scale aircraft wings under repeated loading and various types of loading sequences. Application of the fail-safe philosophy. 31 ref. (Q7, T24a)

1092-Q. Comparison of Constant-Level and Randomized-Step Tests of Full-Scale Critical Components. W. B. Huston. Paper from "Full-Scale Fatigue Testing of Aircraft Structures". Pergamon Press, Inc., New York 22, 1961, p. 133-147.

Summary of fatigue-critical area data obtained from tests of C-46 aircraft wings utilizing constant-level and randomized-step loadings. Comparison with fatigue sensitive areas found during flight operations. 4 ref. (Q7, T24a)

1093-Q. The Ultimate Strength of Damaged Structure-Analysis Methods With Correlating Test Data. W. J. Crichlow. Paper from "Full-Scale Fatigue Testing of Aircraft Structures". Pergamon Press, Inc., New York 22, 1961, p. 149-209.

Procedures for the strength analysis of aircraft structures in the presence of specified degrees of damage. Influence on ultimate strength of cracks and longitudinal splice as a crack arrestor. Tabulation of test correlation data. 14 ref. (Q27a, T24a)

1094-Q. The Fatigue Testing of Aircraft Structures. Pilot Lecture on Test Equipment and Test Procedures. W. J. Winkworth. Paper from "Full-Scale Fatigue Testing of Aircraft Structures". Pergamon Press, Inc., New York 22, 1961, p. 210-232.

Basic requirements for full-scale fatigue testing of aircraft structures, particularly wings, with reference to specimens and test loads, methods and equipment. (Q7, 1-54; T24a)

1095-Q. Fatigue Ratio as Design Evaluation of Aircraft Structures--Some Results From Tests on the G 91. L. Locati and G. Sarzotti. Paper from "Full-Scale Fatigue Testing of Aircraft Structures". Pergamon Press, Inc., New York 22, 1961, p. 345-363.

Determination of fatigue ratios, or the ratio of fatigue to tensile strength under load, of aircraft components under repeated load cycles and for life values of 10,000, 100,000 and 1,000,000 cycles. (Q7, T24)

1096-Q. (French.) Cobalt as an Alloying Element in Steel. D. Coutsouradis and L. Habraken. Revue de la Societe Royale Belge des Ingenieurs et des Industriels, Mar. 1961, p. 106-116.

Effect of Co in carbon, low alloy stainless heat resistant steels and tool-steels on phase composition, resilience, tensile strength, elastic limit, ductibility and hardness at room and elevated temperatures, transformations and the electrolytic potential. 37 ref. (Q-general, P-general, 2-60; ST, Co)

1097-Q. Effect of Irradiation Growth on the Creep of Uranium Under a Uniaxial Load. W. S. Blackburn. Philosophical Magazine, v. 6, Apr. 1961, p. 503-508.

Theories are developed from assumption of homogeneous deformation and uniform stress to calculate irradiation growth effects on the creep of uranium under a uni-axial applied stress when the temperature is sufficiently high for the internal stresses set up by the differential expansion of the individual crystals to the insufficient of themselves to cause plastic flow. 4 ref. (Q3, 2-62, 2-67, 3-66; U)

1098-Q. (German.) Comparative Study of Notch Impact Strength of Differently Heat-Treated Carbon Steels. Georg Altmeyer and Arnold Peiter. Materialprufung, v. 3, Apr. 20, 1961, p. 147-155.

Notch impact testing of differently heat treated (quenched or cooled from 700-900° C. and subsequently annealed) CK 67, CK 60 and CK·22 steel (0.74-0.17% C) to prove significance of a proposed method by which notch impact strength versus temperature curves may be evaluated. 7 ref. (Q6, 2-61, 2-64; CN)

1099-Q. (German.) Welding Deposits of Unalloyed Steel With Particular Reference to Phosphorus Content and Notch Impact Strength. Kurt Born and Otto-Ewald Goerdt. Archiv fur das Eisenhuttenwesen, v. 32, Apr. 1961, p. 225-236.

Investigation of notch impact strength from 20 to -100° C. as influenced by microstructure, nonmetallic inclusion, heat treatments and phosphorus content for welds obtained from unalloyed lime basic-coated electrodes and by welding with covered arc. (Q6n, 2-60, 2-64, 3-71, 9-69; ST, 7-51)

1100-Q. Experiments on the Postbuckling Behavior of Square Plates Loaded in Edge Compression. Noboru Yamaki. Journal of Applied Mechanics, Series E (American Society of Mechanical Engineers, Transactions), v. 28, June 1961, p. 238-244.

Determination of the relations of maximum deflection, stresses and strains at typical points in a square Al plate with applied loads under four different boundary conditions. 4 ref. (Q28k; Al, 4-53)

1101-Q. A Modification of the Coulomb-Mohr Theory of Fracture. Burton Paul. Journal of Applied Mechanics, Series E (American Society of Mechanical Engineers, Transactions), v. 28, June 1961, p. 259-268.

Failure of the Coulomb-Mohr theory to explain features of the simple torsion, tension and compression tests. Modification of the theory by tension cutoffs and friction angle to bring the theory into agreement with the above tests. Application of the theory for the general biaxial states of stress for gray cast iron. 22 ref. (Q26; CI-n)

1102-Q. (German.) Compression Strength of Copper Materials Used in Electrical Engineering. A. Keil. Metall, v. 15, May 1961, p. 421-422.

Measurement of compression strength, electrical resistance and hardness of cold worked cylindrical Cu, brass, Cu-Cr alloy and silver bronze specimens before, during and after 1/2 hr. annealing at 20-600° C. and subsequent air cooling. (Q28g, P15g, Q29n, 2-64; Cu-b)

1103-Q. (German.) Properties of Carbon Steel Building Ribs When Tensile Stressed. R. de Strycker. Draht, v. 12, Apr. 1961, p. 143-150.

Creep properties of temperatures from 20-100° C. Relaxation, fatigue and stress-corrosion testing of tensile stressed carbon steel wires (0.73-0.80% C) of given mechanical properties after various pretreatments (as-drawn, bath hardened, 200° C. aged and 400° C. stress-free annealed). (Q3, Q27c, Q7, R11s, 3-66, 2-61; CN, 4-61)

1104-Q. A Comparison of the Brittle Behavior of Metallic and Nonmetallic Materials. G. T. Hahn and R. I. Jaffee. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 107, May 16, 1961, 33 p. (Available as PB 171626 from U. S. Office of Technical Services, Washington 25, D. C.)

Basic influences on brittle behavior include electron bonding, crystal structure and degree of order. Properties of brittle materials important for design include elastic, plastic deformation, fracture, notch sensitivity, energy absorption, fatigue and thermal shock resistance. (Q26s)

1105-Q. The Stability and Properties of Alloy Steels at Elevated Temperatures. M. T. Simnad. General Atomic Division. U. S. Atomic Energy Commission, GAMD-1769, Nov. 21, 1960, 78 p. (Available from U. S. Office of Technical Services, Washington 25, D.C.) $2

Review of literature dealing with the formation of the sigma phase and its embrittling effect on the welds and properties of stainless steel including crystal structure and phase equilibria, fracture characteristics and corrosion resistance. Graphic and tabular presentations of phase and temperature effects on various properties of different types of steels. 49 ref. (Q26s, Q-general, M26q; AY)

1106-Q. Yield Strength of Machined Ring-Stiffened Cylindrical Shell Under Hydrostatic Pressure. M. E. Lunchick and J. A. Overby. Experimental Mechanics, v. 1, June 1961, p. 178-185.

Experimental investigation of the effects of initial imperfections and residual welding and rolling stresses of a machined and stress relieved high-tensile steel shell, at a pressure indicating agreement with calculation by maximum-shear-stress or Hencky-Von Mises criterion. Comparison of the collapse pressures of machined and welded models indicating that residual welding and rolling stresses do not adversely affect collapse pressure. 8 ref. (Q23b, 3-74; ST)

1107-Q. Contribution to the Theory of Superconducting Alloys With Paramagnetic Impurities. A. A. Abrikosov and L. P. Gor'kov. Soviet Physics JETP (Journal of Experimental and Theoretical Physics, v. 12, June 1961, p. 1243-1253.

In the framework of superconductivity theory the transition temperature is lowered in comparison with that of a pure metal when paramagnetic impurities are introduced into a superconductor. Determination of dependence of transition temperature on impurity concentration. Study is made of thermodynamic and magnetic properties of superconducting alloys in the concentration range close to critical. Concentration dependence of the energy spectrum gap. 17 ref. (Q23r, P12, P16, P15g, 3-69)

1108-Q. Improve Fatigue Strength With Abrasive Tumbling. Paper from "Grinding Stresses--Cause, Effect and Control". Grinding Wheel Institute, Cleveland 15, 1961, p. 53-55.

Annealed bars of Mn, oil-hardening toolsteel are ground and subjected to abrasive tumbling to illustrate the improvement in fatigue strength attainable because of the compressive stress induced on the metal surfaces during tumbling. (Q7a, G23, G18; TS)

1109-Q. Relief of Residual Grinding Stresses by Annealing. H. R. Letner and A. B. Sauvageot. Paper from "Grinding Stresses--Cause, Effect and Control". Grinding Wheel Institute, Cleveland 15, 1961, p. 57-60.

Oil-hardening toolsteels are cut, ground, austenitized in a NaCl-KCl salt bath at 1450° C. and quenched in agitated oil at 70° F. Half of the specimens are then tempered at 420° F. and allowed to cool in air. Results show effect of heat treatment on residual grinding stresses and hardness. (Q25h, G18, Q29n, 2-64; TS)

1110-Q. Controlling Grinding Stresses. A. L. Ball. Paper from "Grinding Stresses--Cause, Effect and Control". Grinding Wheel Institute, Cleveland 15, 1961, p. 63-67.

Residual grinding stresses in a workpiece can be controlled within limits. Examples demonstrate effects of wheel type, downfeed and coolant on stresses in hardened steel. Bath and quench also effectively reduce stresses. Critical effects of downfeed in grinding Ti. 4 ref. (Q25h, G18; ST, Ti)

1111-Q. Determination of Creep of Structural Joints From Simple Tensile Creep. Joseph Marin. ASTM Preprint, no. 77, 1961, 7 p. $.30.

Approximate method for theoretical determination of the creep deformation in single riveted or bolted butt type joints based upon simple tensile creep stress-strain-time relations for the material. 6 ref. (Q3, 10-51; 4-57, 7-53, 7-54)

1112-Q. Tensile Strength-Hardness Correlation for Titanium Alloys. Charles F. Hickey,

Jr. ASTM Preprint, no. 87, 1961, 9 p. $.30.

Tensile and hardness properties are obtained as a function of testing temperature, heat treatment and section size of material. The resulting correlation holds for stable alpha-beta alloys but does not apply to metastable alpha-beta alloys or all-beta alloys. 6 ref. (Q27a, Q29n; Ti-b)

1113-Q. Determination of Compressive, Bearing, and Shear Creep of Sheet Metals. H. R. Kattus and H. L. Lessley. ASTM Preprint, no. 76, 1961, 10 p. $.30.

Creep testing of a Ti-2.5Al-16V alloy at up to 1000° F. using specially designed loading fixtures containing cartridge heaters as integral parts to obtain temperature uniformity. (Q3; Ti-b, Al, V, 4-53)

1114-Q. Room-Temperature Creep Rate of Molybdenum and Effect of Strain Rate on Tensile Properties of Molybdenum. R. Q. Barr, M. Semchyshen and G. A. Timmons. ASTM Preprint, no. 85, 1961, 10 p. $.30.

The strain-rate sensitivity of unalloyed Mo is verified on stress-relieved and recrystallized specimens. Yield strengths are found to vary proportionately with elastic strain rate and tensile strength with plastic strain rate. 6 ref. (Q3, Q27a, 3-68; Mo)

1115-Q. A Method for Determining the Plastic Flow Properties of Sheet and Round Tension Test Specimens. J. Nunes and F. R. Larson. ASTM Preprint, no. 41, 1961, 13 p. $.30.

True stress-strain, true strain rate, mechanical anisotropy and "corrected" flow stress for 16V-2.5Al and 4Al-3Mo-1V Ti alloys, 301 and AMS 5548 stainless steels, H-11 steel and 24S-T4 Al alloy. 10 ref. (Q23; Ti-b, 4-53, 4-60)

1116-Q. Rapid-Rate Compression Testing of Sheet Materials at High Temperatures. E. C. Bernett and W. W. Gerberich. ASTM Preprint, no. 81a, 1961, 13 p. $.30.

Creep and yield strengths of 2024-T81 Al alloy, 17-7 PH stainless steel, 6Al-4V Ti alloy and N-155 Fe-base alloy from 600-2000° F. (Q29, Q3m, Q23b, 2-62; Al-b, Fe-b, SS, Ti-b, 4-53)

1117-Q. Elevated-Temperature Dynamic Moduli of Metallic Materials. W. H. Hill, K. D. Shimmin and B. A. Wilcox. ASTM Preprint, no. 74, 1961, 16 p. $.30.

Forty metals and alloys including Al, Be and Ti alloys, plain carbon and low-alloy steels, stainless steels, a Co alloy, Ni alloys and refractory metals are tested at temperatures up to 1800° F. Results are compared with static moduli in most cases. 8 ref. (Q21a, Q21b, 2-62; Al-b, AY, Be, CN, Co-b, Ni, SS, Ti-b)

1118-Q. Fatigue Properties of Uncoated and Coated Unalloyed Molybdenum at 1800° F., Room Temperature, and - 40° F. A. A. Mittenbergs, G. D. Haley and D. N. Williams. ASTM Preprint, no. 73, 1961, 17 p. $.30.

Fatigue behavior of unalloyed commercially pure arc-cast Mo is investigated in tension-tension loading on protected and unprotected, unnotched and notched sheet specimens. Three oxidation-resistant coatings are evaluated under fatigue loading. 5 ref. (Q7, 2-61; Mo, 8)

1119-Q. Welded Ferritic Steel Construction for Intermediate Low-Temperature Service. A. A. Wells. ASTM Preprint, no. 80c, 1961, 20 p. $.30.

Ductility and transition temperatures are determined by Charpy V-notch testing, drop-weight testing and tensile testing from 88 to -85° F. 28 ref. (Q23, Q27, 2-61; SS-d)

1120-Q. Friction and Wear of Metals in Gases Up to 600° C. D. F. Cornelius and W. H. Roberts. ASLE (American Society of Lubrication Engineers) Transactions, v. 4, Apr. 1961, p. 20-32.

Cu, mild steel and brass are rubbed against a hardened toolsteel in vacuum, dry helium, dry CO_2 and dry air. Several alloys with Cr content ranging from 10-30% including a series of four Co-Cr-W alloys are paired for rubbing at elevated temperatures up to 700° C. in gaseous environment. Specific wear rates and friction coefficients as a function of temperature. Lowest wear rates are observed with the nitrided steels. 26 ref. (Q9n, Q9p, 2-62; Cu, ST)

1121-Q. (German.) Quality of Hanger Tabs for Suspended Roof. H. Longin. Radex Rundschau, Apr. 1961, p. 561-565.

Investigation of failures occurring in 18/8 CrNi steel hanger tabs for open-hearth furnace roof suspension by chemical analysis of furnace dust and failed hanger tabs, microstructure investigation and by

annealing of 18/8 CrNi steel in containers filled with furnace dust at 1000° C. Elimination of failures by decreasing Ni and increasing Cr content in the steel. 4 ref. (Q7; SS, Cr, Ni)

1122-Q. Velocity of Sound in Liquid Lead-Tin Alloys. Robert B. Gordon. Paper from "Physical Chemistry of Process Metallurgy". Pt. 1. v. 7. Metallurgical Society of AIME. Interscience Publishers, Inc., New York 1, 1959, p. 461-470.

A constant, linear decrease in the velocity of sound with increasing temperature is found with no indication of presolidification phenomena. An anomaly appears in the dependence of the sonic velocity, its temperature coefficient and the adiabatic compressibility on alloy composition. (Q21f; Pb-b, Sn-b, 14-60)

1123-Q. (Japanese.) Studies on Heat Treatment of TiC 50 Ni-Cr-Co-Mo Cermets. Masataka Sugiyama and Hisashi Suzuki. Japan Institute of Metals, Journal, v. 25, Mar. 1961, p. 167-170.

Vacuum sintered specimens of 50% TiC, 30% Ni, 10% Cr and 5-9.5% Co, with 0.5-5% Mo substituted for Co, are tested and examined metallographically after vacuum heat treatment and quenching from 950-1280° C. Data are given for creep rupture, Vickers hardness, density, Curie temperature, ductility, microstructure and phase dispersion and stability as a function of heat treatment time and temperature. 4 ref. (Q-general, J-general, 1-73, 2-62; Ti-b, Ni-b, C, Cr, Co, Mo, 6-70)

1124-Q. (Japanese.) Relation Between Heat Treatment and Hardness and Torsional Strength of Ni-Cr Structural Steel at Room and High Temperatures. Pt. 5. The Austempering of Structural Special Steels. Hideji Hotta. Japan Institute of Metals, Journal, v. 25, Mar. 1961, p. 174-177.

Isothermal transformation curves for 20-900° C. are constructed from microvickers hardness measurement, dilatometry and micro-examination of specimens after tempering to 860° C., quenching and austempering from 300-600° C. Torsional strength, Charpy impact value and Rockwell, Brinell and Taniguichi-Yeda impact hardness are determined with transformation microstructures as a function of heat treatment temperature. 4 ref. (Q-general, J26p, N8g, 2-62, 2-64; AY, Ni, Cr)

1125-Q. (Japanese.) Tensile Strength of Ni-Al-W Alloys at High Temperatures. Takeshi Miyazaki and Yuki Shirakawa. Japan Institute of Metals, Journal, v. 25, Mar. 1961, p. 188-191.

Measurement of tensile strength and specific electric resistance from 20-800° C. of vacuum annealed wire specimen of Ni alloy containing 0.73-4.15% Al and 0.89-5.10% W with Co additions. Tensile and resistance properties are improved with Al content increase of 3.50% and decrease with temperature increase. (Q27, P15g, 2-60, 2-62, 2-64, Ni-b, Al, W, Co, 4-61)

1126-Q. (Japanese.) Torsion Test as a Method for Measuring Toughness of Gray Cast Iron. Hiromu Tanimura, Kiichi Taniguchi and Yuji Nagamatsu. Japan Institute of Metals, Journal, v. 25, Mar. 1961, p. 198-201.

Comparative tensile, Charpy impact and torsion tests on gray iron specimens of various graphite structures and compositions for evaluating the agreement of the methods in measuring toughness as a function of resilience. Data are given for elongation, stress-strain relations, shear, elastic moduli impact values and tensile and torsional strength. 4 ref. (Q23s, Q1, Q-general; Ci-n)

1127-Q. (Czech.) Effect of Heat Treatment on the Fracture of Cast Steel. Adolf Lorenc. Slevarenstvi, v. 9, Apr. 1961, p. 132-138.

30KhN3MA steel and austenitic steel containing 12% Mn are cast into test pieces which are broken in the cast state, after austenitization followed by quenching, annealing at a temperature below the Ac_1 point or homogenization. Relationships between structure and fracture, previous heat treatment and ductility. 11 ref. (Q26, 2-64; ST, 5)

1128-Q. (Czech.) Effect of Molybdenum Sulphide on the Sliding Properties of Cast Iron Used in Thrust Bearings. V. Sevcik. Strojirenstvi, v. 11, Apr. 1961, p. 283-289.

Friction tests are carried out with the pair, cast iron-steel, using powdered MoS_2 or a suspension of MoS_2 as a lubricant. Effect of the lubricants on friction and wear of uncoated or phosphate coated cast iron. 12 ref. (Q9, 18-73, T7d; CI, ST, 17-57)

1129-Q. Stress Rupture Unit Uses Electron Beam Heating. Al Donlevy and Jack K. Y.

Hum. SAE Journal, v. 69, July 1961, p. 60-61.

Electron beam heating is used as a heat source in stress rupture testing of Cb, Mo, Ta, W and their alloys at 2400° F. Work must be done in a high vacuum and, at present, 2200° F. is the low test temperature limit. (Q3q, X24f; Cb, Mo, Ta, W)

1130-Q. (Japanese.) Influence of Temperature History on Creep. Shuji Taira, Masateru Ohnami and Mizune Sakato. Japan Society of Mechanical Engineers, Transactions, v. 27, Apr. 1961, p. 373-380.

Transient stage creep in 0.15% carbon steel as dependent on strain increment and change in internal yield stress, recovery or aging, as a function of fluctuation and related time intervals in thermal cycling tests in tension from 300-900° C. 13 ref. (Q3s, 2-62, 3-68; CN-g)

1131-Q. (Japanese.) Creep Under Step-Wise Temperature Cycling. Shuji Taira, Masateru Ohnami and Syoichi Sugioka. Japan Society of Mechanical Engineers, Transactions, v. 27, Apr. 1961, p. 380-386.

Creep curves are determined for low-carbon steel, 18-8 stainless and 13% chromium steel as a function of time, cycle and temperature for thermal cycling tests from 450-650° C. under fixed tensile stress. A theoretical analysis is made in terms of a "mechanical equation of state in solids". 5 ref. (Q3, 2-62, 3-66; ST)

1132-Q. (Japanese.) Accelerated Stage Creep and Creep Rupture Under Temperature Cycling. Shuji Taira and Masateru Ohnami. Japan Society of Mechanical Engineers, Transactions, v. 27, Apr. 1961, p. 387-395.

Influence of thermal cycling from 600-700° C. on creep and rupture life, embrittlement and elongation of 318 stainless steel specimens. 20 ref. (Q3s, 2-62; SS-e)

1133-Q. (Japanese.) Dynamic Creep and Fatigue of an 18-8 Molybdenum-Columbium Steel at Elevated Temperature. Shuji Taira, Ryoichi Koterazawa and Susumu Kaji. Japan Society of Mechanical Engineers, Transactions, v. 27, Apr. 1961, p. 396-402.

Creep and fatigue test data for specimens at 650° C. are correlated with data for rupture and hardness tests and electron microscopy examination. Precipitation hardening characteristics are related to strength values as a function of alternating stress. 11 ref. (Q3, Q7, Q-general, N7, 2-62, 3-66; SS-e)

1134-Q. (Japanese.) Effect of Notch on Fatigue Strength of Steel at Elevated Temperature. Minoru Kawamoto, Tsuneshichi Tanaka and Mitsunori Miyake. Japan Society of Mechanical Engineers, Transactions, v. 27, Apr. 1961, p. 403-410.

Rotating bending fatigue tests on 0.21% carbon steel with various circumferential notches to determine the effect of test temperature, strain rate and notch sharpness on the fatigue strength and notch factor. Relation of fatigue strength to temperature induced blue brittleness. 12 ref. (Q7c, Q23s, Q26s, 2-62, 3-68; CN-g)

1135-Q. (Japanese.) Effects of Holding Time on the Thermal Fatigue of 18-8 Columbium Steel. Noritada Kato. Japan Society of Mechanical Engineers, Transactions, v. 27, Apr. 1961, p. 410-423.

Effect of variation in the temperature cycle, holding time, stress amplitude and cyclic plastic strain on thermal fatigue strength of specimens tested at constant mean temperature of 350° C. for varied temperature ranges and times. Influence of composition on hot ductility. 5 ref. (Q7j, Q23p, 2-62, 3-67, 3-68; SS-e)

1136-Q. (Czech.) Heat Resistant 15Cr35Ni3W Steel. Josef Vodsedalek. Hutnicke Listy, v. 16, Apr. 1961, p. 270-275.

Steel containing 0.04-0.08% C, 0-1.23% Mn, 0-0.63% Si, 0-0.008% P, 0-018% S, 14.53-15.33% Cr, 33.49-37.16% Ni, 2.05-3.8% W, 0-1.24% Mo, 0.45-1.77% Ti, 0.12-6.88% Al and 0-0.21% B is mechanically tested at 20-800° C. after solution annealing at 1150° C. and subsequent aging at 700-750° C. for 20-2000 hr. Creep strength as a function of Ti and Al contents, microstructures. 7 ref. (Q3m, 2-60, 2-61, 3-71; SS, SGA-h)

1137-Q. (Swedish.) Yield Stress of Carbon and Low-Alloyed Tube Steels for Pressure Vessels From 20-500° C. B. Lofblad, E. Lowgren and L. Roslund. Jernkontorets, Annaler, V. 145, Mar. 1961, p. 143-172.

Investigation to obtain a basis for calculation of values for standardized carbon and low-alloyed tube steels including ST 35, ST 45, 1 Cr/0.5 Mo and 2.25

Cr/1 Mo. Results are plotted in diagrams where a minimum curve for the 0.2% proof stress has been plotted for each grade. (Q23b, 2-61; AY, CN)

1138-Q. (Translation.) Relaxation of Elastic Stresses Under Neutron Irradiation. S. T. Konobeevskii. U. S. Atomic Energy Commission, AEC-tr-4425, May 1961, 24 p. (Translation from Atomnaya Energiya, v. 9, 1960, p. 194-200.) (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Effect of neutron irradiation on relaxation of elastic stresses in flat springs of U-Mo alloys and on relaxation of microstresses which cause widening of the lines in an X-ray diffraction pattern of rolled uranium. 7 ref. (Q25, 2-67; U-b, Mo)

1139-Q. Fracture Toughness Tests of High-Strength Sheet metals. Pt. 1. Harold Bernstein and George C. Young. Engineering Dept. U. S. Naval Gun Factory, NAVORD Report 6496, May 18, 1959, 19 p.

Effect of section thickness, strength level, surface finish, flash welding, fusion welding and Mig welding on the fracture toughness of 6150 steel, 4340 steel, AMS 6434 steel, X-200 Airsteel, Vascojet 1000, Tricent M-300, Potomac A, Crucible 56, 4340 steel and B120VCA Ti alloy. (Q26; SGB-a, 4-53)

1140-Q. Fracture Toughness of High-Strength Sheet Metals. Pt. 2. Harold Bernstein and George C. Young. Engineering Dept. U. S. Naval Weapons Plant, NAVORD Report 6496, Jan. 28, 1960, 23 p.

Fracture toughness results on several high-strength sheet steels are presented. Data cover the effects of heat treatment, section size and directionality. (Q26r, Q23r; ST, SGB-a, 4-53)

1141-Q. Strength of Thick-Walled Cylindrical Vessels Under Internal Pressure for Three Steels. Joseph Marin and Tu-Lung Weng. Welding Research Council, Bulletin Series, no. 67, Mar. 1961, 13 p.

Pressure-expansion relations and maximum internal pressures for 30 thick-walled cylinder specimens of varied inside-outside diameter ratios for A212 Grade B Firebox, A285 Grade C Firebox, and T304 stainless steel are determined in fraction tests with calculations based on simple tension and torsion-shear true stress-strain relations. 6 ref. (Q10b, Q25, T26q; ST)

1142-Q. (Pamphlet.) Discontinuous Deformation and Fracture of Metals. Mar. 1961. 14 p. Dept. of Metallurgical Engineering, Illinois Institute of Technology, Chicago 16, Ill.

Determination of the effect of prestraining 95-5 phosphor bronze, OFHC Cu, Armco iron, 1018, 1113, C 1213 and 4340 steels and 70-30 brass on the yield point, elongation and propagation of deformation by a spreading band. 8 ref. (Q24, Q23p, 3-68; Cu-b, Fe-a, ST)

1143-Q. Evaluation of Aircraft Material by Fracture. W. E. Anderson and P. Paris. Materials Engineering Quarterly, v. 1, May 1961, p. 33-44.

Fracture and fatigue testing of 7171-T6, 2024-T3, 7075-T6 Al alloys and AM 350 CRT, 301 FH, AM 355 CRT and 300 M steel alloys to determine relationship between crack growth rate and critical stress intensity. Calculation of stress intensity factor. (Q26, Q7; Al-b, ST)

1144-Q. Notch Toughness of Structural Sheets. R. D. Stout and E. H. Kottcamp. Metals Engineering Quarterly, v. 1, May 1961, p. 58-69.

Mechanical testing of C1080 structural steel and low-carbon steel consisting of ferrite-pearlite aggregates to determine notch ductility and notch transition temperature as affected by austenitic grain size, pearlite spacing and tensile strength. Electron microphotographs. 17 ref. (Q23s, 2-59, 3-71; CN-g, SGB-s)

1145-Q. Effect of Structure on the Properties of Titanium Alloys. E. Bohanek. Metals Engineering Quarterly, v. 1, May 1961, p. 70-88.

Forming, heat treating and mechanical testing of Ti-35A, Ti-55A, Ti-8Al-1M-1V, Ti-4Al-3Mo-1V, Ti-6Al-4V and Ti-13V-11Cr-3Al alloys to determine effect of grain size on tensile strength, ductility, creep and twinning resistance, drawability, elongation and microhardness. Photographs of microstructure. (Q-general, 2-59; Ti-b)

1146-Q. Electron-Beam Welding. E. G. Thompson, E. C. Bernett and H. Binder. Metals Engineering Quarterly, v. 1, May 1961, p. 89-102.

Mechanical testing of electron beam welded specimens of Mo and arc-cast

Mo-0.5% Ti alloy from 80-3200° F. to determine porosity, tensile strength, elongation, Young's modulus and stress-strain relationship. 12 ref. (Q27, Q23, 9-68; Mo-b, Ti, 7-51)

1147-Q. Preventing Fatigue Failures. Pt. 5. Calculating Fatigue Strength. F. B. Stulen, H. N. Cummings and W. C. Schulte. Machine Design, v. 33, June 22, 1961, p. 159-165.

Calculations to determine tensile and fatigue strengths and standard deviation values for 4340 and 4350 steels, 6Al-4V-Ti alloy, 7076-T61 alloy, 5-Ni-10Al-bronze and BeCu under four stress situations including constant amplitude service stress, steady stress superimposed on constant amplitude stress, alternating stresses of varying amplitudes and steady stresses superimposed on alternating stresses of varying amplitudes. 24 ref. (Q27a, Q7a; Al-b, Cu-b, ST, Ti-b)

1148-Q. Rapid-Rate Compression Testing of Sheet Materials at High Temperatures. E. C. Bernett and W. W. Gerberich. Jet Propulsion Laboratory, California Institute of Technology, Technical Report no. 32-76, June 15, 1961, 11 p.

Test equipment and procedures for evaluating structural sheet material compression properties at preselected constant strain rates and/or loads. Data are given for an Al alloy, stainless steel, Ti alloy and Cr-Ni-Co-Fe alloy. (Q28, 2-62; Al-b, Fe-b, SS, Ti-b, SGB-s, 4-53)

1149-Q. Contact Stress and Load as Parameters in Metallic Wear. A. Dorinson and V. E. Broman. Wear, v. 4, Mar-Apr. 1961, p. 93-110.

Analysis of metallic wear in the presence of white oil under different loads and contact stresses. Wear process is found to be multistage, showing abrupt rise, leveling-off and transition to accelerated wear. 17 ref. (Q9)

1150-Q. Relation Between Wear Rate and Debris Composition in Wear of Wrought Iron and Mild Steel. B. J. Nield and O. G. Griffin. Wear, v. 4, Mar-Apr. 1961, p. 111-122.

Comparison of wear rates of wrought iron and mild steel under unlubricated conditions to determine the effect of relative humidity on wear rate and debris composition. The composition of wear debris as determined by X-ray diffraction analysis may be a guide to the type of wear mechanism and the conditions under which debris is produced. 12 ref. (Q9; CN, Fe)

1151-Q. An Electron-Microscopic Study of Friction and Wear. Rolf Weil and Roger A. Paquin. Wear, v. 4, Mar-Apr. 1961, p. 123-136.

Static and dynamic friction testing of Ni, Cu and Cr electroplated on Cu sheet followed by microscopic examination of the surface. Coefficient of friction is not affected by surface roughness, load, mechanical properties and plating conditions. Determination of relationship between wear, surface roughness and work hardening. 16 ref. (Q9, M21e; Cu, Cr, Ni, 4-53, 8-62)

1152-Q. On the Nature of Solid Friction. Gordon E. Gross. Wear, v. 4, Mar-Apr. 1961, p. 161-164.

Review of papers on solid friction studies, friction and adhesion of molecularly smooth surfaces, friction in polymers, promotion of wear by reciprocal sliding and several other topics dealing with friction in terms of the microscopic properties of solids. 4 ref. (Q9)

1153-Q. Study of Plastic Deformation in Metals With the Electron Microscope. H. Wilsdorf and D. Kuhlmann-Wilsdorff. Philips--Serving Science and Industry, v. 7, June 1960, p. 193-198.

Report on investigation of plastic deformation in Al-Cu alloys and metal films by electron microscopy. Analysis of crystal structure slip lines and dislocation decorations in film samples of Al, Cu and Zn. 29 ref. (Q24, M21e; Al, Cu, Zn, 14-62)

1154-Q. (German.) Correlations Between Mechanical Properties in Castings and in Separately Cast Testing Rods. Wilhelm Patterson and Friedrich Iske. Forschungsberichte des Landes Nordrhein-Westfalen, n. 964, 1961, p. 3-4.

Comparative measurement of hardness, tensile strength and "Heller-Jungbluth wall thickness parameter" in cast iron castings and cast testing rods. (Q-general, 3-73; CI, 5)

1155-Q. (German.) High-Alloyed Steels in Nuclear Power Plants. J. Jagersberger. Atomwirtschaft, v. 6, Mar. 1961, p. 154-157.

Review of function of alloying elements in development of mechanical and physical properties of steel with emphasis on susceptibility to radio-activation. Effect of heat treatment on properties of steel subjected to radiation as influenced by alloying elements. (Q-general, P-general, 2-60, 2-64, 2-67; ST)

1156-Q. (Spanish.) Effect of Tin in Spring Steel. Jose M. Palacios Reparaz. Tecnica Metalurgica, v. 17, Jan-Feb. 1961, p. 17-28.

Spring steels containing 0.004-0.116% Sn are mechanically tested to study the effect of Sn on tensile strength, elongation, elastic limit and impact strength. (Q27a, Q23p, Q21, Q6n, 2-60; ST, Sn, SGA-b)

1157-Q. Hardness-Tensile Strength Conversion for Rockwell Hardness, C Scale. ASTM Bulletin (Materials Research and Standards), v. 1, June 1961, p. 448-451.

Hardness-tensile strength correlation for 4340 steel heat treated above Rockwell C 40 by oil-quenching and tempering. (Q27, Q29, 2-64; ST)

1158-Q. Creep Testing by Centrifugal-Force Loading. R. E. Hook, A. M. Adair and J. W. Spretnak. ASTM Bulletin (Materials Research and Standards), v. 1, June 1961, p. 464-470.

Design and construction of a machine for creep testing of electrolytic tough pitch Cu at 300° C., 750 rpm. and 5470 psi. maximum fiber stress and of Ni rich Al binary alloys at 650° C., 1080 rpm. and 10,950 psi. maximum fiber stress. Statistical evaluation of the creep data. 18 ref. (Q3q, 1-52; Cu-b, Ni-b, Al-b)

1159-Q. Expression of Stress-Rupture Data With Functions Derived by the Least-Squares Method. M. J. Stutzman and J. W. Faber. ASTM Bulletin (Materials Research and Standards), v. 1, June 1961, p. 460-464.

Stress-rupture considered as a function of temperature, stress and time-to-rupture. Expression of the time-temperature variables as a function of stress by the Larson-Miller parameter and calculation of the line of minimum deviation by the least-squares method. Illustration of data that follow a straight line (Stellite 31) and data that follow a parabolic curve (Nicrotung). Method of converting test data to the equivalent stress for a designated time-to-rupture at a given temperature. (Q3m; Ni-b, SGA-h)

1160-Q. Use of the Bulge Test for Determining Mechanical Properties of Stainless Steel Foil. D. B. Ballard. ASTM Bulletin (Materials Research and Standards), v. 1, June 1961, p. 471-473.

Determination of yield pressure, burst pressure and maximum bulge height for 17-7 PH and AM 350 stainless steel foils using a hydraulic bulge tester. Yield pressure is indicated to be a function of heat treatment. 12 ref. (Q10b, Q23b; SS)

1161-Q. Effects of Hot-Cold Working on High-Speed Steels. R. F. Harvey. Cobalt, no. 11, June 1961, p. 36-37.

To test results of hot cold working ground samples of M-2 and M-6 high-speed steels austenitized at 2225° F. are cooled from 900-1000° F. and subjected to 1500-ton pressure. Thickness reduction, deformation and hardness determined. Microscopic examination of austenitic grain structures. (Q29n, M27c, 3-68; TS-m, Co)

1162-Q. High Speed Steels Meet Tool Needs. Pt. 2. Peter Payson. Metal Progress, v. 80, July 1961, p. 91-96.

To date, metallurgists have determined that high-speed steels are hardened by tempering above 1000° F. because fine alloy carbides precipitate in the matrix. This phenomenon, secondary hardening, makes it possible for tools of such steels to retain cutting edges at red heat. (Q-general, Q29, M27; TS-m)

1163-Q. Toughness in Weld Metal. Stanley S. Sagan and Hallock C. Campbell. Digest of "Factors Which Affect Low-Alloy Weld Metal Notch Toughness". Welding Research Council Bulletin, no. 59, Apr. 1960, 16 p. Metal Progress, v. 80, July 1961, p. 170-172.

Effect of metallic arc welding variables on the Charpy V-notch toughness of the deposited weld metal from -80 to 75° F. Factors considered include alloying elements, electrode size, heat treatment, welding position and dilution of weld metal by base metal. (Q23s, 2-61; 7-51)

1164-Q. Progress in High-Strength Aluminum Alloy Castings of Airframes. William A. Bailey and Emmett N. Bossing. Western Machinery and Steel World, v. 52, June 1961, p. 45-47.

Mechanical properties of Al alloy castings used in airframes and missile

configurations. Effects of factors in the casting process and subsequent heat treatment and of the alloy composition on mechanical properties of Al alloy castings used in airframes and missile configurations. (Q-general, 2-60, 2-64, T24; Al-b, SGB-A, 5)

1165-Q. Investment Castings as Members in Critical Structural Assemblies. N. Silverberg and W. F. Shaw. Western Machinery and Steel World, v. 52, June 1961, p. 48-49.

Mechanical properties of 17-4 PH alloy investment castings used in aircraft and missiles. (Q-general, T24; SS, 5-62, 17-57)

1166-Q. Structural Characteristics of Fasteners for Honeycomb. Jack Cherne. Assembly & Fastener Engineering, v. 4, July 1961, p. 33-37.

Tensile strength of SL 78 potted-in fasteners as affected by skin thickness, core density and over-all sandwich thickness of 2024 ST Al honeycomb panels. (Q27a, T7f)

1167-Q. Study of the Rate Controlling Process for Compressive Deformation of High Purity Aluminum. A. E. Riessen. Materials Central (Wright Air Development Division). U. S. Office of Technical Services, PB 171488, Sept. 1960, 27 p. $.75.

To determine the rate-controlling deformation mechanism in a hardness test from 297-358° K. a "unique" testing technique involves the removal of the minor load spring in a standard Wilson Rockwell Hardness Tester which renders the minor load a "dead load" of 30.825 lb. when the arm is released as when making a hardness determination with no load on the weight pan. An attempt is made to correlate the activation energy for compression with a recognized rate-controlling process for tensile deformation of Al. (Q29n, Q24; Al)

1168-Q. Applicability of Present Creep Prediction Techniques for Extrapolating Very Long Time Creep Behavior. K. D. Shimmin. Materials Central (Wright Air Development Center). U. S. Office of Technical Services, PB 171487, Oct. 1960, 21 p. $.75.

The Manson-Haferd time-temperature parameter method proves the most successful in correlating existing stress-rupture data and promises the most success in extrapolating data to times up to 100,000 hr. (Q3, 10-51)

1169-Q. Behavior of Riveted and Welded Crack Arrestors. R. J. Mosborg. University of Illinois (Bureau of Ships). U. S. Office of Technical Services, PB 171576, Aug. 1960, 114 p.

Steel plates 2 ft. and 6 ft. wide containing welded inserts of T-1 steel, riveted doubler plates or welded inserts of ABS Class C normalized steel subjected to laboratory-propagated notch crack tests. A riveted doubler plate performs well and it is noted that rivet holes do not necessarily attract propagating cracks. Drop-weight and explosion-bulge tests results plus data from various Charpy V-notch criteria are compared with the results from large scale tests of crack-arrestor specimens. (Q26q; ST, 7-51, 7-53)

1170-Q. Creep of a Recrystallized Aluminum SAP-Type Alloy. G. S. Ansell and F. V. Lenel. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 452-456.

The creep behavior of an Al-Al_2O_3 alloy with a dispersion spacing of 1 micron at 400, fabricated by compacting an atomized Al powder, extruding the compact, cold working and recrystallizing the extrusion, is investigated in steady state tests from 500-620° C. Theoretical analysis is made in terms of a model proposed by Ansell and Weertman for dispersion strengthening with creep being attributed to dislocation climb. 7 ref. (Q3, M26c, N-general; Al-b, 6-70)

1171-Q. Prismatic Glide in Cadmium Crystals. J. J. Gilman. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 456-457.

Rates of prismatic plastic glide $(10\bar{1}0)$ (2110) in pure Cd crystals are measured from 158-276° C. The glide rate is proportional to the 2.75 power of the applied shear-stress and the activation energy is 29.2 kcal. per mol. The rates of prismatic glide in Cd and Zn crystals are determined by the strengths of the atomic bonds across the prism planes. (Q24, M26c, 3-67, 3-73; Cu-a, 14-61)

1172-Q. Effect of Copper Additions on the Activation Energies for Creep of Aluminum

Single Crystals. D. Walton, L. Shepard and J. E. Dorn. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 458-460.

The influence of small solute additions 0.005-0.25% of Cu on the activation energies for creep in single crystal bar specimens determined from 78-850° K. Data are given for secondary creep rate, flow stress, strain aging phenomena and activation energy as a function of time, temperature and composition. 7 ref. (Q3, N7e, 2-60, 2-61; Al, 14-61, Cu)

1173-Q. Delay Time in Single Crystals of Aluminum, Zinc and Iron. I. R. Kramer. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 474-478.

The delay time for single crystals of Fe, Zn and prestrained Al are measured under conditions of high speed deformation. The delayed yielding of Al is affected by the orientation of the crystal and those of Zn and Fe by impurity content. Under the dynamic conditions employed, the calculated "activated volume" term appears to be very small for the metals studied. 12 ref. (Q24c, 3-67, 3-72; Al, Fe, Zn, 14-61)

1174-Q. Notch Sensitivity of Refractory Metals. A. G. Imgram, F. C. Holden, H. R. Ogden and R. I. Jaffee. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 517-527.

The tensile and notch tensile properties of four refractory metals, Mo, W, Cb and Ta and one alloy, Mo-0.5% Ti in bar and sheet form are investigated from -250 to 20° C. after various heat treatments. The notch sensitivity of each material is evaluated on the basis of several criteria including the notch-unnotch strength ratio, the ductility transition and the fracture transition. (Q23s, Q23r, Q27d, 2-63, 2-64; EG-d37, Mo-b, Cb, Ta, W)

1175-Q. Hardness Anisotropy in Single Crystal and Polycrystalline Magnesium. M. Schwartz, S. K. Nash and R. Zeman. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 554-560.

Knoop hardness in the rolling and longitudinal planes of hot and cold rolled sheets of sublimed Mg is measured as a function of the angle between the long axis of the indenter and the rolling direction. The measurements are correlated with similar data taken on the (0001) and (10$\bar{1}$0) planes of a single crystal of Mg where the hardness is measured as a function of the angle between the long axis of the indenter and the (11$\bar{2}$0) direction. 13 ref. (Q29n, 3-72; Mg-a)

1176-Q. Development of Copper Base High Strength-Medium Conductivity Alloys--Cu-Ti-Sn and Cu-Ti-Sn-Cr. Matti J. Saarivirta. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 596-606.

Room and elevated temperature mechanical and physical properties of two new precipitation hardening Cu-base alloys, Cu-1.5% Ti-2.5% Sn and Cu-1.5% Ti-2.5% Sn-0.4% Cr, as obtained by solution annealing and subsequent heat treatment and cold working. Tensile properties, ductility and electrical conductivity of these alloys compare favorably with the above Cu-Be-Co alloys. 6 ref. (Q-general, A-general, N7, P-general, 2-64; Cu-b, Ti, Sn, Cr)

1177-Q. Effect of Grain Size on Brittle Fracture in Steel. F. de Kazinczy and W. A. Backofen. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 640-641.

Grain size dependence of fracture and yield stress for brittle fracture (at the ductility transition temperature) is investigated from -220 to -100° C. for notched and plain specimens of low-carbon steels with varying grain sizes as produced by heat treatment. 6 ref. (Q23, Q26s, 2-59, 2-63, 2-64; CN-g)

1178-Q. Identification of Deformation Twins in a Molybdenum-35% Rhenium Alloy. H. W. Schadler and A. Lawley. Metallurgical Society of AIME, Transactions, v. 221, June 1961, p. 650-652.

Laue X-ray back reflection examination of deformation markings in specimens deformed 6% in tension at 78° K. showing that deformation twins form on (112) planes by shear in the (11$\bar{1}$) direction. 9 ref. (Q24b, Q24c, M22g; Mo-b, Rh)

1179-Q. (German.) Nonoctahedral Slip in Polycrystalline Aluminum. Randolf J. Hartmann and Eckard Macherauch. Zeitschrift fur Metallkunde, v. 52, May 1961, p. 353-358.

Tensile deformation of 550° C. vacuum annealed pure Al (99.99%) specimens with 0.2-0.5 mm. average crystallite diameter and combined X-ray, light and electron microscope examination to investigate frequency of nonoctahedral slip as influenced by deformation rate, crystallite diameter, ratio of Burger's vector and slip plane spacing. (Q24a, Q27, M21; Al)

1180-Q. (German.) Yield Point of Alpha Iron Single Crystals. Manfred Evers. Zeitschrift fur Metallkunde, v. 52, May 1961, p. 359-364.

Tensile testing of 850° C. vacuum annealed, water quenched, electrolytically polished, 200° C. annealed and -65 to 50° C. aged alpha iron single crystal specimens containing 0.005% C. Yield point as influenced by aging stress, time, temperature and strain rate. (Q24c, Q27, 2-65; Fe-a, 14-61)

1181-Q. (German.) Fatigue Strength of Uranium Containing 0.35 Wt.% Columbium. Hans Buhler and Walter Schreiber. Zeitschrift fur Metallkunde, v. 52, May 1961, p. 365-367.

Alternating torsion testing (frequency 1430 cpm.) of 630° C. annealed uranium specimens containing 0.35 wt.% Cb. Representation of results in terms of S-N curves (Wohler curves), damage line and axial loading diagram. (Q7a, Q1; U-b, Cb)

1182-Q. (German.) Hardness and Backspring of Metal Wires. Konrad Thielmann. Zeitschrift fur Metallkunde, v. 52, May 1961, p. 368-370.

Method and apparatus for measuring torsional backspring of metal wires (examples given for Pb, Al, Cu, Fe, CuNi 45, Ni67Cu, MS 58, SiBz 2, MnMBz 12) and evaluation of Brinell hardness from torsional backspring data. (Q1, Q29n; Al, Cu-b, Fe, Ni-b, Pb, 4-61)

1183-Q. Why Stress Relieve Cryogenic Vessels Made From 9% Nickel Steels? Welding Design & Fabrication, v. 33, Dec. 1960, p. 57-59.

Tests show that tanks and pressure vessels made from 9% nickel steels withstand impact shocks and high pressures at low temperatures without stress relieving. (Q6, Q28, 2-63, T26q; AY, Ni, 17-57)

1184-Q. (Italian.) Effects on Macro and Microstructure of Thermal Cycles on Alpha Uranium. R. Salice and F. N. Zein. Metallurgia Italiana, v. 53, Apr. 1961, p. 133-142.

Thermal cycle test on alpha uranium from 550-100° C., 630-100° C. and 630-400° C. are made to study the effect of temperature on subgrain formation, grain boundary corrugation and migration accompanied by intergranular deformation. These changes develop more rapidly for the 630-100° C. cycle since internal stresses are stronger. The double texture formed during thermal cycles is discussed and a correlation between the grain size and double texture is suggested. 15 ref. (Q7j, M27, M28, 2-61; U)

1185-Q. (Italian.) SAP and Aluminum Behavior to Thermal Fatigue. B. Buttinelli and G. de Gregorio. Metallurgia Italiana, v. 53, Apr. 1961, p. 143-148.

Influence of thermal fatigue on mechanical properties (hardness, impact, tensile strength and elongation) of SAP and Al. Observations are also made of dimensional instability, structure brittleness and crystal grain growth. 5 ref. (Q7j, Q-general, P10d, M27; Al)

1186-Q. (Translation.) Composition and Properties of Soviet Gas Turbine Steels. U. S. Office of Technical Services, 60-21031, Dec. 11, 1959, 44 p. $1.25.

Review of heat resistant, austenitic, high-alloy Soviet steels with comparative data given for brand designation, chemical composition, comparable steels, Soviet and non-Soviet, applications, heat treatment, chemical stability and physical and mechanical properties including stress-rupture strength, creep resistance. 20 ref. (Q-general, P-general, W11m; SS-e, 10-54, 17-57)

1187-Q. The Effect of Molding Material on the Mechanical Properties of 356-T6 Aluminum Alloy Castings. Gordon L. Tingley. Current Engineering Practice, v. 3, Apr. 1961, p. 15-23.

Ultimate strength, yield strength and elongation are compared for castings produced in permanent molds, green sand molds, dry sand molds, shell molds, Niforge aluminum molds and rammed graphite molds. (Q27a, Q23; 5)

1188-Q. A New Material for Engine Bearings. P. G. Forrester. Current Engineering Practice, v. 3, Apr. 1961, p. 4-7.

Results of bearing fatigue strength tests performed on a Glacier Viking machine comparing a new reticular Sn-Al alloy with Sn-base whitemetal, Pb-base whitemetal, unplated Cu-Pb alloy and Cu-Pb alloy with Pb-base overlay. 9 ref. (Q7a, T7d; Al-b, Cu-b, Pb-b, Sn-b)

1189-Q. Nickel-Alloyed Ductile Iron Rolls. Inco Nickel Topics, v. 14, Apr. 1961, p. 6-7.

Hardness and resistance to galling, scuffing and fire-cracking of chill cast, pearlitic and acicular rolls. (Q29, Q9n, Q26, W23k)

1190-Q. Steel With Hitherto Unattainable Characteristics Developed. Inco Nickel Topics, v. 14, Apr. 1961, p. 8.

Heat treatment involving age hardening of martensite of a newly developed alloy steel containing Ni, Co, Mo, Ti and carbon to produce a high yield and tensile strength, low-ductility temperature steel which can be cold formed, shaped or machined and is crack and corrosion resistant. (Q-general, Q23q, R-general, 2-64; AY)

1191-Q. The Stress Field of a Slipped Crystal and the Early Plastic Behavior of Polycrystalline Materials. B. Budiansky. Harvard University (Office of Naval Research). U. S. Office of Technical Services, PB 171531, Apr. 1960, 36 p.

Investigation of the initial phases of the plastic deformation of polycrystals during which elastic strain predominates. Results obtained for the polycrystal composed of grains having one slip system each indicate that, in the absence of mechanisms of plastic deformation other than slip, such a hypothetical material would need stresses far above the elastic limit for plastic strains to become comparable to elastic strains. (Q24)

1192-Q. (German.) Impact Bend Testing of Case Hardened and Notched Specimens. H. Brugger. Harterei-Technische Mitteilungen, v. 16, Apr. 1961, p. 12-18.

Impact bend testing of case hardened 25 CrMo 4, 34 CrMo 4, 15 CrNi 6, 20 MnCr 5 and C15 steel specimens to investigate influence of composition, heat treatment, case depth, shape of specimen and testing variables. (Q5, Q6, J28g, 2-60, 2-64, 3-73; AY)

1193-Q. Dynamic Anelastic Deformation of Metals. H. G. Hopkins. Applied Mechanics Reviews, v. 14, June 1961, p. 417-431.

Research into nonlinear stress-wave propagation in metals and alloys as polycrystalline aggregates. Calculation of rate of strain and pressure effects on dependent and independent mechanical behavior as related to low amplitude stress levels. High amplitude stress effects on deformation and compressibility of quasi-fluid and solid mechanical behavior. 136 ref. (Q22, Q28)

1194-Q. Residual Stress Versus Cutting Fluid Selection When Grinding High-Temperature Alloys. D. A. Stewart and H. R. Soderstorm. Lubrication Engineering, v. 17, June 1961, p. 286-291.

Deflection method testing of 25% Ni-15% Cr-Fe alloy, 7% Ar-4% Mo-Ti alloy and two CrCoNi-base alloys to determine residual stress when using various grinding fluids. (Q25h, G18, 18-73; Fe-b, Ni-b, Ti-b, SGA-h)

1195-Q. Experiments on Fabricated Pipe Bends. P. H. R. Lane and R. T. Rose. British Welding Journal, v. 8, June 1961, p. 323-334.

Stress distributions, changes in bend angle and diameter and flexibility factors for gusseted pipe bends subjected to in and out-of-plane bending and internal pressure. Comparison of experimental results with theoretical smooth-bend behavior and nature of divergence. 4 ref. (Q5, 3-74, 4-60)

1196-Q. The Effects of Internal Pressure on Thin-Shell Pressure Vessel Heads. E. O. Jones, Jr. Welding Research Council Bulletin Series, no. 69, June 1961, p. 1-10.

Determination of shell-to-head junction stresses and external pressures-to-collapse for hot rolled 1010 steel pressure vessels with torispherical, 2 to 1 and 90° ellipsoidal and 120° toriconical heads and wall thicknesses from 0.110-0.137 in. (Q10b, 3-74, T26q)

1197-Q. Wrinkling of a Large, Thin Code Head Under Internal Pressure. A. Fino and R. W. Schneider. Welding Research Council Bulletin Series, no. 69, June 1961, p. 11-13.

Failure by meridional wrinkling in the knuckle region of a large thin semi-ellipsoidal head designed to A. S. M. E.

code formulas at a pressure below the code prescribed test pressure. Influence of head diameter to thickness ratio and head geometry on propensity to such failure. (Q10b, 3-73, T26q)

1198-Q. (German.) Behavior of Tungsten Wire Under Torsion Stressing. H. J. Boos and H. Wiedenmann. Metall, v. 15, June 1961, p. 576-578.

Torsion testing from 0-500° C. under nitrogen atmosphere of cleaned bright, oxide or graphite covered ("black") tungsten wire specimens by measuring length change after a defined number of twists and by twisting to fracture. Influence of heat treatments and surface coatings. 6 ref. (Q1, 2-61, 2-64; W, 4-61)

1199-Q. (Russian.) New Formulas to Determine Deformation Resistance During Rolling. Yu. M. Chizhikov. Izvestiya VUZ--Chernaya Metallurgiya, Feb. 1961, p. 77-85.

Determination of deformation resistance during rolling of mild steel. 10 ref. (Q23, F23; CN)

1200-Q. (Russian.) Mathematical Analysis of the Strain Condition in Tensile Deformation. V. Kh. Sobolev and L. D. Sokolov. Izvestiya VUZ--Chernaya Metallurgiya, Feb. 1961, p. 93-95.

Theoretical examination of conditions in a test bar to find the true strain. Values are used in an experimentally derived formula. 4 ref. (Q27h, Q25, Q21)

1201-Q. (Russian.) Testing of Low-Carbon Steel Hardened by the Heat Left Over After Rolling. K. F. Starodubov, Yu. Z. Borkovskii and Yu. P. Gul'. Izvestiya VUZ--Chernaya Metallurgiya, Feb. 1961, p. 109-113.

Investigation of the possibility of exploiting the heat of rolled low-carbon steel immediately after rolling for further treatment and hardening. 15 ref. (Q29, 2-61, F23; CN)

1202-Q. (Russian.) Strength of Flat Bottoms of Steel Teeming Ladles. A. A. Kazantsev. Izvestiya VUZ--Chernaya Metallurgiya, Feb. 1961, p. 151-153.

Method for calculation of stresses in different parts of flat bottomed teeming ladles which are frequently used for Martin furnaces. 9 ref. (Q25, W19b)

1203-Q. Attenuation of Sound in Germanium at Ultra-High Frequencies. E. Roland Dobbs. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 291-293.

The acoustic wave in pure Ge is measured from 1.5-300° K. using compressional waves at 508 Mc/s and shear waves at 333 Mc/s. The temperature dependence of the attenuation is accounted for in terms of the known behavior of the phonon mean free path. 9 ref. (Q21f, M25, 2-63; Ge-a)

1204-Q. Ultrasonic Attenuation in Metals. R. W. Morse. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 233-239.

Review of experiments on the interaction between ultrasonic and electrons in metals at low temperature by observation of an attenuation of ultrasonic waves by electrons which occurs when the electron free path is comparable to or greater in size than the ultrasonic wave length. Application of attenuation measurements to determination of Fermi surface, superconducting energy gap, anisotropy and possibility of an acoustic factor in Au, Ag, Sn and Cu single crystals at 1.2° K. 9 ref. (Q21, P15g, 2-63, 3-72; Ag, Au, Sn, Cu, 14-61)

1205-Q. Shear Wave Attenuation in Normal and Superconducting Tin. A. R. Mackintosh. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 240-243.

Measurement on Sn single crystals at 1.2° K. with attenuation 80 Mc/s, the temperature dependence of the electromagnetic part of the absorption of waves in a superconductor being determined theoretically. Values are obtained for magneto-acoustic effects as a function of temperature and magnetic field direction. 6 ref. (Q21f, P16, P15g, 2-63; Sn, 14-61)

1206-Q. Investigation of the Mechanical Properties of Metals at Temperatures Below 1° K. N. M. Reinov and A. P. Smirnov. Paper from "Seventh International Conference on Low Temperature Physics, Proceedings". University of Toronto Press, Canada, 1961, p. 712.

A thermal method is used to determine the quantities of heat yielded during the deformation process in extension of superconducting metal with low thermal conductivities and heat capacities at temperatures below 1° K. Application to measurement of thermal elastic limits of Sn and In. (Q21, Q-general, M23r, 2-63, 3-68; In, Sn)

1207-Q. (French.) Spanish "Sulf-Inuz 18" High-Speed Steel. Rene Brochon. Machine Moderne, v. 55, Apr. 1961, p. 25-26.

Service life of drills and a lathe centering cone, manufactured from Sulf-Inuz 18 steel containing 18% tungsten. Effect of sulphurizing. (Q9, G17, T6n, 2-60, 2-64; TS-m, 17-52, 17-57)

1208-Q. Investigation of Three Analytical Hypotheses for Determining Material Creep Behavior Under Varied Loads, With an Application to 2024-T3 Aluminum-Alloy Sheet in Tension at 400° F. Avraham Berkovits. NASA Technical Note D-799, May 1961, 40 p. (Available from National Aeronautics and Space Administration, Washington, D. C. D. C.) $1.

Mathematical formulation of hypotheses including time-hardening, strain-hardening and life-fraction rules to estimate tensile creep strain under varied loads and constant temperature from creep data obtained under constant load and temperature. Predicted creep behavior is compared with data for 2024-T3 specimens under cyclic loading. (Q3, 2-61, 3-68; Al-b)

1209-Q. A Review of Recent Developments in Titanium and Titanium Alloy Technology. R. A. Wood. Defense Metals Information Center, Battelle Memorial Institute, DMIC Memo. 113, July 3, 1961, 4 p.

Summary of mechanical properties such as fracture toughness, creep characteristics and elevated temperature strength of Ti-13V-11Cr-3Al, Ti-8Al-1Mo-1V and Ti-8Al-10V alloys. Comparison of the tensile properties of zone-refined iodide titanium and sodium-reduced and electrorefined Ti. 12 ref. (Q-general, A-general, C-general, 2-60, 2-61; Ti-b, 10-54)

1210-Q. (Russian.) Some Properties of Cast Graphitic Steel. A. P. Serbin and N. I. Blinov. Liteinoe Proizvodstvo, Mar. 1961, p. 24-26.

Wear properties, antifrictional quality, thermal stability, plasticity, hardness, resilience and elongation as dependent on heat treatment, cooling method and chemical composition. The most favorable chemical composition is 1.3-1.45% C, 1.4-1.6% Si, 0.07% Cr and 0.4% Mn. 6 ref. (Q-general, P11, 2-60, 2-64; TS)

1211-Q. (Russian.) Brittleness of Cerium Cast Iron. P. I. Talanov and N. I. Astafurova. Liteinoe Proizvodstvo, Mar. 1961, p. 27-28.

Effect of small additions of Ce to cast iron on its resilience, threshold of brittleness, graphite spheroidization and neutralization of the adverse influence of Ti, Bi, Pb, Sb and other impurities on the globularization of graphite and cleanliness of crystal boundaries. (Q21, Q26s, N8q, M26, 2-60; CI, Ce)

1212-Q. The Pressure Variation of the Elastic Constants of Sodium. William B. Daniels. Paper from "Progress in Very High Pressure Research". John Wiley & Sons, Inc., New York 16, 1961, p. 203-215.

Pressure variation of the single crystal elastic constants of Na are measured from 0-299° K. using a modified ultrasonic pulse echo method. Results are interpreted in terms of Fuch's theoretical calculation of the Coulomb contribution to the shear stiffnesses of the alkali metals. 22 ref. (Q21d, 2-61, 3-74; Na, EG-e)

1213-Q. Quantum Effects in Diffusion: Internal Friction Due to Hydrogen and Deuterium Dissolved in Alpha Iron. W. R. Heller. Acta Metallurgica, v. 9, June 1961, p. 600-613.

Torsion pendulum measurements from 4.2-300° K. on annealed and quenched wire specimens with theoretical analysis of internal friction phenomena in terms of quantum mechanics. Effect of dissolved hydrogen-deuterium on relaxation and magneto-mechanical damping effects as a function of temperature. Relation of isotope shifted peaks to tunnelling effects and localized lattice distortion around the dissolved atom. 24 ref. (Q22, M26, N1, 2-60, 2-61; Fe-a, H)

1214-Q. Activation Energies for High Temperature Creep of Polycrystalline

Magnesium. W. J. McG. Tegart. Acta Metallurgica, v. 9, June 1961, p. 600-613.

Constant stress creep tests on 99.99% Mg specimens from 450-850° K. with activation energy variation determined as a function of stress and temperature. Creep rate is analyzed in terms of two thermally activated mechanisms, dislocation climb and nonbasal cross-slip acting additively. 18 ref. (Q3, Q24a, M26b, 2-62, 3-66; Mg)

1215-Q. Fatigue of Indium Antimonide. R. E. Maringer and J. J. Duga. Acta Metallurgica, v. 9, June 1961, p. 617-618.

Fatigue tests on single crystal specimens of InSe under cyclic plastic strain at 400° C. Fatigue cracking is observed at the boundary between intersecting slip bands and is rationalized in terms of dislocation pile-ups. Surface distortion is associated with slip as a function of strain. 8 ref. (Q7, Q24a, M26b, 3-68; In-b, Sb)

1216-Q. The Yield Stress of Iron Above Room Temperature. D. V. Wilson. Acta Metallurgica, v. 9, June 1961, p. 618-620.

Tensile test determination of the lower yield stress of polycrystalline low-carbon steel (alpha iron) from 20-200° C. as influenced by temperature dependent Cottrell locking of dislocations. 7 ref. (Q23b, Q24c, M26b, 2-61; Fe-b)

1217-Q. Pseudo Yield Point Effects. G. F. Bolling, L. E. Hayes and H. W. Wiedersich. Acta Metallurgica, v. 9, June 1961, p. 622-624.

Single crystals of Pb, Cu and Ag and polycrystalline specimens of Cu, Al and Fe are examined in various tensile machine at several temperatures and strain rates. Load-elongation and crosshead rate-elongation curves are derived as a function of time, with negative yield points appearing on the curves as a function of the machine characteristics, creep rate and strain rate sensitivity and positive yield points by a combination of machine characteristics and strain rate sensitivity. (Q24c, 1-52, 3-68; Ag, Al, Cu, Fe, Pb)

1218-Q. (French.) Titanium and Its Alloys. Technique Moderne, v. 53, Apr. 1961, p. 152-154.

Mechanical and physical properties and corrosion resistance. Effect of O, N, C, Al, Fe, Cr, Mn, Cu, Ni, Co, Bi, H, Mo, V, Cb and Ta on alpha-beta transformation. Weldability and effect of N, O and C impurities on tensile strength of the base metal and ductility of weldments. (Q-general, P-general, R-general, N-general, K9s, 2-60; Ti-b)

1219-Q. (French.) Formation of Electron-Microscopic Structures of Aluminum and Their Relationship to the Restoration of Mechanical Properties and Electrical Resistivity. Technique Moderne, v. 53, Apr. 1961, p. 159.

Samples of pure Al or Al alloys containing 120 x 10^{-6}% Cu are subjected to 90% cold deformation and held for 0-2 hr. at 0-250° C. to study recovery and recrystallization processes and their influence on hardness, tensile strength and electrical resistivity. Relation to formation and growth of atomic blocks in microstructure. (Q29, Q27, Q22n, M27, P15g, N5, 3-68; Al, Al-b, Cu)

1220-Q. (German.) Federal Laboratories for Material Testing at the Institute of Technology in Stuttgart. Karl Wellinger and Dietrich Uebing. Materialprufung, v. 3, May 20, 1961, p. 190-197.

Methods and apparatus used in creep testing at temperatures up to 1200° C., thermal cycling, fatigue testing of tubing by simultaneous cyclic pressurizing and bending, pressurizing of boilers with fatigue testing of chain links, mechanical testing of weldments, and impact-tensile testing from -200 to 20° C. 7 ref. (Q-general, 1-54, T26q; 4-60, 7-51)

1221-Q. The Mechanical Properties and Structure of Some High Tensile Alloy Steels. S. Becker and M. G. Bader. Research Council of Israel, Bulletin, v. 9C, Feb. 1961, p. 61-78.

Tensile strength and hardness are investigated in Si-Mo-V-Cu high-tensile alloy steels in the water quenched and tempered condition. Results are compared with observations made by optical microscopic analysis to establish a relationship between mechanical properties

and microstructure evidencing precipitation hardening. 14 ref. (Q27, Q29, M27, N7a; ST, Si, Mo, V, Cu)

1222-Q. Metals and Alloys at Elevated Temperatures (Anomalous Fracture in the Creep of Nickel). T. C. Reuther, P. Shahinian and M. R. Achter. Report of NRL (Naval Research Laboratory) Progress, June 1961, p. 25. (Available as PB 1713109 from U. S. Office of Technical Services, Washington 25, D.C.) $1.25.

Tapered Ni rod specimens are crept in vacuum and oxidizing air from 1200-1500° F. for various times to investigate the occurrence of fracture in larger sections of specimens at less stress than for smaller sections in air. The anomaly, which does not occur in vacuum is attributed to internal oxidation strengthening of cracks in the smaller sections with the fracture being progressively displaced to the heavier section as the stress increases. (Q26q, Q3, R1h, 2-66, 3-66, 3-73; Ni)

1223-Q. Metallurgical Aspects of Plastic Flow Processes (Low Cycle Fatigue). E. A. Lange and E. P. Klier. Report of NRL (Naval Research Laboratory) Progress, June 1961, p. 27-28. (Available as PB 1713109 from U. S. Office of Technical Services, Washington 25, D. C.) $1.25.

Two welded pressure vessels of A201 steel are tested to failure under high stresses at low cyclic fatigue loading. Catastrophic failure is by development of a fast-moving through crack (brittle fracture) for one of the vessels and by a slow-moving through for the other, both being explained in terms of the levels of applied stress and the NDT (nil-ductility transition) temperature of the steel. (Q26, Q7, Q23, 3-66, T26q; ST)

1224-Q. Improved Steel for Polaris (Temperature Dependence of Plane-Strain Crack Toughness of a High Strength Steel). J. E. Srawley and C. D. Beachem. Report of NRL (Naval Research Laboratory) Progress, June 1961, p. 28-29. (Available as PB 1713109 from U. S. Office of Technical Services, Washington 25, D.C.) $1.25.

Crack propagation tests from -280 to 80° F. on sheet specimens of a air hardened and tempered low alloy, high-strength steel, with the crack toughness as a function of thickness and temperature being calculated by a relationship drawn by Irwin. 4 ref. (Q23s, Q26q, 2-61, 2-64, 3-73; AY, SGB-a, 4-53)

1225-Q. Fundamental Study of Weld Joint Behavior (Significance of Energy Absorption to Shear Fracture Failure). A. J. Babecki and P. P. Puzak. Report of NRL (Naval Research Laboratory) Progress, June 1961, p. 29-32. (Available as PB 1713109 from U. S. Office of Technical Services, Washington 25, D. C.) $1.25.

Explosion tear test plates of STS steel with through-thickness cracks are tested under explosion loading at conditions to produce ductile (shear) failure. Tear resistance is measured for various heat treatment conditions and temperatures are correlated with Charpy-V energy absorption levels. (Q6q, Q-general, K9r, 2-61, 2-64; ST, 7-51)

1226-Q. (Japanese.) The Difference in Wear of Cast Iron Brake Shoes in Each Season. Minoru Nakai. Imono (Japan Foundrymen's Society, Journal), v. 33, May 1961, p. 336-339.

Statistical comparison of wear in summer as opposed to winter for cast iron brake shoes on railway cars with seasonal variations being attributed to temperature and humidity differences. (Q9n, T23; CI, 17-57)

1227-Q. (Japanese.) The Influence of Cementite Particle Dispersion on the Strength Indices of Tempered Carbon Steels. Genjiro Mima. Tetsu-to-Hagane (Iron and Steel Institute of Japan, Journal), v. 47, May 1961, p. 699-706.

Relationships between yield strength, tensile strength and hardness and transformation microstructures in specimens of plain carbon steel are studied after isothermal tempering at 690° C. for 6 min. to 400 hr. Effect of size-frequency distributions of cementite particles, mean free ferrite paths and ferrite grain size on mechanical properties. 21 ref. (Q-general, M27, N8, 3-71; CN-g)

1228-Q. (Japanese.) Effect of Al, Al + Ti and W + V + Nb on Properties of Heat-Resisting 38% Ni Alloy. Sadao Koshiba, Tsuneo Kunou and Shin Kimura. Tetsu-to-Ha-

gane (Iron and Steel Institute of Japan, Journal), v. 47, May 1961, p. 727-733.

Tensile properties from 20-900° C., rupture strength, oxidation resistance, microstructure, nature of precipitates and hardness after aging and solution treatment to 1150° C. are examined for Ni-Co-Cr alloy specimens as a function of alloy additions. (Q-general, M27, R1h, 2-60, 2-61, 2-64; Ni-b, Co, Cr, Al, Ti, W, V, Cb)

1229-Q. Creep and Rupture Properties of Carbon Steels. A. I. Smith, E. A. Jenkinson and D. J. Armstrong. Institution of Mechanical Engineers, Proceedings, v. 174, 1960, p. 745-765.
